Standard gauges at Elswick and Woolwich did not compare well together. They were found to differ quite appreciably. The same condition of things was found to exist in the Indian and home arsenals, and there was no central authority to settle the point and declare who was right. At Kew sextants can be tried and certificates issued showing the errors of division at different parts of the scale. There is no central institution, however, for electrical instruments being tested. The electrical engineers who gave evidence spoke to the advantage the Reichsanstalt conferred in Germany, and sometimes electrical engineers of this country had to obtain assistance from it. The Treasury is the authority for laying down the lines on which the laboratory shall be worked, for it is the Treasury which finds the money. It has endowed the laboratory with a sum of £18,000 for buildings and a yearly grant of £4,000, which, however, will be increased as necessity arises. There are to be 36 members on the governing body, 24 of which will be supplied by the Royal Society, and 12 by three institutions—the Iron and Steel Institute, the institution of Naval Architects, and the Society of Chemical Industry. Precaution will be taken to keep the institution always in touch with the existing indus-

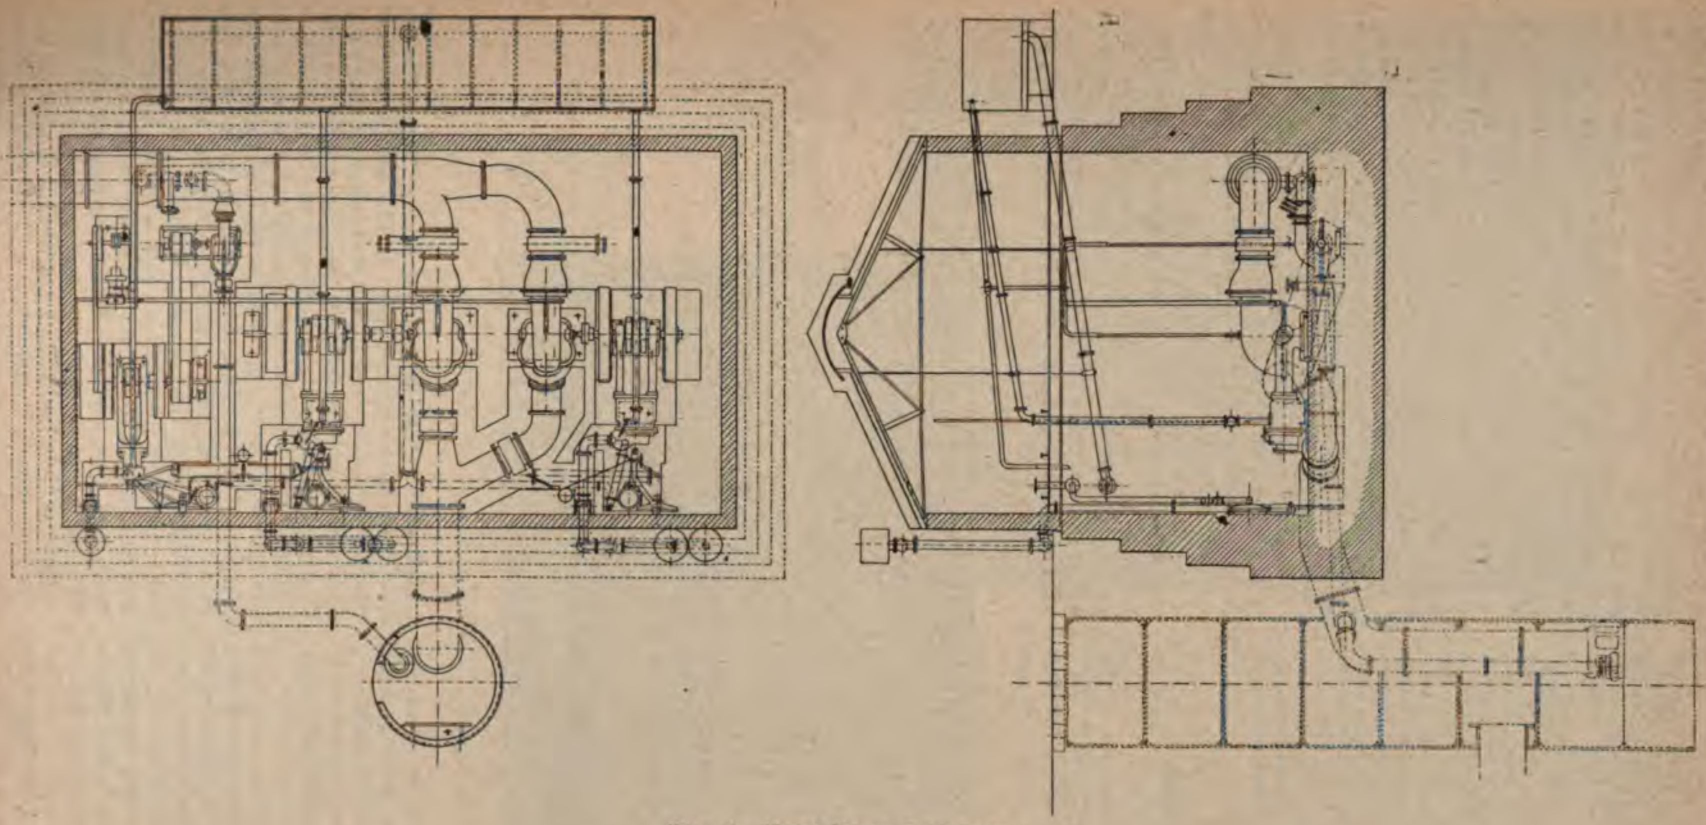

FIG. 4.—UNION DOCKS, LIMEHOUSE.

tries, so half the members of the executive committee will be from the above institutions. Should any member of the executive committee fail to attend half the number of meetings he will not be eligible for appointment again for twelve months. The executive committee will produce the annual report of the work done in one year and of the programme of experimental work for that ensuing. The following are the present executive committee: Lord Lister, P.R.S.; Lord Rayleigh (chairman); Mr. A. B. Kempe (treasurer R.S.); Professor A. W. Rucker (secretary R.S.); Sir Courtenay Boyle; Captain Abney; Sir N. Burnaby; Mr. G. Beilby; Sir E. H. Carbutt, Bart.; Captain E. W. Creak, Professor R. B. Clifton, Professor G. C. Foster, Mr. F. Galton, Professor O. J. Lodge, Sir A. Noble, Professor J. Perry. Sir W. Roberts Austen, Professor A. Schuster, Mr. A. Siemens, General Sir A. Strachey, Professor J. J. Thomson, Dr. T. E. Thorpe, and Sir J. Wolfe Barry. This executive committee have the power to appoint sub-committees, the members of which are not necessarily members of the governing body. The following are also members of the general board: Sir M. Foster, Sec. R. S., Sir F. A. Abel, Professor W. G. Adams, Professor W. E. Ayrton, Mr. H. Bell, Mr. A. Buchan, Mr. R. G. Crompton, Professor G. F. Fitzgerald, Professor J. Joly, Lord Kelvin, Mr. J. T. Milton, Sir, W. H. Preece, Mr. W. F. Reid, the Earl of Rosse, Dr. R. H. Scott, Mr. W. N. Shaw, Mr. C. E. Stromeyer, Admiral Sir W. Wharton, Sir W. H. White. The following have been asked to serve on one or other of the committees: Messrs. E. D. Archibald, C. V. Boys, Professor H. L. Callendar, Forbes Carpenter, W. H. M. Christie, J. H. Dallmeyer, Professor J. A. Ewing, Mr. S. Z. de Ferranti, Professor J. A. Fleming, Messrs. R. E. Froude, E. H. Griffiths, J. Mansergh, J. Mathews, W. H. Maw, Dr. L. Mond, Hon. C. A. Parsons, Professor A. W Reinold, Captain H. N. Sankey, Messrs J. Swinburne, G. J. Symons, H. A. Taylor, Professor S P. Thompson. J. I. Thornycroft, C. H. Wordinham, and A. F. Yarrow

We note in the regulations that 12 of the governing body shall be elected by three engineering institutions. We wonder by what stretch of imagination the Society of Chemical Industry can be placed under this head. On the whole the selection for the committee appears a good one. But one institution has been left out, and we may have to return to this subject again.

Mr. William Froude, who made the classical experiments for the Admiralty on the propeller, and showed the advantage first of experimental models for deducing the reistance of full-sized ships, is succeeded by his son, Mr. R. E. Froude, F.R.S., as superintendent of experiments at the Admiralty experimental works, Gosport.

Whitworth Scholarships.—The following gentlemen are placed at the head of the Whitworth Scholarships list, and receive £125 a year for three years:—1. Alec W. Quennell (21), engineer, London. 2. Hanson Topham (22), engineer, Great Horton, Bradford. 3. William V. Shearer (21), engineering student, Langside, Glasgow. 4. George Wall (25), student, Oldham.

The Spanish-American sea war has created a new life in the yards of the United States. The little repairing shop of the Moran Bros. Co., at Seattle, on the Pacific coast, has developed into a yard covering an area of 14 acres, having a frontage of 700 ft. on Elliott Bay. There are a machine shop, pattern shop, foundry, blacksmith and boiler shops, and all the other shops for a complete engineering company. Lately it built 12 stern wheel steamers for the Yukon river trade, the dimensions were 175 ft. long, 35 ft, broad, and 6½ ft. deep. Engine cylinders 20 in. in diameter, 7 ft. stroke. There is to be a floating dry dock 400 ft. long, built in two sections. There is to be a 75-ton crane also erected.

The South Wales centre of the Institute have brought forward a proposal for the better accommodation of the members. Some little modification at the Stratford centre may permit of this being done.

"VRIL" ELECTRIC LAUNCHES.

In the adjoining illustrations we show one of the electric launches built according to the "Vril" system. Fig. 1 shows a boat constructed for the Morecambe Electric Launch Syndicate running at full speed. Fig. 2 shows the same boat looking from above, giving an idea of the seating accommodation. Fig. 3 is an outline diagram showing the plan and cross section, and the arrangement of motor and accumulators.

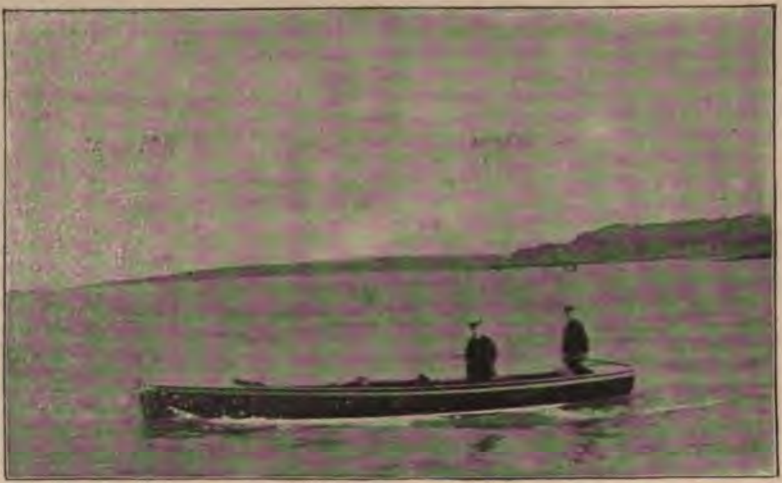

FIG. 1.

This boat has been built on new lines, and was intended to run at a speed of seven miles per hour; however, on trial, it was found that a speed of 8¼ miles per hour for five hours could be maintained. The length of the boat is 28 ft. over all, and 27 ft. 6 in. on the water line, the beam is 6 ft. 6 in., the depth 3 ft. 4 in., and the draught about 1 ft. 9 in. She is carvel-built of mahogany, and is copper and yellow metal fastened throughout.

The propeller, which is of gun-metal, is driven by *one of* the "Vril" patent motors. The special feature of this motor is the provision of special means whereby the great difficulty is entirely overcome of controlling the speed and output of the motor, without the aid of external resistance or alteration in the connections of the batteries. The common method of getting two or more speeds is to arrange that the cells are grouped into one, two, or more sets in series for full speed and in parallel sets for other speeds. This in course of time leads to trouble with the cells, owing to the impossibility of running cells in parallel without some complicated arrangement to regulate the discharge from each individual group. In the "Vril" system the cells are always in series, and the full voltage of the battery is always on, the various speeds being obtained by alteration to the motor circuits only.

The motor is controlled by a Callow-Eck patent controller, which gives two speeds ahead and astern. These are adapted to give an absolutely instantaneous make and break from and to any point, and have large contact surfaces to ensure cool working.

The motor is adapted to work a reciprocating bilge pump so as to keep the boat clear of water. The accumulators are constructed on the "Vril" system with improved connecting lugs, placed in ebonite boxes with rebated edges and acid-tight ebonite lids, and sealed with "Okonite" special paste. The cells are fitted with double rubber rings on the connecting lugs making an absolutely acid and water-tight battery box and entirely preventing acid spilling out of the cells through the rolling and pitching of the boat. It is also claimed that this overcomes the difficulty arising from the connections of the cells corroding through the creeping of the acid up the lugs to the terminals. The gases given off during charging are led away by a ventilating plug clear of the terminals, thus leaving the connection from cell to cell a sound mechanical and electrical connection; a matter of great importance, and one that has hitherto given considerable trouble.

Okonite insulated cables are used throughout, as it has been found, we understand, from long experience that nothing will stand acid, acid fumes, seawater, oil and the generally damp conditions that appertain to marine or river boat-work, and at the same time maintain its high insulating qualities so well as this kind

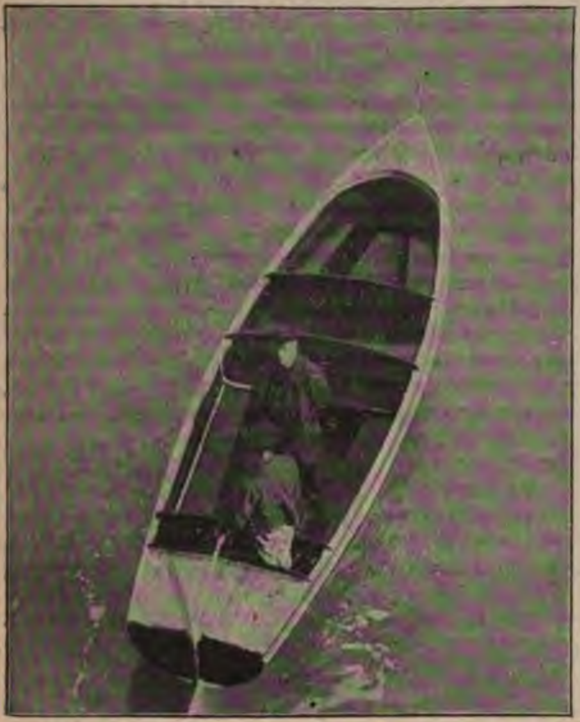

FIG 2.

of cable. The cables are sheathed with lead to protect them from mechanical injury.

The seating capacity of the boat illustrated is 22 passengers in addition to the steersman.

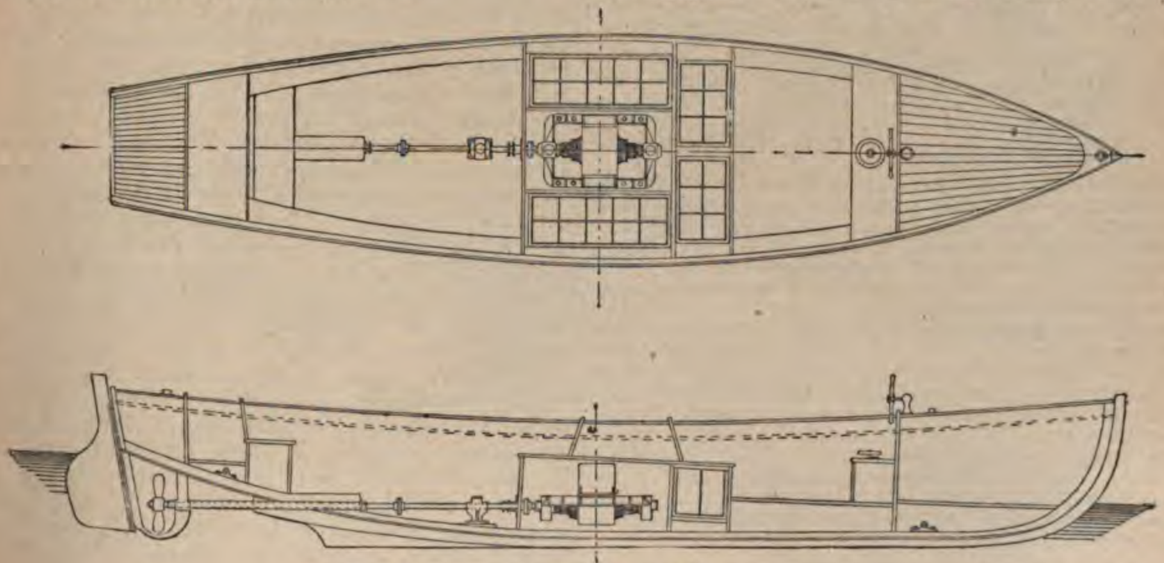

FIG. 3. "VRIL" ELECTRIC LAUNCHES.

The boat was constructed in accordance with the designs of Mr. Cecil Callow, by the "Vril" Launch Co., of St. Helens, Isle of Wight, whose selling agents are Messrs. Laing, Wharton & Down, Ltd., of London and Leeds. During Cowes week Messrs. Laing, Wharton & Down were commanded to exhibit the properties of a "Vril" launch to H.R.H. the Prince of Wales, who was so satisfied with the boat shown that he, accompanied by the Duke of York, went a trip in it round the yachting fleet.

ELECTRICAL NOTES.

(From our own Correspondent.)

THE United States stole a march on this country in fitting many of the auxiliary machines on board battleships with electric motors, and now they are again first in the field with *Electrically propelled Ferry boats.* These have soon to be started on the Delaware River between Philadelphia and Camden, New Jersey. It will not be difficult for electric arrangements to show a higher efficiency than steam, since with ferry boats there is waiting at the piers, and only a limited amount of time is taken up in crossing and the fires must burn whether the boat is standing or in motion. With steam there is not a high efficiency. With electrically fitted boats the power is completely cut out when the boat is at the pier, so there is no waste there. The efficiency of the electric is the efficiency of the system on board the boat whilst the ferry boat is in motion. In the case of the electric motor fitted on board and with batteries to run the motors the charging is very simple. It can be done whilst the boat is in the slip at the end of each trip. Under these conditions the batteries would always be at full charge, and when these are in full charge their efficiency is very high indeed. The ferry boats may thus be expected to show a saving in coal. But there will be other gains following on the displacement of steam machinery with accumulators and motors. All the space on the main and upper decks which is usually occupied with working beams, smoke stacks, &c., will be saved The attendance will be reduced to a minimum, there will be less vibration, the control gear put in the pilot house, and the steersman may operate the motors. The control will be very simple, and no chance of error by signalling, since the same man who steers directs the motor.

Electrically Driven Barge.—There has been placed to run on the Mersey an electrically equipped barge, the installation consisting of storage batteries and a motor. The length of the vessel is 75 ft., and its displacement 225 tons when fully loaded. The equipment consists of 112 storage battery cells, each a lead-lined teak box, 16 in. by 22 in. by 14 in., containing 29 plates $9\frac{1}{4}$ in. high, 12 in. broad, and half inch thick with ebonite separators. The cells are sealed to prevent the acid solution spilling, and each cell has a fume outlet connected by lead piping with the open air. There are two 40 H.P. motors taking a current of 150 amperes at 200 volts, each motor works its own screw. A Hopkinson series control is used for varying the speed of the vessel. There are five speeds and a reversing switch under the control of the steersman. The space taken up by the installation is less than would be taken up by a steam engine and boiler of the same power. It is said that the speed of this barge is greater than that of similar barges driven by steam.

Electrical Refrigerator.—A Scotch electrician is said to have brought out an electrical refrigerator. The current is used inside for driving off the ammonia. There are no moving parts. Machines are said to be under construction for the production of 100 lbs. of ice per day.

A Water Automobile.—There is first a light raft on which the vehicle is placed. A chain is thrown off a sprocket wheel and causes the transmission of power to the wheels of the motor car. It is attached to another sprocket wheel which causes the propeller shaft between the two cylinders to rotate at any desired speed. The man acts as driver and steersman. There are two upright handles in front of him, one to manipulate the machinery, the other the rudder.

Power by the Tides.—We have always felt a certain fascination for this subject, but never could get proper *data*. We are at last, however, supplied with *data* as to what could be done at Pont-L'Abbé Finistère, France, where the tides are utilised during 14 hours per day in generating power. At flood tides the water flows through a canal two and a-half miles inland, into a pond in rear of the power house, receiving the water, which returns to the sea at ebb-tide. The total fall is from 6½ to 7½ ft., and 80 H.P. are generated by means of turbines. The turbines are to be used for the generation of electricity.

Test of Electric-Driven Fans.—The comparative test of 12-in. electric fans of five different types, was made by Messrs. J. T. Mountain and E. A. Hughes, of the Engineering department of the University of Michigan. Three of the fans were driven by direct-current motors and two by alternating current. The principal point to be ascertained was the "gross efficiency." This was the ratio of the useful work done by the fan compared with the work put into the motor. The air displaced per minute was measured by means of a large airtight rectangular box. The fan discharged into one end through a 12-in. circular opening, and the volume of air measured at the other end as it issued through a 17-in. circular opening. The outlet was divided into eight zones, and the average velocity of the air through these taken by means of a calibrated anemometer. The results are given below:—

No. of Fan.	Kind of Motor.	Efficency.	Weight of air moved per second per watt input.
			ounds.
No. 1	Direct Current	33·35	·0374
,, 2	,, ,,	21·06	·0229
,, 3	,, ,,	19·70	·0211
,, 4	Alternating ,,	14·40	·0171
,, 5	,, ,,	9·37	·0154

The results showed that direct-current fans are more efficient than alternating-current fans. Fans with straight blades were more efficient than curved blades. A straight-blade fan delivered 944 cubic ft. of air per minute, whilst a curved-blade fan running at the same speed displaced only 844 cubic ft. of air per minute. The rise in temperature of direct-current fans was comparatively very small.

Marconi's Telegraphy at the Manœuvres.—The plan of the Naval Manœuvres was a protecting fleet for an expected transport, and a hostile fleet to try and capture it. The transport was to be on its way from America, the protecting fleet was to find it. The transport had fitted on board an installation of Marconi's system, so had the protecting fleet. When searching for the transport a ship of the protecting fleet discovered its position by means of the wireless telegraphy at a distance of 30 miles, and again at a distance of 25 miles. It is said that by a system of cruisers at a distance of 50 miles from each other, a complete system of detection could be maintained.

The Helicoid Locknut Patents (Parent) Co., Limited, whose speciality the Automatic Locknut (a coil of steel of immense power) is finding favour with all users, notify that their offices have been removed from 147, Dashwood House, New Broad Street, E.C., to Acton Hill Works, Acton, W.

HOMACOUSTIC SYSTEM OF VOICE-TUBES.

THE essential features of a voice-tube should, no doubt, be for maritime work, to clearly transmit and receive without mutilation the messages to and from the bridge to the engine-room, and various other important stations with absolute certainty, without restrictions as to rapidity of speech, or modulation of the voice, and to accomplish it while a high rate of speed is being maintained, notwithstanding the din of machinery, the vibrations of the vessel, the interception by extraneous sounds, and the roar of the gale or of gun-fire.

We have, on a previous occasion, given a description and illustration of the Homacoustic system of voice-pipes, but in view of the fact that considerable improvements have been effected in the system of late, it affords us much pleasure to again refer to the subject.

Referring to the illustrations, Fig. 1 shows the new type of apparatus, termed the Admiralty pattern. Fig. 2 shows a quartermaster delivering orders to the engine-room from the fore-and-aft bridge. Fig. 3 shows such an instrument being used, having a 5-way switch-plate at the base, but which are made for the various number of tubes required. Figs. 4 and 5 are views of the new insulating and watertight bulkhead-piece.

Dealing now with instruments themselves, it will be seen that they consist of three essential elements—viz., a mouth-piece, two ear-pieces, and a whistle-signalling device. The passage from the mouth-piece to the conducting-tube is controlled by a plug-valve, so that in one position of the plug the passage is clear, and in the other position it is closed. To this plug at each end the ear-pieces are attached, so as to have communication with the central passage of the plug. Normally, the ear-pieces hang in their up-and-down or approximately vertical position, as shown in Fig. 1, when the mouth-piece passage is closed by the plug, and no air can escape except by the signalling-whistle. In this way the tube is in a condition for giving the signal for ringing up a person to give a message. To receive the message the person takes the ear-pieces, which are both telescopic and flexible, to allow of adjustment, and raises them into the extended position, as shown in Figs. 2 and 3, which action opens the plug-valve, and allows free communication to be set up between the mouth- and ear-pieces and the line-conducting tube, and conversation can be carried on.

In the case of an instrument being connected to a number of stations, a commutator or switch-plate is used, as shown in Fig. 3, which consists of a foundation to which the various tubes are connected at the bottom and arranged in a circle, and on the upper face thereof a movable disc-plate is mounted to pivot about a stud in the centre. This disc-plate has the same number of apertures as there are pipes, and over one aperture is fixed the speaking-and-hearing instrument, while over the others are placed small-hinged covers, which act as signals by being blown over by the pneumatic pressure sent along the tube, at the end of which is the cover, thus allowing the person at this instrument to ascertain which service of piping is being used, and showing over which tube he must turn his switch-plate to converse. Of course, if no

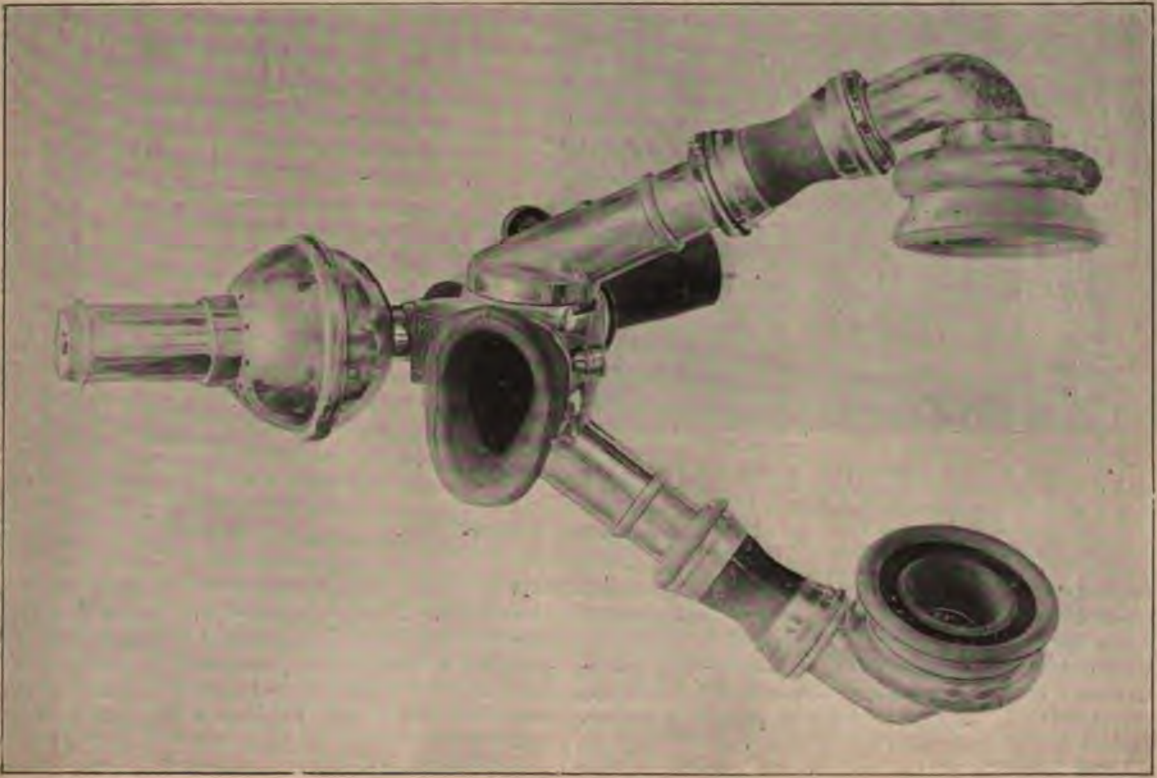

Fig 1.

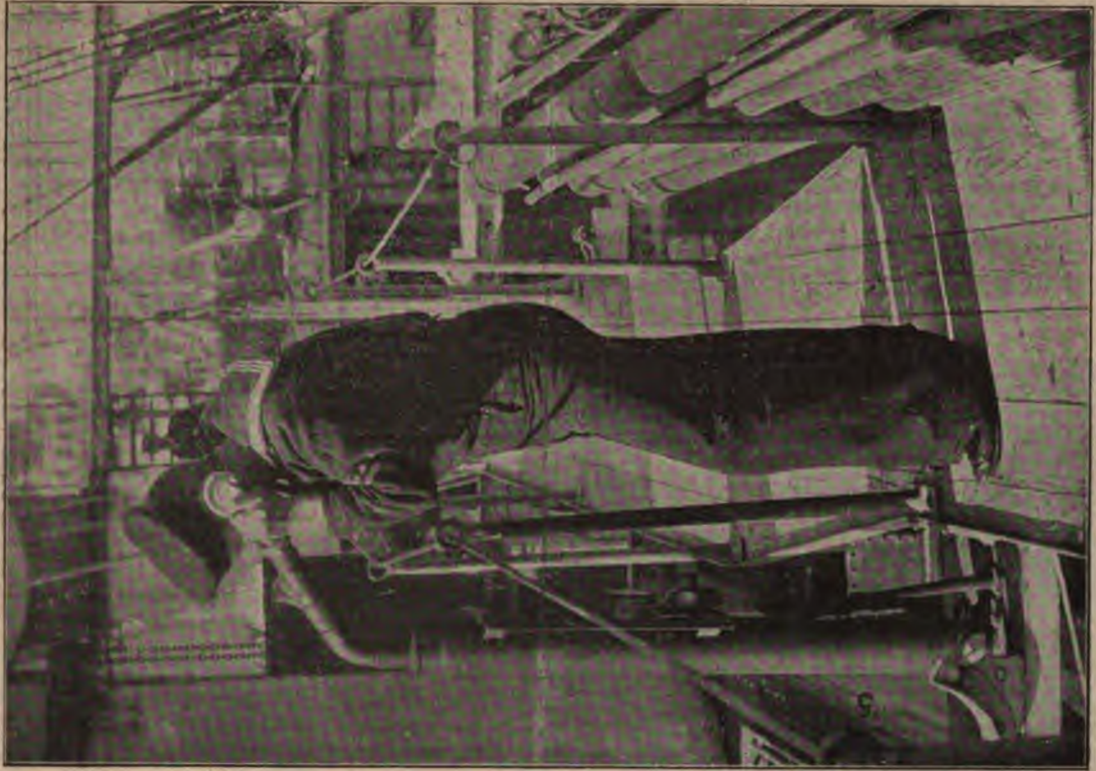

Fig. 2.

Homacoustic System of Voice-Tubes.

cover is blown over then the instrument happens to be placed over the proper tube, through which communication is desired to be made. This arrangement abolishes the multiplicity of mouth-pieces, and thus saves much space.

One of the great difficulties to overcome in the matter of voice-pipes on board ship has been the complete insulation of the installation from the effect of extraneous sounds. This has been carried out by the employment of a non-resonant alloy of metal for the conducting-pipes and the fixing of the latter upon the structure of the ship, so that there is no direct contact with any hard substance or part of the ship.

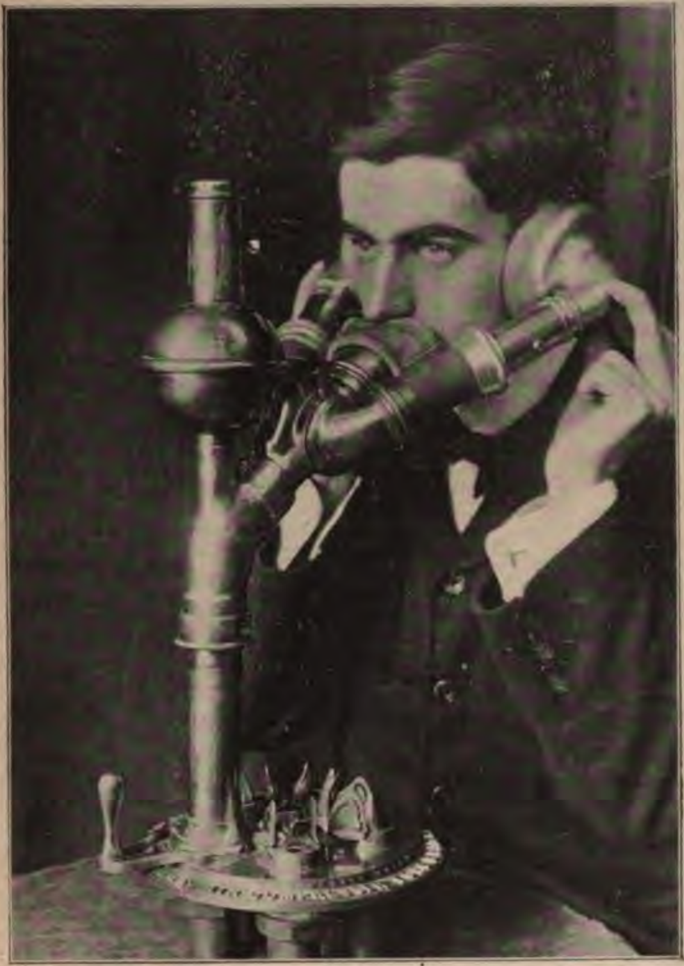

Fig. 3.

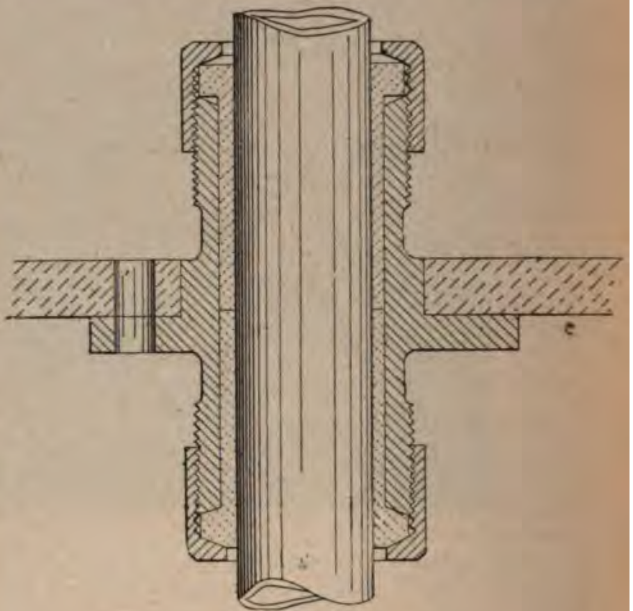

Fig. 4.

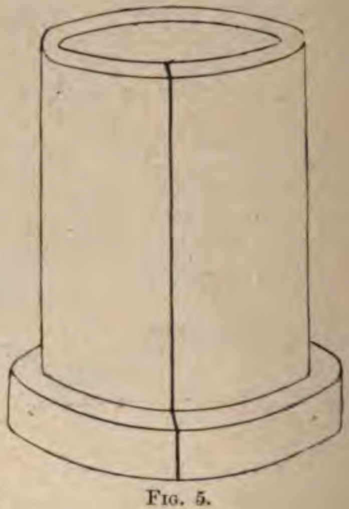

Fig. 5.

Homacoustic System of Voice-Tubes.

To effect this at the bulkheads, or water-tight compartments, a very ingenious and simple bulkhead-fitting has been devised, through which the pipe is threaded, and which are shown in Figs. 4 and 5. It may be mentioned that this fitting may be used for any other kind of pipe other than voice-pipes, which, in passing through a bulkhead, require a watertight joint to be made thereby. It will be seen from the illustration to consist of a flanged casting, having an internal recess and screwed nipples projecting on either side, upon each of which a coned gland-nut is fitted. The pipe having been threaded through this device and placed in position, the nuts are unscrewed, and a split indiarubber packing-piece is inserted into the central recess, the packing-piece having a collar or shoulder, serves as the washer which abuts against the end of the nipple. If now the nuts are screwed up against the packing-piece the latter is compressed, thereby forming a watertight joint, the pipe being practically held in suspension by the rubber sleeves, thus allowing for contraction and expansion in steam pipes, and water pipes, and at the same time insulating the pipe by means of the indiarubber-washer from any extraneous

vibration, as against voice tubes. We understand this device has proved a great success.

Considerable difficulty has been experienced from time to time in the proper transmission of certain words; for instance, "fifty" is often heard as "sixty," while "eighty" is readily distinguishable. This matter was carefully investigated by Mr. Cutmore, the inventor of the Homacoustic system, and it was discovered that by the use of a series of expansion-valves fitted to the pipes throughout an installation, the defects caused by loud and rapid talking were entirely eradicated, and the breaking up or mutilation of words obviated. This device has the effect of apparently reducing the actual distance of the speakers from one another to one-half. It also adds volume and intensity to the voice, rendering messages marvellously distinct and audible.

These voice-tubes have been adopted by the British Admiralty, the Austrian, Dutch, and other foreign navies. They are manufactured by the Homacoustic Apparatus Co., who are the patentees, at 115, Queen Victoria Street, London, E.C.

Reviews.

Steam-Boiler Practice. By Walter B. Snow, S.B. New York: John Wiley & Sons. London: Chapman & Hall, 1899.

Mr. Snow aims at treating his subject in its relation to fuels and their combustion on one side, and on the other to examine the economic results obtained with various methods and devices. His ten chapters thus divide themselves into two parts. The first five deal with the first sub-title of the volume. He shows in the initial chapter how many qualities—some of them apparently irreconcilable one with the other—have to be combined in a perfect steam-generator and that low consumption of fuel, though, of course, a very important quality, is not such as will enable others—such as the question of prime cost, durability, and quantitative efficiency—to be entirely disregarded. For marine purposes it may be added that considerations of weight involved and space occupied become of supreme importance. Having thus, as it were, cleared the ground, he proceeds to the consideration of the chemical and other properties of water and steam, and then to the chemical theory of combustion. Here he examines the chemical composition of various fuels, British and Colonial, as well as American, and liquid as well as solid. The amount of air necessary to be supplied for perfect combustion is then arrived at, and the fact remarked upon that, when mechanical stoking and the employment of forced draught is resorted to, the proportionate amount of the air supply can be diminished to a surprising extent. The means to be adopted for the purpose of examining the air supply and the flue gases is also described and illustrated. Then comes an examination of the efficiency of fuels. These, of course, have to be taken into consideration, from the practical point of view, in relation to their efficiency in the particular type of steam-generator employed and to their cost when delivered in the bunkers. This last matter is one to which—when we come to consider the cost of competition of various countries as coal-producers—too great attention cannot be paid. As the author says at page 127, "the cost of producing a given amount of steam is the ultimate criterion by which the efficiency of any fuel must be judged." "And," he adds, "the commercial efficiency not only concerns the amount of water to be evaporated by a pound of fuel, but is directly dependent on certain items of expense," which he enumerates. These include interest, rent, taxes, and insurance of the cost of the plant; depreciation, repairs, cost of water used, labour (including that taken up in getting rid of the ashes); and, lastly, the cost of the fuel delivered in the boiler-house.

Proceeding to the examination of the efficiency of the boilers, our author points out that the best basis of comparison is established when the evaporation is expressed in pounds of water evaporated per pound of combustible. But he adds that even this is subject to a modification, on account of the proportion of ash and elementary water in the coal.

The book concludes with an appendix containing very full rules as to the best means for conducting boiler trials.

What we have quoted from the volume is not, of course, new, but it shows that what the author has to tell will be found to be clearly and logically expressed, and will, on that account, be valuable to students. The volume contains a large number of tables, diagrams, and accumulated information.

The Naval Pocket Book. Edited by L. G. Carr Laughton. London: Thacker & Co., 1899.

The fourth issue of what is still fondly called "Laird Clowes' Pocket Book," though the founder is still obliged through continued ill-health to leave the care of his bantling to another hand, comes to us with exceptional interest this year. For one of the characteristics of the book (and one wherein it differs from and is very supplementary to Brassey's Naval Annual) is the completeness and thoroughness with which it deals with smaller and less fully equipped naval vessels. And, as our readers are likely to remember, much of the history of the recent Hispano-American war turns on the adventures of vessels which were not of themselves of any very great importance. Here, however, we find the need for some corrections and additions. At page 603, where is given the list of the American vessels subventioned for service as armed cruisers, we find the displacement of the *New York* and *Paris* given as 13,300 tons at 23 ft. draught. That of the *St. Louis* and *St. Paul* is given as 11,629 tons at 26 ft. draught. The latter are the bigger ships, and certainly when three ft. deeper in the water than the other pair would not be likely to displace 1,700 tons less. It is a pity, too, that the columns of the details of the auxiliary vessels at page 606, were not filled in. Most of the particulars referred to could have been easily extracted from Lloyd's Register of Shipping or the "Warships of the World." Both in this table and in the next gross tonnage seems to have been taken as a term convertible with displacement. Let us assure the editor that they are by no means synonymous expressions.

Again, at page 190 there is a table of old vessels lent for training purposes, &c. Many readers will turn thither in view of the recent destruction of H.M.S. *Clarence*, or to compare the table with that in Mr. C. McL.Hardy's recent book on "Boys for the Navy." The ship is there entered as a third-rate of 4,579 tons built in the year 1827. The reviewer believes, though he cannot be quite sure of this matter, that the entry in question refers to the old *Clarence*, the predecessor to the ship just burnt, in the duty of acting as reformatory ship. The *Clarence* of 1827 was an eighty-four gun ship originally. The ship just destroyed was built as a 120-gun ship, and was some forty years ago—when still under her original name of *Royal William*—one of a numerous lot of sailing line-of-battle ships, which were under orders to be adapted for the screw.

These little criticisms may be very trifling. At all events they do not affect the comparative strength of the fleets of the world. But it is right that they should be pointed out in order that, if possible, the minor tables should be rendered as accurate as the larger ones. For the latter we have nothing but praise. They seem to give the fullest and most recent information regarding all the navies of the world. No doubt, if Mr. Laughton were a candidate for Parliament, and on, what Sir George Willis thinks, the wrong side, our author might find himself branded with the Brassey family as divulgers of his country's secrets if the gallant general in question had sufficient knowledge to appreciate the thoroughness of its information. We have mentioned this point because we wish to protest most strongly against any such foolish idea. The work which the Brassey's (father and son) and the compiler of this little book have done in spreading accurate information as to the comparative strength of navies, has accomplished the task of enlightening the man in the street as to the power and duties of our maritime defences, and thus to make him willing and anxious to contribute his share to maintain our navy in its present high state of efficiency. The work is for public benefit and the public will not let itself be misguided by noisy dotards, but will welcome another issue of so useful a work of reference.

For want of space we are obliged to hold over our Patent List, &c.—Ed. M.E

NAVAL ENGINEER APPOINTMENTS.

The following appointments have been made at the Admiralty from July 26th to August 25th, 1899 :—

Alton, G. B., fleet engineer to the *Duke of Wellington*, additional, to date August 7th.

Bain, D. H. W., assistant engineer to the *Wallaroo*, for temporary service, to date August 2nd.

Barr, E., engineer to the *Revenge*, for the *Boxer*, to date September 15th.

Bartlett, E. E., probationary assistant engineer to the *Terrible*, to date August 7th.

Batchelor, H. R., chief engineer to the *Vivid*, for the *Magpie*, to date August 3rd.

Batchelor, H. R., engineer to the *Pembroke*, for the *Salmon*, to date August 4th.

Beckett, W. H., engineer, has been promoted to the rank of chief engineer in her Majesty's fleet.

Beckett, W. H., chief engineer to the *Wildfire*, as assistant to chief engineer at Sheerness Yard (for drawing office), to date July 15th.

Benn, E. P. St. J., assistant engineer, has been promoted to the rank of engineer in her Majesty's fleet.

Bevan, W. J., fleet engineer to the *Duke of Wellington*, for the *Narcissus*, to date August 21st.

Bingham, P., engineer to the *Duke of Wellington*, for the *Teazer*, undated.

Blake, A. V., staff engineer to the *Duke of Wellington*, additional, as overseer at Barrow-in-Furness, to date July 6th.

Bone, H., engineer to the *Duke of Wellington*, for service at Portsmouth Dockyard, as second assistant to chief engineer, to date August 3rd.

Brown, A., assistant engineer, has been promoted to the rank of engineer in her Majesty's fleet.

Bryan, C. B. (probationary), assistant engineer to the *Andromeda*, to date September 5th

Butland, J. T. C., assistant engineer, has been promoted to the rank of engineer in her Majesty's fleet.

Charlton, F. J., assistant engineer, has been promoted to the rank of engineer in her Majesty's fleet.

Chater, F. A., assistant engineer to the *Rupert*, to date August 19th

Cock, A. E., assistant engineer to the *Andromeda*, to date September 5th.

Cornish, E., staff engineer to the *Pembroke*, for the *Hawke*, to date August 2nd.

Damant, W. S. (probationary), assistant engineer to the *Hannibal*, to date August 14th.

Davies, W. A. J., chief engineer to the *Seagull*, undated.

Dixon, R. B., engineer to the *Pembroke*, for drawing office at Chatham Yard, to date August 3rd.

Ellis, J. H. W. H., staff engineer to the *President*, additional, for service in Comptroller's department at the Admiralty, to date July 6th.

Fletcher, G. H., assistant engineer (temporary) to the *Thunderer*, to date August 19th.

Garde, R. B., engineer to the *Pembroke*, for the *Angler*, to date August 21st.

Goodyear, R H., assistant engineer to the *Venus*, to date August 18th.

Guyer, F., assistant engineer, has been promoted to be acting engineer in her Majesty's fleet.

Hall, W. B , assistant engineer, has been promoted to be acting engineer in her Majesty's fleet.

Harding, C A., assistant engineer, has been promoted to the rank of engineer in her Majesty's fleet.

Hardwick, W. W., chief engineer to the *Vivid*, for the *Leopard*, lent, undated.

Henwood, J. W., fleet engineer to the *Sanspareil*, tod ate August 21st.

Hobbs, P., engineer to the *Duke of Wellington*, for the *Electra*, to date August 21st.

Hyne, A. L., assistant engineer to the *Andromeda*, to date September 5th.

Kilroy, W. D. (probationary), assistant engineer to the *Andromeda*, to date September 5th.

Kimber, J. L., assistant engineer, has been promoted to the rank of engineer in her Majesty's fleet.

Kirwin, J. J., assistant engineer to the *Niobe*, to date August 18th.

Lakeman, W. B., assistant engineer to the *Jupiter*, to date August 19th.

Loveridge, H. J., assistant engineer, has been promoted to the rank of engineer in her Majesty's fleet.

Ludgate, W. G., chief engineer to the *Seagull*, undated.

Lumsden, W. G. G. P. (probationary), assistant engineer to the *Halcyon*, to date August 3rd.

Main, F., engineer to the *Victory*, for the *Flirt*, undated.

Maltby, P. D., engineer to the *Duke of Wellington*, for the *Canopus*, to date September 15th.

Martell, R. W., engineer to the *Vivid*, for the *Skate*, to date August 21st.

Maxwell, J., assistant engineer, has been promoted to the rank of engineer in her Majesty's fleet.

McDonald, W. N., assistant engineer (temporary) to the *Vernon*, to date September 15th.

Misselbrook, S. G., assistant probationary engineer to the *Repulse*, to date August 18th.

Morris, T., fleet engineer to the *Duke of Wellington*, for the *Camperdown*, undated.

Mountfield, J., engineer to the *President*, for service at Admiralty, to date August 3rd.

Moysey, W. H. S., engineer to the *Tyne*, to date August 18th.

Murray, William K., acting engineer to the *Raven*, to date August 22nd.

Nye, A. J., fleet engineer to the *Andromeda*, to date September 5th.

Page, G. H., assistant engineer, has been promoted to the rank of engineer in her Majesty's fleet.

Paterson, J. A., assistant engineer, has been promoted to the rank of engineer in her Majesty's fleet.

Paul, O. R., engineer to the *Vivid*, for the *Ferret*, to date August 18th.

Pendleton, F. R., assistant engineer to the *Tribune*, to date August 14th.

Reynolds, H. E. J., assistant engineer, has been promoted to be acting engineer in her Majesty's fleet.

Rock, H. E., assistant engineer, has been promoted to the rank of engineer in her Majesty's fleet.

Rodet, E. W., engineer to the *Vivid*, for the *Speedwell*, to date July 25th.

Roome, G. W., engineer, has been promoted to the rank of chief engineer in her Majesty's fleet.

Roome, G. W., chief engineer to the *Vivid*, as second assistant to chief engineer at Devonport Dockyard.

Sagar, E. L., engineer to the *Duke of Wellington*, for the *Petrel*, to date August 22nd.

Sanders, J. S., assistant engineer to the *Vivid*, to date August 19th.

Sillince, W. P., assistant engineer to the *President*, for service at the Admiralty, to date August 3rd.

Smith, H. F., assistant engineer, has been promoted to the rank of engineer in her Majesty's fleet.

Snook, V. E., engineer to the *Pembroke*, for the *Zebra*, to date August 9th.

Soper, E. P., assistant engineer to the *Trafalgar*, to date August 18th.

Sparrow, F. W., assistant probationary engineer to the *Howe*, to date August 18th.

Stearn, W. T., engineer to the *Centurion*, for the *Whiting*, to date August 21st.

Stocker, P., assistant engineer, has been promoted to the rank of engineer in her Majesty's fleet.

Stokes, W., assistant engineer, has been promoted to the rank of engineer in her Majesty's fleet.

Swinney, E., chief engineer to the *Vivid*, for the *Gipsy*, undated.

Taylor, O. J., staff engineer to the *Sphinx*, to date July 26th.

Thomson, J., assistant engineer, has been promoted to be acting engineer in her Majesty's fleet.

Ware, C. G., assistant engineer, has been promoted to the rank of engineer in her Majesty's fleet.

Willoughby, J. T., chief engineer to the *Proserpine*, to date August 4th.

Wood, W. H., engineer to the *President*, for service at Admiralty, to date August 3rd.

H. Binko & Co.—We are informed that Mr. H. Binko, late managing director of Binko, Ridsdale & Co., Limited, has resumed his old-established business as electrical engineer and manufacturer at 34, Leadenhall Street, E.C., under the former style of H. Binko & Co.

INDUSTRIAL AND TRADE NOTES.

THE CLYDE AND SCOTLAND.

(From our own Correspondent.)

THE month of August, and especially its latter half, has been crowded with events of interest and importance connected with the shipbuilding and marine engineering industries on the Clyde. On the 16th the Allan Line twin-screw-steamer *Bavarian*, 10,200 tons, the largest and fastest of the fleet, and the largest vessel yet produced by her eminent builders, Messrs. W. Denny & Bros., Dumbarton, ran her official trials on the firth, the result being a speed of 17¾ knots as the mean of several runs with and against the tide on the measured mile. On the same date the twin-screw steamer *Kinfauns Castle*, built by the Fairfield Co. for the Castle Mail Packets Co.'s fleet of Cape liners, was also steaming about the firth, and on the 23rd the official trial trip took place. On the builders' trial of this vessel, which took place earlier, the mean speed attained on the measured mile and between the Cloch and Cumbrae Lights was 18 knots, with the engines developing 12,000 I.H.P. The *Kildonan Castle*, a sister vessel to the *Kinfauns*, was sent off the stocks at Fairfield on the 22nd. On the 23rd Messrs. Denny, Dumbarton, consigned to the water the twin-screw *Papaioa*, which they have built to the order of the New Zealand Shipping Co. for their frozen meat trade between New Zealand and the mother country. The vessel is to carry 8,000 tons of deadweight, all told, on a draught of 25½ ft. This vessel, it is of interest to state, is, like the *Kinfauns Castle*, the initial twin-screw-steamer of the fleet, the New Zealand Shipping Co. having gone in for the two screws as enhancing the safety of the ship, she being intended also to carry 40 first and 40 second-class passengers.

Other events of note which are casting their shadows before include the speed trials of the Royal Mail Liner *Tagus*, which is now in the final stage of outfit opposite the yard of her builders, Messrs. Robert Napier & Sons, Govan; the departure of H.M.'s. first-class cruiser *Hyacinth* from the fitting-out berth of her builders, the London and Glasgow Shipbuilding Co., Govan; the launch of a large 8,000-ton cargo-carrier from the yard of Messrs. A. & J. Inglis, Pointhouse, for the British India S.N. Co.; and the launch from Messrs. Stephen & Sons, of Linthouse, of the 10,000-ton *Tunisian* for the Allan Line, a duplicate for most part of the *Bavarian* above referred to.

Whilst outstanding events, such as the foregoing, sufficiently indicate the briskness with which work is progressing in the yards and engine shops of the Clyde, it is gratifying to be able to record that August has seen a distinct revival in the placing of new contracts. Altogether about 55,000 tons of new shipping have been booked, the lion's share of the work going to builders on the lower reaches of the river.

Messrs. Caird & Co., Greenock, who are seldom without tonnage in hand for the Peninsular and Oriental Co., have been instructed to proceed with a steamer of about 6,000 tons register intended for that company's cargo service. The new vessel, which will be 450 ft. long, will be similar in all essential respects to the *Assaye*, recently completed for the company.

Messrs. Russell & Co., of Kingston Yard, Port-Glasgow, who have as many as 12 berths, all of which are kept constantly occupied with large steamers, mainly of the cargo-carrying type, have booked orders for three steamers each 355 ft. long, and of 7,000 tons deadweight carrying capacity, which will be fitted up for the cattle trade. The machinery for these vessels, which are for Dutch owners, will be supplied by Messrs. Dunsmuir & Jackson, of Govan.

Messrs. Murdoch & Murray, shipbuilders, Port-Glasgow, who have been credited with receiving orders for as many as a dozen steamers for passenger and cargo service on the river Amazon, inform us that, whilst it is true some additional vessels have been ordered recently, the wholesale order above alluded to is misleading. The statement must have reference to a number of vessels which are already well under way in this yard.

Messrs. William Denny & Brothers, Dumbarton, are credited with having received from the Allan Line the order to build and engine a twin-screw-steamer of the same dimensions and tonnage as the *Bavarian*. She will be built of steel to the scantlings and under the special survey of the British Corporation Registry of Shipping, and will be supplied with triple-expansion twin-engines to give the vessel a good speed, by Messrs. Denny & Co., of Dumbarton Engine Works.

Messrs. Napier & Miller, of Yoker Shipbuilding Yard, have booked an order for a screw-steamer of about 5,000 tons, for Messrs. John Warrack & Co., Leith. The engines and boilers will be supplied by Messrs. Dunsmuir & Jackson, Govan.

Messrs. William Simons & Co., Renfrew, have received, from the Mersey Dock and Harbour Board instructions to supply three steam hopper barges, and in connection with the same order Messrs. Fleming & Ferguson, of Paisley, are to supply a powerful side ladder dredger, the total cost of all being £89,620.

The Clydebank Engineering and Shipbuilding Co., Limited, have contracted with the London and South-Western Railway Co. to build and engine a twin-screw passenger steamer to replace the *Stella*, recently lost. The vessel, which will present certain improvements upon the *Vera*, the latest addition to the company's fleet, is to have a speed on service of 19 knots, and to be delivered in April next.

The purchase of this great concern by Messrs. John Brown & Co., Limited, of Sheffield, has now been practically arranged, and a statement regarding the reconstituted directorate and other matters may shortly be expected. Rumour is presently busy with another probable fusion of shipbuilding and armour plate-making firms on the lines of the Clydebank Co. and John Brown & Co. The report is that the London and Glasgow Shipbuilding and Engineering Co., Limited, are at present negotiating with a Sheffield firm with a view to amalgamation. An interchange of views has already, it is said, taken place between parties, and it is believed that, as a result, the desired "combine" will eventually be accomplished.

Messrs. Kincaid & Co., Clyde Foundry, Greenock, have contracted to supply the engines and boilers for three of the passenger and cargo steamers for the river Amazon, recently ordered from Messrs. Murdoch & Murray, shipbuilders, Port-Glasgow, and have also received an order for engines of 800 H.P. for a cargo steamer for the Australian trade, which is to be built at the Foyle Shipyard, Londonderry.

Messrs. Ramage & Ferguson, Leith, have been commissioned by Mr. Harry M'Calmont, M.P., well-known as a sportsman, to build for him a new steam yacht, to replace the twin-screw yacht *Giralda*, which, it will be remembered, he sold to the Spanish Government during the war with the United States. This new vessel, which is to be ready for the spring, will be a twin-screw-steamer, 210 ft. in length, of over 800 tons Thames yacht measurement, and will be built to Lloyd's highest requirements, and have a high rate of speed.

The fact that those responsible have managed to dry-dock the American liner *Paris*, after her severe ordeal on the Manacles, at Milford Haven, and that the work of shoring her up for the purpose of repairing the damage to her hull has been accomplished, sets at rest the expectancy felt on the Clyde that the big vessel might be brought to that river for the necessary repairs, the owners and the Clydebank firm having, it appears, arranged that the latter shall execute all the work required. It is understood that the Clyde Trustees would not have been adverse to granting the use of one of their graving docks at Govan for this purpose, could the work have been executed in a reasonable time. In this connection it may be stated that Mr. James Deas, the Clyde Trust engineer, has had plans completed for some time for the lengthening of Nos. 1 and 2 graving docks. It is thought that a suitable opportunity for commencing operations is only being awaited to have the work put definitely in hand.

The work of sounding Glasgow Harbour for the purpose of ascertaining the various depths of water, which is done once in four years, and has been in progress for the past two months, is now completed, and the results are being compiled so as to form a chart for the guidance of the Clyde Trust in future dredging operations, and also for the guidance of mariners and others interested in the various depths of water in the channel. This applies to the harbour and that portion of the river and firth lying within the jurisdiction of the Clyde Trust, viz., down to a line stretching from Newark Castle, Port-Glasgow, on the south, to Cardross on the north bank of the river. The 1891 soundings were accepted by the Admiralty as official and still remain on their charts as such, the soundings below Newark Castle being those of the Clyde Lighthouses Trust, and those further down being taken by the Admiralty officials themselves. The soundings in the upper reaches were taken at intervals of 20 ft. across and 100 yards up and down the river, and in the lower reaches, of 20 ft. across and 200 yards up and down. Some work with reference to the set of currents, and the manner in which these carry the scour down from the harbour and deposit it in the quiet pools further down, has yet to be done with the object of finding out what portions of the waterway become shallow first and so require most dredging.

All-potent steam has rendered the presence of tall masts and spars on board ships all but superfluous. As a flagstaff no doubt, and as a standard on which to rig cargo derricks, the centre line mast still justifies itself, but in many broad modern cargo carriers with side cargo hatches and derricks, or side cranes to suit, the utility of still adhering to the central mast, even as a standard or pillar for supporting the ends of cargo derricks, seems almost questionable. The width of many modern vessels and their hatches, and the number of derricks to be carried, entail brackets which nearly embrace one-fourth of the beam. In view of such facts Captain Haynes, R.N.R., Glasgow, has devised an arrangement of derricks and winches by which he boldly dispenses with the central mast altogether, and a model illustrating his ideas was lately shown to shipping and other members interested on the Glasgow Royal Exchange.

Captain Haynes erects struts at the sides of the vessel and connects them by an overhead crossbeam and intermediate cross platform. The derricks to any number may be supported at any convenient intervals across the ship by this platform, and it also supports the winches about 8 or 10 ft. above the deck. This allows sufficient space underneath for cattle or cargo as required, and it keeps the winches out of the wash of the sea and permits the craneman, when cargo is being discharged, having a good view of the working process in the hold, and also of the goods as they are swung on the quay. When the derricks are all lowered when on a voyage at sea, the framework of this derrick and winch supporting arrangement can still be made available for unfurling sails if thought advisable, and there is at all times, of course, a dwarf mast over the centre of the framework serving as flag-pole and signal hoist. The arrangement is said to have found favour with gentlemen connected with Lloyd's and the British Corporation Registry of Shipping.

THE TYNE.

(From our own Correspondent.)

Shipbuilding.—The scarcity of enquiries for cargo steamers continues to be noted, and it is generally felt that as long as the present prohibitive prices rule, no improvement in demand is likely to occur. Very few orders are being placed just now, and such as are being successfully negotiated are in pretty nearly all cases, for vessels required for special services. There appears, however, to be some slight revival in the freight market, and the mooring places of the port continue to be happily free from the accumulation of laid-up tonnage which formed so prominent a feature a couple of years ago. These are healthy signs, and we may not after all be so near a collapse in shipbuilding as has been anticipated.

The bad practice of losing time unnecessarily, which is being indulged in to a ruinous extent by one section of shipbuilding operatives, has again been the subject of discussion between the employers and the representatives of the workmen. Nothing resulted from the discussion, however, beyond the declaration by the trade union representatives, that they would make further efforts to restrain their constituents from indulgence in the vicious habit referred to. It is not seriously expected that these "further efforts" will prove more effectual for the suppression of the evil than the efforts previously made; but the employers have evidently been desirous to give the union officials every possible chance, and to exhaust all conciliatory means for the bringing about of a more satisfactory state of things, before resorting to the somewhat drastic measure which is the true and only remedy for the evil complained of. This measure is simply to repudiate trade union interference in the setting on of men, and take it upon themselves to throw their yards open to all capable workmen whether members of a union or otherwise. It is trade union exclusiveness which has left the employers almost at the mercy of the drunkard and the loafer; for they have been forced to accept men of the latter stamp, who will just work long enough to provide the means of getting a good supply of their favourite liquid, and no more—as the trade union will not allow anyone to start work who is not a member. Things would be different if the employers had the power to set on whom they pleased. This is a power which rightfully belongs to them, and, however reluctant they may be to run counter to the views of the trade union officials, they *must* claim it and use it, before they can succeed in bringing about regularity of working in their yards.

In the absence of new orders for cargo boats, it is satisfactory to be able to state that some of the orders for specialities have found their way to the Tyne, Messrs. Armstrong, Whitworth & Co. having been commissioned to build two very powerful dredgers for service in the East Indian rivers, and one, of still larger dimensions, for Australia. Instead of the ladder and bucket arrangement, which is usually employed in dredgers, these vessels will be equipped with pumps of peculiar design, which will be effective in raising the muddy deposit that is the principal element to be dealt with in the deepening of Eastern waterways. The dredger for Australia, which is to be the largest, will, it is said, cost about £60,000, and the others, it is understood, will not be very far behind in the matter of costliness. All three will be fitted with watertube boilers, which, as well as a portion of the machinery, will also be constructed on the Tyne. These, it may be stated, are the first dredgers undertaken to be built on the Tyne for a period of 18 years, the last one turned out on the river having been the *Wear*, ordered by the River Wear Commissioners from the now extinct firm of Hawks, Crayshaw & Sons. Some few years earlier a dredger was built at Walker by another firm which has since ceased to exist; but on the whole it cannot be said that much has been done in this branch of work by Tyne builders, and it is a good augury for the future to see one of the foremost firms on the river giving their attention to this special line of business, in which they are sure to achieve success. Besides the icebreakers referred to last month, this company have several large oil-carrying steamers in progress at their Low Walker yard, and are extremely busy with battleship work at their Elswick establishment.

Messrs. Swan & Hunter continue to be extremely busy in the shipbuilding department; but it has not transpired that any orders have as yet been booked for the pontoon yard. It is understood that the great Cunard liner, which the firm are building in one of their covered berths, will be put off the stocks about the middle of this month (September), and preparations are already being made for the successful carrying out of the interesting function. The vessel, which is over 600 ft. long, is being equipped in a thoroughly up-to-date manner, and the date of her removal from the stocks to the water will undoubtedly be a red-letter day in connection with the industry of shipbuilding on the Tyne.

Messrs. Wigham, Richardson & Co. are amongst the firms that are well booked forward, and are sure to keep their briskness of trade intact during next year as well as this. There are now five vessels in progress, two of which are of exceptionally large dimensions, and it is understood that other vessels of an equally important class are in preparation.

One of the results of the change recently brought about in the constitution of the firm of Messrs. R. Stephenson & Co. is that no new work is likely to be entered upon at the shipbuilding yard for a period of twelve months or more. This is to give ample opportunity for the carrying out of the great scheme of alteration and extension that has been decided upon, and which is expected to place the firm—as far as productive capacity is concerned—in the first rank of shipbuilding firms. It will, of course, take some time to clear out the work in hand, but when that is got out of the way, the place will be quite unencumbered, and perfectly free for the prosecution of the changes contemplated.

The Palmer Co. have still an abundance of work on the stocks at their Jarrow yard, all the vessels (with the exception of the three torpedo boat destroyers) being of a large class. The splendid steamer *British Princess*, which has been built to the order of the British Shipowners' Co., Liverpool, is being fitted out at the shearlegs, and on account of her great size forms a very conspicuous object at that part of the river. The vessel is to carry 10,000 tons deadweight, and is fitted with exceptionally powerful machinery to drive her at a high rate of speed.

The whole of the other yards are still kept going briskly, including the smaller establishments at the mouth of the river, which are well supplied, with orders for fishing vessels. Premises are being erected at North Shields—and are now a good way advanced—in which the building and engining of small vessels is to be undertaken, and probably repair work also. The premises are in a good situation, and it is fully expected that the enterprise will be a success. The graving docks and slipways of the Tyne are nearly all occupied with vessels undergone painting or repairs.

Engineering.—In all the marine establishments a high state of activity is maintained, and in every instance there is at least one vessel being fitted with her equipment of propelling machinery. The Wallsend Slipway Co. have some important repair contracts in hand, in addition to the new work, and all the departments will be kept at racing speed during the autumn and winter months.

At the North-Eastern Engineering Co.'s works business is also extremely active, and if appearances are to be relied upon, it will be long before any change for the worse is apparent. The reports respecting a trial trip of a steamer built in Italy, but fitted with this company's engines, are of the most flattering kind, the speed attained on a particularly low fuel consumption being in the highest degree satisfactory.

At Messrs. R. Stephenson & Co.'s South Street Works business is very brisk in both the locomotive and marine departments. The trial of the s.s. *Garonne*, built and engined by the firm for the United Steamship Co., Copenhagen, took place on the 14th ult., and was in every way a marked success. This vessel is fitted with Cedervall's lubricating protective box, which arrangement, whilst excluding sea-water from the propeller shaft, keeps the latter constantly running in oil, with the result that no corrosion, nor fracture can take place. Special note was taken of the effects produced by this apparatus on the trial trip, and experts on board declared that the smooth and perfectly satisfactory performance of the machinery was largely attributable to the presence of the box. The feature of the trial was the almost complete absence of vibration, a result which would have been practically impossible but for the smooth working of the propeller shaft, caused by the presence of the lubricating arrangement mentioned. The trial of another vessel—the *Staunton*—engined at the North-Eastern Works, Sunderland, which took place early in the month, showed equally good results, this vessel having been fitted with Cedervall's box, also.

The extensions at the Blaydon Forge Co.'s works, which have been in progress for several months, are now approaching completion, and the new machinery, which is of the most effective kind obtainable, is being placed in position. With the new arrangements, and the very considerable additional space provided, the company will be able to undertake and execute work of a much more important class than they have hitherto been able to deal with. The company have achieved a good reputation for the soundness of their productions, and we feel sure there will be little likelihood of their forfeiting this in the larger sphere of operations upon which they are now entering.

Messrs. Proctor & Son, iron merchants and manufacturers of steamship accessories, have recently booked some important orders for ventilators and other appliances, and are obliged to work double shift to keep pace with requirements. The firm's workshops at Gateshead are being enlarged with a view to meeting the necessities of the situation, and it is expected that the additional space and the additional machinery provided will soon be available for carrying on the firm's business at a greatly accelerated rate of production.

Owing to the unsuitableness of the premises for his largely developed business, Mr. W. F. Snowdon, asbestos manufacturer, &c., has had to leave No. 2, The Side, and remove to premises on the first floor of No. 32, in the same street. The occupation of these premises will probably only be temporary, or till such time as sufficiently spacious ground-floor premises are obtainable.

The Zynkara Co. are still experiencing a large demand for their speciality, and at the place of manufacture considerable activity prevails.

In the iron foundries business continues active, and brass foundries are not in the smallest degree less busy. The smaller engineering establishments are, generally speaking, doing well.

THE WEAR.

(*From our own Correspondent.*)

Shipbuilding.—Messrs. Pickersgill & Sons have booked an order for a good-sized vessel during the month, and this is the only order that has been heard of.

Messrs. W. Doxford & Sons launched on the 22nd ult. the fine "turret" ship *Clan Urquhart*, which is the 10th vessel built by this firm for the owners of the Clan Line. Four of these vessels, including the *Clan Urquhart*, have been of the larger type, measuring (each) 440 ft. in length, the remainder being of the smaller type, or not more than 400 ft. in length. We are informed that the firm have six others to build for the Clan Line, and the 16 vessels—when all are completed—will assuredly constitute a pretty large fleet of themselves.

Messrs. Short Brothers are now perhaps in a better position than they have ever been as regards the supply of workmen, and particularly of riveters. Three months ago the officials of the Boilermakers' Society, after vainly beseeching the firm to come under their yoke, succeeded in inducing the greater number of the riveters to abandon Short's yard, ostensibly with a view of being incorporated with the Boilermakers' union. Now a large proportion of these men (the pick of them) have returned, and in addition the firm have been enabled to train a number of young operatives—shipwrights and others—into entirely capable riveters. Whilst other firms have been begging the Boilermakers' executive to supply men, Messrs. Short Brothers have been supplying themselves; and the result is that there is no yard on the Wear where at this moment there is so little stoppage of work on account of the backwardness of the riveting.

Messrs. J. L. Thompson & Sons continue extremely busy, and at all the other yards work is still abundant. Some five vessels, aggregating about 25,000 tons capacity, have been launched on the Wear in August, and it is quite probable that as many will be put off the stocks in September.

Engineering.—Messrs. John Dickinson & Sons (Palmer's Hill Works) are still extremely busy in all departments, there being some repair contracts in hand, in addition to the new work. Messrs. George Clark, Limited, are engining a handsomely modelled vessel, just launched by Messrs. Short Brothers, and Messrs. Doxford are also fitting with machinery a new vessel.

The electrical department of the Sunderland Forge and Engineering Co.'s Works has just received a very large accession of work, and the pattern-shop is extremely busy, indicating a plentiful supply of work for other departments in the future. Among the contracts recently secured is the lighting of a large hotel at Gilsland. This installation is belt-driven, and includes boiler, engine, and dynamo. The two latter are combined on the principle adapted so successfully at these works. The company have also a contract from the Easington Coal Co., Limited, to supply an installation of arc and incandescent lamps for surface lighting at the colliery. The installation will include a "Pallion" dynamo and engine combined. The company have recently begun to manufacture, as a speciality, a circular saw bench with an electric motor attached, by which the saw is driven. This arrangement is particularly well suited for application on shipboard, as the machine can be fitted either on deck or in one of the holds. It is needless to observe that in discharging timber-laden vessels a large amount of time and labour may be saved by cutting on board such portions of the cargo as may be too large for easy handling. This speciality has already achieved a fair measure of popularity, and orders for it are increasing in number daily. The company have just completed a large lighting and power installation in a shipbuilding yard on the Wear, and are commencing a similar contract in another local establishment of the same kind. They have also just finished the last of four installations of 80 lights each (with engine and dynamo combined) in four vessels built by Messrs. Short Brothers for the Southern Steam Shipping Co., and have now several lighting installations in hand for vessels building on the Tyne and on the Wear.

In the forging department orders are also plentiful, stern frames and rudders being the articles most in evidence. The company are now making a special type of balanced single plate built rudders, which is attracting much attention. The introduction of the balancing principle in merchant ship rudders is undoubtedly a great step in advance, and the Sunderland Forge Co. are to be congratulated on their enterprise in initiating the improvement. One of these balanced rudders has been fitted to the s.s. *Clan Urquhart*, and another is now ready for the ship to be launched by Messrs. Doxford.

Ironfounders continue to be well supplied with orders, and both brass and copper works are busy. At the Monkwearmouth Ironworks business is good, the demand for the special patent sections, manufactured at this establishment, being rather on the increase. The Rectory Engine Works (Messrs. Wilcox Brothers), are doing a steady trade.

The Hartlepools.—Shipbuilding at this centre maintains the high degree of briskness noted on previous occasions, and notwithstanding the dearth of orders in other districts, it is understood that new business of importance has been successfully negotiated by builders at this port. Sir W. Gray & Co. have obtained the contract for repairs to the large oil steamer *Clam*, which was stranded on the coast of Algeria while on a voyage from North Shields to Batoum. The vessel, which belongs to Messrs. Samuel & Co., is very badly damaged, and will have, to a large extent, to be reconstructed. The work of repair and alteration will, it is expected, occupy about three months. It is stated that Messrs. Gray have also booked an order for a new vessel of good size, from Messrs. Ruthven & Co., of Cardiff. The marine engine works continue busy, and in Messrs. Richardson's electrical department there are several important orders on hand. Work at the docks is now quite brisk, the timber-importing trade being in full swing

Stockton.—There is no change in the state of work at the shipbuilding yards, and marine engine works continue as busy as ever. Boiler shops and bridge works are full of orders, and in the former establishments some difficulty is experienced in giving delivery in accordance with contract requirements. Steel manufacturers have more work than they can deal with, and are in many cases unable to give delivery by specified dates.

Middlesbrough.—The leading shipyard at this centre continues busy, and other establishments are showing scarcely less activity. Steelworks are exceedingly busy and prices are firm, the rate for ship plates being £7 12s. 6d. per ton, and for boiler plates £8 15s. per ton, less 2½ per cent. Steel ship angles are £7 5s. per ton, and iron ship angles £7 per ton.

Engineering works continue to show activity, and local foundries are still extremely busy. At the docks there is now considerable stir, the largeness of the timber imports contributing materially to the general activity that it is to be noticed.

Seaham Harbour.—The great scheme of improvement in the dock accommodation at Seaham Harbour, which has been initiated by the Marquis of Londonderry, is already on the way towards fruition, as work at several points, including the formation of two piers, has been commenced. An idea of the changes proposed to be effected may be formed from the circumstance that the water area of the docks is to be increased from 2½ acres to 10 acres. The capacity of the port at present is to admit vessels up to 1,000 tons only; but it is estimated that when the work of alteration is completed, there will be accommodation for vessels up to 5,000 tons. The contractors for this great work are Messrs. S. Pearson & Sons, Limited, London, and Mr. T. L. Walsh has control of the work on the spot.

THE MERSEY.

(From our own Correspondent.)

ALTHOUGH generally throughout the engineering branches of industry activity is fully maintained, and there are very few works that have not sufficient orders to keep them employed, at any rate during the remainder of the year, and in some cases well into next year, there is unquestionably a slackening off in the weight of new work now coming forward to replace orders as they run out, and consequently the outlook for the future is not quite so satisfactory as it has been. Establishments employed specially on marine engineering have generally a large amount of work on hand, and as this is necessarily of a heavy character, several of the principal establishments in this district have their books full for twelve months ahead, but in other branches of machine tools there is some falling off as regards work giving out. The same remark applies also to heavy stationary engine builders and to locomotive builders—some of whom are anticipating a very slack period—whilst in the textile machinery trade the establishments are rapidly running out their orders with comparatively very little new work coming forward. Electrical engineers are, however, not feeling any slackening off, as the very large developments in this branch are sufficient to ensure them a large amount of work for some time forward.

The returns of the principal trade unions show no falling off as far as present employment is concerned. The Amalgamated Society of Engineers has now less than 2½ per cent. of its total members on donation, with about the same proportion in this immediate district, and a good demand for pattern makers and tool fitters. The Steam-Engine Makers' unemployed list remains at about one per cent. throughout the organisation, with a "clear book" in the Lancashire district. The United Machine Workers' Association has not more than two per cent. on donation either generally or in the Lancashire district. Reports as to the state of trade are mostly of a favourable character.

With regard to the wages question in Mid-Lancashire an agreement has been come to whereby the employers grant an increase of 1s. per week until the question of whether the state of trade at the end of June was as good as at the beginning of April has been decided by an independent person. If the umpire decides that the state of trade at the end of June was as good as at the beginning of April, the arrears of pay from the first pay day in July until the commencement of the advance now granted are to be paid, and the advance now granted will be continued till further notice. If the umpire decides to the contrary the advance now granted will cease, as and from the first full pay three months after the date of the agreement, but the men are not to be called upon to return any money they have received. It may be added that Lord James of Hereford has consented to undertake the duty of umpire.

Messrs. Laird Brothers, of Birkenhead, report that there is nothing special to note this month, beyond the fact that the new fast paddle steamer, *Mabel Grace*, built to the order of the South Eastern Railway Co., has made a very satisfactory preliminary trial, and will undergo her official trial in the course of the next fortnight. It may be added that on the Liverpool side of the Mersey the shipbuilding industry, which for years past has been steadily on the decline, has now practically received its final *quietus*, the few remaining yards being required for the Dock Board extensions, and as a result the last of this at one time important section of the shipbuilding industry on the Mersey will shortly altogether disappear.

In addition to the numerous new undertakings referred to last month, which are in progress in connection with various descriptions of works in close proximity to the Manchester Ship Canal, there are further important developments contemplated, amongst them being the establishment of a very large steelworks, whilst a number of other industrial establishments are also in progress in the immediate vicinity. The Ship Canal Co. are also laying themselves out to provide for the increasing traffic which is coming forward, and are largely increasing their wharfage capacity by deepening the waterway along the Old Trafford section, and constructing a new landing way, which will provide considerably increased accommodation for certain classes of traffic.

Messrs. Isaac Storey & Sons, of the Empress Foundry, Manchester, have recently considerably enlarged their works, and have included in the rearrangement the adoption of electric driving throughout. There are two main dynamoes of 200 amperes each, and a total of 230 volts, both being driven from one counter-shaft with clutches, so that they can be used either separately or simultaneously. The engine is of the Proell-Corless type, made of the firm, of 100 H.P. There is also to be put down a direct coupled plant of about 100 amperes, and the same voltage, for office lighting, and to meet the needs of overtime working in a small section of the establishment. The boiler is of the Lancashire type, by Messrs Beeley, and a Green's economiser, and independent condensing plant are also provided. The main shop is 120 ft. by 80 ft., with galleries 120 ft. by 20 ft, the erecting floor being served by a Vaughan 10-ton electric crane. The galleries are used for brass finishing requirements. Other sections of the works include the coppersmith's shop, 140 ft. by 80 ft.; brass foundry, pattern shops and stores, testing rooms, &c. It may be mentioned that the firm have recently completed a number of surface condensers for torpedo destroyers for the Japanese Government, and have also turned out two sets for the new turbine type of destroyers. They make a specially heavy type for land requirements, which in some cases has as much as 4,000 square ft. of condensing surface.

Messrs. De Bergue & Co., of Manchester, have in hand for the Salford Corporation a special portable riveting plant for riveting the joints of the new electric tramways to be laid down in the borough. This plant will be mounted on a four-wheeled trolley carrying a steam boiler, air-receiver, air-compressor, and a small swing jib crane for carrying the pneumatic riveter. The trolley is self-propelling, being driven by steam from the boiler, and the rivets are heated by a travelling oil furnace running behind the main trolley, and supplied with compressed air by a flexible tube attached to the air-receiver. The apparatus will also include a pneumatic drill and a portable emery grinder, driven in the same way, for levelling off the butting joints of the rails after riveting.

Messrs. E. Goossens, Pope & Co., South Castle Street, Liverpool, are introducing a new design in incandescent electric lamps. In this new pattern the filament is all in one length, which enables it to be subjected to extra "treatment" by a new process which the firm have devised, the result being that the initial candle power of the lamp is maintained for a much longer period, with economy of current. The lamp is also fitted with a patent cap, which is fixed by means of a metal ring, and which dispenses with the use of plaster, so that it is proof against damp. This feature of the lamp renders it particularly suited for use on ships, where it will be found a sure protection against short circuits, waste or loss of current, and other defects to which caps in which plaster is used are liable.

During the past month not only has the upward move in pig-iron prices been checked, but there has been a substantial giving way on late rates in the open market. This is largely due to the big drop in warrants, which has caused considerable unsettlement in the market, and has given an irregularity to prices which has rendered it almost impossible to estimate actual market values. Buying has also been checked, and even at the lower prices at which iron has been offered, very few sales of any weight have been effected. Towards the close of the month there are, however, signs of returning confidence, and some recovery in prices may possibly take place before long. Local makers still ask nominally about 77s. 6d. less 2½ for No. 3 foundry, delivered Manchester, but they are practically out of the market. Lincolnshire makers have receded from the special quotations they were quoting a month ago, and have fallen back to their basis rates of 73s. 6d. for foundry, net, delivered Manchester, and 72s. 2d. forge, net, delivered Warrington, but merchants have been offering at considerably under than these figures. Derbyshire foundry is nominally about 75s. net, delivered Manchester. For Middlesbrough and Scotch iron prices vary considerably according to the different ideas of sellers. For Middlesbrough prices are now about 74s. 4d. to 76s. 4d. net, by rail Manchester. In Scotch iron there have been sellers at 76s. to 77s. net, Manchester Docks, but with the close there is a hardening up of 2s. to 2s. 6d on these figures. American pig-iron, has shown a further advance, and is quoted 75s. 6d. net, for October delivery at the Manchester Docks.

Finished iron is in active demand, both for the home and shipping accounts. Local makers are mostly fully booked in bars for some months ahead and could readily sell further considerable quantities at their full list of £8 5s. Occasional small sales have been made at £8 10s., but it can scarcely be said that this is a figure which makers are able to get in the open market even for forward delivery. Makers, however, are disinclined to commit themselves at all far ahead. North Staffordshire bars are firm at £8 10s. with £8 15s. got in some cases for forward delivery. Hoop makers are exceedingly busy, with list rates firm at £8 12s. 6d. for random, to £8 17s. 6d. for special cut lengths, delivered Manchester district, and 2s. 6d. less for shipment. Sheets are steady at £9 10s. to £9 15s.

In the steel trade business is active except perhaps for raw material, which has been affected by the fall in warrants. Hematite makers, however, still quote 87s. 6d. to 88s. 6d. less 2½ for No. 3 foundry delivered Manchester Local billets are about £6 5s., and steel bars £7 15s. and £7 17s. 6d. for local, to £8 and £8 7s. 6d. for special makes. Steel boiler plates have advanced about 10s., and are now quoted £9 10s. to £9 12s. 6d. Hoops are strong at £9, and a noticeable feature is that considerable American enquiries are just now in the market. In wire rods also fairly large enquiries from America and Canada are being received, and considerable orders have already been booked; delivered f.o.b. Liverpool. Lancashire makers are asking £9 5s. per ton.

The metal market continues active, and prices are strong, but there is still no quotable change in list rates, which delivered Manchester district, remain as under:—Solid drawn brass boiler tubes, 9d.; condenser tubes, 10½d.; copper tubes, 11½d; brazed copper gas and steam tubes, 11¼d.; brazed brass tubes, 10d. common rolled brass, 8¾d.; and common brass wire, 8½d.; and copper wire, 10¼ per lb.

Business is fairly active in the timber trade. The arrivals generally have not exceeded the requirements of the trade, and as deliveries have been satisfactory, stocks, with few exceptions (notably, pine deals), are of moderate compass, and values of most articles are steady. The import of teak squares has been small, and there is a fair demand, with prices firm; stocks are moderate. Teak planks have arrived freely, but continue in fair request, at steady rates; stocks, however, are increasing. Only one cargo of greenheart has arrived, but stocks are too heavy and prices easier.

The coal trade maintains an exceptionally satisfactory position for the time of the year. Housefire coals are necessarily meeting with only a very limited sale, and stocks are accumulating, but as these are still below the average, prices are being well maintained at about 11s. 6d. to 12s. 6d. best Wigan Arley; 10s. to 11s. Pemberton four-foot and seconds Arley; 9s. to 9s. 6d. common housecoal. Steam and forge coals move away freely at fully late rates, averaging 8s. 9d. to 9s. at the pit's-mouth. Supplies of engine fuel are becoming increasingly scarce, and there has during the month been an official advance in prices of 5d. per ton, making a total advance of 2s. 6d. over last year's prices. At the pit's mouth best slack is now 7s. to 7s. 6d., medium 6s. to 6s. 6d., common sorts 5s. to 5s. 6d. per ton.

Shipping is fairly active, with prices averaging about 9s. 6d. to 10s. delivered Garston Docks, near High Level, Liverpool.

The demand for coke is in excess of the output, and prices are exceedingly strong, 17s. to 19s. for furnace qualities and 26s. to 27s. for foundry cokes being quoted at the ovens.

THAMES.

(*From our own Correspondent.*)

Werner, Pfleiderer & Perkins, Ltd.—The paper which Mr. Loftus Perkins read before the United Service Institution on his system of boilers and engines is an important one, since it shows the progress of an engineer in his attempt to make his system perfect. Mr. Thornycroft and Mr. Yarrow have gone through the same ordeal, with the results which we see to-day in the almost perfect systems of steam-using in the torpedo-destroyers. Mr. Perkins had first to get his engines right. We are told that no end of trouble was experienced with the piston rings. It appears that this trouble with the piston rings had first to be tackled by him in the engines of a client in the country where high-pressure steam was used. The rings used continually broke down, and before they did so scored the cylinder. So Mr. Perkins had to settle down and think the problem out. The result was the invention of a metal which was brittle and at the same time wore away into a fine powder. No lubricant was required. It has been tried in the fastest torpedo-boat-destroyers by Mr. Thornycroft with uniform success. Mr. Thornycroft says: "It is a splendid material for piston rings, as there is no chance of the cylinders being scored when it is in use; we supplied it for the piston rings of the torpedo vessels we delivered lately to the French Government, and found we could run the two hours' trial easily at the rate of about 430 revolutions per minute, and without using any oil or grease in the cylinders." Mr. Donaldson, Mr. Thornycroft's partner, said, in the discussion of the trials: "In the preliminary runs we had a great deal of difficulty from priming, finding it impossible sometimes to run even for an hour without trouble in that way. At last, believing that our difficulties arose from the use of oil in the cylinder as a lubricant, which, accumulating in the condenser and pipes, was pumped thence into the boiler, I resolved, as the pistons were fitted with rings of Perkins's metal, to abandon the use of oil altogether, and to run the engines dry; so I had the condenser and boiler cleaned out with caustic potash and then had perfectly pure water pumped in. The result was that we found we could run the boat continuously for two hours without the slightest fear of priming. . . . If Mr. Perkins, by the use of his patent metal, has got over the necessity of using oil in the cylinder of surface-condensing engines, and I believe he has, he will, in my opinion, have added greatly to the life of modern marine boilers." In the year of his reading the paper, 1877, the pressure of steam in the boilers was 300 lbs. The initial pressure shown by the indicator diagram was 268·7, the terminal pressure in the high-pressure cylinder was 150·7, and the mean pressure 167·4 lbs. In the intermediate cylinder the initial pressure was 89·7 lbs and mean pressure 32·5 lbs. In the low-pressure cylinder the mean pressure was 12·2 lbs. Diameter of cylinders: high-pressure 15 in., intermediate 30 in., and low-pressure 60 in. It was stated that the evaporation in the boiler was 10·4 lbs. of water per lb. of fuel, and the consumption of coal one lb. per I.H.P. The rings for the high-pressure cylinders of destroyers are in use to-day.

Mr. C. H. Bryant, of Chiswick, has made an oil motor, and it has been fitted into a launch which runs occasionally on the Thames. Mr. Bryant claims for it that the oil engine can run after it has been once started without any lamp or hot tube to ignite the mixture and obtain the explosion. The heat of the combustion chamber serves to produce ignition. This is not anything new, since the Hornsby-Acroyd engine has done this for years, and there are other engines which do the same. The air charge is divided as it comes in: one portion of it takes up a charge of oil, whilst the other portion goes right down into the cylinder. The Hornsby engine also does this. The engine does not govern well. It governs by cutting a charge right out. There are three cylinders with the pistons connected to cranks at 120° to each other.

Pimbley Patent Forced Circulation Economiser.—This is an ingenious economiser, which consists of a number of pipes of U shape, bolted at the top to a long cast-iron box, and passages are formed in the iron box for the water to pass from one pipe to another. The water enters the economiser at the top box and flows down the first half of the first pipe and up the other half, then through the thoroughfare of the top box to the first half of the second pipe, and so on to the end of the pipes. The pipes are each fitted with a bonnet at the bottom to facilitate cleaning, and also fitted with scrapers worked by rods from a beam coupled to a face-plate crank; the rotary motion of the latter dispenses with the old jack reversing motion. The whole is of thoroughly sound construction. The pipes have three square inches of heating surface to each cubic inch they contain. There are no bottom boxes, because all the pipes hang from the top cast-iron box, and this allows the pipes to expand and contract with perfect freedom.

Joseph Wright & Co., of Tipton and Victoria Street, Westminster, have a very successful feed-heater; no less than 7,000 of them have already been fitted into land and marine steam plants. The construction is very simple. There is a cylindrical vertical vessel, at the bottom of which is a tube plate bevelled upwards from the middle on both sides. Pipes are expanded into the tube plate and go up inside the chamber, bend over at the top, come down, and are expanded into the tube plate on the other side. There is a division plate up the middle of the chamber which reaches up to the bends of the pipes. Water is allowed to enter at the bottom of the chamber above the tube plate, and it rises slowly to the top, where it flows away by the outlet. The time the water takes to reach the top is about half an hour. By allowing it to rise slowly it has time to allow the sediment and salts to fall to the bottom, whence it is removed by a sludge valve. The bevelled tube plate allows the tubes to be all of one length, and so the steam which flows through them is equally distributed throughout the tubes. Instead of being placed vertically, like the feed-heater, the surface-condenser made by this firm is placed horizontally. The tube plate is bevelled on each side of the middle plate, and the water in this instance flows through the tubes. The water flows in by a branch at the top, runs through the tubes and out by a branch at the bottom. Steam flows in at a branch at the top, circulates round the water surface of the tubes, and flows out by a branch pipe at the bottom. These condensing plants are made of very high H.P. capacity.

J. I. Thornycroft & Co.—This firm is much to the front at present as the builders of the yacht on which the hopes of England are concentrated for the bearing of the flag in the coming international race. The *Shamrock* made a record passage between this country and America. She was allowed three weeks to make the voyage, and she did it in two weeks. Sir Thomas Lipton, the owner, sent his steam yacht *Erin* along with her, and it was the condition of the challenge that she should sail across the Atlantic, and only be assisted in towing when there was calm. The conditions were kept, and she did the journey in a fortnight. It will not be the first time that the country will have been indebted to the enterprise of the firm for making record speeds by means of new and improved machinery. When lecturing on "Steam Speeds at Sea," Sir Nathaniel Burnaby said: "Out of the four great steps in speed-making which would make the last quarter of a century for ever illustrious, Mr. Thornycroft must be credited with three, and an electrical engineer, the Hon. Charles Parsons, with the last. Mr. Thornycroft, in his several successes, has given us a new form of boat, a new system of construction, a new form of propeller, and an effective way of generating steam by methods which had been often tried unsuccessfully and abandoned."

BELFAST.

(From our own Correspondent.)

THE great event of the past month has been the finishing and opening up for inspection of the *Oceanic*, which at present lies at the Victoria Wharf. Saturday, the 19th August, was the date fixed for the public inspection, and, as was naturally to be expected, many thousands availed themselves of the opportunity of becoming more intimately acquainted with the magnificent vessel, whose praise has been in every newspaper, and whose name has become so familiar all over the world. The arrangements made were of the most complete character, and were carried out in a manner which contributed to the comfort and satisfaction of everyone. Two classes of tickets were issued, the high-priced ones admitting at any time between the hours of 11 a.m. and 6 p.m., and the others only being available from 3 p.m. to 6 p.m., the money obtained from the sale of these tickets going to swell the funds of the Royal Victoria Hospital. A certain route throughout the vessel was marked out, from which it was impossible to deviate, and officers and members of the crew were stationed here and there to impart information or give guidance to those who needed it. Flags streamed from mast to mast and floated at bow and stern; the Union Jack, the Stars and Stripes, and the White Star Co.'s pennant all having a prominent place, and, as fine weather favoured the occasion, the steamer looked her best. The visitors went on board the liner by a special gangway at No. 2 hatch at the fore end, which landed them on the upper deck at the starboard side, thus allowing them to inspect first of all part of the accommodation provided for third-class passengers, and it was pleasing to find that careful attention has been given to the needs of this section of the travelling public. Ascending again to the upper deck, the visitors passed into the forecastle, where they were permitted to examine the powerful windlass and warping gear, specially designed and constructed for this vessel. They then walked along the port side, going up the stairway to the forecastle deck, and after viewing this they went along to the promenade deck on the starboard side and up the captain's private staircase to the boat-deck, where the boats and fan casings were inspected. After proceeding as far aft as the engine room skylight on the starboard side, they returned on the port side, and went up the captain's bridge, charthouse, and wheelhouse. They then descended to the promenade deck, and walked along the port side as far as the second-class smoking room and library, and then to the poop deck, which is specially arranged for the comfort of second-class passengers. From this the visitors sauntered along the starboard side of the promenade deck, entering the main saloon entrance, where they inspected the staterooms and library situated on this deck. They then went down the grand staircase to the upper deck, and had an opportunity of inspecting the first-class cabins and smoking-room, after which they descended to the saloon deck, proceeding thence along the starboard side to the grand saloon, where the decorations and upholstery were examined, and also the magnificent dome with its elaborate ornamentation representing England, America, Liverpool, and New York, all of which is of special interest, the whole of the work having been designed and erected at an enormous cost; but this magnificent saloon must be seen to be thoroughly appreciated, as it would be almost impossible to give a detailed description of it. All that one can say is that in beauty of design and in excellence of workmanship it leaves nothing to be desired. Coming from the saloon they continued the inspection of the first-class staterooms, afterwards going down to the main deck, where the cabins, bathrooms, and lavatories were seen. Proceeding up the staircase at the after-end of this deck, the first-class pantry on saloon deck was reached.

Passing from this through the galley, sculleries, bakers' shops, butchers' shops, refrigerating chamber, and second-class pantry, the visitors entered the second saloon, which is very handsomely decorated and surmounted by a very fine skylight with richly painted glass of floral design. From this they proceeded along the port and starboard sides for the inspection of the second-class staterooms, thence ascending the second-class staircase and arriving on the upper deck, where the visitors had an opportunity of examining the arrangements for steering the ship and the heavy warping gear, which is in duplicate, specially designed for moving the vessel in docks when the engines cannot be used. The ship can be steered by electricity or by steam or by hand, and should any accident or circumstance render one method impracticable, another can speedily and easily be adopted. Progress was next made along the port side of the upper deck to the engine-room entrance, and permission was freely given to any person wishing to do so to descend to the port engine-room by the spiral staircase and make an inspection of the engines and boiler-room, and then pass through the watertight door in the division bulkhead which divides the two engine-rooms. The space allotted to the engines is unusually great, but not greater than one would expect when the immense size of the vessel is taken into account. There are 15 boilers—12 double and three single-ended—of about 1,000 tons total weight, and there are nearly a hundred furnaces. The engines are triple, four-cylinder, four-crank balanced, of about 28,000 I.H.P., and they drive two three-bladed propellers, placed very close together, with an opening between them. The port and starboard engines are divided by means of a watertight bulkhead, and it may be of interest to state that between seven and eight thousand tons of coal will be consumed in a round voyage from Liverpool to New York and back. From the engine-room the visitors returned to the spiral staircase on the starboard side of the upper deck, and having thus completed their inspection of the gigantic vessel, which, it should be stated, is lighted throughout by electricity, made their departure by a gangway placed at this point. The *Oceanic*, which is commanded by Captain Cameron, proceeded down the lough on the 24th ult. for her trial trip and adjustment of compasses, and for this purpose the river was kept clear for two or three hours. Two days afterwards she left Belfast for Liverpool, where she went into graving dock in order that certain final preparations for the first voyage across the Atlantic might be made. This work would have been done in Belfast but for the fact that another large steamer, the *China*, is at present occupying the graving dock here. On Wednesday, 6th September, the *Oceanic*, it is expected, will sail from the Mersey on her maiden trip to America, and she will have on board Mr. and Mrs. Ismay and a distinguished party, in addition to a full complement of passengers, every berth—first, second, and third class—having been booked some time ago.

Another of the White Star Line, the s.s. *Afric*, left the port on the 22nd ult., after having been in the hands of the builders, Messrs. Harland & Wolff, for some little time, in order to have refrigerating machinery fitted, and some other alterations carried out.

No launches have taken place during the past month, but we hope to have one to report from Messrs. Workman, Clark & Co.'s yard next month.

NORTH-WEST OF ENGLAND.

(*From our own Correspondent.*)

Barrow.—The shipbuilding industry of this district remains very fully and busily employed, and, after the suspension of operations at Bank Holiday, regularity of work has been maintained; but the suspension was not general, and in many departments where workmen could be got to work through the holidays they were pressed to do so, in order to push forward some of the more urgent work in hand. There is no report of any new orders received during the month. Doubtless builders are quite busy enough on the contracts they have now in hand without attempting anything further at present, but some very good orders are in the market, and these are being tendered for, in order that some of the vacant slips in the Naval Construction Works may be utilised. There are only five berths occupied at present, and there is room for at any rate six more ships, although those now in hand require practically all the attention the capacity of the yard is capable of. These five berths are utilised for the three first-class cruisers for the Admiralty and one torpedo-boat destroyer, together with the Japanese battleship. It will readily be seen that these ships represent a very great deal of work, especially as very little start has been made with some of them; but it is almost certain that before the end of the year some of the other berths will be occupied with other craft.

There is a good demand for additional workmen in almost every department of local shipbuilding, but the difficulty in getting them is accentuated by the fact that when they come here they cannot get houses to live in. Barrow is completely congested as far as population is concerned, and all the efforts made to meet the difficulty seem, up to the present, to be inadequate. Here is an instance which came before the Barrow magistrates on August 21st:—An application was made for an order of ejectment against a man who had not complied with a notice requiring him to give up possession of a house now occupied by him. Defendant's wife appeared, and in a broken voice explained that they had been in the house four years. Now they had to leave, and, try as she herself and her husband would, it was impossible to get a house in any part of the town. They had a family of seven children, and when they went to secure apartments they were refused them on the ground that the family was too large. The magistrates said they must make the order, and advised the woman to do the best she could to get a house within three weeks. The fact is that where houses are to sell within easy reach of the shipyard, men are found ready to buy them, although prices are considered very high. When the tenants have to turn out and seek new houses or leave the district, many of them take the latter course, and as a consequence many departments of the Barrow Shipyard are very indifferently supplied with men. As a consequence of this, Messrs. Vickers, Sons & Maxim devised their scheme for building a thousand houses on Walney Island, within easy reach of their works, as previously chronicled in the MARINE ENGINEER, and until they can get these houses ready a floating home has been furnished for about 400 men on board the s.s. *Alaska*. As this is a very novel feature in shipbuilding experience, our correspondent has furnished us with the copy of a circular setting forth the way in which Messrs. Vickers's workmen will be treated on the *Alaska*:—

"In order to provide for the comfort and convenience of their workmen, who cannot get convenient houses or lodgings, Messrs. Vickers, Sons, & Maxim have acquired this vessel, which has been thoroughly overhauled and equipped as a temporary home, with good sleeping accommodation, dining, smoking, reading, and recreation rooms, promenade deck, baths and conveniences, the whole lighted throughout with electricity. The food will consist of:—Breakfast: Eggs, bacon, or fish. Dinner: Beef, mutton (boiled or roasted), with potatoes and bread, varied with steak pudding, hotch-potch, &c. Tea: Bread, butter, jam, cheese, cold meat, &c. Everything to be of the best quality, subject at any time to the committee's inspection. Washing of all underclothing and mending of clothes will be provided. For the above an inclusive charge of 14s., 15s., or 16s. per person per week will be made, according to the berth occupied, viz.:—If a cabin to hold two persons, 14s. per week each; if a single cabin, 15s. per week each; if a large single cabin, 16s. per week each. The internal management of the home will be under the direct control of the purveyor and his staff, and of a committee, Messrs. Vickers, Sons & Maxim retaining a general supervision over the management. It is also proposed that the men should form a club at a subscription of 1s. per annum. The relatives and friends of workmen will have permission to visit those lodging in the home. Workmen employed in the engineering side and shipyard department and men working at the dock may gain entrance to the ship through the works. Arrangements have been made for the accommodation of 100 workmen on 24th August, and additional accommodation will be speedily provided." It will be seen from this that the men living on the *Alaska* will lead a club life, and that their comfort and convenience will be considered in a way that would not be perhaps possible in ordinary lodgings. The movement has "caught on," and it is probable Messrs. Vickers will have no difficulty in getting all the accommodation on the ship taken up. When they are able to do this they will get an increased number of workmen in their employ, and this number will be still further increased when the new houses to be built on Walney Island are ready for occupancy. The new village which these houses will bring into existence will be known as Vickersdale. It is to be built on modern and model lines with good, airy streets and back streets, well designed cottages, possessing good-sized rooms, with lofty ceilings, and fitted with bathrooms, hot and cold water, and all conveniences likely to make the houses very pleasant homes. There will be a public square, athletic grounds, children's playgrounds, and a public park, and the houses will be situated practically on the east side of Walney Channel, across which is the town of Barrow, and within easy distance of the works of Messrs. Vickers, Sons & Maxim. It is proposed to build a high-level bridge to span Walney Channel. When that is done, Walney Island will probably be opened out to industrial enterprise, as well as developed into a charming seaside resort.

The work of fitting the engines and boilers in the Pacific Liner *Ortona*, is proceeding apace, and she is expected to be ready for sea in the early part of November. When she leaves the docks at Barrow, the Ramsden Dock entrance lock will be closed pending the work of lowering the sill at this place 6ft. The entrance here is 100 ft. wide, and when the sill is lowered, a vessel drawing 30 ft. of water can get in and out of the docks. This is a very desirable improvement seeing the larger class of war and other ships now building at Barrow, and seeing also the bigger class of steamers which are coming to the port nowadays. When the sill has been lowered, it is probable the Furness Railway Co. will commence the construction of a new graving dock and lock alongside the Ramsden Dock entrance for deep draught ships. This dock, which will be about 1,000 ft. long and 100 ft. wide, will have 30 ft. depth of water, and will be capable of accommodating the largest ship afloat, or any ship likely ever to be built. The dock will have an entrance from Walney Channel, and from Ramsden Dock. When completed it will enable local shipbuilders to do a big trade in the repairing of ships.

Considerable progress is being made with the three first-class cruisers building at Barrow, and with the Japanese warship, but it is probable before these can be launched the sill of the Ramsden Dock lock will have been lowered.

The adoption of electricity for driving purposes in the Barrow Yard is gradually being proceeded with, and it is found to be of very great advantage, and undoubted economy. The installation is working very satisfactorily, and every day almost gives the dynamos new loads.

In connection with the serious accident to H.M.S. *Bullfinch* it is interesting to note that the Barrow Yard was very unsuccessful with the torpedo-boat-destroyers built here until the shafts and other parts connected with the engines built of steel were made of Vickers's special steel. Other makes of steel proved failures, but when Vickers's material was substituted no difficulty occurred, and the engines showed great reliability when exerting full power and under the greatest strain.

Some discussion has been going on in the papers lately about the desirability of establishing another Bank Holiday, to be fixed between the August Bank Holiday and Christmas, and to be designated the Victoria holiday As far as this district is concerned, Bank Holidays, although very good and very necessary in themselves, constitute a great nuisance to the shipbuilder and the engineer, because the men take, four times a year, a longer spell of leisure than is desirable, and they do not, in a large percentage of cases, return to work for some days after the time at which notices are posted that work will be resumed. The men who are anxious to take a reasonable holiday and to return to work when it is over, are prevented from doing so because others have not got to the end of their surplus money or of the holiday spirit with which they are actuated. The proposal to add another Bank Holiday to the present list would certainly meet with disfavour amongst shipbuilders and others engaged in trade in this neighbourhood.

The new gun-mounting department added to the Naval Construction Works of Vickers, Sons & Maxim has now been completed, and is replete with the very best machinery modern engineering science can furnish. This department is crowded with work, and is likely to remain so for a long time to come, as orders are so very fully held. Indeed, it has already become necessary to increase the area covered by these works, and orders have accordingly been given out for the erection of additional sheds and for the purchase of the necessary machinery and other plant A new steel foundry is being built in the yard, and there are indications of other enlargements in various directions so as to make the works more and more complete and more self-resourceful.

West Cumberland.—There is no new feature to note in the shipbuilding trade of West Cumberland. Orders are plentifully maintained, and the yards at Maryport are very busy and likely to remain so.

Shipbuilding Material.—There is a very full and steady demand for all classes of shipbuilding material, and makers are still very fully employed. This is especially the case as regards ship plates and sections, boiler plates, &c., whilst steel forgings are in very full demand. Orders for all classes of material are being offered freely as well for Admiralty as for ordinary mercantile tonnage. Prices are very steady at £7 12s. 6d. for ship plates, £8 15s. for boiler plates, and £7 2s. 6d. for angles. Steel-makers have enjoyed a long run of prosperity, and from present appearances it is not probable it will be interfered with for a very long time to come.

The Hematite Trade.—The hematite pig-iron trade has been somewhat erratic during the month. Makers at one time lifted their prices to 80s. for mixed Bessemer numbers net f.o.b. They are still very firm at 75s to 77s., whilst warrant iron has varied in price very much, and is now quoted at 72s. 6d. net cash sellers, 72s. 5½d. buyers. Stocks have been increased during the month by about 5,000 tons.

Correspondence.

[*We do not in any way pledge ourselves to the opinions proffered under this heading.*]—Ed. M.E

A NEW METHOD OF FORCED DRAUGHT.

To the Editor of The Marine Engineer.

Sir,—I see in your issue of August 1st a short article on a communication I made to the Institution of Naval Architects, on some experiments carried out with forced combustion by means of hollow fire-bars. I now ask you to correct an error which may lead to a misunderstanding and give a false value to the experiment with natural draught.

The 10 days' work at natural draught was not 10 days' continual steaming at sea, as seems to have been supposed; but 10 days' work in a small supplementary boiler in a factory, from 6.30 a.m. to 5 p.m., which is obviously a different matter.

The system is still in the infant stage, and whether it will live to grow to maturity remains to be seen. "It promises well," as you remark, but we must not shut our eyes to the fact that the crucial test will be that of sudden stoppages at sea with heavy fires. Whilst the current is passing through the bars they keep too cool for the clinker to burn them, but it is possible that by stopping the fan with heavy fires and bad coal, the slaggy matter which forms the clinker may run over the bars and burn them. With the coal used during the experiments on shore such has not been the case; in other words, as far as can be judged, the cold bars seem to cool the under surface of the clinker sufficiently to prevent the union of the metal and the slaggy matter of the said clinker even when the current of air is stopped.

Naples. Nelson Foley.
August 7th, 1899.

THE "KAISER FRIEDRICH DER GROSSE."

To the Editor of The Marine Engineer.

Dear Sir,—In your esteemed journal of August 1st, page 207, you write that the *Kaiser Friedrich* has been withdrawn by the Norddeutscher Lloyd from the service and returned to her builders.

This not being the fact, I request you kindly to rectify it, in the next issue of your esteemed journal, according to the following data:—

The *Kaiser Friedrich* was the property of the firm of F. Schichau, and in spite of her being built as a high-speed passenger steamer, requiring a good quality of coal, the Norddeutscher Lloyd mostly gave her a very inferior coal—besides, many of the stokers had no previous experience.

Under these circumstances it could not give surprise that the *Kaiser Friedrich* was not able to develop her full speed, and there was no other way for the firm of F. Schichau but to withdraw its steamer and give her into other hands.

The *Kaiser Friedrich* will make her next voyages under the flag of the Hamburg-American Line.

Reiterating to you in advance my best thanks for this rectification, I remain, dear sir,

Elbing Yours very respectfully,
August 7th, 1899. F. Schichau.

THE WILSON LINE AND WATER-TUBE BOILERS.

To the Editor of The Marine Engineer.

Sir,—In your Thames Notes—current issue—you mention the *Hero* as having had her Scotch boilers taken out. Our s.s. *Hero* has never had other than water-tube boilers. The comparison you quote refers to our s.s. *Sasso*.

Yours truly,
For Thos. Wilson, Sons & Co, Limited
Hull, A. F. White.
August 8th, 1899.

LAUNCHES AND TRIAL TRIPS.

LAUNCHES—English.

Bernicia.—On July 8th there was launched at Middlesbrough, for Messrs. J. Browser & Sons, Newcastle, a steel schooner-rigged steamer of about 430 tons gross, named the *Bernicia*.

Khartoum.—On July 11th there was launched at Hull, for the Hull Steam Fishing & Ice Co., Limited, Hull, an iron and steel steam ketch of about 300 tons gross, named the *Khartoum*.

Maristow.—On July 13th there was launched at Sunderland, for Messrs. Bellamy & Co., Plymouth, a steel schooner-rigged steamer of about 3,600 tons gross, named the *Maristow*.

Pearl.—On July 15th there was launched at Whitby, for Mr. J. Constant, of London, a steel schooner-barge of about 240 tons gross, named the *Pearl*.

Achecolanda.—On July 22nd Messrs. Pickersgill & Sons launched at Sunderland a steel crew cargo steamer, of the single deck type. The dimensions of the vessel are as follows:—Length, 295 ft.; breadth, 43 ft.; and depth moulded, 21 ft. She had been built to Lloyd's highest class under special survey. The engines and boilers are supplied by Messrs. Geo. Clark, Limited, of Southwick, the former being of the triple-expansion type, with cylinders 21 in., 35 in., and 57½ in., with a 39 in. stroke. The vessel was named *Achecolanda*.

Commander Cawley.—On July 24th there was launched at South Shields, by Messrs. Eltringham & Co., the steam pilot cutter *Commander Cawley*, of the following dimensions:—128 ft. over all, and 23 ft. by 11 ft. 4 in., and is built to Lloyd's 100 A1 class. The engines are to be direct acting, inverted cylinder, triple compound, three-crank engines, fitted with surface condenser; and the ship is to have a guaranteed speed of not less than 10 knots.

Ethel.—On July 24th a trawler was launched from the Selby Shipbuilding Co.'s yard. She is a sister ship to the *Kathleen and Elsie*, built by the same firm for the Central Steam Fishing Co., Grimsby, was christened *Ethel* by Miss Leetham, of York.

Nuttallia.—On July 24th there was launched at Grimsby, for the North-Eastern Steam Fishing Co., Grimsby, an iron steam yawl of about 189 tons gross, named the *Nuttallia*.

Steel Screw Steamer.—On July 24th there was launched at Middlesbrough, by Messrs. Harkess & Son, a steel screw steamer, which they have built to the order of Messrs. Furness, Withy, & Co., Limited, of West Hartlepool. Her engines, designed to give the vessel a speed of about nine knots loaded at sea, are by Messrs. Sir Christopher Furness, Westgarth & Co., Limited.

Seaton.—On July 25th there was launched at South Shields for the North-Eastern Railway Co., a steel steam tug, of about 160 tons gross, named the *Seaton*.

Elfleda.—On July 25th Sir Raylton Dixon & Co, Limited, launched from their Cleveland Dockyards, Middlesbrough, a handsome modelled twin-screw mail and passenger steamer, built for Messrs. Elder, Dempster & Co., of Liverpool. Her principal dimensions are 382 ft. by 46 ft. by 25 ft. moulded. Accommodation will be provided for 108 first-class, and 50 second-class passengers in most spacious and handsomely fitted cabins, with large dining room, panelled in marble and inlaid wood in house on deck. The first class smoking room, second-class smoking room and cabin entrances will be elaborately fitted and decorated, and the vessel will be lighted throughout with electric light. A powerful refrigerating machine with large cooling chambers will also be provided for the conveyance of fresh meat, provisions, &c. Twin-screw triple-expansion engines will be fitted by the Wallsend Slipway and Engineering Co., Limited, Newcastle-on-Tyne, having cylinders 21½ in., 34 in., 59 in., by 42 in. stroke, supplied with steam by four large single-ended boilers working at 130 lbs. pressure, and fitted with Howden's system of forced draught. The ship and engines have been built under the supervision of Mr. G. H. Butterworth, resident inspector. On leaving the ways she was christened *Elfleda* by Mrs. Waynman Dixon.

Suffolk.—On July 25th there was launched from the yard of the Sunderland Shipbuilding Co., Limited, at Wallsend, a handsome screw-steamer, built to the order of Messrs. Birt, Potter & Hughes, Limited, for their well-known line of steamers. The register length of the vessel is 420 ft.; breadth register, 54 ft.; and depth, moulded, 32 ft.; having complete shelter deck for the use of cattle or light cargo. The sailors and firemen are berthed under the shelter deck aft. Provision for the accommodation for captain, engineers, officers, and a few passengers is made on the top of the shelter-deck in large deck-houses. The handsome saloon is tastefully fitted in polished oak, and complete with every comfort. The vessel is constructed on the deep frame principle, thus dispensing with hold beams, and has cellular water ballast all fore and aft, and both peaks fitted as tanks. The shelter, upper, and main decks are of steel, and her class will be 100 A1 Lloyd's, three deck grade, with shelter deck, special survey, also Board of Trade passenger certificate; her deadweight carrying capacity is 8,750 tons. The deck machinery consists of 10 large steam winches, by Mr. R. Welford, of Pallion, and direct steam windlass by Messrs. Emerson, Walker, & Thompson. Alley, McLellan's steam-steering gear, which is placed in the engine room, and worked from flying bridge, together with all the usual appliances for handling cargo and working the ship with the greatest possible despatch. The main engines are upon the tri-compound principle by the North Eastern Marine Engineering Co., Limited, Sunderland, and have cylinders 30 in., 48 in., and 78 in. by 54 in. stroke, steam being supplied by three large steel boilers, working at a pressure of 160 lbs. per square inch. During construction the steamer and her machinery has been inspected on behalf of the owners by their superintendent, Mr. Morrison, and also by Captain Cuthbert (who will take command of the vessel), and by Mr. Justice, and upon leaving the ways was gracefully named *Suffolk* by Mrs. Morrison, after which she was towed into the South Dock for the purpose of masting, &c. This vessel is being insulated all fore and aft by the builders with silicate cotton for the carriage of frozen meat, and she will be fitted with refrigerating machinery by Messrs. J. & E. Hall, of Dartford, Kent.

Jerid.—On July 26th there was launched at Hull, for the Great Grimsby and East Coast Steam Fishing Co., Limited, Grimsby, an iron steam ketch, named the *Jerid*.

Robert Irvine.—On July 26th, Messrs. Irvine's Shipbuilding & Dry Docks Co., Limited, launched from their shipyard a finely modelled steel screw steamer built to the order of Messrs. Robert Irvine & Co., Tower Chambers, West Hartlepool. She is of the following dimensions:—Length, 352 ft.; breadth, 48 ft.; depth, 27 ft. 9 in., and is of the single-deck type, with poop, bridge, and forecastle, is built to Lloyd's highest class under special survey, and capable of carrying 6,000 tons deadweight on a light draught with Lloyd's summer freeboard. A double bottom is fitted throughout on the cellular principle for water ballast. and the after peak is arranged as a trimming tank. She is constructed with deep frames, web frames and longitudinal stringers, thus dispensing with hold beams which gives clear holds for the storing of bulky cargoes. Six water-tight bulkheads divide the holds into seven watertight compartments, and each hold is fitted with iron grain divisions. She is fitted with extra large cargo hatches, and is equipped with double derricks at each hatch, seven steam winches and is replete with all the latest improvements for rapid loading and discharging. A powerful direct steam windlass is fitted forward for the working of the cables, and a steam-steering gear is fitted amidships. The saloon, and captain and officers' accommodation is provided in a house at the fore end of bridge, and the engineers are berthed on the bridge at the side of casings. The seamen and firemen are housed under the forecastle. The sanitary, ventilating, and lighting arrangements have received special attention, and have been effected on the most approved lines. Engines of the triple-expansion type are being supplied by Messrs. Thomas Richardson & Sons, Limited, Hartlepool, with cylinders 24 in., 39 in., 66 in., and 45 in. stroke, and two single-ended boilers constructed to work at a pressure of 180 lbs. As the vessel left the ways, the christening ceremony was performed by Miss Irvine. of Ragworth Hall, who named the vessel *Robert Irvine*, in compliment to the founder of the firm of Robert Irvine & Co., Tower Chambers.

Cito.—On July 27th, Messrs. Earle's Shipbuilding and Engineering Company, Limited, launched at Hull a fine screw steamship, for Messrs. Thomas Wilson, Sons & Co., Limited, Hull. Her dimensions are 219 ft. by 30 ft. by 17 ft. 9 in., and she is fitted with water-ballast in a double bottom in the fore hold, in the fore peak, and in a deep tank in the after hold. She has a large bunker capacity, one complete deck with poop, bridge, and forecastle, and under the latter the crew is berthed. Accommodation is provided in a house on the fore end of the bridge for the captain and officers. Stalls for horses are provided under the bridge. She has three masts, is schooner-rigged, and has four steam winches; also a steam windlass and steam-steering gear. The vessel will be propelled by triple expansion engines, having cylinders 18 in., 30 in., and 50 in. diameter, by 33 in. stroke, steam for which will be supplied by two steel boilers, working at 200 lbs. steam pressure. The christening ceremony was performed by Miss Jessie Cole, daughter of Earle's shipyard manager, who named the vessel *Cito.*

Tresillian.—On July 27th there was launched at South Shields, from the Shipbuilding yard of Messrs. John Readhead & Sons, a screw steamer, built to the order of Messrs. Edward, Hain & Son, St. Ives, Cornwall. The vessel, which is 353 ft. long, 46 ft. 6 ins. broad, and 27 ft. 4 in. in depth, is of the improved single-deck type, and classed 100 A1 at Lloyd's under special survey. The steamer will be fitted with triple-expansion engines, also constructed by Messrs. John Readhead & Sons, having cylinders 24 in., 40 in., and 65 in., with 45-in. stroke, steam being supplied by two large steel boilers working at a pressure of 160 lb. per square inch. The steamer was named the *Tresillian*, and is the 34th vessel built for the above firm by Messrs. John Readhead & Sons.

Ledokol III.—On July 28th Messrs. Sir W. G. Armstrong, Whitworth & Co., launched from their Walker Shipyard on the Tyne an ice-breaking steamer, intended for work at the port of Odessa. The chief dimensions of the vessel are:—Length, 158 ft.; breadth, 42 ft.; depth, 25 ft. 5 in. She has been built to Lloyd's and Board of Trade requirements, and was named *Ledokol III.* Immediately after the launch the ice-breaker was taken to the works of the Wallsend Slipway & Engineering Co., where she will be fitted with triple-expansion screw machinery. Although a small vessel, she is to be fitted with very powerful machinery.

Champion.—On July 29th there was launched at Hull for the Anchor Steam Fishing Co., Limited, of Grimsby, a steel steam ketch, of about 198 tons gross, named the *Champion.*

Vampire.—On July 29th there was launched at Hull for the Atlas Steam Fishing Co., Limited, of Grimsby, a steel steam ketch, of about 198 tons gross, named the *Vampire.*

Glenroy.—On Saturday, August 5th, Messrs. William Gray & Co., Limited, launched a fine steel screw steamer, which they have built to the order of Messrs. Livingston, Conner & Co., of West Hartlepool. She will take Lloyd's highest class, and is of the following dimensions, viz.:—Length, overall, 329 ft.; breadth, 46 ft.; and depth, 23 ft. 6 in.; and 4,650 tons deadweight capacity on a light draught. The deck erections consist of a poop, bridge over machinery space, and topgallant forecastle. A handsome saloon and cabins for officers, &c., will be fitted in a large house on the bridge. The engineers' rooms are also on the bridge, and the crew's accommodation forward. The hull is built on the deep bulb frame principle, with a cellular double-bottom large hatchways, extra powerful steam winches, steam-steering gear amidships, hand-screw gear aft, patent donkey boilers, patent direct steam windlass, boats on beams overhead, shifting boards throughout, stockless anchors, two masts with schooner rig, and all the most approved appliances for a first-class cargo vessel will be supplied. The Central Marine Engine Works of Messrs. William Gray & Co., Limited, supply triple-expansion engines, having cylinders 23 in., 36½ in., and 62 in. diameter, with a 39 in. piston stroke, and two large steel boilers to work at 160 lbs. pressure per square inch. The ceremony of christening the steamer *Glenroy* was gracefully performed by Miss Conner, daughter of one of the managing owners.

Balakani.—On August 8th the s.s. *Balakani* was launched from the yard of Messrs. Sir James Laing & Son, Limited, Sunderland. She has been specially constructed for the carriage of petroleum in bulk for Messrs. Lane & Macandrew, of London, and is the second of three steamers building by Messrs. Laing for that firm. The principle dimensions are:—Length, 335 ft.; breadth, 45 ft.; moulded depth, 29¾ ft.; and her engines have cylinders 24½ in., 40 in., and 66 in., with a 40 in. stroke, and take steam at 180 lbs. pressure from two powerful single-ended boilers. All the latest improvements in auxiliary machinery are fitted, including powerful pumping installation, electric light fitted throughout the ship, steam-steering gear winches and steam windlass, and a donkey boiler of large size. The vessel and her machinery have been built to the highest class at Lloyd's and Bureau Veritas, and conforms to the Suez Canal regulations, and, like her sister ships, has been constructed under the immediate supervision of Messrs. Flannery, Baggallay & Johnson, of London and Liverpool.

Protector.—On August 8th there was launched at Sunderland, by Messrs. Robert Thompson & Sons, a steamer named the *Protector*, for a Boston firm. The vessel was launched sideways into the river.

Baron Eldon.—On August 9th Messrs. Bartram and Sons launched at Sunderland, for Mr. Hugh Hogarth, Glasgow, a large steel steamer of the spar deck type. The principal dimensions are:—Length, 340 ft.; breadth, 48 ft.; depth, 28 ft. 6 in. She has been built to take the highest class in Lloyd's Registry, and under the personal supervision of Captain Murphy, of Glasgow, on behalf of the owners. The propelling machinery will be supplied by Messrs. John Dickinson & Sons, Limited. The cylinders are 24½ in., 40 in., and 66 in. by 45-in. stroke. The vessel was named the *Baron Eldon.*

Lynton.—On August 9th there was launched from the Southwick Yard of Messrs. Robert Thompson & Sons a fine screw steamer, specially designed for cargo and cattle trade, and built to the order of the Liverpool Shipping Co., Limited, of Liverpool. Her dimensions are:—Length B.P., 340 ft.; breadth, extreme, 45 ft.; and depth moulded, 25 ft. 9 in., and will carry about 5,200 tons on 21 ft. draught. She is constructed with extra strength to obtain Lloyd's minimum freeboard for three-deck vessels. There is a cellular bottom and peaks for water ballast divided into transverse and longitudinal divisions for trimming purposes. The accommodation for captain, officers, and engineers being placed in large houses on the bridge deck leaves the bridge and poop spaces clear for cargo if required. The crew are provided for in the topgallant forecastle. The cabins and saloon are tastefully designed in different shades of oak. There are five large cargo hatches with powerful steam winches and double derricks for rapid loading and discharging of cargo. The steam-steering gear is fitted at after end of engine-room, with control shafting to wheelhouse on upper bridge. The vessel is fitted with all the most modern improvements for a first-class cargo and cattle steamer. The engines are by the North Eastern Marine Engineering Co., Limited, and have cylinders 23 in., 39 in., and 65 in., with 42 in. stroke, and extra large boilers of 180 lbs. pressure. During construction the ship and machinery have been personally superintended by Messrs. Maxton & Sinclair, of Liverpool and Belfast. As she left the ways she was gracefully christened *Lynton* by Mrs. Sproule, wife of the managing owner.

Lucifer.—On August 10th there was launched from the West Yard of Messrs. C. S. Swan & Hunter, Limited, Wallsend, a steel screw steamer of the following dimensions:—Length overall 354 ft., beam extreme 47 ft., and depth moulded 29 ft. She has been built to the order of the Bear Creek Oil and Shipping Co., Limited, of which company Messrs. C. T. Bowring & Co., of Liverpool, are the managers, and is designed to carry 5,000 tons of petroleum in bulk as well as 500 tons of bunker coal. The propelling machinery has been built by T. Richardson & Sons, Limited, of Hartlepool, and consists of a set of triple-expansion engines having cylinders, 24 in., 40 in., and 66 in. diameter, with a stroke of 45 in., steam being supplied by two large single ended boilers, each 15 ft. 9 in. diameter, and 10 ft. 6 in. long, working at a pressure of 180 lbs. per square in. During construction the vessel and her machinery have been under the supervision of Mr. Bradney, representing Messrs. Jacobs & Barringer, of London. On leaving the ways the vessel was gracefully named *Lucifer* by Miss M. C. Bowring, of Liverpool.

Steam Trawlers.—On August 10th Messrs. Cochrane & Cooper, Limited, launched from their Grovehill Shipyard, Beverley, two new steam trawlers, Nos. 260-1, built to the order of the Great Central Co-operative Engineering and Ship Repairing Co., Limited, Grimsby. Dimensions 110 ft. by 21 ft. by 11 ft. 3 in. depth of hold. Triple-expansion engines will be supplied by the owners. The vessel will be completed ready for sea with all the most modern appliances for trawling. The launching ceremonies were performed by Mrs. Watson and Mrs. Cooper, of Beverley, respectively. Mr. Dunlin, of Grimsby, represented the owners.

Avondale.—On Saturday, August 19th, Messrs. Short Brothers launched from their shipbuilding yard at Pallion, a handsomely modelled steel screw steamer, built to the order of Messrs. G. H. Elder & Co., of Newcastle-on-Tyne. The vessel has been built under special survey to the highest class in Lloyd's register, and is of the following dimensions, viz.:—Length

285 ft., breadth 43 ft., depth moulded 21 ft., and is of the single decked type. The vessel is fitted with a full poop, long bridge amidships on which houses are fitted up for the accommodation of captain and officers, and topgallant forecastle for crew. There are four large hatchways with a powerful steam winch at each, steam being supplied to the latter by a large multitublar donkey boiler placed in the stokehold. The double bottom, which is on the cellular principle is subdivided into trimming tanks for water ballast. On leaving the ways the vessel was named *Avondale*, the ceremony being gracefully performed by Mrs. Elder, of Newcastle-on-Tyne. The vessel is to be fitted with triple-expansion engines by Messrs. George Clark, Limited, of Sunderland, having cylinders 21 in., 35 in., 57½ in. by 39 in. with two boilers 13 ft. by 10 ft. 6 in., 160 lbs. pressure. The construction of the vessel has been under the supervision of Captain Fothergill, who will take command of the vessel on completion.

Hero.—On August 19th there was launched at Hylton, from the yard of Messrs. Osbourne, Graham & Co., a finely-modelled steamer, especially designed for general cargo purposes, and built to the order of Messrs. Brunsgaard, Kiosterud & Co., of Dram, Norway. Her dimensions are :—Length over all, 351 ft.; beam, extreme, 48 ft. ; and depth, moulded, 29 ft. She will carry about 6,100 tons on 23 ft. draught. She is constructed with extra strength to obtain Lloyd's minimum freeboard for this class of vessel. There is a cellular bottom for water ballast, and both fore and-aft peaks are fitted as tanks, giving the vessel over 1,000 tons of ballast capacity, which will enable the vessel to make passages in ballast with comfort and safety. The deck machinery consists of six powerful steam winches, quick warping steam windlass, all worked from a large multitubular donkey boiler. There is also a powerful hand and steam combined steering gear, fitted on the bridge, and a screw gear aft. The vessel will be propelled by triple-compound engines, built by the North-Eastern Marine Engineering Co., and will have cylinders 25 in., 41 in., and 67 in. in diameter by 45-in. stroke, steam being supplied by two single-ended boilers 16 ft. by 10½ ft., working at a pressure of 160 lb. As the vessel left the ways she was named *Hero* by Miss Syversten, after which she proceeded to Wallsend, where she will have her machinery fitted.

Steel Barge.—On August 19th there was launched from the yard of Mr. Joseph Scarr, Grovehill, Beverley, a steel barge of the following dimensions:—Length overall, 90 ft.; beam, moulded, 24 ft. 6 in.; depth moulded, 8 ft. 6 in. She was built to the order of the London Grain Elevator Co., of London, and is the second built for that firm.

Darleydale.—On Monday, Aug. 21st, Messrs. W. Gray & Co., Limited, launched a fine large steel screw steamer for the Dale Steamship Co., Limited, Messrs. Lucas & Co., of Bristol, managers. She will take Lloyd's highest class and is of the following dimensions, viz.: Length overall, 336 ft.: breadth, 48 ft. 6 in.; and depth, 24 ft. The deck erections consist of poop, long bridge, and forecastle; the saloon, and captain's and officers' rooms will be fitted in the poop. The hull is built with deep frames and cellular double bottom, and aft peak tank for water ballast, five steam winches, steam-steering gear amidships, hand screw gear aft, patent direct steam windlass, patent donkey boiler, grain divisions, stockless anchors, and a complete outfit will be fitted for a first-class cargo boat. Three cylinder triple expansion engines of first-class make are being supplied by the Central Marine Engine Works, of Messrs. W. Gray & Co., Limited. They will develop over 1,200 H.P. The cylinders are 24 in., 38 in., and 64 in. diameter, with a piston stroke of 42 in., and large steel boilers, to work at a pressure of 160 lbs. per square inch. The ceremony of christening the steamer *Darleydale* was gracefully performed by Mrs. Davis, wife of Captain Davis, who will command the *Darleydale*.

Manchester Commerce.—On Monday, August 21st, Messrs. Furness, Withy & Co., Limited, launched from their Middleton Shipyard, West Hartlepool, the finely-modelled steel screw cattle and cargo steamer *Manchester Commerce*, built to the order of the Manchester Liners, Limited, of which firm Sir Christopher Furness is chairman. The vessel is built expressly for the Manchester Liners' service from the Manchester Canal to Canada. The vessel has four masts and is rigged fore and aft with telescopic topmasts and funnel to suit the Manchester Canal bridges, and the scantlings of the vessel are considerably in excess of Lloyd's highest class. The *Manchester Commerce* is 445 ft. long, of the three-decked type with two steel decks laid all fore and aft, and has poop, bridge, and forecastle, and strengthened wood shelter deck between erections, and the vessel is strengthened considerably above Lloyd's requirements to suit the Atlantic trade. All the available space under the shelter deck, upper deck, and bridge is fitted throughout to pass American and Canadian regulations, with the most improved and modern arrangements for carrying 756 head of cattle. A large insulated hold of 10,000 cubic feet is fitted with refrigerating gear for the storage of frozen meat, fruit, &c. The accommodation for the captain is in the saloon, and spare state-room, &c., is arranged on the bridge deck in a large steel deckhouse, with separate house for officers. The engineers are housed at the fore end of the bridge, the seamen and firemen under the forecastle, and the cattlemen in the poop. A cellular double bottom is fitted all fore and aft for water ballast, and there are also four separate tanks under engines and boiler space for fresh water for cattle supply. A specially strengthened deep tank is fitted just aft of the engine-room and both fore and after peaks are fitted for water ballast, giving a total ballast capacity of 1,700 tons. The vessel is divided into nine watertight compartments by means of eight steel bulkheads. Each compartment is fitted with complete grain divisions. A most complete system of ventilation has been arranged to ensure the safe carriage of cattle, grain, or other cargoes. The vessel has eight hatches, eight powerful steam winches, and sixteen derricks provided for the rapid loading and discharging of cargo. Special attention has been devoted to the bunkering arrangements of this vessel so that the bunkering can be carried out in an efficient manner. A powerful steam windlass is fitted forward for working the cables, and combined hand and steam-steering gear is fitted in the after end of the poop. The vessel is lighted throughout by electricity, and will be fitted up as a first-class cattle and cargo steamer, including all the most modern improvements for the Atlantic trade. The engines will be supplied by Messrs. Sir C. Furness, Westgarth & Co., Limited, Middlesbrough, and are of the inverted triple-expansion type, having cylinders, 28 in., 46 in., and 78 in., by 54 in. stroke, steam being supplied by three single-ended boilers 14 ft. 9 in. by 12 ft. and 190 lbs. working pressure; Howden's forced draught being also fitted in connection with the boilers. The *Manchester Commerce* is a sister ship to the *Manchester Corporation*, launched by Messrs. Furness, Withy & Co. for the same owners and now being completed at their yard. On leaving the ways the ceremony of christening the vessel *Manchester Commerce* was gracefully performed by Miss Ethel Withy, daughter of Mr. Henry Withy, J.P., Brantford House, West Hartlepool.

Clan Urquhart.—On August 22nd Messrs. William Doxford & Sons launched from their yard at Pallion the *Clan Urquhart*, the tenth vessel of the turret type built for the Clan Line of steamers, Limited, Glasgow (Messrs. Cayzer, Irvine & Co.), and the 52nd turret afloat. Her dimensions are:—Length. 440 ft.; breadth, 51 ft. 6 in.; depth 32 ft., moulded; deadweight, 8,400 tons. Her engines, 27½ in., 45½ in., 75 in. by 60-in. stroke, are also built by the firm. The vessel is classed with the British Corporation, and on leaving the ways was christened by Miss Constance Cayzer.

Karamea.—On August 22nd the *Karamea*, a large four-masted steel screw steamer, constructed by Messrs. R. and W. Hawthorn, Leslie & Co., Limited, for Messrs. Shaw, Savill & Albion Co., Limited, London, was launched from their shipyard at Hebburn-on-Tyne. Her principal dimensions are: —Length, over all, 435 ft.; breadth, 54 ft.; depth, 40 ft. to shelter deck. The *Karamea* is the sixteenth of a series of 18 vessels built and building by them for the Australian and New Zealand frozen meat trade. The cargo hatches are specially adapted to afford the greatest possible facilities for loading and discharging the holds and 'tween decks. The vessel carries a number of passengers. She is intended for carrying frozen meat from the Colonies, and has the whole of her forward end, including three holds and 'tween decks, insulated with refrigerating apparatus on the Haslam dry air system. The engines of the vessel have been built by Messrs. R. & W. Hawthorn, Leslie & Co., Limited, at their St. Peter's works, and are of the triple-expansion surface condensing type, with cylinders of 30 in., 48 in., and 78 in. diameter and 54-in. stroke, with four large single-ended boilers working at 160 lb. pressure. On leaving the ways the vessel was named the *Karamea*, by Mrs. Burton, wife of Captain Burton, R.N.R., commander of the vessel.

Hannover.—On August 22nd the s.s. *Hannover*, which is being constructed by Messrs. Wigham, Richardson & Co., Limited, for the Norddeutscher Lloyd, of Bremen, was launched from the Neptune Shipyard, Newcastle-on-Tyne. The *Hannover* is a fine steel twin-screw steamer, 445 ft. in length by 54 ft. beam. She is being fitted with twin-screw quadruple-expansion engines, balanced on the Yarrow, Schlick and Tweedy system, which are estimated to drive her at a good speed. The steamer will be suitably fitted up with comfortable accommodation for 24 first-class passengers and for about 750 emigrants. Special care has been taken for their safety, the vessel being subdivided by a most efficient arrangement of watertight bulkheads so as to be practically unsinkable. Besides, she will have no less than 14 lifeboats. In addition to the passengers the steamer will carry a large cargo. She will be completely lighted by electricity and heated by steam. There will be also steam bakeries, galleys, coffee mills, &c., as well as the most improved appliances for working the ship herself and her cargo. The owners were represented by Captain Dahl and Mr. Kruse, under whose inspection the work is proceeding, and the christening ceremony was gracefully performed by Mrs. Dahl, wife of Captain Dahl.

Caisson.—On Wednesday, August 23rd, Messrs. Edward Finch & Co., Limited, launched from their shipbuilding yard at Chepstow, a large caisson, which they have constructed for the Bristol Docks Committee, for use in the inner end of their Avonmouth Entrance Lock. Her principal dimensions and particulars are as follow:—Length, 71 ft.; breadth, 10 ft. 2 in.; depth, 34 ft. 9 in.; launching weight, 200 tons; hull, 110 tons; permanent ballast, 90 tons. She is built entirely of mild steel of Lloyd's quality, having four tiers of beams, two watertight decks, one stringer and an upper wood deck, and three transverse watertight bulkheads. The caisson is divided into eight watertight compartments. Six of these will be used as water ballast tanks for sinking the caisson into its position, having a total capacity of 325 tons. The water is admitted through the dock side of the caisson by 6 in. diameter pipes, each compartment having special valves, which are all worked from the upper deck. Greenheart facing timber is fitted on stems and keel, and an elm belting around both sides. The peculiar shape of this caisson, which in section is very much like a cigar, rendered the launching a very difficult operation. Three launchways were used, the main one being placed under the centre of the caisson, and an outer one about 8 ft. from this on either side, to which the caisson was shored from underneath her belting, thus giving a launching base of about 16 ft. Great care was necessary to ensure the ways travelling simultaneously, and Messrs. Finch & Co. are to be congratulated upon their clever arrangement of the many details, and the success which attended it.

Olanda.—On Wednesday, August 23rd, Messrs. William Gray & Co., Limited, launched the handsome steel screw steamer *Olanda*, for the Scheepvaart en Steenkolen Maatschappy, of Rotterdam. The vessel will take Lloyd's highest class, and her dimensions are:—Length, overall, 300 ft.; breadth, 42 ft.; and depth, 21 ft. 9 in. The deck erections consist of a poop, bridge, and forecastle, with tasteful saloon and cabins for captain, &c., in the poop. The officers' and engineers' rooms are in the bridge, and the crew's accommodation is forward. The hull is built with deep bulb-angle frames, and a cellular double-bottom and aft peak tank, four steam winches, steam-steering gear amidships, hand-screw gear aft, patent donkey boiler, steam windlass, boats on beams overhead, stockless anchors, two telescoping masts; and a complete outfit will be provided for loading and discharging quickly cargoes of coal, ore, &c., for carrying which the *Olanda* is specially adapted. The Central Marine Engine Works of Messrs. William Gray & Co., Limited, supply the triple-expansion engines, with cylinders 21½ in., 35 in., and 58 in. diameter, and a 39-in. piston stroke; also two large steel boilers to work at 160 lbs. pressure per square inch. The ceremony of naming the steamer *Olanda* was gracefully performed by Miss Nora Gray, daughter of Mr Tom Gray, late of Sunderland, and cousin of the managing owner, Mr. Victor R. Los, of Rotterdam, who was also present at the launch, along with Mr. Baggallay (of Messrs. Flannery, Baggallay & Johnson), Mr. Bullen, representing Messrs. H. E. Moss & Co., and Mr. Bonke, of Rotterdam.

Rokeby.—On August 23rd Messrs. Ropner & Son, Stockton-on-Tees, launched a steel screw steamer of the following dimensions, viz.:—Length, between perpendiculars, 340 ft.; breadth, extreme, 49 ft. 6 in; depth, moulded, 28 ft. 3 in. The vessel will take the highest class at Lloyd's, and is built off the three-deck rule to the order of Messrs. George Pyman, of West Hartlepool, having poop, bridge, and topgallant forecastle. The saloon and cabins for captain and officers will be fitted up in the poop, and the accommodation for engineers in iron houses on bridge deck, the crew being berthed in the forecastle as usual. She has double bottom on the cellular principle for water ballast, and has been designed to carry a deadweight cargo of about 6,300 tons, is fitted with all the most recent appliances for expeditious loading and unloading of cargoes, has direct steam windlass, steam-steering gear amidships, with powerful screw gear aft, six large steam winches supplied with steam from two donkey boilers. The vessel will be fitted with a set of triple-expansion engines by Messrs. Blair & Co., Limited, of 1,500 I.H.P. The christening ceremony was gracefully performed by Mrs. Fry, of Cardiff, who gave the vessel the name of *Rokeby*.

LAUNCHES.—SCOTCH.

Cruden Bay.—On July 24th there was launched at Anstruther a wooden steam ketch, of about 117 tons gross, named the *Cruden Bay*.

Blanche.—On July 25th there was launched from the yard of Messrs. S. McKnight & Co, Limited, Ayr, a fine steel screw steamer of the following dimensions:—145 ft. by 24 ft. by 11 ft. 3 in., constructed for Liverpool owners. The vessel on leaving the ways was gracefully christened *Blanche* by the daughter of the owner.

Atbara.—On August 4th Messrs. A. Rodger & Co. launched at Port-Glasgow a steamer of 4,650 tons deadweight carrying capacity, and of the following dimensions:—Length, 320 ft.; breadth, 46 ft.; depth, 23 ft. 9 in. The steamer, which has been built for Maclay & Macintyre, Glasgow, was named *Atbara* by Mrs. Fyfe, wife of Sheriff Fyfe, Glasgow. The machinery will be fitted on board by Hall, Brown, Buttery & Co.

Hillbrook.—On August 4th Messrs. Russell & Co., launched at Port-Glasgow, a steel spar-decked screw steamer, named *Hillbrook*, of the following dimensions:—Length, 340 ft.; breadth, 46 ft.; depth, 28 ft. 6 in; to carry 5,800 tons deadweight. The owners are Messrs. Hugh Evans & Co., Liverpool. The vessel will be engined at Greenock by Messrs. Rankin & Blackmore, the cylinders being 24 in., 39 in., 65 in. by 35 in. stroke.

Seabreeze.—On August 8th the launch took place at Paisley of a fine new steam yacht for Mr. Andrew Carnegie, of Skibo Castle. The yacht has been built to the highest classification in Lloyd's Registry, and is a fine, well-modelled, well-equipped yacht, being fitted out in a very complete and tasteful manner. Immediately after the launch the *Seabreeze* proceeded down the river for trials, which were highly satisfactory, and thereafter the yacht left for Skibo. The *Seabreeze* was engined by Messrs. Bow, M'Lachlan & Co, and built by Messrs. J. M'Arthur & Co., Paisley. As the yacht left the ways she was named *Seabreeze* by Mrs. M'Lachlan, of Paisley.

Clan Macfadyen.—On August 9th Messrs. Blackwood & Gordon launched at Port-Glasgow a steel screw steamer for Messrs. Cayzer, Irvine & Co., of Glasgow, for their Clan Line of steamers. The dimensions of the vessel are as follows:—Length, 326 ft.; breadth, 40 ft.; depth moulded, 26 ft. 2 in.; gross tonnage, 2,830 tons, with a deadweight carrying capacity of 4,000 tons. The vessel has been built to the three-deck rule, 100 A1 Lloyd's class, and has large poop, bridge, and forecastle. The saloon, captain's house, and chart-room are fitted up on bridge deck, the engineers' and officers' accommodation being fitted up under after end of bridge, the firemen and sailors being accommodated in poop. The steamer on leaving the ways was named *Clan Macfadyen* by Miss Constance Cayzer, daughter of Sir Charles Cayzer, principal director of the company. The steamer, after being launched, was placed in the builders' wet dock to receive her machinery and boilers, which have also been constructed by the builders.

Lutra.—On August 10th Messrs. Scott & Co. launched at Greenock the fine steam yacht *Lutra* for Lord Malcolm, of Poltalloch. The vessel, which is 150 ft. in length, 21 ft. in breadth, and 13 ft. deep, will be supplied by the builders with engines of 350 I.H.P., with cylinders 12 in., 10½ in. and 31 in., with a stroke of 26 in. The *Lutra*, which is of 300 tons yacht measurement, will be handsomely fitted up.

Tanagra.—On August 10th Messrs. Russell & Co. launched at Port-Glasgow a steel spar-decked screw steamer of 5,450 tons deadweight carrying capacity, to the order of Messrs. William

Thomson & Co., St. John, N.B. Dimensions:—Length, 330 ft.; breadth, 48 ft.; depth, 26 ft. The steamer is built to Lloyd's highest class. She will be supplied by Messrs. Kincaid & Co., Greenock, with triple-expansion engines of 24 in., 40 in., and 65 in. by 42½ in. stroke. The steamer was named *Tanagra* by Miss Philips, daughter of Lloyd's chief surveyor, Greenock.

Jed and Kennet.—On August 11th there were launched by the Irvine Shipbuilding and Engineering Co., Limited, at Irvine, two steel screw steam trawlers for Hull owners. The vessels were built to Lloyd's highest class under special survey, and are fitted with all the latest appliances for the North Sea fishing Dimensions: 105 ft. between perpendiculars, by 21 ft. by 11 ft. 6 in. moulded. Messrs. Muir & Houston, Limited, Glasgow, are supplying the vessels with triple-expansion engines of about 250 I.H.P., and having cylinders 10 in., 16 in., and 27 in. by 20 in. stroke, steam being supplied by a steel boiler working at 180 lbs. pressure. As the vessels left the ways they were respectively named *Jed* and *Kennet* by Miss Mary Gilmour, of Irvine, and Miss Nellie Ferguson, of Irvine.

Pera.—On August 14th Messrs. Mackie & Thomson launched at Govan the steel screw steamer *Pera*, which they have built for Messrs. Bailey & Leetham, Hull, for general trading purposes. The dimensions of the vessel are:—Length, 225 ft. between perpendiculars: breadth, 34 ft. extreme; moulded depth, 16 ft. 7 in.; and carrying capacity, 1,700 tons on a mean draught of 15 ft. Triple-expansion engines will be supplied by Messrs. Muir & Houston, Limited, Kinning Park. The vessel, which is built to Lloyd's 100 A1 class, and will be rigged as a fore-and-aft schooner, with two pole masts, was named by Mrs. Mackie, Falkland Bank, Partick.

Finanzminister Witte.—On August 15th Messrs. Robert Duncan & Co., Limited, launched at Port-Glasgow a steel screw steamer of 2,000 tons deadweight for "Rossija" Steamship Co., of Libau, Russia. The dimensions are 235 ft. by 34 ft. 6 in. by 18 ft. 9 in. moulded. Messrs. Hall Brown, Buttery & Co., Govan, are supplying triple-expansion engines 18½ in., 30 in., 49 in., by 33 in stroke; two boilers 12 ft. by 9 ft. 6 in., 160 lb. water pressure. There are three large hatches 27 ft. long, and one smaller one aft; steam winch to each hatch, steam windlass and steam-steering gear, and all modern equipments, for the Baltic trades. The capacities for cargo measure about 100,000 cubic feet. Captain, officers, and engineers have their accommodation on the top of the bridge amidships; while the crew are housed forward. As she left the ways she was named *Finanzminister Witte* by Mrs. Mees, wife of the Russian Consul, Glasgow, and was afterwards towed to Glasgow to receive her machinery. The vessel has been built to Lloyd's 100 A1 class.

Kildonan Castle.—On August 22nd there was launched from the Fairfield Shipbuilding and Engineering Co., Limited, Govan, Glasgow, the *Kildonan Castle*, the second of the two magnificent twin-screw steamers of 10,000 tons which the Castle Mail Packets Co. are this year adding to their fleet engaged in the mail and passenger services between the United Kingdom and South Africa. The building of these two vessels marks an important new departure in the history of the Castle Company, for they are the first of the twin-screw type ordered by Sir Donald Currie & Co., the managers, and they are moreover by far the largest steamers that have been constructed for this popular line. The *Kildonan Castle* is built with a straight stem and elliptical stern, a long forecastle, and poop, also a lofty promenade deck with boat deck above. Over this are a navigating deck and a flying bridge. Under the promenade and boat decks are central houses, leaving an open passage at the ship's sides, and above the boat deck provision is made for carrying the lifeboats. The vessel is built of steel throughout to the requirements of the Board of Trade for a foreign-going passenger steamer, also under special survey and with scantlings, as required by Lloyd's latest rules for the 100 A1 class. A cellular double-bottom is fitted the full length of the ship, and the holds are subdivided into separate compartments by watertight bulkheads, which are arranged and constructed so as to meet the recommendations of the Bulkhead Committee, with a double collision bulkhead fitted forward All the decks are plated, and sheathed with teak The *Kildonan Castle* will have two large elliptical funnels and three raking pole masts, fore-and-aft schooner rigged. Her dimensions are as follows:—Length, overall, 532 ft. 3 in.; Length, on water line, 515 ft.; breadth, extreme, 59 ft. 3 in.; depth, moulded, 38 ft. 9 in. The gross tonnage of the vessel is about 10,000, and the I.H P about 10,500. When completed the *Kildonan Castle* will contain accommodation for about 300 first-class passengers, berthed amidships, 160 second-class berthed aft, and about 200 third-class berthed forward. The state-room accommodation is of a lofty and commodious description, principally arranged on the main upper and promenade decks. On these are several single-berth state-rooms, but the greater portion of the cabins have two berths each, while there are a few family cabins. The sleeping beds are made to fold up, and will have Zephyr spring mattresses. Many of them are of double breadth. The main entrance is in the middle of the vessel, and leads direct to first-class dining saloon, a capacious room situated on the upper deck amidships. The sanitary accommodation and lavatories throughout the vessel have received special consideration, and are of the latest and most improved description. The ventilation has been carefully studied and a most complete system adopted. Electricity is brought to bear in ventilating the saloons, corridors, and sleeping cabins in between decks, by means of motor-driven fans. A continuous water service will be supplied throughout the ship. A complete installation of electric light is being arranged on board, the generating plant consisting of three independent sets of engines and dynamos. Electric bells will be fitted to the sleeping cabins and saloons. The cargo hatches will be equipped with nine steam winches for the rapid handling of cargo, an additional steam winch being also fitted for the purpose of hoisting the boats, of which 16 are provided. In addition, a full outfit of life-saving appliances, among them a number of buoyant life-jackets, have been supplied, and all other details required by the Board of Trade Passengers' Act. The steam-steering engine is placed aft on the poop deck, enclosed in a house, and controlled from the navigating bridge, also the reserve hand gear and steering wheels. A large steam windlass with frictional brakes and capstan will be fitted on the forecastle deck, adapted for the cables, which are 2⅞ in. in diameter. There are four heavy anchors made of nickel steel and of the patent stockless pattern. Two powerful steam warping capstans, with separate engines, are placed on the poop deck. In order to minimise rolling, deep plate bilge keels are fitted, and these with the centre bar keel—having together a side area of 750 sq. ft.—will ensure greater comfort for passengers by reducing very considerably the angle of roll in bad weather. The propelling machinery of the *Kildonan Castle* consists of two sets of four-cylinder, four-crank quadruple expansion engines, balanced on the Yarrow-Schlick-Tweedy system. It is claimed for this type of machinery that with a boiler pressure of 210 lb. per square inch, it ensures great economy of fuel, combined with minimum vibration of the ship. The engines are designed to run at a high piston speed with large bearing surfaces and comparatively light reciprocating parts. The shafting is of Whitworth steel throughout, and the working parts are forged from ingot steel, the principal bolts being specially annealed. The main condensers of galvanised steel plate are elliptical in section. They are placed close to the ship's side, and do not form part of the framing of the engines. In this and several other respects the machinery compares favourably, as regards weight, with the type of engine usually fitted in mail steamers. The pistons are of Whitworth steel, and, to carry out the balancing of the engines as accurately as possible, they were turned down to the correct weight after the other reciprocating parts were finished and weighed. The propellers are of bronze, with cast steel bosses. Every care has been taken to combine with the highest class of material and workmanship all details which experience has proved to be necessary to obtain freedom from breakdown on a long ocean run. Two powerful independent centrifugal pumping engines are fitted in the engine-room, and are so arranged that both main condensers can be circulated by either pump in the event of a breakdown of the other. Each of these pumps has a special bilge suction connection, so that in the event of a serious leak above the double bottom, both can be used for pumping out the ship. The discharges from these and all other pumps are below the water-line. to avoid spray being carried into the state room side ports. Three large steam pumps are fitted specially for hot bath, cold bath, sanitary, and fire service purposes. The fire service mains from these pumps are carried right fore and aft on the weather deck, and also in the passenger 'tween decks, with connection for hose at the necessary points. Very special plant is provided, entirely in duplicate, for evaporation and distillation. The total output of pure cool drinking water from this installation is 13,000 gallons per day. Combined with the fresh water supply throughout the ship there is a complete installation of filters. For the refrigeration of ship's provisions and the carrying of fruit or other cargo, a powerful duplex CO_2 machine is fitted in combination with six large insulated cold chambers. The electric light and power installation is on a considerable scale. In addition to nearly 1,000 lights in the ship, there are 23 motor driven blowing and exhausting fans (20 of which are each capable of passing 3,400 cubic ft. of air per minute) for sending air down to the engine-room and stokeholds, and for extracting vitiated air from the passenger 'tween decks. Electric lifts are employed for hoisting ashes in port when the hydro-pneumatic ejectors are not in use. For signalling in a fog an electrically controlled steam whistle is fitted, which is automatically sounded at the required intervals of time by a clock control. For communicating between the navigating bridge and the engine-room and other parts of the ship, loud-speaking telephones are fitted. Lady Tennant, wife of Sir David Tennant, the Agent-General for Cape Colony, performed the launching ceremony. As the big ship began to slip slowly down the ways she was christened *Kildonan Castle* by three of Sir Donald Currie's granddaughters. The huge hull took the water in splendid fashion, and was afterwards towed round to the Fairfield Co.'s dock, where she will receive her machinery, and be otherwise equipped for sea. After the launch the Fairfield Co. entértained a large number of invited guests at luncheon.

Tyrie.—On August 23rd a screw steam trawler, named the *Tyrie*, was launched from the yard of Messrs. J. Duthie & Co., Montrose. The vessel is the last of three built for the Fraserburgh and North of Scotland Steam Fishing Co., Limited. She is 119 ft. long, 21 ft. broad, and 12. ft deep. She will be fitted with triple expansion engines.

Insizwa.—On August 23rd Messrs. Hall, Russell & Co. Limited, launched at Aberdeen, the *Insizwa*, a steel screw passenger and cargo steamer, built to the order of Messrs. John T. Rennie, Sons, & Co., of Aberdeen and London, for their direct line of vessels between London and Natal. The dimensions of the vessel are:—Length over all, 342 ft.; breadth, 42 ft.; depth, 28 ft.; and about 3,000 tons gross register. The vessel is of the spar-deck type, with promenade deck aft, long bridge, and topgallant forecastle, flat plate-keel, and water ballast in cellular double bottom. The steamer is constructed to class 100 A1 at Lloyd's and has all the modern requirements to pass the Board of Trade. She will have a very complete outfit of navigating instruments, including two of Lord Kelvin's patent compasses and sounding machines. An installation of electric light, bells, &c., is being fitted up by Messrs. Claude Hamilton, Limited, Glasgow. The *Insizwa's* engines are triple-expansion of the most modern type, constructed by the builders, having cylinders 25½ in., 40½ in., and 69 in. by 45 in. stroke, capable of developing 3,000 I.H.P.

Papaloa.—On August 23rd Messrs. William Denny & Bros. launched at Dumbarton a fine twin-screw steamship which has been built to the order of the New Zealand Shipping Co. She is a sister ship to the *Papanui*, built for the same company by the Messrs. Denny and delivered towards the end of last year, and has been constructed to the British Corporation requirements. Her principal dimensions are 430 ft. by 54 ft. by 33 ft. She is to be engaged in the frozen meat trade between New Zealand and the home country. Accommodation is to be provided for 40 first and 40 second-class passengers, whilst space is also to be reserved for a number of third-class passengers. The refrigerating plant is that of the Linde British Refrigeration Co., Limited, of London. The furnishing of the vessel generally has been carried out in hardwood, and everything will be finished in a most complete manner. The engines, which are being supplied by Messrs. Denny & Co., are of the direct-acting tri-compound twin-screw pattern, with inverted cylinders. The diameters of the cylinders are 22 in., 35½ in., and 58 in. by 48 in. stroke. The vessel is to carry 8,000 tons of deadweight, all told, with a draught of 25½ ft. The christening ceremony was gracefully performed by Miss Mirabeau, daughter of Mr. Paul Mirabeau, of the Chargeur Rennis Shipping Co., of France, who named the vessel *Papaioa*.

TRIAL TRIPS.

Saxon Prince.—On July 21st the steamer *Saxon Prince* left the shipbuilding yard of Messrs. Short Brothers for her trial trip, which proved in every way satisfactory. Afteradjusting compasses, a series of runs was made over the measured mile, and a mean speed of 13 knots was attained. The vessel (of which we gave full particulars in our Launch columns, June issue, page 135) has a large deadweight and carrying capacity. special attention having been given to the arrangement of the upper and main decks to enable a large number of cattle to be carried. After the trial trip the vessel proceeded to Antwerp to load a general cargo.

Jokai.—On July 22nd the new steel screw steamer *Jokai* left the Tyne for her official loaded trial trip. She has been constructed by Messrs. R. Craggs & Sons, Middlesbrough, for the Royal Hungarian Sea Navigation Adria Co., Limited, of Fiume (of which we gave particulars in our Launch columns, May issue, page 89), for whom they have two duplicate vessels in hand. The main engines for this and the other two vessels under construction are by the North Eastern Marine Engineering Co., Limited, Wallsend-on-Tyne, and consist of a set of triple-expansion engines with cylinders 21 in., 37 in., and 62 in. in diameter, with 42 in. stroke, steam being supplied by two large steel boilers working at 200 lbs. pressure. On trial both ship and machinery proved satisfactory, the vessel attaining a speed of over 11 knots.

Hugin.—On July 24th the new steamer *Hugin*, built by Messrs. Wood, Skinner & Co., Limited, Bill Quay, for Messrs. Bruusgaard, Kjosterud & Co., Dram (of which we gave full particulars in our Launch columns, July issue, page 171), left the Tyne for her trial trip. On the completion of the trial, which was most satisfactory in every respect, the vessel proceeded to Blyth to load.

Grosmont.—On July 25th the s.s. *Grosmont*, recently built by Messrs. Ropner & Son, of Stockton-on-Tees, to the order of Messrs. Gladstone & Co., West Hartlepool (of which we gave full particulars in our Launch columns, August issue, page 233), made her official trial trip in the Tees Bay, when an average speed of about 11½ knots was made. The trip was satisfactory in every respect. The vessel has been built under the supervision of Mr. C. Brockett, the owners' superintendent surveyor, who was present at the trial trip, and was highly pleased with the results. The builders were represented by Mr. L. Ropner. After the adjustment of compasses, the steamer proceeded on her run round to Cardiff, where she will load for Ceylon.

Mavisbrook.—On July 25th the fine steel screw-steamer *Mavisbrook*, built by Messrs. William Gray & Co., Limited, to the order of Messrs. Miller & Richards, of Glasgow (of which we gave full particulars in our Launch columns, August issue, page 233) was taken to sea for her trial trip, the results of which were perfectly satisfactory both as regard the vessel and her machinery, an average speed of 11 knots being recorded, and the machinery running without the slightest hitch. On the conclusion of the trial the *Mavisbrook* was headed for the Tyne, where she takes in her first cargo.

Steam Launch.—On July 28th the Lytham Shipbuilding Co. took out for speed trials a twin-screw launch of the following dimensions:—Length, 81 ft.; beam, 16 ft. 6 in.; depth, 5 ft.; built to the designs and under the superintendence of Messrs. Flannery, Fritton & Given, of Liverpool and London, to the order of the Egyptian Delta Light Railways, Limited, for service on the Nile. She is built of galvanised steel with wooden deck, and made in three sections for purposes of transport. Forward of the machinery is a large roomy saloon panelled in teak and fitted with two companions, as well as a skylight, and large square portholes, which make it eminently suitable for the warm climate. The draught of the vessel was 2 ft. 3 in. mean, and the mean speed obtained was 11½ knots. The machinery ran well throughout the trials, and the vessel proved herself in excess of the contract both as regards speed and lightness of draught.

Harburg.—On July 29th this steamer, built by the Flensburg Shipbuilding Co., for the Deutsch-Australische Dampfschiffs-Gesellschaft, went down the Flensburg Harbour on her official trial trip. She is a spar-deck boat 390 ft. long by 48 ft. beam by 31 ft. depth, moulded, with long poop and topgallant forecastle, and accommodation in deck-houses on top of poop amidships. She will carry 6,500 tons deadweight on Lloyd's summer freeboard, and is intended for the Australian trade. The arrangements for handling cargo are of the most complete description. The engines, of 2,500 H.P., gave the vessel an average speed of 13 knots. The trial was in every way successful.

Elswick Park.—On Wednesday, August 2nd, this fine steel screw steamer, built by Messrs. William Gray & Co., Limited, went on her trial trip. She has been built to the order of the Elswick Park Steamship Co., Limited, Newcastle (Messrs. Weidner, Hopkins & Co., managers), (of which we gave full particulars in our Launch columns, July issue, page 173). The trial was in every way satisfactory, and there was a large party of visitors on board. The steamer averaged 11¼ knots on trial, and then proceeded on her voyage to Galveston to load cotton.

Beta.—On August 2nd Messrs. William Gray & Co., Limited, sent to sea the s.s. *Beta*, which they have built for Mr. B. J. Van Hengel, of Amsterdam (of which we gave full particulars in our Launch columns, July issue, page 170). There were present on the trial trip, which was a most satisfactory one, Mr. Van Hengel, Captain Decher, Mr. Lotinga (the owner's representative in West Hartlepool), Mr. Lotinga, jun., and Miss Lotinga, Mr. Hessler, Mr. Assman, Miss Hallass. Captain Murrell represented the builders on the trial.

Ormley.—On Wednesday, August 2nd, the large steel screw steamer *Ormley*, built by Messrs. Craig, Taylor & Co., Thornaby-on-Tees, to the order of the North of Ireland Steamship Co., Limited, Belfast (Mr. W. R. Rea, manager), (of which we gave full particulars in our Launch columns, July issue, page 172), left Stockton for her trial trip in the Tees Bay. The engines gave entire satisfaction, a speed of 11½ knots being easily maintained, Mr. Rea and Mr. Joseph Lewis (superintendent engineer) expressing themselves as highly pleased with both the ship and engines. She carries a deadweight of over 7,000 tons. After the trial trip, the vessel proceeded direct to Cardiff, under the command of Captain Webber.

Greta.—On August 4th the trial trip of the steam trawler *Greta* took place, and proved highly satisfactory, a speed of about 10 knots being attained. The vessel was launched for Hull owners by the Irvine Shipbuilding and Engineering Co., Limited, Irvine, and is equipped with all the latest appliances for the North Sea fishery. Her dimensions are 105 ft. by 21 ft. by 11 ft. moulded, and the engines, which were supplied by Messrs. Muir & Houston, Limited, Glasgow, are of the triple-expansion type, having cylinders 10 in., 16 in., and 27 in. in diameter by 20-in. stroke.

Mingary.—On August 4th the new steam yacht *Mingary*, built by the Ailsa Shipbuilding Co., from designs by Mr. G. L. Watson, for Mr. Charles D. Rudd, of Shielbride, by Fort-William, ran her official trials on the Firth of Clyde. The machinery, which is of the triple-expansion type, by Messrs. Dunsmuir & Jackson, Govan, worked with great smoothness and steadiness, and a mean speed of over 13 knots per hour was attained on the four continuous double runs between the Cloch and Cumbrae Lights, being fully a knot per hour over the contract speed. The yacht was in every way thoroughly tested, and the results attained gave the utmost satisfaction to the owners' representatives and the party on board.

Somerford.—Messrs. Speeding, Marshall & Co., of Sunderland, have added another vessel to their fleet, viz., the screw steamer *Somerford*, built by the Blyth Shipbuilding Co., Limited, of Blyth (of which we gave full particulars in our Launch columns, August issue, page 233). This vessel was taken to sea on Saturday, August 5th, for the usual trial of speed, there being on board a large company, including representatives from the owners, builders, and engineers, who were all highly satisfied with the results of the trip. After the trial the ship was taken to the Tyne, where she will load and proceed to Cronstadt, under the command of Captain Clark.

Kumara.—On August 5th the trial trip of the finely modelled New Zealand screw steamer *Kumara*—which has been built to the order of the Shaw, Savill and Albion Co., Limited, of London, by Messrs. C. S. Swan & Hunter, Limited, of Wallsend, and fitted with machinery by the Central Marine Engine Works, West Hartlepool (of which we gave full particulars in our Launch columns, June issue, page 134)—took place. This vessel is the third which has been engined by the Central Marine Engine Works, and the fifth built by Messrs. Swan & Hunter for the Shaw, Savill & Albion Co., and is expected to keep up the high reputation for regular working and economy which has been previously attained. During the building the construction of the hull has been superintended by Captain McKirdy and Captain Scotland, and the machinery by Mr. C. T. Young and Mr. G. Adams, on behalf of the Shaw Savill Co. These gentlemen, together with Mr. W. C. Borrowman on behalf of the engine builders, and Mr. C. S. Swan, representing the shipbuilders, were present on the trial trip, the vessel leaving the Central Marine Quay at 3 o'clock for the Tyne. As there was no cargo nor bunkers on board, the trial was not an exhaustive one, but the machinery ran to the satisfaction of all concerned, and the vessel passed into the Albert Edward Dock to receive bunker coals, and make final preparations for the voyage to London, where she will load cargo for New Zealand.

Lord Ormonde.—On August 11th the new steamer *Lord Ormonde*, constructed by Messrs. William Dobson & Co., of Walker-on-Tyne, for the Irish Shipowners' Co., Limited, of Belfast, with engines by Messrs. John Dickinson & Sons, Limited, of Sunderland (of which we gave particulars in our Launch columns, August issue, page 234), was taken to sea, and had several runs over the measured mile, obtaining a speed of 12 knots per hour. Mr. T. R. Dixon, representing the owners, expressed himself highly satisfied with the trial, and the vessel sailed for Baltimore.

Volund.—On August 12th the steel cargo steamer *Volund*, built by the Laxevaags Engineering and Shipbuilding Co., Bergen, Norway, went on her trial trip. She has been built to the order of Messrs. O. & A. Irgens, Bergen, and to Norwegian Veritas, highest class. The vessel is of the following dimensions:—Length, extreme, 245 ft.; breadth, 32 ft.; depth, moulded, 16 ft. 1 in. She is 1,085 brutto register tons. The engines are of the triple-expansion type, about 630 I.H.P., and the average speed is 10½ knots. The ship has a steel deck, double bottom for ballast, peak tank abaft, and is specially built for the timber trade. She is well fitted out in every way, having Emerson Walker's patent steam anchor windlass, Fisher's patent steam-steering gear, Bower's patent rapid-closing apparatus for stop valve—worked from bridge as well as engine-room—Bower's patent protection box for propeller shaft, three steam winches, and large donkey-boiler. The vessel and her machinery have been built under the superintendence of Mr. C. Dahm, Bergen. There were present on her trial trip the managing owners Messrs. O. & A. Irgens, and a large company of ladies and gentlemen. The trial was in every way a complete success.

Garonne.—On August 14th the fine steel screw steamer, *Garonne*, recently launched from the shipbuilding yard of Messrs. Robert Stephenson & Co., Limited, Hebburn-on-Tyne, to the order of the United Steamship Co., of Copenhagen, was taken out to sea on her official trial trip. The ship, which has been built to the highest class in the Bureau Veritas registry, is a fine type of the modern well-deck cargo steamer. Her dimensions are 250 ft. between perpendiculars by 35 ft. breadth, moulded, by 18 ft. 4 in. depth, moulded; and carries a deadweight of about 1,870 tons on her winter freeboard. She is for trading between the Baltic and the French wine ports, and has steel 'tween decks specially strengthened to carry wine. She is fitted with water ballast in double bottom, all fore and aft, and also in the after peak. The cargo arrangements are very complete. She has four steam winches, steam windlass, steam and hand steering gear, and patent anchors. The crew are berthed in the topgallant forecastle, and the accommodation for officers, engineers, saloon, and spare stateroom is in an upper bridge on the top of main bridge, and all accommodation is heated by steam. The engines—which are of the triple-expansion type with cylinders 19½ in. by 32½ in. by 54 in. by 36 in. stroke, supplied with steam from two main boilers, working at 180 lbs.—were also supplied by the builders. The trial was very successful, a mean speed of 10½ knots on the mile being attained, and the coal consumption worked out at a very low figure. Amongst the guests on board were Captain Hein, director of the United Steamship Co., and Captain Rabe, who has superintended the construction of the hull; and Mr. Fricke, who has superintended the construction of machinery; also Mr. Truxen, ship surveyor; and Mr. Wilson, engine surveyor of Bureau Veritas. The builders were represented on board by Mr. Walker, general manager; Mr. Campbell, Mr. Crow, and Mr. Stafford. After the trial, which was a loaded one, the ship proceeded to the Baltic with her cargo. The *Garonne* is the first of two steamers the builders are supplying to the United Steamship Co., Limited, and is the 130th steamer belonging to this company.

Duke of Rothesay.—On August 14th the large steamer *Duke of Rothesay*, built by the Caledon Shipbuilding and Engineering Co., Limited, at Dundee, for the Dublin and Glasgow Steam

Packet Co. (the Duke Line) for their cross-Channel service (of which we gave particulars in our Launch columns, July issue, page 175), made a successful trial trip.

Imperial Prince.—On August 14th the *Imperial Prince*, steel trawler, had a successful trial off the Northumberland coast, the speed attained being a mean of 10 knots. The *Imperial Prince* is the fifth of six sister boats constructed by Messrs. J. T. Eltringham & Co., and engined by Mr. G. T. Grey, South Shields, to the order of Mr. W. H. Storey, North Shields.

Bavarian.—On August 18th the twin-screw steamer *Bavarian* built by Messrs. Denny & Bros., Dumbarton, for Messrs. James and Alexander Allen (of which we gave full particulars in our Launch columns, June issue, page 137) ran her official trials on the Firth of Clyde, which consisted of several runs over the measured mile at Skelmorlie and a cruise down the firth. The machinery worked as perfectly as possible, and the mean speed attained was 17·95 knots, almost a knot over that required by the contract.

South Australia.—On August 22nd the screw steamer *South Australia*, recently launched from the shipbuilding yard of Messrs. Short Brothers, to the order of the Southern Steam Shipping Co., Limited, of London. of which Messrs. Lawther, Latta & Co. are the managers (of which we gave full particulars in our Launch columns, August issue, page 234), went out on trial with very satisfactory results. After adjusting compasses the vessel was taken a series of runs over the measured mile when a mean speed of 13 knots was attained. After the trial the vessel proceeded to Middlesbrough, under the command of Captain Barnes, where she loads for the Cape and Australia.

Eastham.—Lately a new and powerful steam tug has been delivered to the Manchester Ship Canal Co. by the builders, Messrs. Fay & Co., of Southampton. She is named the *Eastham*, and is a valuable addition to the company's fleet. She is 80 ft. long, 20 ft. broad, and has a draught of about 10½ ft. Her engines are about 500 I.H.P., and she is capable of towing the largest ships using the canal.

The Marine Engineer.

LONDON, OCTOBER 1, 1899.

SELDOM has any body of men or association been favoured with so instructive and scientific a survey of a marvellous mechanical evolution as the Mechanical Science section of the British Association has received from its president, Sir William White. This communication is marked not only by the exhaustive knowledge of the author of the subject with which he deals—viz., steam navigation at high speeds, but it is probably rendered unique by the clear and simple analysis of the cogent reasons underlying the rapid series of evolutions that has taken place, and it affords also an ample apologia for the great increase in dimensions and displacement of ships both in the Navy and the commercial marine that has accompanied such evolution. At the same time, Sir William White points out that with the means at present in common use we are near the limits of over-sea speed when other controlling factors are considered: viz., in the commercial marine, Will it pay? and in the Navy, Will the cost be justified by the fighting power and efficiency? Looking at the results so far attained the following characteristics are noticeable:—1st, growth in dimensions and weights of ships and large increase in engine-power as speeds have been raised; 2nd, improvements in marine engineering accompanying increase of steam-pressure, economy of fuel, and reduction in the weight of propelling apparatus in proportion to the power developed; 3rd, improvements in the materials used in shipbuilding, better structural arrangements, relatively lighter hulls, and larger carrying power; 4th, improvements in form leading to diminished resistance and economy of power expended in propulsion. In Transatlantic traffic, in which the greatest evolution has taken place, speed has been increased from 8½ to 22½ knots, and the time on the voyage has been reduced to about 38 per cent. of what it was in 1840. Ships have been more than trebled in length, doubled in breadth, and increased tenfold in displacement. The engine-power has been made 40 times as great. The rate of coal consumption (measured per H.P. per hour) is now only about one-third of what it was in 1840. To drive 2,000 tons' weight across the Atlantic at a speed of 8½ knots, about 550 tons of coal were then burnt; now, to drive 20,000 tons across at 22 knots, about 3,000 tons of coal are burnt. With the low-pressure steam and heavy paddle engines of 1840, each ton weight of machinery, boilers, &c., produced only about 2 H.P. for continuous working at sea. With modern twin-screw engines and high-pressure steam, each ton weight of propelling apparatus produces from 6 to 7 H.P. Were modern engines proportionately as heavy as those in use 60 years ago, they would weigh about 14,000 tons, and machinery, boilers, and coals would exceed in weight the total weight of the *Campania* as she floats to-day. Increase of speed has, therefore, been dependent upon improvements in marine engineering; but it has also depended upon improved materials of construction. The use of wood for hulls imposed limits, that the use of iron, and later, steel, has removed. Considerable improvements in form favouring economy of propulsion have all aided to the same end, though these have sometimes to be waived for other considerations, such as stability and seaworthiness.

IN war-vessels the same evolution has been going on. Up to 1860 12 to 13 knots were considered sufficient, but this requirement has since steadily increased to 20 and 23 knots. This increase of speed has been accompanied by a considerable increase in size, not only because they are faster, but because they have greater powers of offence and defence, and possess greater coal endurance. The improvements in marine engineering and shipbuilding have tended to keep down this increase of dimensions consequent on increase in load carried, speed attained, and distance traversed. It is to be noted also that, large as are the dimensions and tonnage of modern battleships and cruisers, they are all smaller in length and displacement than the largest mercantile steamers. This is not always realised, as merchant steamers are ordinarily described by their registered tonnage, which is far less than their displacement. The increased dimensions of warships are also justified by their gain of economy in propulsion by such increase of dimensions, as for a speed of 20 knots the I.H.P. per ton of displacement is only 1·09 in a cruiser 500 ft. in length, as compared with 3·33 I.H.P. per ton of displacement for a cruiser only 280 ft. long. Similarly a cruiser 500 ft. long, with 14,200 tons displacement, requires only the same H.P. to drive her at 22 knots as does a cruiser 435 ft. long with 11,000 tons displacement. In the latter cruiser, therefore, we obtain a greater margin of coal endurance and powers for extra armament and armouring.

IN the case of torpedo-boats, which furnish some of the most notable examples extant of the attainment of extraordinarily high speeds for short periods and in smooth waters, by vessels of small dimensions, the law shown to hold good in larger vessels applies equally. In the development of speed from 18½ knots to 26 knots the weight has increased from 30 tons to 150 tons, and the length from 81 ft. to 150 ft. In destroyers also, which are not yet of seven years' standing, the evolution is also apparent. The first examples with 26 to 27 knots were 180 ft. long and of 240 tons. Vessels now in construction for 32 to 33 knots have lengths of about 230 ft. and weight of 360 to 380 tons. High-pressure steam, water-tube boilers at forced draught, and high speeds of engine-revolution are their characteristics. Each ton of propelling apparatus produces about 45 I.H.P., and this compares with about 12 I.H.P. per ton weight of propelling apparatus in a large modern cruiser also with water-tube boilers. In a destroyer nearly half the total weight is devoted to propelling apparatus as compared with 20 per cent. in a cruiser, resulting in extreme lightness of hull, scantling, and fittings for their power, which would not be favourable to endurance for ships of large size, and where high powers might be frequently or continuously required. Still, the results obtained in torpedo-vessels being so wide a departure from those of sea-going vessels may foreshadow an intermediate type of propelling apparatus applicable to large sea-going vessels, and yet securing sufficient durability and economy of fuel in association with further savings of weight.

The turbo-motor rotary engine of Mr. Charles Parsons reduces the weight of machinery shafting and propellers much below that of the reciprocating type. The *Turbinia*, 100 ft. long and only 44½ tons displacement, has attained 33 to 34 knots in short runs. There are three shafts, each carrying three propellers, making over 2,000 revolutions at full speed. A water-tube boiler of special design supplies steam at 175 lbs. pressure, and is exceptionally light, being highly forced. About 100 I.H.P. is produced per ton of propelling apparatus, which is rather more than twice that obtained from the best reciprocating machinery of torpedo-boats or destroyers. In the *Turbinia* about half the total weight is devoted to propelling apparatus. Two other vessels of the destroyer type with turbo-motors (one for the Royal Navy) are now approaching completion, and will serve as a comparison with similar boats driven by reciprocating engines. Mr. Parsons claims at least equality in coal consumption with the best triple-expansion engines. He has had to deal at the unusual speeds of revolution with completely new conditions for propellers, and has found a solution, apparently satisfactory, in multiple screws of small diameter. The new boats, developing, it is expected, up to 18,000 H.P., may produce, as a result, very far-reaching effects upon marine engineering construction.

Model experiments have a very considerable value in leading to deductions as to probable results in the driving of ships of large size at speeds much exceeding any of which there is present experience. Careful modern experiments have shown that Froude's simple ratio of the surface resistance of vessels varying directly as the square of the speed has now been corrected to a ratio of 1·83 power of the speed, which, though apparently a small correction, is of importance at high speeds. The laws of the variation of the residual, or wave-making, resistance may also largely differ from the same simple ratio. It has been found up to 11 knots to vary as the square of the speed, at 16 knots as the cube of the speed, and up to 20 at the 3·3 power. Then the index begins to diminish: at 22 it is 2·7; at 25 knots it has fallen to the square, and from there to 30 knots it varies, as practically does the frictional resistance. The higher increments of speed are therefore attained with less proportional resistance from this cause. In the largest cruisers the point of minimum index for wave resistance is not reached until 47½ knots, which is outside practical politics at present, and further present increase of speeds in cruisers and battleships must be faced with the highest index of increased wave resistance.

The possibilities of ocean navigation 60 years hence are impossible to predict; but, with regard to the near future, Sir William White considers that still further advance may be made upon the lines above indicated. If greater draughts of water can be made possible, so much the better for carrying power and speed. Scientific methods of procedure and the use of model experiments on ships and propellers will become of increased importance. Already avenues for further progress are being opened. Water-tube boilers have effected a saving of one-third of the weight necessary to obtain the same power with natural draught in the older cylindrical boilers. The best form of water-tube boiler has yet to be evolved. Differences of opinion exist as to probabilities of increased steam pressure. As a matter of course, increases of pressure beyond 160 lbs. to 180 lbs. cannot produce the same increase of economy as was found in the rise from low pressure to 180 lbs. Some do not favour a higher pressure than 250 lbs., others go to 300 lbs. The use of rotary engines, such as Mr. Parsons's turbo-motor, opens up great possibilities. Mr. Parsons believes he can halve the weights of engines, propeller, and shafting, with the same power as in present Atlantic liners; and this, effected in association with water-tube boilers, might revolutionise the design of this class of vessel, or permit great increase of speed with present dimensions. Liquid

TILDEN FOUNDA

fuel, if it could be obtained in sufficient quantities, appears to offer a possibility of at least 30 per cent. reduction in weight of fuel carried, which would amount to 1,000 tons in Atlantic liners. Alloys of steel with nickel now give a metal better than mild steel, with ample ductility. Possibly a deadweight of 1,000 tons could be saved in an Atlantic liner by the adoption of such alloy, if cost would permit. It must never be forgotten that as ships grow in size, speed, and cost, the responsibilities of those in charge increase. The engineer in charge must have great powers of organisation and good technical knowledge. The "human factor" is often forgotten, but is all important, and it is to be hoped as responsibilities increase men will be found to bear them.

THE MOSSBERG PATENT THRUST BEARING.

ALTHOUGH the anti-friction roller-bearing has been used so widely in some branches of manufacture, such as rolling mills, turbines, electric cars and worm gear, it is surprising that it has not made much progress in its application in marine engines. This is probably due to the heavy loads involved, difficulties in obtaining uniform bearing on all the elements of the roller system, and the question of ready access and simple adjustability as wear and tear occur. There is no possible doubt of the great benefit derived from such a roller system of bearing in an abstract sense, but its application has been met with considerable prejudice, particularly in connection with marine matters. One thing to bear in mind with this kind of bearing is that the pressure is transmitted by what may be termed line-contact, and in transmitting large pressures a sufficient lineal length of line-contact must be provided to ensure no crushing or deformation of the rollers when under pressure, as otherwise their life must be very short. Again, in the case of the pressure being in a direction parallel with the axis of revolution, in order to obtain true rolling contact the rollers must of necessity be conical, and the lateral component of the force resisting the end pressure has to be taken into account, and provision made for properly dealing with it.

We have on previous occasions dealt with this problem, and have illustrated and described some of the appliances which have been designed for this purpose, and have now the pleasure to deal with a device which is manufactured by the Mossberg Roller Bearings, Limited, of 6, Victoria Street, London, and Birmingham, at which latter place their works are situated.

In the adjoining illustration Fig. 1 shows the three parts forming the bearing separated from one another, viz., the thrust collar, the cage of rollers, and the thrust block. Fig. 2 is a sectional view of the parts in position. Fig. 3 shows a perspective view of a thrust block for a propeller shaft, the various parts being removed. Fig. 4 shows an application of the thrust bearing to a propeller shaft in place of the old style thrust block. Fig. 5 is a view of the bearing as applied to turbine wheels.

It will be seen from the illustration that the bearing consists of two circular parts with conical roller path, one of which is stationary, and forms the thrust block, and the other revolves with the shaft, and forms the thrust collar. Between these circular parts a cage is arranged carrying a number of conical rollers of such a form as to make true rolling contact with the conical paths. The rollers are held in the cage in such a way as to be retained in position. It will be seen from Fig. 3 that all the parts are made in halves, so as to be capable of being placed around the shaft and removed therefrom without disconnecting it in any way. The bearing shown in Fig. 5 has, we understand, been doing a heavy duty in a most satisfactory way, viz., supporting a shaft with a load of 20 tons, revolving 260 revolutions per minute.

As an interesting fact in reference to this bearing, we will record the results of a comparative test which

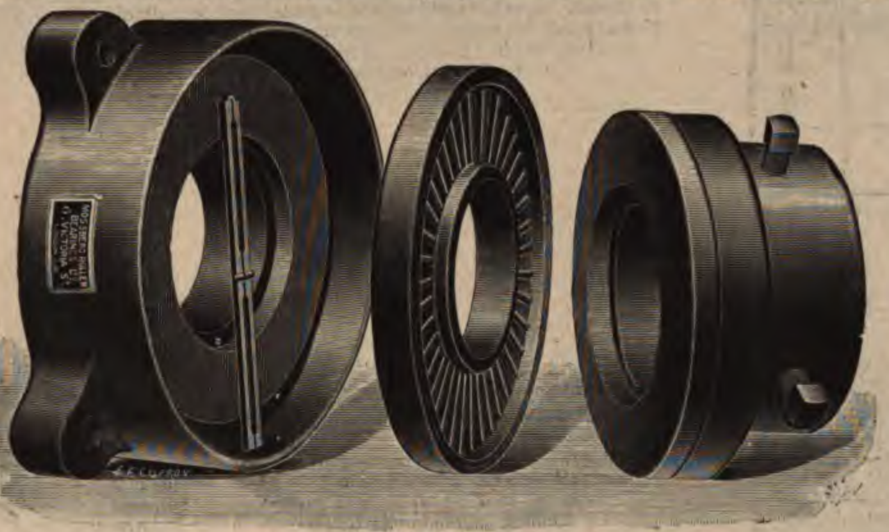

FIG. 1.

was made with it in conjunction with an ordinary plain footstep bearing. The load was 8,000 lbs. in each case, and the area of each bearing was 76 square inches, giving a load of about 104 lbs. per square inch of surface. A torsional pull was applied at a radius of 10½ in., and the pull to start motion in the case of the plain bearing was 400 lbs, and in the roller bearing only 20 lbs., giving a friction co-efficient of ·05 and ·0025 respectively. This, it will be readily conceded, is a remarkable result, and one which shows the subject is worthy of attention, as the reduction of thrust block friction to 1-20th on a large ocean liner must mean a considerable saving of power, and hence of coal.

From the copies of testimonials we have seen the question of the life of the bearing appears to be satisfactorily established, as some of them have run for three years continuously without any defect showing. It may be interesting to note, as bearing on the matter, that some of the electrical engineers are using these patent roller bearings to carry the main shaft in engine generators having flywheel armatures with excellent results.

THE FLEETS OF THE MAIL LINES.

(*From our own Correspondent.*)

The Dangers of Deep-Draught Steamers

have recently been well exemplified by the experience of the Cunard cargo boat *Ultonia* This vessel, as may be remembered, left Boston for Liverpool on August 5th, but immediately after sailing she put back with serious leakage forward. She was temporarily repaired, but the damage she had sustained was so serious that it necessitated her missing her next westward sailing altogether, so that in the month of August, when things are good, the Cunard Company had to leave blank a Boston sailing each way. A careful survey of Boston Harbour has followed on this accident, and this has proved that the mishap occurred on an uncharted danger. The system of sounding the channels in Boston Harbour must have been very much neglected of recent years whilst important changes have been taking place, for the survey which followed the *Ultonia* accident revealed two other serious differences between the depths as shown in the chart and the actual amount of water existing. Needless to add, the differences are against the ship. By this means, however, the *Ultonia* will attain a fame which her size, speed, or accommodation will never earn for her.

Nevertheless, her reputation as a shoal-finder, however, will scarcely equal that of the steamship *Mameluke*, which in June, 1897, struck an uncharted danger in the Delaware when inward-bound to Philadelphia with a heavy cargo of ore, sustaining damage to the extent of £5,000 by the contact. A patch of rock and boulders was afterwards found at the place, and this was dignified with the name of the ship which had so unwittingly found it. The harbour authorities have now dredged the spot and made it safe for the passage of steamers drawing 26 ft. at any state of the tide. This has cost them about £14,000 sterling, but their work is by no means finished, for a depth of water of 26 ft. is not enough for the steamers of to-day. The new Leyland liner ***Winifredian*** had a draught of 31 ft. 8 in. when she sailed from Boston on her maiden trip, whilst 30 ft. is by no means unusual in vessels leaving New York. Even the port of Baltimore has touched this figure with the Hamburg-American steamship *Bengalia*.

A Reported New Cunarder.

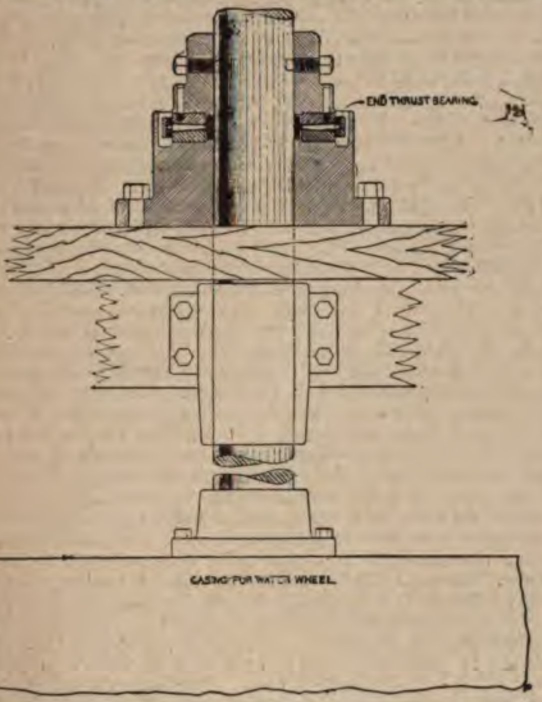

Fig. 5.

No sooner is the *Oceanic* started on her maiden trip than the rumour is circulated that a vessel greater even than the big White Star boat has been ordered by the Cunard Line. The report is circumstantial enough. We are told that she is to be 15 ft. longer than the *Oceanic*, and is to be constructed by the Clydebank Yard. Several points in this story seem to militate against its probability. Clydebank has not had orders from the premier Atlantic line since it turned out the *Servia* and *Aurania* for them in the early eighties. These vessels did not quite come up to the expectation of their owners—though the fault probably did not lie with those who built them—and it was to Fairfield that they next turned. Fairfield has given them two famous pairs of record-breakers in the *Umbria* and *Etruria* first, and afterwards in the *Campania* and *Lucania*, and one does not see any reason why custom should be withdrawn from them. The recent change at Clydebank, whereby Messrs. John Brown & Company, of Sheffield, have absorbed the old firm, does not suggest any solution of the mystery. Lastly, the time is by no means ripe for the placing of an order of the kind suggested. It is now too late to hope that a vessel could be got ready in time for the Paris Exhibition traffic of next year. So there is no immediate hurry. The present fleet is quite adequate to ordinary demands upon it, and in the ordinary course of events is likely to remain so for some little time; but, above all, there is the fact that in a few months there will be so much fresh experience available in regard to steamships of the biggest class. The *Oceanic* for one will, before a few months are passed, be able to give some valuable hints even to the rivals of her owners. The first of the new steamers of La Compagnie Générale Transatlantique is actually now in the water. The Vulcan Company at Stettin is progressing with its leviathans for the Hamburg-American and the Norddeutscher Lloyd. Everything is to be gained by postponing a move for the present. But though the rumour is improbable, it has not been denied. This may, perhaps, be accounted for by the fact that it is thought by some persons in any event not to be worth while correcting press rumours; whilst such a report is that at present flying about affords a good and gratuitous advertisement for the line which is fortunate enough to be credited with an intention which seems at least to be premature.

The Channel Islands Service.

An important announcement has been made by the two lines which so efficiently serve the Channel Islands. It is to the effect that from and after the 2nd October a working arrangement will be carried out between the hitherto bitter and keen rivals whereby great economies will be effected. Instead of a nightly departure by the South-Western boats from Southampton, and by the Great Western from Weymouth, each company will in future make but tri-weekly sailings at night. Though there will still be a sailing every night, it will be made alternately by the two companies, who will honour each other's return tickets. Provision will be made for day sailings also when needed. The agreement is an excellent one for all concerned. Its possibility has undoubtedly been brought about by the lamented accident to the *Stella*. That and certain previous occurrences had made it incumbent on the two lines to assure the public that there should in future be no room for any suggestion of racing between the two sets of steamers. The companies began their *rapprochement* by attempting to arrange for different hours of arrival. Having once got to discussion, they saw that the compromise might with advantage be carried still further. Passengers will lose little, if anything, by the arrangement—at all events during the winter season. The loss of the companies, which has ever been serious during all except the few months of the summer, will now be very largely reduced, if not actually turned into a profit.

The Gaspesia

even in her new career for her new owners seems not to have reached the end of her troubles. In September she loaded a cargo of deals for the United Kingdom at Bathurst—what a come-down for the vessel that but a year ago was by her own efforts going to put Milford in the place of Liverpool and Southampton, and herself in that of the *Lucania* and *Oceanic!* But she got into trouble off Singen, and, after anchoring in what was reported as a dangerous position, put into Sydney, Cape Breton, to repair her steering gear.

The Hamburg-American Line

has now got back into the position which it relinquished prior to the time of the Hispano-American war, and can once again make a weekly sailing to New York with a twin-screw express steamer. The *Columbia*, one of the two steamers disposed of to Spain, resumed work for her old owners at the beginning of September, and the Schichau-built *Kaiser Friedrich* is advertised to resume her interrupted sailings on the Atlantic, this time under the "flag of the Hamburg-American Line," to quote the words of the advertisements. She inaugurates her new career with a sailing on October 2nd.

The Norddeutscher-Lloyd

is inaugurating its improved service to China and Japan with the sailing of its fine new twin-screw liner *König Albrecht* on October 8th. The service will be continued fortnightly, and will, it is to be feared, make a keen competition keener for British shipowners. Such a vessel is, of course, far in advance of the legitimate requirements of the trade at present, and can only be placed in the service by high subsidies provided with the express intention of securing the future developments of the countries which are being opened up. The *König Albrecht* will be far the largest vessel ever seen in those seas, eclipsing even the British cruiser *Terrible* in her displacement. Her gross tonnage is over 10,000 tons. The Norddeutscher-Lloyd, which, as I mentioned last month, sent the *Werra* back to Bremen from Liverpool, have not long suffered her to remain in idleness. They have refitted and redecorated her, and are sending her out as an extra boat in the New York service on the 2nd October.

The Kaiser Wilhelm der Grosse

continues to do well. Leaving the Needles on her 21st trip at

1.58 p.m., and Cherbourg Breakwater at 6 p.m. on August 30th, she was off Sandy Hook Lightship at 7.15 a.m. on September 5th, having made her passage at a speed of 22·08 knots. The most remarkable thing about the details of this trip seems to be the uniformity of the daily runs. None of them were big for the vessel which made them, but they were all well together. Her run to noon on August 31st was 411 nautical miles; to noon on September 1st, 546 miles; to September 2nd, 546 miles again; September 3rd, 556 miles; to September 4th, 538 miles; and then, to Sandy Hook, in the early morning of the 5th, 452 miles; her total distance steamed therefore was 3,049 nautical miles. Thus, though this was her best run to the westward, her best day's steaming on the voyage was exactly a knot worse than that of the record day's steaming which she holds. Returning she passed Sandy Hook Lightship at 12.30 p.m. on September 12th, and was off Cherbourg Breakwater at 11.16 a.m. on the 18th. Her passage was thus five days 18 hours and six minutes, and her average speed 22·44 knots. Her time was therefore neither as good nor was her mean speed as high as her previous best. But again the running was singularly even. To noon on the 13th, in the broken day, she did 499 miles; then to the 14th 504 miles; to the 15th 517 miles; to the 16th 536 miles; to the 17th 530 miles; and to Cherbourg 503 miles, making a total distance steamed of 3,099 miles.

La Lorraine.

The new steamship of La Compagnie Générale Transatlantique was launched from the company's yard at Penhoet on the 20th September. She is the first of a pair of sisters now under construction. She is upwards of 500 ft. long, and over 60 ft. beam. Her gross tonnage will exceed 10,500 tons. She has the proud distinction of being the largest craft ever constructed in France. It is hoped that both she and her sister will be ready for the Paris Exhibition traffic of next year. With their new ship *L'Acquitaine*, formerly the *Normannia* of the Hamburg-American Line, *La Touraine*, which has already done good service for the French company, and the sister, which are now getting ready for service, a twin-screw weekly service will be within the power of this company next year.

The Castle Line.

I had the pleasure on the 22nd of August of seeing the *Kildonan Castle*, second of a pair of sisters launched from the Fairfield yard. As the new ship is fully described elsewhere, I must not dwell too long on her description save to say that she in every respect resembles her sister the *Kinfauns Castle*. The launch was remarkable for the fact that the good ship was released from the stocks not by one lady, but by three. A very pretty idea had occurred to Sir Donald Currie, chairman of the Castle Mail Packet Company, and Sir Donald's ideas generally prove valuable facts. He had the ship launched by three diminutive grand-daughters The launch was in every way successful, and after the usual hospitality with which Fairfield welcomes its guests, we went aboard the *Lucy Ashton* en route for the Tail of the Bank. Off Greenock there was a fine ship indeed awaiting us. The *Kinfauns Castle* with her 10,000 tons looked more like a magnificent yacht than a great ocean liner in the evening sun. It seemed almost incredible that but three months previously one had seen her sans fittings, sans engines, sans upper works, sans masts and funnels, put into the water as one had seen her younger sister earlier in the day. Yet in that brief space the hulk had been made a ship complete in every detail which the experience and foresight of those who have built up a great company could suggest. That night we lay at our anchors, and had a fine opportunity of seeing something of the arrangement and decoration of the inside of the ship. The midship dining saloon is on the upper deck. It is capable of seating nearly as many passengers as the ship can carry in her first-class. In point of fact, when allowance is made for those who take large rooms for a single person, and for the children, who have their own accommodation below (where seats that can be altered to suit the little passengers' dimensions are thoughtfully provided), the saloon gives ample room to seat every one at once. It is beautifully panelled in mahogany inlaid in the Chippendale style. The windows here, and elsewhere, are a feature of the ship. I say windows advisedly, for port-holes they cannot be called any more. They are rectangular, and so large that they have four panes of stout glass in each; but so stout is the glass and so solid the brass framework that there is no likelihood of any sea, even in the Bay of Biscay, injuring them. How they will be appreciated when the big ship gets into the tropics! In admiring the windows, however, the central shaft, or dome, must not be forgotten. It is large, but its art is so well disguised that its simplicity takes one's fancy at once. Its straight sides are ornamented in relief, and are coloured plain dead white. The only touch of gilding in the whole apartment is on a slight wrought-iron grill under the glass at the top of the dome. The effect is charming, so tasteful and so cool! Perhaps it is not out of place to explain my constant reversion to cool effects by saying that before I left the ship the August sun taught those who played cricket (with real bats and real wickets) on the promenade deck something of the heat which the good ship will meet with to the south of Madeira, and the extensive installation for ventilation and the great windows were fully appreciated by Sir Donald's guests in the Irish Sea. Leaving the saloon one comes into the main companion, and notices here a bold variation from what is considered the usual practice. The main staircase is a single stair all the way up—it does not bifurcate at the half landing into two narrower sets of stairs. The reason of this new departure is again to increase the possibility of air getting below. At the head of the stairs opening out of the main companion is the library, well furnished with well-bound books and writing tables. Through this we go to the drawing-room. Here, as throughout the ship, head room is afforded in plenty. The height at the sides is about 9 ft. 6 in., but in the centre the room rises to a height of nearly 14 ft. This great advantage has been attained in a simple manner and without in any way weakening the structure of the vessel. The raised portion of the central deckhouse—in which the drawing-room and certain other apartments are situated—comes up on to the navigation or boat-deck. The extra height is given by making the central part of this deck inside the passage ways, where those who use the deck go to and fro, of curved steel plates. The room which is especially associated with the ladies is beautifully inlaid with satin-wood and the furniture and silk hangings harmonise well. But the smoke-room is the gem of the ship. It, too, has the peculiar roof of which I have just spoken; but the decoration is perfect. The walls are panelled in oak with that dark green polish which is now so popular ashore. The central idea is to suggest an old Dutch interior, and the blue Delft tiles which are let into the walls bear it out well. These give representations of various buildings in South Africa and of the line's well-known steamship the *Dunottar Castle* in Table Bay. The ironwork of the doors and of the bar hatch, the electric light fittings, and every detail in the room give one the impression that many typical old Dutch interiors have been well studied by the designer. A commodious lavatory adjoins this room. On this deck, also under the shade of the boat-deck, are numerous deck staterooms. These, like the rooms on the main and saloon decks, are large, lofty, and well-fitted with conveniences in the way of chests of drawers and hanging cupboards. The second-class accommodation is such as is worthy of the ship. This dining saloon is panelled in oak, otherwise it would be hard to distinguish it from the first-class. The staterooms here and in the third-class are most inviting. The third-class passenger indeed finds his comfort in every way studied. But to return to the trip. On the Wednesday a large party came down in the morning aboard the *Lucy Ashton*, and then the ship started for a cruise to the Isle of Arran, showing her paces meanwhile. The absence of vibration was most remarkable now, thanks to the fact that the machinery, like that of recent vessels of the line, is on the four-crank quadruple-expansion principle, and balanced on the Yarrow-Tweedie-Schlick patent. The steam for the two sets of engines is supplied at 210 lbs. pressure. After a very enjoyable cruise, the party from Glasgow left us regretfully aboard the tender, and, reduced in number to little over a score, we put off to sea as the evening closed in. Next day (Thursday) as we ran down the Irish Sea we had a demonstration of the celerity with which the boats could be got out—if need be—under a new arrangement patented by one of the firm's employees, Mr. Meldrum. Up we went to the navigation-deck, where are the officers' quarters and the chart and steering rooms, and where the long rows of lifeboats lay on their metal chocks. The idea of the new invention is to avoid all difficulty and waste of time in tightening the falls of the boats by instantly taking up the slack when they come to be running out. The metal chocks can be let fall by knocking away short rods which support them, and then the boat stands on a short metal support at either end. A little steel block is then struck away, and a short piston, which carrie the support, is free to sink under the weight until the tightening falls relieve it of the pressure. All that has to be done by the two men, who are sufficient to get the boat out, is to angle her out through the davits. Several boats were dealt with during the demonstration, and it was seen that under half a minute was all the time that was needed. At 11 o'clock that evening the vessel, having been running steadily and easily at about 16 knots since leaving the Clyde, the Lizard Lights were seen; and next morning, when we had torn ourselves away from the shower-baths and sprays which are so liberally provided below, we found the ship manœuvring off Portland. The steering gear is of Brown's patent, worked by the telemotor from the bridge, and the steering engine is the largest of the type I have seen. When the helm was put hard over for circling, it was wonderful to remark how imperceptible was the shock given to the surrounding parts by the rush of the heavy engine on the end of the tiller. Thanks to her twin-screws and the Fairfield bow, the big ship proved most handy, and each circle made seemed smaller than the last. Early that afternoon we made Southampton, being followed up the water by the Hamburg-American liner *Augusta Victoria*, whose band very courteously saluted us with "God Save the Queen." All the answer our little company could make was a cheer, and cheer we did, too, our hail being swollen by the assistance of a number of stokers who had come up to have a look at the big German. In the afternoon we had the opportunity of going aboard the *Briton*, the premier boat of the Union Line, a vessel of just our own size, which lay next us at the quay. It was very remarkable to compare the work of the Irish and Scotch yards, and to see in what different ways two companies working the same trade elaborate details for the comfort of those whom they serve. Here, on Saturday morning, a number of us quitted the ship, being unable to complete the voyage to Tilbury, where the vessel docked on the Sunday. The Mayor and Corporation of Southampton and the members of the Chamber of Commerce were entertained to lunch ere the ship left Southampton. Doubtless they were as full of praise for the ship, and for the hospitality and kindness of Mr. Mirrilees, and of the constant attention of Mr. Matheson, as were the humbler guests who came round in the ship. That the vessel marks a distinct step in the development of the trade no one can deny. Apart from the fact that she brings Sir Donald Currie now into the growing camp of those who think duplication of machinery the right thing, she is so large and so entirely given up to passenger accommodation that it may be said that she offers those who go the long trip to the Cape a ship such as a few years ago could not have been even imagined for the most competitive trade in the world—that to New York, where, too, the distance to be traversed is but the half of the Cape voyage.

A New Company,

which may have an important influence on the future, is the Jamaica Produce and Fruit Company, Limited, which came before the public during the latter half of September. Its origin is due to the report of the West India Royal Commission, which sat a year or so ago, and which recommended the encouragement of fruit culture for the islands in the place of the bounty-killed cane sugar industry. Oranges and bananas are the fruits to whose supply and carriage the company looks in the first instance. Four steamers, costing about £80,000 apiece, are being built for the service on the Clyde. These are to be fitted with refrigerating apparatus for the perfect carriage of the fruit. They are to be delivered next April. The Government has guaranteed a subsidy equal to about three per cent. on the capital of the concern. It would appear that this money will be earned partly by the fruit-carrying business, and partly by the carriage of mails. Under this latter head it may be that the new comer will be a competitor with the West India Royal Mail Company. In this connection it must not be forgotten that the contract with the old company is about to come up for renewal. It is possible that the new line may take away the mail contract, and, if that be so, the prospect for those interested in the old company would be serious indeed.

The Carisbrook Castle,

of the Donald Currie Line, has just made a remarkable passage homewards, doing the run in 14½ days. She landed her mails on the Thursday night, instead of, as is usual with the best mail steamers, on the Saturday.

The City of Rome,

of the Anchor Line, on her outward trip ran on to an iceberg in a fog on the last day of August. No damage was done to the ship, but the newspapers have published a "graphic" account of the scene on board by one of the passengers. He makes out that a complete panic occurred. The incident was so void of dangerous results that no action seems to have fallen to the duty of the officers and crew. But they did not lose their heads to the extent which the passengers did, and the latter, conscious of the fact, offered a "petition of congratulation" to the master.

The Oceanic,

which I viewed in dock at Liverpool on the last day of August, has made an excellent maiden trip at 19·57 knots mean speed with about three quarters power. But I am dealing with the details of the big ship elsewhere in this issue.

The Exploitation of Southwold

seems to be the latest departure of the Belle Line of steamers and of its kindred undertaking, the East Coast Development Company. Southwold is to have a Belle steamer called after it. Messrs. Denny, of Dumbarton, have been entrusted with the task of constructing her, and she is to be an advance even upon the vessels that have already been put into the service. She will be ready for next season's traffic, and by that time the new pier at Southwold, which is to be about 700 ft. long, will be ready for her—and for the other vessels of the fleet—and a call will be made at the new resort on the Yarmouth voyage. Facilities for carriage and for landing are not quite all the holiday-maker desires. He must have a place to rest in. So the Grand Hotel, Southwold, is already showing itself above its foundations. The older resort of Walton is also being kept well up to date, a large pavilion being in course of construction on the pier, where owing to the services of the electric railway approach is at all times easy. The hotel here is to be enlarged, and a floral hall and winter garden constructed near the railway station. The season just concluded has seen the record to Yarmouth lowered by the *Yarmouth Belle*, she having reduced the passage from the company's berth off London Bridge to Yarmouth to nine hours, inclusive of all stoppages. Three times this year the employees of the company have distinguished themselves by their successful efforts to save life. Two of these feats have been performed by members of the crew of the *Yarmouth Belle*, one of them by Mr. Mills, her chief officer. The third instance of an act of bravery was performed by W. Huntingford, of the *London Belle*, who rescued a lady who fell from Clacton Pier. This action was a very hazardous one, and it has evoked substantial recognition. The owners of the steamer have presented Mr. Huntingford with a silver watch, and the Royal Humane Society awarded him their bronze medal; whilst those who witnessed his gallantry made a handsome subscription on his behalf.

The New Cunarder.

The launch of the *Ivernia* for the Cunard Line from the yard of Messrs. C. S. Swan & Hunter is remarkable in many ways. First it shows that vessels of the class which great mail lines affect can be built elsewhere in Britain than on the Clyde and at Belfast. Secondly, it shows the type of development to which the oldest Atlantic company now turns; for a vast cargo, a few saloon and intermediate passengers, and a heavy steerage complement are what the new ship provides. The White Star idea is different altogether in regard to their intermediate ships. Having made a move towards the admission of passengers to their bigger cargo ships, Messrs. Ismay, Imrie & Co. carry none but first-class. The same curious distinction in policy is seen between the intermediate vessels of the great German lines. The Norddeutscher Lloyd *Barbarossa* and her sisters carry saloon only. The Hamburg-American *Pennsylvania* has accommodation for many steerage passengers as well as her first-class complement. The launch of the *Ivernia* gives Cunard's the biggest cargo ship afloat, she surpassing the *Cymric* in tonnage. It also brings the number of steamships of over 11,000 tons gross to 24. Of these the White Star Line have no less than seven—the *Oceanic* and *Cymric* on the Atlantic and the five sisters on the Australian line. The Hamburg-American Line also have seven. Their list is headed by the great *Deutschland* now building for the mail service, and includes the *Kaiser Friedrich*, which is perhaps more correctly described as being "under their flag." Two of this line's seven vessels were built at Messrs. Harland & Wolff's. The Norddeutscher Lloyd have two, both mail boats, and both constructed in German yards. The Cunard Line have four—the two mail steamers *Campania* and *Lucania*, this *Ivernia*, and a sister to her, the *Saxonia*, building at Clydebank, the discovery of whose frame possibly gave birth to the unfounded rumour of the new and vast Cunard mail boat. Then the Americans have two big ships in the *St. Louis* and the *St. Paul* and the Dominion Line two more in the *New England* and the *Commonwealth*. These two are Queen's Island ships, so that of the 24 in the list Messrs. Harland & Wolff are responsible for no less than 11; whilst three come from the Clyde, one from the Tyne, two from the States, and seven from Germany.

SIMPLE HEATING DEVICES.

It is an undoubted fact that our cousins across the water have a marvellous ability for the adaptation of known devices for new purposes, and in no branch of science is this more plainly shown than in the case of small tools. We have pleasure in describing and illustrating some of the heating devices of American manufacture which are being put upon the English market by the South British Trading Co., Limited, of 6, Victoria Avenue, Bishopsgate Street Without, London, E.C.

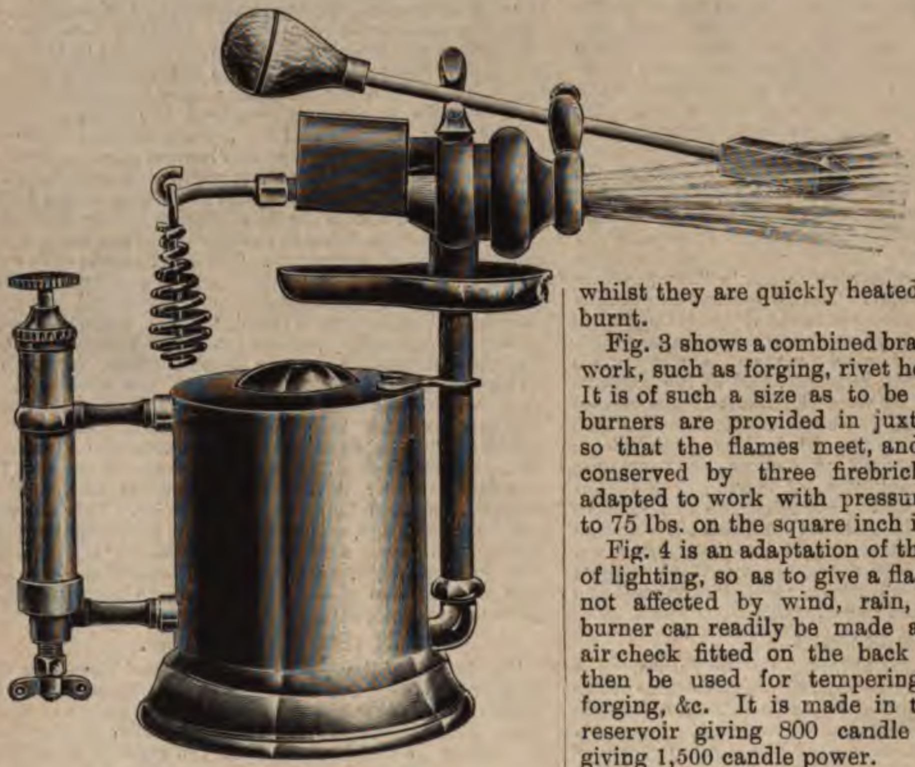

Fig. 1.

Fig. 1 represents a Kerosene Combination Hot-Blast hand-brazer, and is shown heating a soldering iron. It consists of a tank, or reservoir, with an air-pump attached to the side thereof, and adapted to pump air into the tank. The burner is supported on the tank by the feed-pipe for conveying the oil contained in the tank to the burner. A tray is provided under the burner to hold inflammable matter with which to heat the burner initially at starting. The quantity of oil consumed is regulated by the valve forming part of the burner. It will be noticed that a very simple, but, at the same time, effective, handle has been provided on this valve to prevent the transmission of heat from the burner to the hand. It consists of a spiral-wire formation, which is hooked to the valve-spindle by a central wire, so that the contact with the heated spindle is small and the surface for dissipating the heat very large.

Fig. 2 illustrates a modified construction of burner which gives special facility for heating tinmen's irons. The flames project from both sides of the generator through various apertures along a line 4 in. long, pass under the irons, strike the sides of the hood, and are deflected in a circle completely encompassing the irons, and, at the same time, keeping the generator hot for its work. The irons rest upon a corrugated support, which allows the flames to pass under them, and their points protrude beyond the flame, so that, whilst they are quickly heated, the tin on them is not burnt.

Fig. 3 shows a combined brazer and forge for heavier work, such as forging, rivet heating, and tool making. It is of such a size as to be readily portable. Two burners are provided in juxtaposition to each other, so that the flames meet, and the heat generated is conserved by three firebricks. This apparatus is adapted to work with pressures ranging from 35 lbs. to 75 lbs. on the square inch in the reservoir.

Fig. 4 is an adaptation of the burner for the purpose of lighting, so as to give a flame of clear white light, not affected by wind, rain, or temperature. This burner can readily be made a heater by moving the air check fitted on the back of the burner. It can then be used for tempering tools, heating rivets, forging, &c. It is made in two sizes, viz., 10-gallon reservoir giving 800 candle power, and 15-gallon giving 1,500 candle power.

The method of working is the same in each device, viz., the air is forced into the reservoir merely as a means for displacing the petroleum, which is led up by a pipe from the bottom of the reservoir into the vaporiser forming part of the burner, so that the oil issues from the latter in a gaseous condition, and being properly mixed with air at its delivery it burns with a smokeless flame. It will be seen that it is only necessary to pump air in to keep up the displacing pressure, which may be done intermittently, as the reduction in volume is so slow. The heating or lighting effect can be regulated either by the valve on the oil pipe or the pressure in the reservoir.

Samples of these heating devices can be seen at the above Co.'s Show Rooms.

H.M.S. "London" has been coated on the bottom with Hartmann's Rahtjen's Improved Composition (The Red Hand Brand) and which is annually supplied to over 1,100,000 tons of the British and Foreign Navies.

THE "OCEANIC."

ON January 14th of the present year the greatest and most elaborately fitted vessel ever constructed was put into the water at Queen's Island—a mere box of steel. Yet at the end of August of the same year she was on view in the docks at Liverpool, a ship instinct with life, beautiful in her appearance, filled with every luxury that modern ingenuity can devise for some 1,600 passengers of various classes (to say nothing of the great crew that is needed to work her), and ready to take her place in the reduction of the distance that separates the two portions of the Anglo-Saxon race.

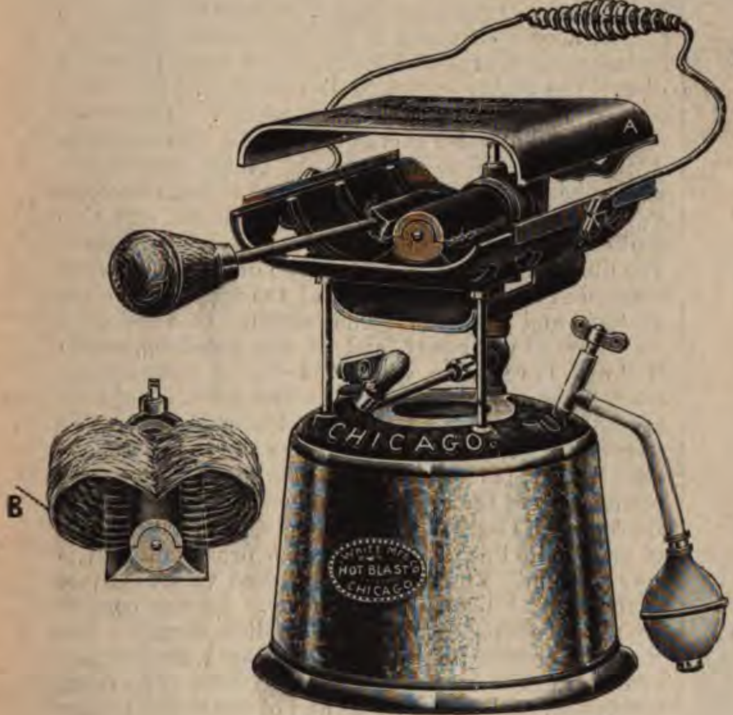

FIG. 2.

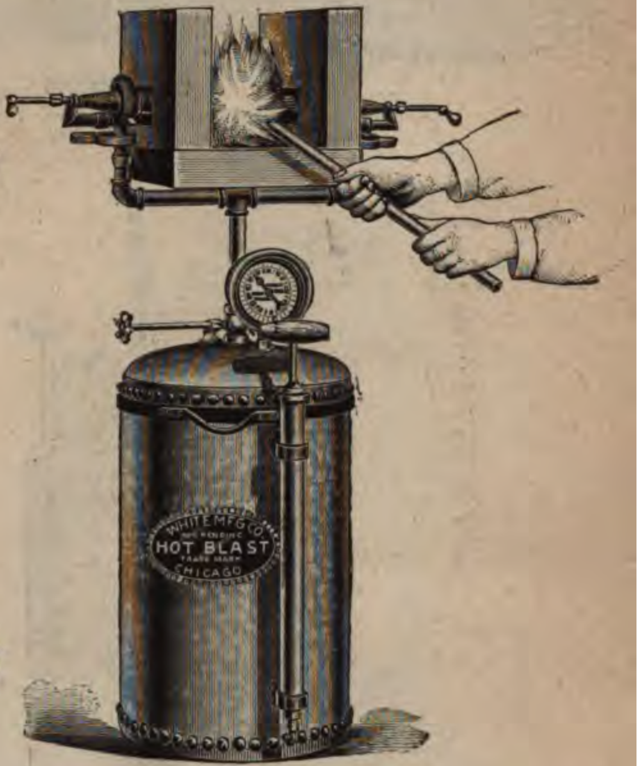

FIG. 3.

It is very difficult to describe such a work. The actual execution has taken the greatest firm of builders in the world over two years and a-half, to say nothing of the period consumed in drawing out designs. The highest art has been employed in decorating her. The ripest experience has been brought to study all the details for the comfort and the safety of those whom she carries. Yet, after a visit of a couple of hours, part of which time is necessarily consumed in social duties and in the requisite refreshment which a 400-mile journey entails, one has to glance at some of the points which so many experts have thought out.

The dimensions of the vessel are:—Length over all, 704 ft.; between perpendiculars, 685 ft. 7 in.; beam, 68 ft. 4 in.; and depth, 49 ft.

The gross tonnage is 17,274 tons; net, 6,176 tons, and displacement 28,000 tons at 28 ft. draught.

The construction of the ship has been all for strength. The main keel is 2 ft. wide. No less than nine longitudinal webs extend parallel with it for the greater part of her length, whilst throughout her length there is a double bottom 5 ft. 1 in. deep, except under the machinery space, where it is increased nearly 50 per cent. The frames of the vessel are spaced 31½ in. apart. They are of channel steel 9 in. deep, with 4 and 4½ in. flanges. The shell-plates are exceptionally long, to reduce weight as much as possible whilst increasing the homogeneity of the fabric. The general length of these plates is 28 ft., yet upwards of 17,000 are used, the general width being 4 ft. 6 in., with a minimum thickness of 1 in., and a weight ranging from 2 to 3¼ tons. The provisions for safety in case of accident are largely enhanced by the means of stiffening the hull. Thus there is a longitudinal bulkhead in the machinery space for a length of 97 ft., as well as 13 transverse bulkheads and no less than five steel decks. Upwards of 1,704,000 rivets have been used in the building of the ship, and the liberality with which they have been sown where strains may be encountered is particularly seen in the vessel's upper strakes amidships, where they appear to be almost continuous through the whole length of the plates.

Her bottom is coated with Hartmann's Rahtjen's improved composition—the Red Hand brand.

A remarkable forging is the stern-post, which, with the arms for carrying the screw-brackets, weighs no less than 98 tons.

The ship is, of course, rigged with pole-masts. These are three in number. She has two funnels, which, though they appear small enough when viewed as a part of the ship, would be huge enough tunnels laid on their side on *terra firma*. These have to take the waste products from the furnaces of no less than 12 double-ended and three single-ended boilers, which burn 550 tons of coal a day, and supply the steam at 210 lbs. pressure to the 28,000 H.P. engines which drive the ship. Fitted to the boilers are 98 Geddes "balanced" fire-doors and 98 Morison "suspension" furnaces, manufactured by Thomas Richardson & Sons, Limited, and the Leeds Forge Co., Limited, respectively. The main engines are two sets of triple with four cylinders in each. They are balanced on the Yarrow-Tweedie-Schlick principle, and the arrangements in the engine-room, combined with the staunchness of the hull, have managed (wonderful as it may sound) to get over the long-standing trouble of vibration when running at full speed at sea. The engine-governors are Aspinall's patent. The propellers are three-bladed.

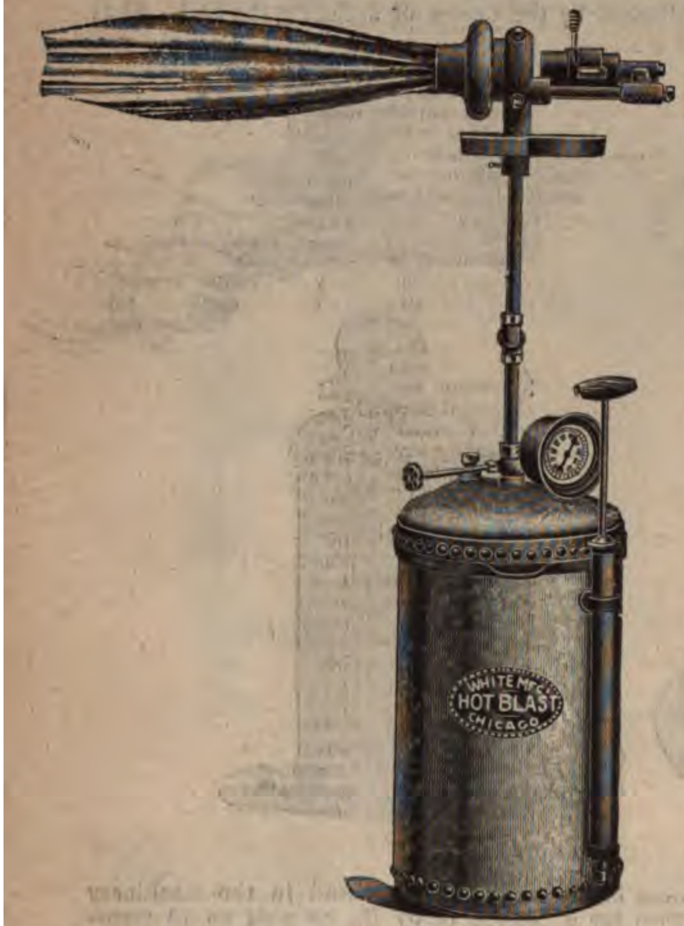

FIG. 4.

The chief feature of the ship is, however, her passenger accommodation. It may be remarked, as a sort of summary of the whole, that, though the gross tonnage of the *Majestic* and her sister the *Teutonic* is just under 10,000 tons each, and though the gross tonnage of the new ship is three quarters higher than this, the *Oceanic* does not offer to carry by any means a proportionately larger number of passengers. Thus, though shortness of room was never alleged against the old favourites, even greater space than they can afford is offered to each individual carried aboard the new ship. The saloon has as many seats as the ship has first-class berths, so every one can dine at the same time. The room is remarkable for its decoration. It is panelled in oak washed with gold, whilst its saloon dome, decorated with allegorical figures, representing Great Britain and the United States and Liverpool and New York, after the design of Mr. Norman Shaw, R.A., is very beautiful and striking. Its dimensions are: length 80 ft., breadth 64 ft. (being the full width of the ship), and height 19 ft. to the top of the dome. The usual interlocking tiles are furnished as a flooring throughout the passages and other usual parts of the ship, but in the main companion they are laid in a way not hitherto applied to steamers. Large lozenges of white rubber are at their corners cut into by small black blocks of the same shape. Thus the effect of a marble floor is conveyed to the eye, though the noiselessness and firmness of foothold are qualities of its own. The main companion is very fine. It is well lighted from above, and very roomy. There are striking and massive carved door-posts, coloured plain white, which lead to the passages at the side of the ship. The magnificent staircase has panels of brilliant Turkey red with gilt designs upon them, and this striking effect very much relieves the general view. The library is over the saloon, the dome of the lower apartment forming the centre of the room, as in the *Teutonic* and *Majestic*. The carving of the doors, which are of mahogany, and of the panelling, which is of oak, is very fine, whilst the electric light fittings are well worthy of notice. The design is that of two-candle wall sconces of the Empire character. The selection of books, both in this room and in the second-class library, is large, and the binding of both sets is reminiscent of the taste of the head of the firm. The smokeroom is lighted by two domes, one on each side of the middle line of the ship. Its ornamentation is very tasteful. The pictures represent various scenes in the life and history of Columbus. In the corners are niches containing beautiful Italian figures. The walls are covered with highly embossed leather gilt, and there is a carved mahogany frieze. The ornamentation, both of the frieze and of the stained glass sliding shutters to the side ports, is of sea-nymphs. The seating is very much after the style of that which is so greatly admired aboard the *Majestic* and *Teutonic*. The staterooms are large and lofty, whilst the rooms on the upper deck are most luxurious. The arrangements of these vary greatly. Some are panelled in silk cretonne, and there are most elaborate and convenient appliances for washing-stands and toilet tables. The beds in these rooms are *beds* and not bunks. Large tables, which are capable of being used by passengers either from the bed or from the seats, are fitted. Some of the rooms are arranged in suites, so that the wealthy Americans can have their bed, sitting, and bath-rooms all together. The general service of baths, lavatories, and sanitary conveniences is very perfect, and the ship is fitted with the usual barber's shop with its electrical appliances. The promenade deck is of course covered by a boat-deck after the modern fashion. The clear space upon it is very striking, though only natural in view of the ship's great beam; its length is about 400 ft. For convenience of those who spend their days here there is a cloak-room for wraps in the deckhouse, and the deck-steward has his pantry and his lift. Above this deck on the navigation deck are ranged the 24 boats in long rows, and here are the chartroom, the wheelhouse, the captain's house, and the officers' quarters. Thus those who are entrusted with the responsibility of directing the fortunes of the great vessel are quite isolated from the distractions of the crowd. There is a stairway, too, to this deck from the engine-room, so that, without passing through the public quarters, Captain Cameron and Mr. Sewell, (the commodores of the navigation and engineering departments of the line respectively), can hold their conferences. The steering gear is in an after-house. It is of the usual type which the builders put into their vessels, though, of course, of extra strong and massive construction. The usual springs for relieving the strains when the rudder is struck by a heavy sea are provided, as well as full appliances for alternative handling of the ship in case of a breakdown.

The second-class passengers have their accommodation aft of the first class. Their public rooms are very luxurious and comfortable, and their staterooms seem little inferior to those of the first class. The steerage arrangements as regards the separation of the sexes are on the usual White Star principle. Closed rooms are provided here for both the married couples and for the single women.

The first voyage of the *Oceanic* was characteristic of the thoroughness with which her owners prepare against every eventuality. An abortive strike was in progress in Liverpool, and the strikers—regardless of the benefits which the line has conferred on their class—thought that stopping the new vessel for want of firemen would be a weighty stroke. So, as a precautionary measure, the *Oceanic* did not come alongside the stage. She weighed anchor and dropped down to the bar just before dusk on the evening of Wednesday, September 6th. She was at Queenstown between eight and nine o'clock next morning. That port she left at 12.40 p.m. on the 7th, having then on board 383 saloon passengers, 244 intermediates, and 829 in the steerage. Her crew numbered 434 persons, so that altogether she carried 1,790 souls. The Right Hon. W. J. Pirrie, managing director of the firm which designed and built her, was amongst the passengers. It was unfortunate, indeed, that serious illness prevented Mr. Ismay from being there also. The vessel encountered a swell on the first day out, and on the following day a moderate sea from the south-west; on the third day there were showers, and on the fourth a little haze, but generally the weather was all that could be desired. She sighted Fire Island at 8 a.m. on the Wednesday after sailing, and was abreast of the lightship at Sandy Hook at 10.17 a.m. Her passage was thus 6 days 2 hours and 27 minutes, and her speed 19·57 knots. She never developed above 20,000 of the 28,000 H.P. of which she is capable, and never rolled more than five degrees. This may have been thank partly to the bilge keel with which she is fitted, but the design and size of the ship must have largely contributed to this result. All went perfectly smoothly, and her engines were never even slowed. Mr. Sewell, the chief engineer of the ship, as well as the makers of the engines, must be congratulated on this performance. The daily runs were: to noon on September 8th, 443 miles; to noon on the 9th, 470 miles; to noon on the 10th, 457 miles; to noon on the 11th, 496 miles; to noon on the 12th, 483 miles; and to Sandy Hook, 431 miles. Thus the total distance covered was 2,780 nautical miles. She was alongside her dock at 1.45 p.m., great enthusiasm marking her reception. She left on her return trip at 6 p.m. on September 20th.

THE "PETTER" PETROLEUM ENGINE.

THE use of petroleum as a motive fluid appears to be receiving the attention amongst engine manufacturers that its ready application and general convenience entitle it to. It is particularly suitable for small powers where a minimum of space is only available.

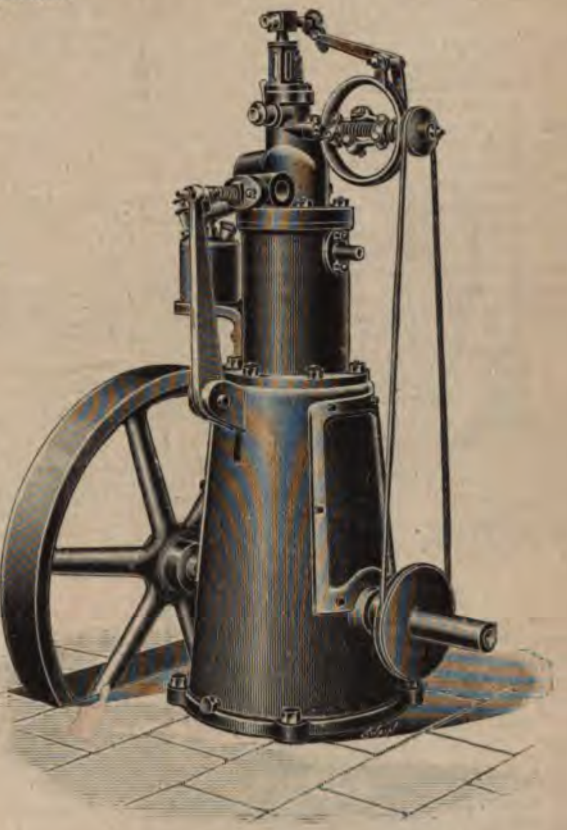

Fig. 1.

We illustrate in the adjoining diagram one of the 1¼ brake H.P. vertical petroleum engines built by Messrs. James B. Petter & Sons, of the Nautilus Works, Yeovil, Somerset, for use in river launches, and the essential feature which is prominent in the design is simplicity of construction, especially with regard to the arrangement of the valves. It will be observed that there are only two valves, which are placed opposite to each other in such a manner that both valves can be removed, inspected, and replaced by removing only one of the valve-boxes, and thus

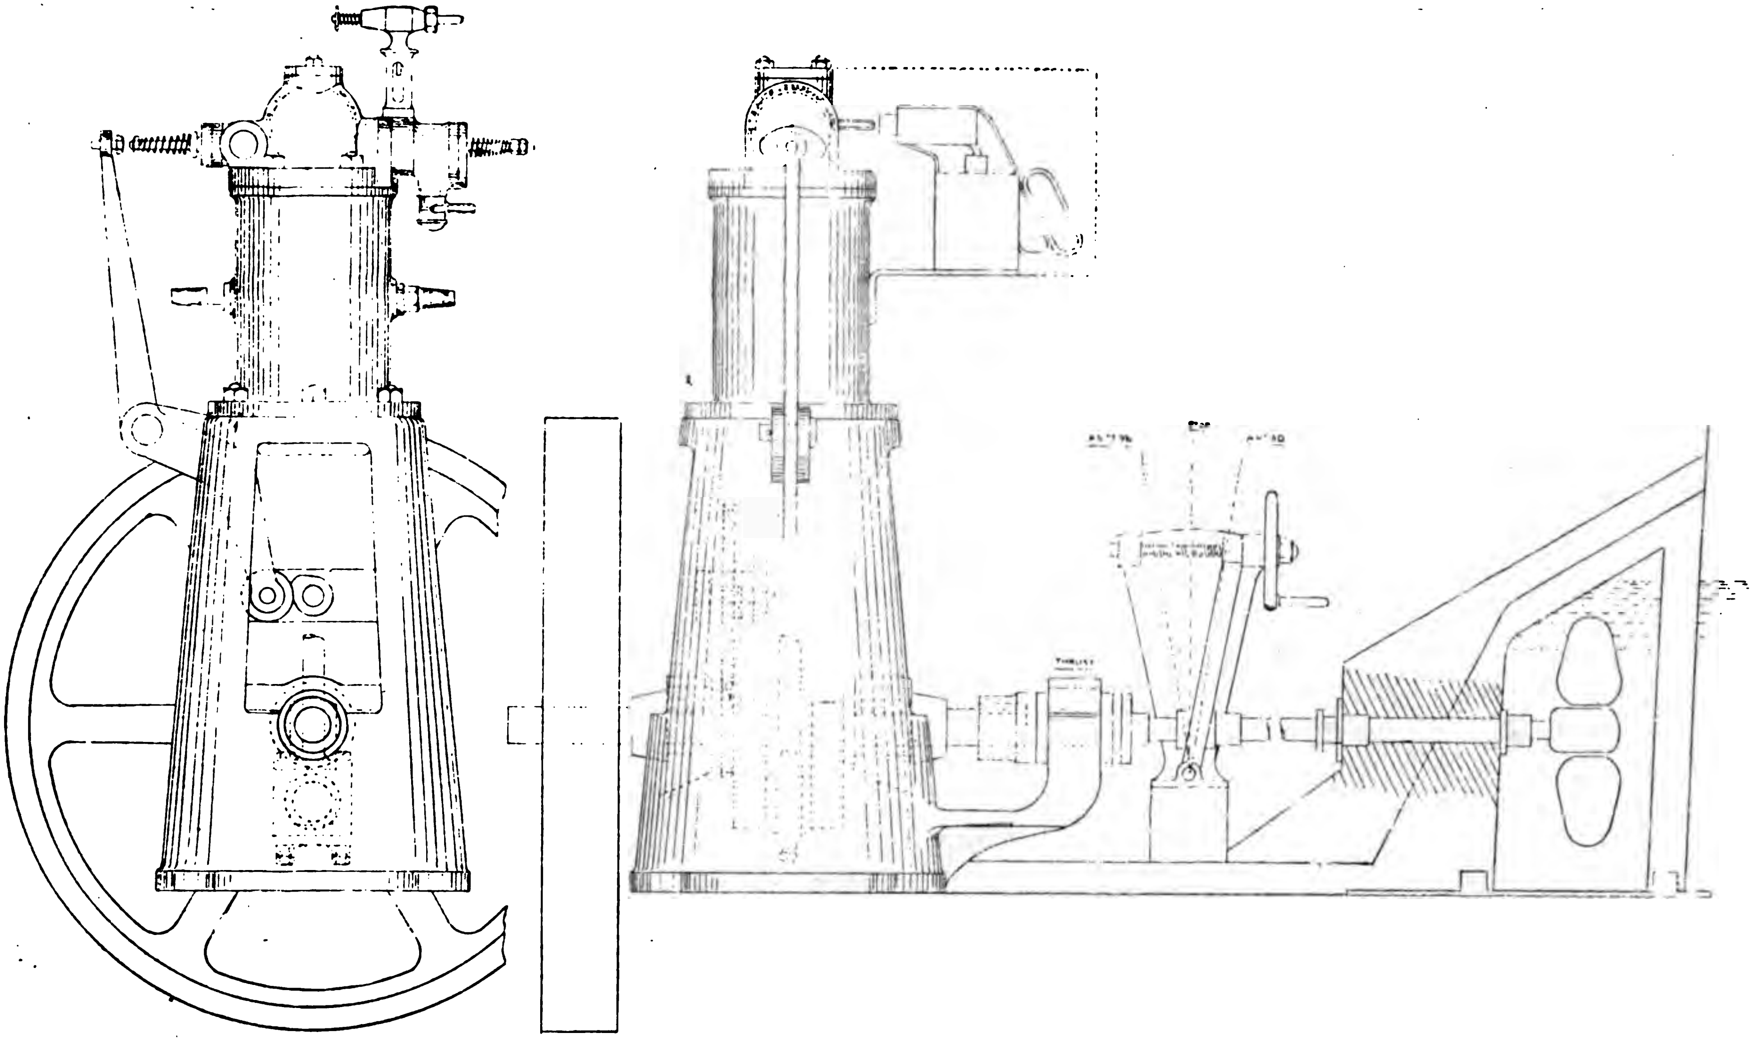

Fig. 2.

breaking only one joint. The oil and air inlet-valves are operated by the suction of the piston, whilst the exhaust-valve is worked by a lever actuated by gear-wheels driving by the main shaft.

Fig. 1 shows a perspective elevation of the engine complete, and Fig. 2 is a vertical longitudinal elevation showing the engine installed in a boat and connected to a propeller, which is feathering and fitted with blade-controlling gear. The engine is governed by a centrifugal governor, which controls the oil supply. The bed of the engine is adapted to contain the crank-shaft and all gearing, so as to entirely enclose the same, thus keeping it free from dust, preventing splashing, and reducing the noise of the working parts. As seen in the diagrams, doors are provided for obtaining access to the working parts.

The vaporiser which forms the top or back of the cylinder is heated by means of an atmospheric lamp in the usual way, the explosion of the vapour being effected by tube ignition.

The space occupied is very small, and the general arrangement and construction is such as to ensure the engine running for a long period without attention.

NAVAL MATTERS—PAST AND PROSPECTIVE.

(From our own Correspondents at home and abroad.)

A New Armour Plate.

AMONGST the experiments which have recently been conducted at Shoeburyness was a most interesting one with a new kind of armour plate. This plate is made up of six inches of ordinary steel, and faced with three inches of a special composition, the nature of which is being kept a secret. A 350-lb. projectile was fired at the plate from a distance of 200 yards, black powder being used, but on investigation it was discovered that the plate was practically uninjured. The same proved to be the case after several rounds had been fired, and in some cases we are told the projectile was reduced to dust by the force of the impact. When cordite was used, however, the plate was penetrated about three inches, and in some cases pierced, but in no instance did the plate crack, a circumstance that leads one to believe that the new armour plate would be useful in naval warfare. A hole caused by a projectile going through a plate can always be plugged with matting, but it is far more difficult to stop the inrush of water if the plate is cracked and smashed. As a result of two shots being fired at the plate simultaneously, and hitting it within a space of 18 in., the special composition was still unfractured. When fired at obliquely, however, the special facing split from the steel backing, a result which was somewhat unexpected, for before this course was adopted the welding of the ordinary steel plate and the special composition could not be detected.

The Russian Navy.

Russian shipbuilding yards are at present as busy as ever hurrying forward the various battleships and cruisers in course of construction. On the Neva great activity is being displayed, and at the Galerny Island yard a large battleship of 13,600 tons has been laid down. The *Pallada*, which it will be remembered was launched a short while back, and her sister cruisers are all being rapidly pushed forward. The new battleship laid down is presumably an enlarged *Tsarvitch*, for the displacement is said to be greater than has yet been reached in Russia, the ships of the *Sevastopol* class being of less than 11,000 tons, and the new ships still in hand of about 12,600 tons. The sister ships of the *Pallada*, the *Diana* and *Aurora*, are still in hand. They are of 6,630 tons displacement, fitted with Belleville boilers, from which it is calculated to give them an I.H.P. of 11,610. An interesting anecdote is related in connection with the *Pallada's* namesake, a frigate sunk in 1856 in the Imperator Nikolai Harbour to prevent her falling into our hands. She lies in about seven fathoms of water, and recently Lieutenant Apastasiev went down in a diving bell and brought away an iron bolt, out of which Captain Beltin, one of the six survivors of the ship's company, had a beautifully ornamented inkstand made, with a silver plate affixed bearing the names of the frigate's company engraved upon it. He has presented the inkstand to the captain of the new cruiser for the use of himself and of his successors.

Portsmouth Dockyard.

The departure of the *Terrible* for the China Station relieves this yard of a deal of trouble. Whether she would get through the Suez Canal without running aground was discussed by many here, and the same doubt was felt as to the ability of the *Powerful* to come home *via* the Suez Canal without running into danger. It was supposed that the two ships would meet at Port Said about the 1st of this month, but there is more likelihood of their meeting in the vicinity of Simon's Bay. Both the *Powerful* and *Terrible* would have had to have their weights adjusted so as to give them as trim and even a keel as possible. Some disappointment was felt when it was finally settled that the Lady Mayoress of London was not to officiate at the launch of the *London*. The honours were to be instead carried out by Lady George Hamilton, whose presence was doubly welcome, as it is so many years since she has officiated at a function of this kind. There were, however, a good many who had hoped that the Lady Mayoress would have presided. Work is to be commenced on the new battleship *Kent* now that the *London* has taken the water.. A good deal of material has already been prepared, and the work of lengthening the building slip by more than 100 ft. is almost completed. As regards the other vessel under construction here, the *Pandora*, it is doubtful when she will take the water. She has now been under construction for nearly three years. However, a time will come. Experiments are still in progress with the *Surly*, and at present briquettes are being used, and although they are not quite as smoky as oil, they are not what may be termed a distinct success. The *Canopus*, as was expected, has proved that she is not so much the failure she was asserted to be by one of the London dailies. It has been proved now that she can steam at 17 knots continuously for 10 days with her normal coal supply, thus being able to cover a distance of more than 10,000 miles without resorting to a coaling station. The first-class cruiser *Scout* will not be out of hand until the 31st of this month instead of the 1st.

The United States Navy.

The builder's trial of the new United States battleship, *Alabama*, is said to have been satisfactory in every particular. The speed attained was $17\frac{1}{4}$ knots, whereas the contract required a speed of but 16 knots. On the first run the *Alabama*, under $103\frac{1}{2}$ revolutions, averaged 15·25 knots an hour, over a course of $11\frac{1}{4}$ knots. She steamed over the course twice in a moderate sea, half of the way against the wind. On the second run, under forced draught and at $114\frac{1}{2}$ revolutions, the average speed was 16·33 knots, and on this run the maximum of $17\frac{1}{4}$ knots was attained. In the annual report of, Chief Naval Constructor Hitchborne it is stated that the sum of 16,000 dols. was expended in preparing the *Oregon* for her trip to Manilla, and 25,000 dols. in getting the *Iowa* ready for her voyage to the same place. Mention of Manilla reminds one that great preparations are being made for the return of Admiral Dewey. However, the gallant admiral will probably do his best to escape as many as possible of the entertainments and dinners which are sure to be given in his honour. Following the example of Admiral Dewey, Admiral Sampson has laid a claim in the Supreme Court of the District of Columbia for prize money to the amount of 700,000 dols., which he claims is due to himself and the officers and men under him who took part in the battle of Santiago. The greater portion of the money claimed is for the capture of the *Infanta Maria Teresa*, which, after being refloated, disappeared beneath the waves off Cat Island. Experiments are about to be carried out in the United States Navy with metallic furniture. A suite of furniture made of cold-rolled steel with bronze ornamentation is to be supplied to the *Atalanta*, and the officers of this ship are to report upon its suitability to the Navy Department.

Stranded Warships.

From news to hand from Hong Kong it appears that the repairs to the *Bonaventure*, made necessary by the damage sustained when she went ashore in Kernileff Bay, will cost from £6,000 to £10,000. During the salvage operations the *Undaunted* also sustained some damage, having the casing of her after hawse-pipes torn out, and many minor fittings in the shape of cleats, cowls, stanchions, davits, &c., carried away. A correspondent, writing from Hong Kong, says that when the *Bonaventure* struck, the force of the impact raised her bows almost clear of the water, and there she remained. The *Undaunted* at once went to her assistance, and endeavoured to tow her off the rocks; but after several cables had broken, several minor accidents happening in consequence, the attempt was abandoned until other ships could render assistance. Despite the efforts made on the following day, it was not until the forenoon of the third day that she had been stranded that the *Bonaventure* was floated. When she finally was released she was temporarily patched up and sent under her own steam to Nagasaki. At a court-martial held subsequently on Captain Montgomerie and the navigating officer of the *Bonaventure* both these officers were honourably acquitted, the court holding that the rock was unknown, and that they had done everything in due order. The court-martial held on Lieutenant and Commander J. W. Pochin and Lieutenant H. F. Dawson at Simon's Town in connection with the stranding of the *Thrush* resulted in both officers being reprimanded. The vessel was ashore five and a-half hours in all. In the opinion of the court, insufficient allowance was made for the currents in shaping the vessel's course past Cape Delgado, and no leadsman was posted in the chains at the time of the occurrence. It was admitted, however, by the judges that every effort was made to refloat the vessel in the shortest time.

The Navy and South Africa.

In connection with the dispute between the home Government and the Boers in the Transvaal Republic, it was suggested that a naval brigade should take part in any fighting. Such a course would be only fair considering that the Navy has taken part in so many of our "little wars" in South Africa, and especially in the fighting between the Transvaal Republic and this country. There was a naval brigade at Majuba Hill under the command of Commander Francis Romilly, and unfortunately this gallant officer was killed in that disastrous fight by a wound in the abdomen. Fleet Surgeon (then Surgeon) Mahon attended him until the last, and also gave others wounded in the rout the benefit of his skill, which led to his being taken prisoner by the Boers. A bullet penetrated his helmet whilst engaged in this humane work, and he richly deserved, but did not get, the Victoria Cross for his gallant conduct. Lieutenant Trower, a gunnery officer of the *Boadicea*, was another naval officer killed at Majuba Hill, and therefore the Navy has every right to take part in avenging the defeat and the conduct of the Boers towards the vanquished and their medical attendants afterwards. Disappointment will certainly be felt if the Admiralty do not sanction the landing of a naval brigade in case of hostilities. It would not, perhaps, be wise to deplete the Cape Squadron to too great an extent, but a few hundred seamen and marines with guns could be landed and be scarcely missed. A naval brigade would probably render as good an account of themselves nowadays in Africa as they did against the Zulus when Cetewayo threatened Natal.

Devonport Dockyard.

The most important event for the present month at this yard will be the launch of the *Bulwark* on the 20th. The *Bulwark* will by this time have been only seven months under construction, reckoning from the date when she was "officially commenced." There are many new vessels completing here, for, in addition to the *Ocean* and *Implacable*, there are the *Hermes* and *Highflyer*, cruisers, the *Thistle*, gunboat, and *Leven*, torpedo-boat destroyer. The *Ocean* will probably be quite as much a success as the *Canopus* has proved herself to be. The trials of her auxiliary engines and the port engine of the propelling machinery were both very satisfactory. The engines and boilers for the *Implacable* have now arrived at this yard, and Messrs. Laird Brothers are to establish here a local staff of about 50 mechanics and labourers to work on the machinery of the vessel. Preparations are being made for the establishment of another Whale Island at Devonport, and negotiations are in progress for the purchase of 150 acres of ground on the Cornish side of the Hameaze. However, it will be many years before the buildings ashore are ready to take the place of the existing gunnery-ship. The new Royal Naval Barracks continue to make rapid progress, but it will be some two years before they are completed. The Admiralty have decided to increase the number of warrant officer artificer engineers from 46 to 75, and there are a large number of candidates for the posts. The steam trials of the new twin screw-gunboat *Thistle* were successful in every way. She is to be commissioned next month for the West Coast of Africa. The *Hermes* is to be commissioned on the 5th inst. for service on the North American and West Indies Station.

An Imperial Programme of Work.

The programme of work mentioned in the Naval Works Bill is very heavy, and before the various items are finished many millions of money will have to be spent. That the college, barracks, harbours, and defensive works referred to by Mr. Goschen are badly needed there is no doubt whatever, and therefore the First Lord was not doing anything very rash when he challenged anyone to point to a single undertaking which was not absolutely necessary. The proposed outlay is very large, but the country will have ample value for its money in the many important works to be carried out. The breakwater extension at Portland Harbour is now practically completed, and the work on the detached and commercial moles at Gibraltar continues to make good progress. The necessity for these moles is clear to all, for, when finished, an effective torpedo attack on the shipping at "Gib." will be practically impossible. There is, by the way, an excellent article in a recent number of the *Navy and Army Illustrated* on the works at the Rock, accompanied by photographs. New dockyards, docks, and railway connections are to be commenced at Dover, and the extension of the Keyham workships completed as early as possible. The new Royal Naval College at Dartmouth is also to be commenced without delay, and at Hong Kong there is to be an extension of the present defensive works. On improved dock accommodation for our warships some £6,000,000 are to be spent. Chatham is to have a new dock capable of accommodating the largest battleship afloat, and at Malta two new docks are to be built, one of 790 ft. and one of 550 ft. Bermuda is to have a first-class floating dock, 13 acres in extent, and new docks are to be commenced at Simon's Bay for coaling purposes, and also at Hong Kong. These are only some of the chief items in this truly imperial programme.

Some Details of the "Holland" Submarine Boat.

Some interesting details are to hand from America about the *Holland* submarine boat. Its owner claims that it can move about under water after the manner of a whale, and whilst in this position can discharge its dynamite guns with deadly effect. The boat contains three pieces of ordnance, two of which are invented by Mr. Holland himself. In the bow of the boat is a torpedo tube for the regulation Whitehead torpedo used in the Navy. Above and directly in line with the Whitehead tube, but pointing up at a higher angle, is the dynamite gun. In the stern of the boat is a tube designed to discharge a submarine projectile with great force at the hull of a warship. Inside she is a "marvel of mechanical ingenuity," every inch of available space being taken up by some piece of intricate mechanism. The hull is built in the strongest possible manner. It is made of plates of half-inch milled steel, bolted on over frames in longitudinal sections, and is braced to resist the crushing power of water. When awash the displacement is 65 tons: the addition of ten tons of water in the compartments sinks the boat 50 ft., and she cannot go below that depth. The *Holland* has a cruising radius of 2,000 miles. She could take aboard 40 gallons of oil and (which is very doubtful) go two-thirds of the distance across the Atlantic. Fitted with sleeping accommodation and cooking apparatus on a small scale, the boat could go on an independent cruise for two months (another doubtful statement). The *Holland* is steered by four rudders, two in each plane, all controlled by electricity. To submerge the boat, the storage batteries are first charged from the dynamo, and the fumes of sulphuric acid exhausted. The cap of the hood is screwed down from the inside, and word is passed from the executive officer to the gauger to flood the water-bottom. If the boat is to sink very far, the gauger puts the index of the submerging dial to a high figure, and having set the pointer to the desired depth, the controlling valves admit exactly that quantity of water and no more. To come to the surface, the water is blown out of the compartments by the stored air, or it is pumped out by electricity. The *Holland* boat has recently undergone some tests in discharging torpedoes and running under water, as well as partly submerged, and these tests are said to have been successful.

Sheerness Dockyard.

There are completing at this yard the *Perseus* and *Prometheus*, cruisers, and the sloops *Condor* and *Rosario*. As regards the *Perseus*, she is rapidly advancing towards the stage of completion. If her trials are as successful as those of her sister ship, the *Pioneer*, this yard may congratulate itself on the work done by those employed here on her. The *Pioneer* completed the whole of her trials in six days, commencing with a preliminary steam trial, and going through the whole gamut up to her circle-turning trials. Early last month the *Skipjack* arrived from Jarrow-on-Tyne. She has been fitted with the Reed type of water-tube boiler at Messrs. Palmer's shipbuilding yard. Her official trials will take place before long, but she has yet to undergo an extensive overhaul of her hull. Her present refit will cost about £39,000, of which nearly £33,000 has been expended on her new machinery and boilers. The gunboat *Speedy* has had her boilers retubed with Messrs. Thornycroft's type of boiler, and at her trial a speed of 19½ knots per hour was attained. She is to be completed for commission without delay, and will probably hoist the pennant at the end of this month. The refit of the *Ganges*, until lately the training ship at

Falmouth, is to be completed at this yard instead of at Devonport. She is to recommence her instructional duties at Harwich when completed.

A Pamphlet for Naval Engineers.

A reminder of the recent agitation amongst naval engineers—an agitation which had practically no satisfactory results—is given us by the publication of a pamphlet printed at Plymouth dealing with shorthandedness and other grievances of the engineer officers of the Royal Navy. The pamphlet deals with the engineer officer, both at school and on board ship, and suggests several improvements which might be made in the position of the students at Keyham, and one which certainly deserves mention is that prizes in reduction of fees be awarded and the number of students be increased with a view of extending the list. The writer of the pamphlet, "An Engineer (not R.N.)," gives some particulars of what it costs to train a youth for the various branches of the service. Not including uniform as commissioned officer, the writer has come to the conclusion that to train a youth for the engineering branch of the Navy would cost £576; for the medical branch, £606; for the executive branch, £593 10s. (from which £100 is deducted for the year's schooling, during which other branches are receiving pay); and accountant branch, £182 (from which £118 12s. is deducted for pay received from 18 to 20). Of course, under certain conditions these figures will alter very considerably. In another part of the pamphlet the writer deals with the question which arose some months ago as to the smallness of the number of engineers in command of the machinery of warships, and also the question of giving engineers the privilege of reprimanding and punishing the men under them as occasion demands. It will, without doubt, be some time before the anomalies in the engineer's position pointed out by "An Engineer" are removed, but the pamphlet clearly and without prejudice sets forth the case of the naval engineers, and therefore is worthy of attention.

Coaling Vessels at Sea.

An ingenious device for coaling vessels at sea has just been brought forward by the Lidgerwood Manufacturing Co., of New York. This firm is well-known as the makers of hoisting engines and cableways, and therefore it is only natural that they should have turned their attention to the subject of adapting some special form of cableway for the purpose of coaling vessels at sea. Their efforts appear to have met with considerable success, for the Navy Department of the United States are said to have shown great interest in the invention, and have accordingly entered into an agreement with the company to equip one of the steam colliers belonging to the department with one of these sea-coaling cableways. This vessel has been ordered to the New York navy yard, and the Lidgerwood Manufacturing Co. are immediately on her arrival to set to work to instal their apparatus. In this device the warship may take the collier in tow, or the collier may take the warship in tow, leaving a space between the ships of 300 ft. Elevated cables, leading from the masthead of a collier to shear-poles on the warships, serve to support and propel a carriage, from which hang bags of coal. The coal is elevated from the deck of the collier, transferred to the carriage at the masthead, and propelled across the intervening space at a speed of 1,000 ft. per minute. The arrangement for compensating for the lurching of the vessels in seaway, it is said, is exceedingly ingenious, and having been tested on a small scale, leaves little doubt as to the working of the appliance at sea. Coaling can be carried on whilst the ships are moving ahead. The idea is good, and therefore it is to be hoped that the invention will prove to be of practical value.

Chatham Dockyard.

It was originally intended to have launched the *Venerable* in August last if a satisfactory stage in her building had been reached by that time. Unfortunately, however, it will be some little time before she takes the water. As a number of distinguished guests are to be present at the ceremony, and Admiral Holland's house is not at present in a suitable state for entertaining, this will delay her taking the water as early as she could have done. Her predecessor, the *Irresistible*, was built in eight months, and, as Princess Christian performed the christening ceremony for her, the Princess Victoria has been approached with the object of inducing her to officiate at the launch of the *Venerable*. As soon as the *Venerable* takes the water, a new battleship, at present unnamed, will be commenced on No. 7 slip. She is to cost considerably more than £1,000,000, and is designed upon similar lines to the *Canopus*, but is expected to be more powerful and speedy than any ship of this class. There are four first-class battleships now in hand at this yard, reckoning the new battleship, as the *Venerable*, *Goliath*, and *Irresistible* are all in an incomplete state. Preparations are also being made for the construction of a new third-class cruiser. The official report of the trials of the water-tube boilers and machinery of the *Pioneer* states that they passed off without the slightest hitch throughout. Some little doubt was felt at first whether this would be the case. At her eight-hours natural draught trial the average speed was slightly below what it should have been, but the mean H.P. was in excess of that stipulated. She will probably hoist the pennant at the end of this month and proceed to the South-East Coast of America to relieve the *Beagle*. Rear-Admiral Andoe's place as superintendent at this yard has now been taken over by his successor, Rear-Admiral S. C. Holland, who hoisted his flag on board the *Pembroke* at the commencement of last month.

Coal Consumption of the "Canopus" and "Ocean."

A considerable amount of hostile criticism has been expressed as to the excessive coal consumption of the new first-class battleships *Canopus* and *Ocean*. The evidence, however, hardly warrants this, for although it is a fact that the contract trials were not quite as successful as could be wished for, it is probable that the coal consumption will be considerably diminished when the proposed alterations in draught have been effected. The Belleville boilers must not be blamed for the trouble, although many critics, attaching too much faith to the utterances of the member for Gateshead, have endeavoured to make us believe that this is the case. One London daily paper, which is nearly always ready to air the views of either officers or men of the Navy who consider they have "grievances," asserts that both ships are failures. The "naval expert" of the *Morning Post* would do well to make a deeper study of the engines and boilers of warships than he evidently has done before coming to such a rash conclusion. The *Canopus* and *Ocean* are admittedly experiments as far as their boilers are concerned, and therefore criticism of this nature should be deferred until the experiments have had a fair chance. Probably nobody at the Admiralty wishes more to see our warships possessing high speed, powerful armament, adequate protection, and large coal capacity than Sir William White, and to obtain these necessary qualifications experiments are bound to be carried out. There is little doubt that in time the *Ocean* and *Canopus* will prove good and economical steamers, and will be as great a success as the giant cruiser *Powerful*.

Elswck-built Crusers.

The paper read by Mr. Watts, the chief constructor of Elswick shipyard, has brought about some arguments in the weekly press which are worth referring to. The chief argument brought forward by the adversaries of the type of cruisers constructed at Elswick is that Mr. Watts did not give details as to weights or publish working drawings of the vessels and specifications. No doubt Mr. Watts refrained from giving this information with good reason, but if he could have done so, and, at the same time, have compared them with the weights of the cruisers built in the Government dockyards, more point would have been given to Sir Edmund Fremantle's remarks about the Admiralty authorities being horrified at the idea of taking anything out of a ship, and that, in consequence, weight which might be better employed was taken up by obsolete equipment. In a letter to the *Army and Navy Gazette* explaining some parts of the speech with which he opened the discussion at Newcastle, Sir Edmund Fremantle said that he merely wished to show that the natural conservatism of a great service such as the British Navy made us reluctant to move with the times and to sacrifice weights, whether in structure, armament, or stores, which had previously been considered essential. He also considers that we have shown little reluctance of late years in adopting new inventions and improvements; but that we cling too much to the idea of making a modern battleship or cruiser as self-contained as possible with qualities of strength and permanence, which are no longer necessary or advisable, in view of our numerous depots abroad, where our ships must go for coal, and the fact that the types of ships of war are constantly changing. He gives a few comparisons between the vessels built for the Japanese Government and the British cruisers of the same type in order to prove his point; but he has apparently forgotten to mention that the Japanese cruisers are built for service principally in Japanese waters, and that they could not probably bear the strain of racing from one end of the world to the other, as British cruisers do, without developing some serious defects. Admiral Fremantle must know that there are strong reasons for making British battleships or cruisers "as self-contained as possible."

Pembroke Dockyard.

The new Royal yacht will probably be undocked on the 15th of next month, when she will depart for Portsmouth, where she will be completed about the 18th. Rear-Admiral Sir John Fullerton visited this yard last month, and gave instructions regarding some proposed alterations, which necessitated the transference to her of two additional gangs of shipwrights from the *Spartiate* and *Drake*. One of these proposed alterations concerns the ornamental work on the stern. The non-inflammable wood fittings are even now said not to be quite as satisfactory as could be wished, even after the chemically treated timber had been treated with charcoal. The feed pumps of the boilers in the new yacht were found to have too large a bore, and consequently were returned to the makers to be altered. The covers and the tubes in the boilers will be made to a universal pattern. There is a considerable difficulty in this, for the boilers will contain about 5,000 such covers, and an additional 1,000 spare covers are to be provided. The *Drake* is probably one of the most interesting cruisers at present under construction in any of the yards. She and her three sisters and the four ships of the *Essex* class are all to have their armour extended to the bows, and also from the lower protective to the upper deck. In the opinion of some naval architects the fitting of armour so far forward has many difficulties, due to the extra weight. Preparations are being made to receive the keel of the *Essex* in No. 5 building slip. Captain C. J. Barlow has taken the place of Captain Burgess Watson as superintendent at this yard, on the cutter's promotion to flag rank.

Charity for the Navy.

Admiral Sir N. Bowden Smith, the Commander-in-Chief at the Nore, has just made an appeal through the medium of the press for subscriptions towards building a sailors' home at Chatham, where a suitable site has been obtained from the Government for that purpose. Admiral Smith points out that Chatham is far behind Portsmouth and Devonport as regards recreation and wholesome accommodation for the men, and that, although there are on occasions from 6,000 to 10,000 men quartered there, the only place in the town for their use is the "Sailors' Welcome," a small home conducted on temperance principles. This home is now quite inadequate for the requirements of the place; and it appears that many men are driven to look for beds in slums and other wretched places, since sufficient respectable accommodation for them is not to be found. It seems a little out of place that the Navy should have to appeal to public charity in order to get suitable accommodation for our naval seamen; but it must be remembered that the required accommodation is principally for men on leave, and who are, therefore, to a certain extent not under the control of the Admiralty. However, it is to be hoped that the British public will respond as generously as possible to Admiral Bowden Smith's appeal. It is proposed to conduct the new venture on the same lines as the Home at Portsmouth, controlled by Miss Agnes Weston. The estimated cost of the building is £15,000, and donations toward the proposed home may be sent to the Capital and Counties Bank, High Street, Chatham; or to Captain G. L. Atkinson, Dockyard Reserve House, Chatham; or to Admiral N. Bowden Smith, at the Admiralty House, Sheerness.

EXPANSION GLAND FOR STEAM-PIPES.

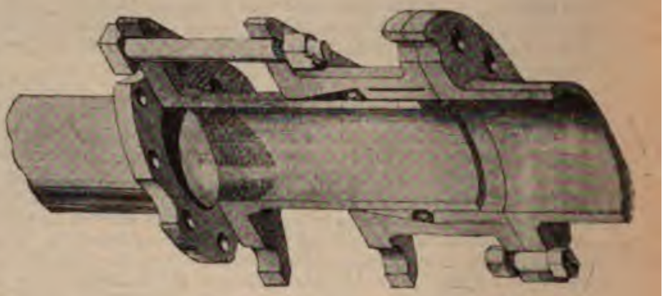
THE many serious accidents to steam-piping on board ship have pointed out that every precaution should be taken by steamship owners and by the Admiralty that such pipes should be protected by any device that may tend to give them elastic movement under strain or vibration and power of expansion and contraction under changes of temperature.

Mere elasticity of design of ranges does not seem to have done much in this way, nor is a single deep expansion gland, usually filled with dense packing, of much service, as such a gland is absolutely rigid, except as regards longitudinal movement, and the excessive friction of the usual long hard packing is well known.

The device we illustrate herewith seems to us much more effective than anything we have seen as yet, both as an expansion gland for changes of length due to changes of temperature and also as adapted to permit a considerable amount of elastic play in all directions.

This is effected by there being no length of hard packing employed, and by the end of the pipe being a free fit within the gland.

The pipe terminates within a gland, the bore of which is conical, terminating with its smallest diameter at its exterior, and within which are one or more packing-rings. The packing-ring is made from the best asbestos cloth, and on entering behind the ring it is forced up between the pipe end and the conical gland, making a steamtight joint by the pressure of the steam itself.



The outer end of the gland being a free fit on the pipe, and the inner end of the latter being also free in the bottom of the gland, the pipe can rock to some extent upon the packing-ring; and the frictional grip is very small, and thus permits easy play of one part of the pipe to the other, both laterally in any direction and longitudinally.

This is as nearly as possible a universal joint with an end movement also, which is exactly the desideratum for the perfect relief of a line of piping under vibration, shock, strain, or expansion and contraction.

In order to fit a new ring of packing, the joint between the gland and the junction piece is broken, the neck bush (which is in two segments) is removed, and the ring of fresh packing is passed over the pipe end.

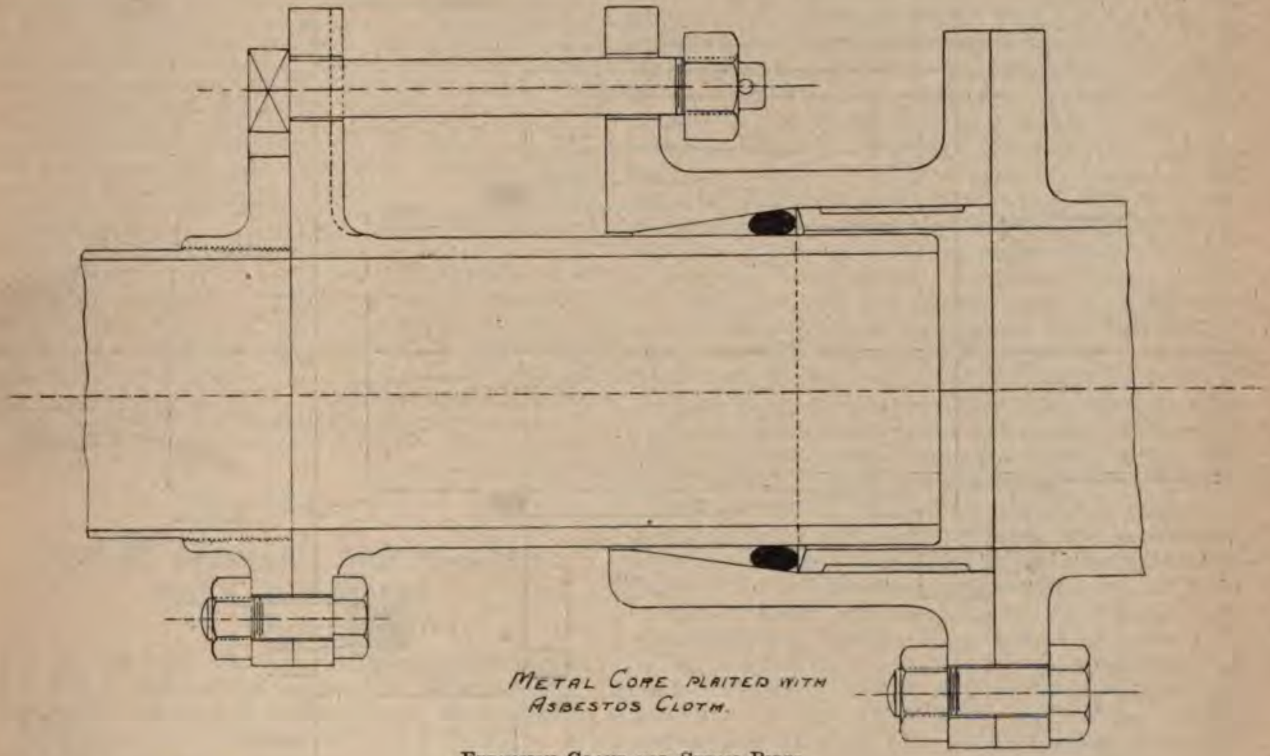
Nothing could be simpler than this joint, require less attention, or have less tendency to become hard and obstructive, as would be the case with a long ordinary packing under high pressure.

We understand from the makers (Messrs. Thomas Richardson & Sons, of Hartlepool, and the introducer, Mr. Geddes, of Liverpool) that these glands are working most successfully at sea with boiler-pressures up to 220 lbs., with only one ring of packing. There can be no doubt, therefore, that they are steamtight.

MARINE ENGINEERS' NOTES.

(From our own Correspondent.)

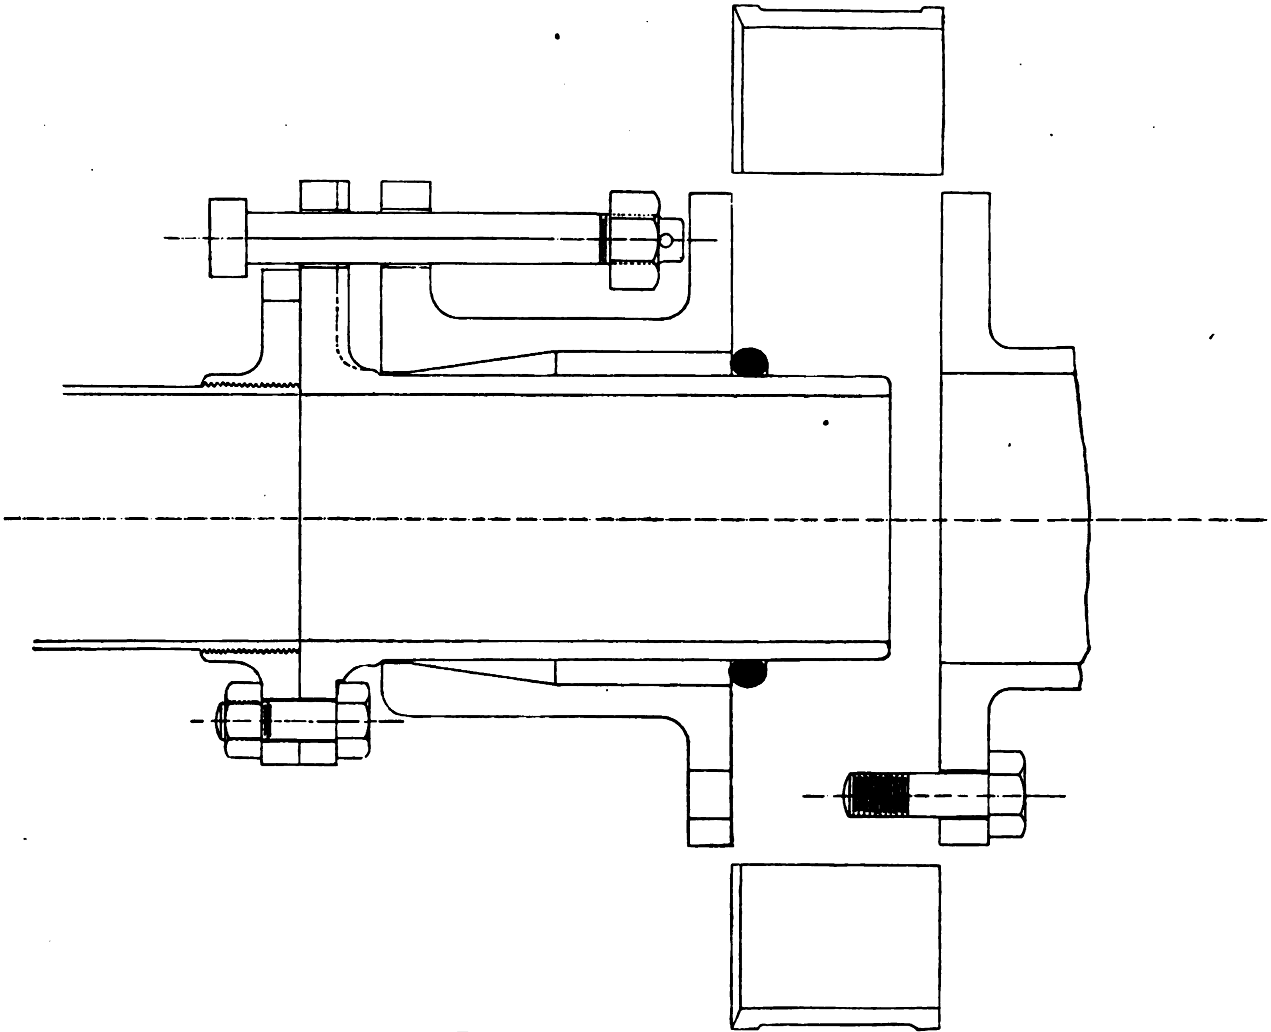
THERE have been two meetings of members held at the Institute of Marine Engineers during the month. The first meeting is reported on page 312. At that meeting the further experiments on the influence of the velocity of water on its absorbent power which were published in the *Engineer* were dealt with, and formally introduced to the members. And it was explained that more than one firm of engineers had written stating that similar results had been obtained in the course of their trials, and the results of the experiments had explained to them the meaning of their own results. The velocity of flow through the tube was certainly an influence, and affected the heat-absorbent power of the water. Mr. Williams carefully explained that, he did not say the conclusions were wrong. He had merely said the results did not sufficiently prove them. The second paper discussed was on the comparative performances of two steamers by Mr. McArthur. More data were given of two other steamers, but the conditions under which the vessels separately did their performances did not appear, and these doubtless vitiated the comparison considerably. A paper was read by Mr. Halliday on the Marine Engineers' Laboratory. Mr. Halliday's paper really took the form of an address on the advantages of a marine engineers' laboratory in raising the status of engineers in mental, moral, and social directions. He explained that the idea of such a laboratory was primarily put forward some years ago by Mr. Macfarlane Gray and Mr. Flannery, now Sir John Fortescue Flannery. The council of the institute has now stepped in and taken the idea up, and successfully launched it as a going concern. This paper may contribute considerably towards its initiation, and it will assist in every way possible by setting its advantages before the members at home and abroad. From Mr. Halliday's paper one gathers that there are 13 sets of apparatus got together, and that it is the place of the council as a whole and individually to build up a properly equipped laboratory for the members. The council has set the example. We are quite sure that the matter has only to be placed before the members for them individually to take part in getting apparatus together. This laboratory work has in a manner taken the place of the Education Committee's work. A certain sum was voted for that purpose. It may be supposed that the council will at least spend the same amount on apparatus during the twelve months. Then there is the scheme and the enormous influence of Mr. Macfarlane Gray and Sir John Fortescue Flannery to fall back upon. Within their initiatory idea for a laboratory they must have had some scheme by which they intended to fit up the building with apparatus. That scheme must exist to-day, and surely an appeal has only to be made for them to set in motion and provide apparatus to the extent of that provision. However, a sufficient number of associates has been found to go on with the three or four experiments in hand, and the apparatus for these has already been provided.



EXPANSION GLAND FOR STEAM PIPES.

We quote the following from the paper:—"After the matter had been considered, the council agreed to place at the disposal of the Experimental Committee three rooms of the institute building. It was a wise idea of the founders of the institute that they should try to create a feeling in the members scattered over the seas that they should consider the building in the Romford Road a kind of shrine. When they returned after many days the feeling would draw them towards it as the Arab is drawn towards his Mecca. To enhance this view the founders made it a rule that each member should give something of his own to the institute—something to which his name would for all time be attached. It has thus come about that engineers, as wanderers in distant parts, when they saw wonderful things, thought of the old place in Romford Road, and brought them home to be seen by the members there. During the year those at home, as well as those abroad, have directed their energies in a common groove, and have begun to furnish the apparatus for a fully equipped laboratory. The council and the committee, and the younger members, the associates, and the graduates are devoting time and work to the business, and with quiet persistence and energy on their part will soon have something to be seen by members when they come to the place. And the committee would suggest that each member of the institute should of himself put the rule in operation which recommends that each member should present something to the institute during his membership."

The laboratory being now in regular operation, we may proceed to the next step. The third-class certificate is still a matter in embryo. The full statement of the case has already been placed before the membership by Messrs. Sage and Adamson. The next step is to set the matter in motion. How can this third-class certificate be initiated? From the papers sent out by the Board of Trade, it is clear that a third-class certificate is very desirable. There ought to be an acknowledgment made to the young engineer that he is quite competent and a desirable person on board ship. On the other hand, it ought to be made quite clear that, when a young engineer does not hold a certificate from his superintendent setting forth that he is a competent and reliable workman, he should be looked on as an undesirable person on board a steamer. Our plan would be to make the granting of these certificates an institute affair. One talks about the status of the engineer. Our opinion is that if an engineer is a competent and reliable officer, his status may be left to take care of itself. But the status of the institute is a very different thing. It is the duty of the most humble member of the institute to promote its influence and status on every possible occasion. And what would promote its influence more than to make the institute the guardian of the standard of competency of the young engineers who are applicants to the Board of Trade for certificates of competency? It is for the council, then, to receive suggestions, to thresh them out, and to get into a working arrangement with the superintendents for the issue of certificates of competency to young men in shops ashore who may be willing or anxious to join the engineering staff on board steamships. We think we see a working plan; but it is for the council of the institute to set the matter in motion, and it will be better at this stage simply to offer these suggestions.



Expansion Gland for Steam-Pipes.

A contribution to the discussion on Mr. Halliday's paper on feed-heaters was read at the meeting of the institute on Monday, 24th September, which had been sent in by Mr. Northcott (member). Mr. Northcott says: "When economy is gained by using what would otherwise be wasted heat, the cause of the increased economy is clear. But when we warm the feed-water by means of live steam, or steam taken directly from the boilers, it is not at all clear why any saving should result from feed-heating. On the contrary, as most feed-heating arrangements entail a loss of heat by radiation, one might expect a live-steam feed-heater to lead to a loss rather than to a gain. If we get Peter to pay Paul we don't increase the sum of Peter's plus Paul's possessions. . . . . Mr. Halliday is apparently convinced that not only do live-steam feed-heaters lead to increased economy although no waste heat is utilised, but that when waste heat is used to heat feed-water the gain is greater than the amount of heat utilised by a further saving in the boiler, and due to the feed-water being hot instead of cold. He asserts that hot feed-water is 'in better form for receiving heat than is cold water.' Also that hot water 'absorbs more heat' than cold water." Both statements are somewhat nebulous. We should think that it is quite possible that hot feed water would be in better form to receive heat, since it was thermally more akin to the water in the boiler, and secondly, that it is quite possible that hot water might absorb more heat if it was in better thermal condition for doing so. Mr. Northcott goes on to say that "The author really means, I take it, that hot water absorbs heat faster than cold water." No, we hardly think that is what the author means, because hot water does not absorb heat faster than cold water, for his second paper proves that it does not do so. "Further on," says Mr. Northcott, "he would appear to think when a boiler is not receiving either hot or cold feed its circulation is normal and best, but that this normal and best state is disturbed less by the admission of hot than cold feed. If this be correct, it would follow that the heat going up the chimney will be least when the boiler is not being fed—that rather more heat will be wasted when hot feed is being introduced, and that the greatest waste of heat will obtain when cold feed is being introduced—even although the hot feed is got from live steam. Is there any evidence in support of this?" Mr. Northcott goes on, "Before most of the members were born it had been ascertained experimentally that the rate of transmission through so-called 'heating surface' increased with the rate with which the water was caused to flow past the transmitting surface. Very early experiments showed also that when the water receiving heat was at or about the temperature of evaporation the flow of heat through the heating surface was about four times as fast as when the absorbing water was at a low temperature." We are quite willing to believe that experiments were thought to prove this, only they did not. Mr. Northcott goes on to say, "I agree with Professor Elliott in thinking that 'mere velocity of matter apart from thermal and other conditions' would not increase the rate of absorption." Is the paper on mere velocity of matter? It is on feed-water *heaters*. Newton dealt with velocity of matter years ago. This paper deals with the velocity of matter with thermal and other conditions thrown in. And in no instance is velocity of matter discussed in the paper apart from "thermal and other conditions." Mr. Northcott goes on to say, "A good circulation clears away the particles of water that have received heat from the 'heating surface,' and the steam bubbles that may have been formed thereby, and gives other particles of colder water the chance of warming themselves by absorbing heat drawn from the plate." The words "a good circulation" is a qualified phrase, and very acceptable. We are not now led to believe that the more rapid the circulation the better. "A good circulation" is now sufficient. The editor of the *Engineer* puts it this way:—"Should the surface of the plate be not wet, the absorption is defective. On the other hand, circulation in itself is injurious. The circulation should only be sufficient to keep the plates wet. When the circulation is just sufficient to make them wet, the absorption is then at its maximum" This idea appears to be borne out by Mr. Halliday's experiments. The attendance of members at the Institute during the daytime is inconsiderable; yet the provision made for this runs considerably into the annual income.

EASTON, ANDERSON, AND GOOLDEN, ERITH IRON WORKS.

It was in 1864 that Dr. William Anderson, C.B., F.R.S., laid out the works of the above company, and the site was certainly well-chosen, both from its river frontage and because of its proximity to the South-Eastern Railway system—perhaps, though, this latter is of doubtful advantage. From London to Erith is a distance of 13 miles, and the time taken by the train to travel this distance is about an hour, more or less. We have heard and we have read curious things about the goods traffic on this system, and lately, we believe, a coal train has been entirely lost, and, although known to be missing for some weeks now, it has not yet put in an appearance. But the Thames, which is just a mile wide at Erith, is of unquestioned advantage. Most heavy machinery and boilers can be simply run out by travelling crane above the boat and lowered into it without the least trouble. The main gate to the works is about half-a-mile from Erith Station.

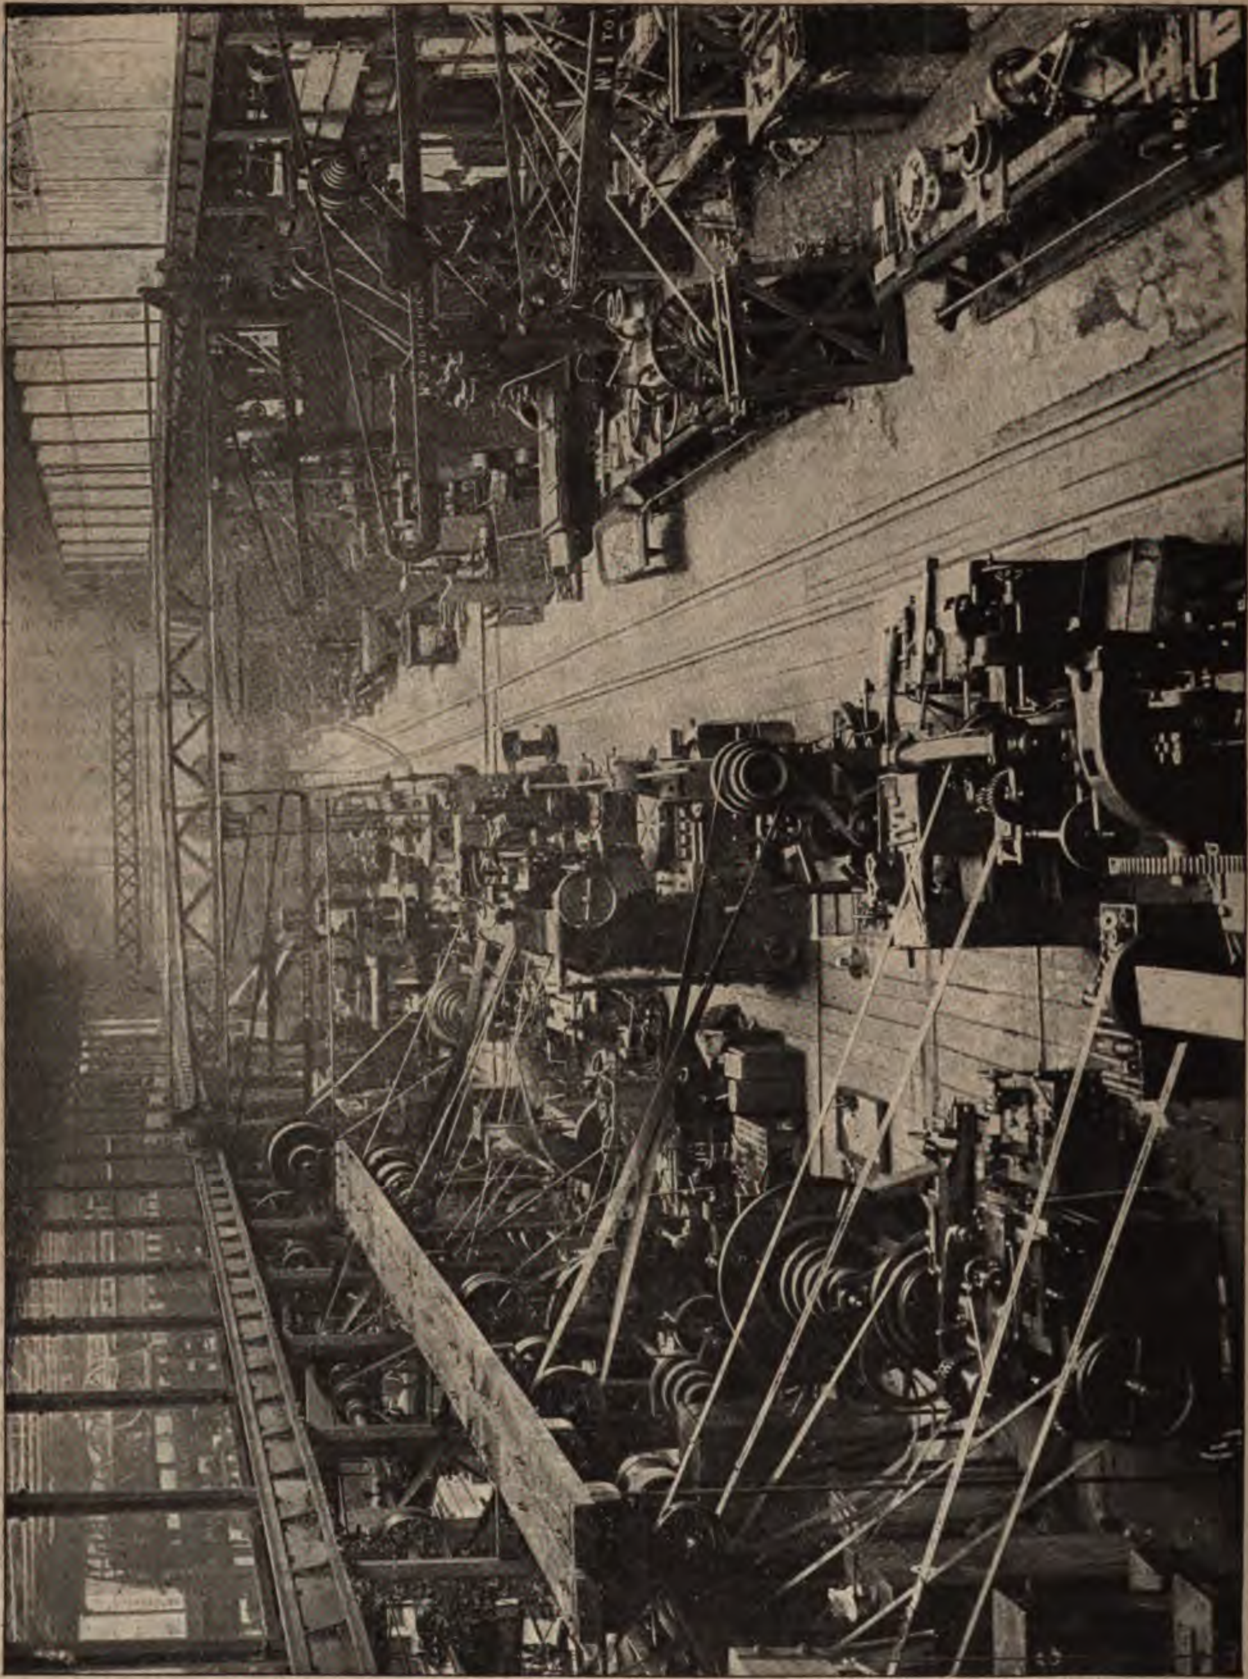
The original works of the company were at the Grove, Southwark, but gradual extensions were made at Erith, until in 1873 the Grove Works were closed, and the machinery and tools were moved down to Erith. The extent now of the works is 17 acres, and the river frontage is 800 ft. The works are entered through the offices. On the ground-floor of the offices are the clerks' and manager's rooms, and above is the drawing office, which has accommodation for 44 draughtsmen, and at present there is a full complement. In the offices there are also an estimating, electrical, and photographic rooms.

The shops are built with their direction running towards the river, so that the travelling crane can work out on a gantry over boats and barges. The main building consists of six equal spans 43 ft. wide and 600 ft. in length. The two middle spans are fitted up as machine and erecting shops, and the roofs of them are carried up so as to give plenty of head room for building large engines. The high traveller rails are 39 ft. from the floor level. At the present time when one enters they see numbers of hydraulic lifts being fitted up. These are for offices and mansions; one was for Queen Anne's Mansions. A number of electric lifts are also in process of erection for the South London Railway. Further along a number of compound vertical tandem engines are being constructed and erected. The circulating pumps and engines for H.M.S. *Aboukir* and *Cressy*, now building at Fairfield, are being constructed. At the end of the shop there is a testing room, and the ventilating fans and engines built in the shops for the Fairfield Works were being tested. As the working pressure was 300 lbs., and the pressure at the time was only 140 lbs., the fans and engines were not seen at their best. Still they worked very smoothly. Amongst other things being constructed and lying in this erecting shop were a number of sluice gates for Chatham Dockyard, vertical pumps for well sinking at Madrid, pumps for the Brush Company's works, also large beam engines for Sutton Waterworks.

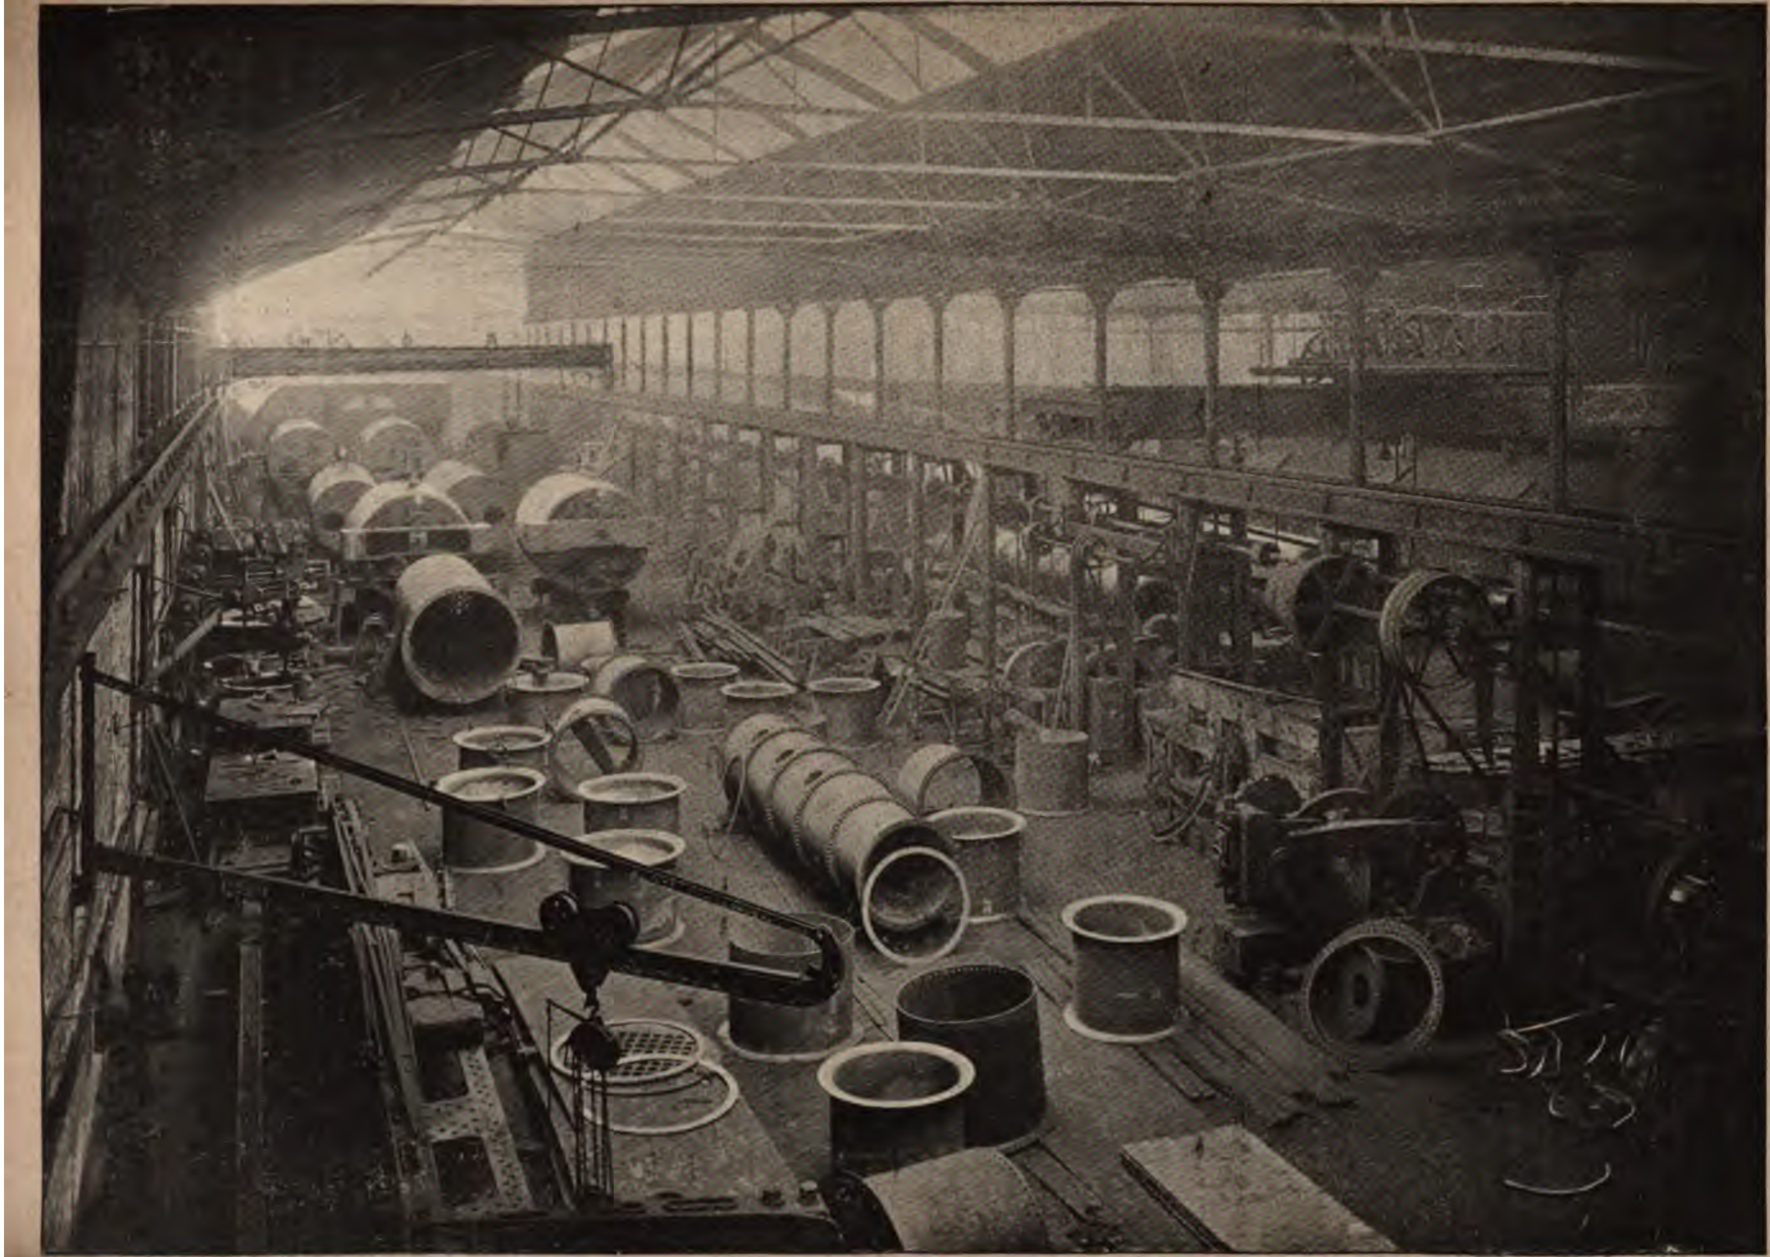
The erection of the machines under construction was going on in the middle of the floor, but ranged along the walls and next the pillars were machine tools. Some of the machines were very large and could take in work of great dimensions. There was a huge lathe with 30 ft. bed, another huge horizontal lathe with 18 ft. wheel, two or three large planing machines with about 20 ft. travel, and the crosshead carrying tool is 6 ft. rise above the table. The Sutton engine was of large size, the shaft being 18 in. diameter. The piston rings for the circulating pump engines were of Sir John A. Durston's own design. They were ordinary split rings, but with a recess at each side. They were turned for a 1·64 in. wear, and when this was worn down the shoulder of the recess came against a corresponding shoulder, which prevented the steam which had leaked into the inside expanding them further and increasing the friction.

The machine shop engine is of the beam type, and like all this kind works very smoothly. In the same room are two engines driving dynamos for supplying current to the electric cranes. The dynamos have an output of 105 volts, 500 amperes, and the speed is 750 revolutions. Four Cornish boilers supply steam to the shop engines and the steam hammers. Three of the boilers are for the shop engines and for trials and one for the smithy.

The two bays towards the east of the erecting shop



Machine Shop, Messrs. Easton, Anderson & Goolden, Limited, Erith Ironworks.



Boiler Shop, Messrs. Easton, Anderson & Goolden, Limited, Erith Ironworks.

are used for boiler making. This shop is fitted with the usual fires, flanging plate rolling machines, and hydraulic rivetters. Further east two sheds have been erected with overhead cranes, under which frame-and-lattice work is made. The moulding shop and smiths' shop are in the two bays to the west. In the moulding shop there are three cupolas, and castings are made up to 20 tons in weight. Many of the cylinders cast in the works are very large and they are loam castings. Everything going on in this shop appears to be of massive descriptions. There is an overhead crane capable of lifting 20 tons.

The electrical shop is towards the west, and two boilers of the locomotive type supply the steam to the engines. These engines are horizontal and run at a speed of 300 revolutions. A number of dynamos were under construction for slate quarries, and two rather large (110 kilowatts) for the lighting of Pembroke town. Two had just been completed and were under test with the engines in the erecting shop. There are two electrical shops: one where the winding of bobbins and armatures is going on, and the other for turning the iron parts of the machines. Fifteen motors for the South London electric lifts were under construction. A neat little machine was in operation for stamping out armature disks. The pattern shop is large, as was to be expected from the variety of the work always in hand and the consequent variety of patterns.

M. Björnstad said they did not take in hand poor work. The men usually worked to gauge and to a nearness in fit of 1-10,000th of an inch. The consequence was that Government and local authorities could rely on the work turned out. The engines coupled to the dynamos for Pembroke town are triple-expansion and enclosed. About 10 gallons of oil is poured into the base of the engines, and after flowing through a strainer it is pumped at 25 lbs. pressure into all the bearings. Although the speed is 400 revolutions per minute, an engine of the same type had been known to run without stopping for three months, and when examined the tool marks had not been worn out of the bearings. The engines for the Leicester Corporation Waterworks were constructed at these works. They were of the triple-expansion inverted cylinder type, with cylinder 17, 27 and 24 in. diameter respectively, the stroke being 3 ft. and the steam pressure 120 lbs. per square inch. Three pumps of the plunger type beneath the cylinders were 12¼ in. diameter and 3 ft. stroke. The air, feed, and circulating pumps are worked off the main engines. The pumps were: feed pumps 2 in. diameter; air pump, 11½ in. diameter; and circulating pump, 6 in. diameter. The working speed is 25 revolutions per minute. There were three trials, each lasting 12 hours. The steam used was ascertained by weighing the air pump overflow; the water condensed in the cylinder jackets, and the water from the cylinder and valve chest was also included in the air pump overflow. The head of water in the pumps was taken from the engine-room pressure gauge, which was afterwards tested against a mercury column and the results corrected.

During the trial complete readings and diagrams were taken every hour; they were taken separately both by the staff of the Corporation and by that of the contractor.

THE CLYDE PASSENGER PADDLE STEAMER "WAVERLEY."

TO the noble fleet of swift passenger paddle steamers which, season after season, ply on the waters of the Firth of Clyde, connecting the various and often remotely situated watering-places with the several railway termini of the three great railway systems, only one addition was made this year, but in herself very noteworthy. This was the paddle steamer *Waverley*, an accession to the flotilla owned and worked by the North British Railway Co., of which we have pleasure in giving an illustration herewith.

Like her immediate predecessors in the North British fleet the *Waverley* is the production of Messrs. A. & J. Inglis, of Pointhouse Shipyard and Warwick Street Engine Works, Glasgow. All the vessels turned out by this firm for the same service—and their connection with the North British Co. has been a close one from the very beginning, they having built an earlier vessel of the same name as far back as 1865—have been remarkably successful; but the *Waverley*, added to the fleet in July of this year, has—as it was designed to do—excelled them all. She is of much larger dimensions than any of the other boats of this company's fleet, and ranks indeed amongst the largest of the pleasure steamers on the Clyde. Not only so, but she has been designed and engined to secure and maintain great swiftness; and the results of her services so far have proved such as to place her in the very front rank of swift paddle steamers, power, length, and displacement considered. On the occasion of the official speed trial on the measured mile in July she attained a speed equal to 19·73 knots an hour; and notwithstanding that this surpasses the speed of any vessel of her size plying on the Firth of Clyde, both on the official trial and in subsequent service, this high rate of speed has been unaccompanied by even the slightest vibration or other discomfort.

The *Waverley* is 235 ft. in length, 26 ft. beam, 8 ft. 6 in. deep, and has a tonnage of 448·5 tons gross register. She is licensed to carry 1,500 passengers. She has been plying from Craigendoran round the Island of Bute, besides taking part in the general service of the North British Steam Packet Co.'s system. The accommodation of the vessel has been arranged with the view of providing the utmost possible comfort for all classes of passengers. On the upper deck there is a wide and uninterrupted promenade extending almost the entire length of the vessel. The deck saloon is a spacious, admirably lighted and elegantly furnished apartment; and the dining cabin is another exceedingly handsome and well-appointed interior. In the fore part of the vessel there is also a series of well arranged and commodious cabins.

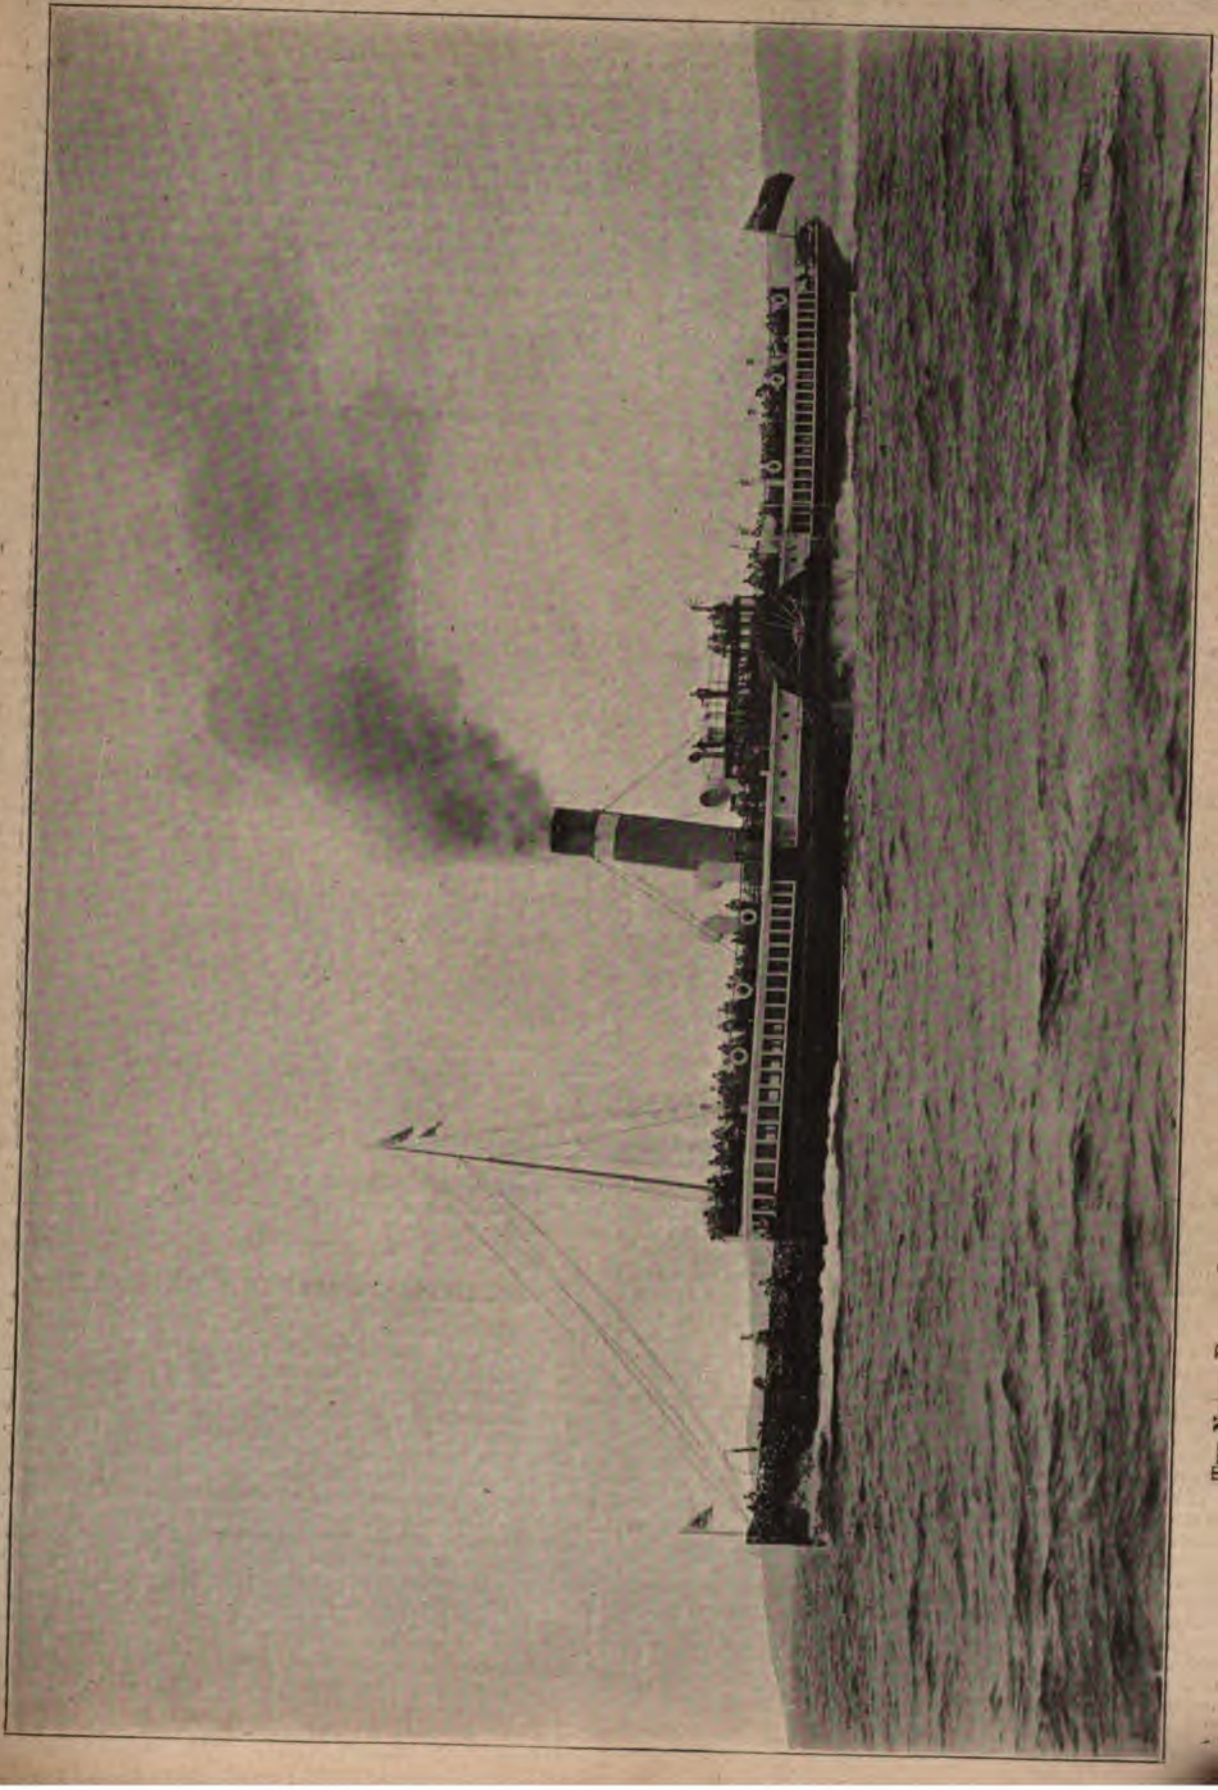
The *Waverley* is propelled by diagonal engines of the compound type, the departure from the single type of engine in this instance being one of many other indications of the spirited policy which the North British directors are evincing in ordering steamers of the very highest class suitable for the requirements of their extensive and extending service.

THE SHANGHAI ENGINEERING. SHIPBUILDING AND DOCK CO.'S "ORIENTAL" DRY DOCK AND WORKS, SHANGHAI.

THE Shanghai Engineering and Shipbuilding Co.'s fine graving dock, which has been constructed under the personal superintendence of Mr. J. Blechynden from the designs of Captain J. P. Roberts, was opened on June 1st. The dimensions are:—

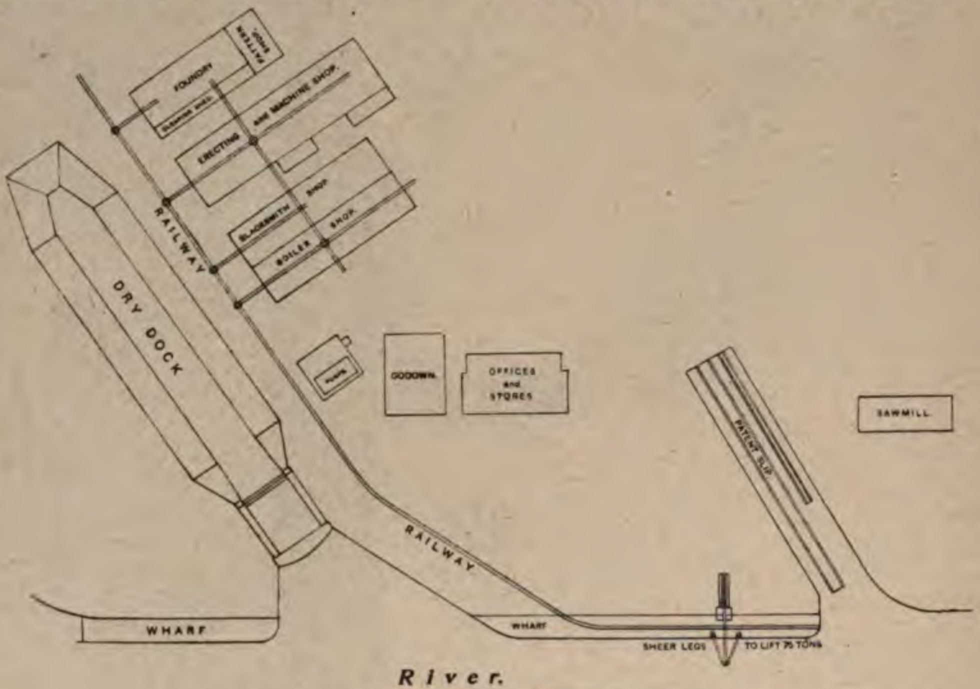
	Feet.
Length on blocks from outer caisson	526
Length on top	571
Width on bottom	54
Width on top	128
Width of entrance on bottom	64
Width of entrance on top..	80
Depth of water on sill	24

The property has a frontage of 2,000 ft., with a depth at low water springs of 26 ft. alongside, and extends 1,000 ft. to the rear. The dock strikes the wharf frontage at an angle of 45 deg., thus materially affecting the facility of docking. The blocks, each standing on six piles, are driven close together and



THE NORTH BRITISH STEAM PACKET CO.'S P.S. "WAVERLEY," BUILT BY MESSRS. A. & J. INGLIS, POINTHOUSE, GLASGOW.

placed every 4 ft., to the inner chase. The caisson, which serves both chases, is of wood well braced and bolted, being of a new design, which enables the laying of trolley lines over its deck, as it is intended to establish a complete trolley service over the whole of the estate for the purposes of economical and rapid transport of heavy material. The bed of the dock has a width of 75 ft. and is of concrete 7 ft. thick, of which some 12,000 tons have been used, the whole being covered with 3 in. deals securely bolted. To form some idea of the magnitude of the undertaking, we may mention that underneath this concrete are about 3,500 12 in. square piles averaging 24 ft. in length, which are driven in about 3 ft. apart. On these are firmly bolted 24 longitudinal stringers, upon which are, likewise secured, over 100 transverse stringers of the same material, the whole of the stringers being embedded with the concrete. The bulkheads at each gateway, which are absolutely water-tight, are formed of tongued and grooved piles 12 in. square, driven 20 ft. below the sill and extending at the chase piles 40 ft. into the sides. The sides of the dock are supported by heavy baulks firmly braced back and forming the usual steps all round.



"Oriental" Dry Dock and Works, Shanghai.

The dock is drained from two waterways running fore and aft, and 6 ft. each side of the centre line, thus being well clear of the keel blocks. The pumping out of the dock, which can be accomplished in 2½ hours, is done by two centrifugal pumps respectively, of 22 in. and 27 in. diameter, driven by an ordinary compound engine. In case of accident a second engine capable of working the 27 in. pump stands close by. For the ordinary draining of the dock a 10 in. centrifugal pump has been provided. On the southern division of the wharf frontage will shortly be placed a pair of steel sheerlegs, with a hoist of 27 ft., and capable of lifting 75 tons, a weight which is hardly likely to be required at Shanghai.

The buildings, which stand prominently on the southern section of the company's premises, namely, the machine, boiler, and fitting shops, through which the trolley lines run, are of the most improved design, everything being calculated from an utilitarian and economical standpoint, and enjoy the advantage of containing the latest improvements known to engineers. The machine shop, which measures 260 ft. by 66 ft., has two lathes of 54 in. and two of 44 in. centres, with a 46 ft. bed; when connected a shaft of over 70 ft. can be turned. Special lathes are also to be found for the turning of shaftings, pulleys, &c. Several planing machines, the largest of which is capable of running over a surface of 14 ft. square. Of drilling machines may be mentioned a large horizontal machine of the most improved type, capable of covering an area of 8 ft. by 10 ft. without moving the material, and a radial machine with a radius of 10 ft. In addition to these are the many machines, such as the band and circular saws for the cutting of cold steel, slotting, wheel-cutting, &c., to be found in every well-appointed shop. The boiler shop, with an area of 240 ft. by 75 ft., boasts of a drilling machine capable of negotiating a boiler with a diameter of 15 ft., and a plate edge machine, with a 24 ft. range. A complete set of hydraulic riveters ready for rivets of 1¼ in. diameter, and a set of masting rolls and other appliances. In the blacksmith's shop is a four-ton steam hammer, in close proximity to blowers and furnaces for the forging of shafts 16 in. in diameter. Also foundry plant which includes three "Rapid" cupolas and large brass furnaces. The pattern shop is also well appointed, and up-to-date with every requisite. The illumination of the dock and several buildings is intended to be amply provided for, there being no less than 57 arc and 220 incandescent lamps, contracted for by Messrs. Mandl & Co., the same to be fitted by the Oriental Electrical Co.

A slipway, with a cradle capable of carrying a vessel of 350 tons weight, and which will be hauled up by a steam winch, intended also for the hoisting at the sheerlegs, will be shortly completed.

INSTITUTE OF MARINE ENGINEERS.

The winter session of the Institute of Marine Engineers opened on Monday evening, September 11th, at 58, Romford Road, Stratford, E., Mr. A. Boyle (chairman of the council) presiding.

The Chairman said that in opening the forthcoming session they might congratulate themselves on the favourable auspices under which they were starting their winter meetings, which he trusted would be a great success. They had one paper ready to be discussed, and promises of several more, and he believed they would have some instructive meetings. That evening they resumed the discussion of two papers which had been read, and to a certain extent discussed. These were "Experiments on the heat absorption power of water," by Mr. George Halliday, and "A comparison between the performances of two steamships," by Mr. J. D. M'Arthur. The first-named was a series of results of experiments made by an apparatus kindly presented by the editor of the *Engineer*. Mr. Halliday had elicited a very important principle—that the heat absorption of water was increased and the evaporative efficiency of a boiler was increased by the rapidity of circulation up to a certain point, and that when this was reached the evaporative efficiency decreased. These experiments had been continued, and he now asked Mr. Halliday to explain what he had ascertained.

Mr. Halliday said that during the discussion a very important point was brought out by Mr. Macfarlane Gray—that when the velocity of the water got up to a certain point there was a maximum of absorption of heat by water. The first experiment he made he thought proved this fairly well, but Mr. Macfarlane Gray pointed out that he did not furnish sufficient data to prove that the rate of absorption failed after a certain velocity had been reached; that in one or two cases he had two points, and in another one point. He, of course, maintained that in every case there was a full absorption point, and that in no case was there a straight line showing that the amount of heat remained the same, whatever the velocity might be. Seeing the position Mr. Macfarlane Gray took up, he made careful notes and readings of what took place when the velocity reached a certain point where the absorption power fell. These results he had published. On the first experiments he simply got a hint that such a thing existed; on the second there was absolute certainty that such a thing did exist—that a maximum absorption of heat did take place, and that it depended on the amount of heat offered to the tube containing the water. When using the Fletcher burner he did not turn on the gas full; he allowed an easy burning row of gas to work on the tubes. In that case he had the maximum when the rate of flow was 100 cubic centimetres per minute. Then he turned on the heat further, and the maximum point came when the velocity of the water was measured by about 200 cubic centimetres per minute. He then put on two gas metres so that the tube was entirely enveloped by flames, and in that it was about 500 cubic centimetres. In each case he used the same tube, and the water was measured by what flowed right through. Since this was published the maker of a feed-water heater wrote him that this feed-water heater depended on the principle of pumping the water through a series of tubes at different speeds, and he found that under certain circumstances it would heat the water more than in others. That gentleman's argument was that the feed-water heater was the best, but he would not say that because the feed-water heater allowed the speed of the water to be regulated as it came through the pipes, therefore it was the best. Another firm had coincided with certain results that had been obtained.

Mr. Williams remarked that the objections he made on the last discussion had not been answered. An impression had got abroad that he was objecting to the proposition put forward by Mr. Halliday, whereas he repeatedly said he did not object to the proposition. There might be a maximum co-efficient transmission of heat to water dependent on the velocity on the surface, but his objection was to the evidence. It was simply a question of evidence, and the fact of Mr. Halliday thinking the second experiments necessary to put before them was sufficient to prove that his statement was correct.

The Chairman thought it was not necessary to go beyond the scientific value of the experiments made at the institute, and he was sure every opportunity would be given to members to see these experiments. It was unnecessary for him to give any definite opinion.

Mr. Halliday said really there was no difference in the figures in the paper now before them. Further experiments showed that they could not be disproved. Again, experimental results by a person of 20 years' experience had never been questioned; they had always been taken as correct. They might question a machine which someone had invented and said would do a certain thing, but the results he had never heard questioned, and these results were entirely as they stood before. With regard to the point that these results were felt necessary because of the discussion, he entirely disagreed. They were different results altogether. The first results were made with steam as a heating agent, the temperature of which was never over 300 deg.; the second results were obtained by heating a copper tube by means of gas, the temperature of which was something like 2,500 deg., and in the second case they got much better results. He had spoken with two or three prominent engineers on the matter, and they did not question the results at all.

The Chairman said he had spoken to Mr. Macfarlane Gray, and he had given every credit for the work done. It was very creditable to the institute that they were able to conduct experiments such as this on the premises. The council looked upon this as a very important part of the educational work which he hoped they were doing as regarded marine engineering. They had 13 sets of experiments, and he might suggest that a testing machine would be a very valuable acquisition.

The discussion then closed.

With regard to the second paper, "A comparison between the performances of two steamships," the hon. sec. (Mr. James Adamson) said one well-known member, in the course of correspondence on the paper giving a comparison between two steamers, had forwarded some particulars and results gained from two other steamers termed A A and B B :—

PARTICULARS.	A A	B B
Length between perpendiculars ..	345 ft.	330 ft.
Beam	46 ft. 6 in.	46 ft. 6 in.
Load draught ..	22 ft. 4 in.	20 ft.
Deadweight capacity	5,800 tons.	5,000 tons.
Diameter of cylinders	17 in., 24 in., 32 in., 42 in., 42 in.	17 in., 24 in., 32 in. 42 in., 42 in.
Stroke of pistons ..	42 in.	42 in.
Revolutions at usual speed	67	62
Average I.H.P. ..	1,240	1,050
Diameter of propeller	15 ft.	15 ft.
Pitch do. ..	17 ft.	17 ft.
No. of boilers and pressure	Two 260 lb.	Two 250 lb.
Mean diameter and length of ditto ..	13 ft. by 10 ft. 6 in.	11 ft. by 10 ft. 6 in.
No. and diameter of furnaces	Three, each 3 ft.	Three, each 3 ft.
Type of donkey boiler	Marine	Marine
Nature of draught	Ellis & Eaves's	Ellis & Eaves's
No. & size of winches	Seven 8 in. cylinders	Seven 7 in. cylinders
Dimensions of fan engine cylinders	Two, 8 in. by 12 in.	Two, 8 in. by 12 in.
Type of feed pumps	Weir's and ordinary	Weir's and ordinary
Do. do. heater	Weir's	Weir's
Do. evaporator ..	Mudd's	Mudd's
Steering engine ..	Davis's	Davis's
Total No. of auxiliary engines, including pumps, ash hoist, winches	12	11
Average speed ..	9·15 knots	8·5 knots
Average daily consumption of good Welsh coal ..	14·4 tons	13·10 tons
Average consumption per I.H.P. per hour	1·07 lb.	1·15 lb.
Average consumption per ton carried per mile ..	·0249 lb.	·0294 lb.

The Chairman said there were a great many points of detail which should be carefully considered. It showed how largely the cost for doing the same work was increased in one ship owing to lack of attention to details. It laid particular stress on the losses occasioned by the use of high-pressure steam for small auxiliary engines.

Mr. Ruthven said that on the last occasion, Mr. Adamson gave them figures, which were much more valuable after years of experiments than these isolated cases. The difficulty was to separate the ship from the engines, the engines from the boilers, and the boilers from the *personnel*.

A member thought it would be necessary to have a series of voyages, and ships running in the same weather, to make these experiments properly.

Mr. Maclaren pointed out that there was a difference of two feet in the diameter of the boilers, and that would increase the ship's weight.

The Chairman said the engineer as a rule had not much control of the ship or of the weather. All he had to do was to get as much power out of the coal he used as possible.

Mr. Ruthven observed that auxiliary engines of ships in the Navy were being fitted with special evaporators to take the steam from the auxiliary engines and pass it through a special condenser.

The Chairman thought it would be an advantage to use it in that way. The paper was certainly a credit to the author, and it might be further discussed.

The Hon. Secretary said the whole point seemed to be, what is the economy of the five-crank engine? There was a great deal of valuable matter behind this.

The discussion was adjourned, and a vote of thanks to the chairman for presiding concluded the meeting.

ELECTRICAL NOTES.

(*From our own Correspondent.*)

OUR electric launches require secondary batteries for storage work, and the very light one used on the street railway line of Ghent may come in of use. The car takes 108 cells, which together weigh about two tons, and these are sufficient to drive the car 35 miles. A launch would probably take about half this weight, and the weight then would be equivalent to a displacement of 20 cubic feet of water. The peroxide of the positive element of the cells is formed electrically. The positive electrode consists of a block built of many horizontal layers of corrugated lead sheets. These sheets are laid with the adjacent corrugations at right angles to each other, so as to give numerous channels and a large space to be filled with peroxide. The plates are turned together at the corners, and the whole then becomes a block. Nine holes are bored in the plates at right angles to the surface, and the negative electrode, which consists of nine cylinders, goes into these holes. These cylinders are formed of perforated lead piping containing the negative action mass in the form of porous spongy lead. The negative cylinders are held out of contact with the positive block by means of perforated hard rubber insulating jackets. Each cell when discharging at the rate of 15 amperes has a capacity of 300 ampere-hours, and when discharging at 50 amperes has a capacity of 250 ampere-hours.

Washington Experimetal Tank.—The special machinery for the experimental tank at Washington has just been completed. Congress appropriated £20,000 for its construction. All the mechanism installed is electrical. The carriage for towing the wooden models rests on eight wheels, and spans the whole width of the basin, and is driven by four electric motors, and these can get up a speed to the carriage of 2,000 feet per minute. The armatures of the motors have a speed of about 800 revolutions per minute, and are fully capable of taking the full load for five minutes. The carriage weighs 23 tons, and its speed is varied by a controller for the current coming from the station, and also by cutting out or in the several driving motors. Forty-five different speeds can be given the carriage, ranging between 0 and 2,000 ft. per minute. There are two brakes to the carriage, independent of each other. One consists of two strips of iron, one on either side. These strips are pressed together by hydraulic cylinders, whilst a slipper on the carriage tends to force them apart. The other is an hydraulic brake, which consists of a cylinder and piston located in the water of the tank, the piston being connected to the carriage by means of a cable and hook. There is also a dynamometer, which records the pull of the models through the water. The forward end of the spring of the dynamometer, to which a bracket is attached, is moved forward or backward by an electric motor. This spring measures the resistance of the model. Two electric-driven centrifugal pumps discharge the water from the tank. The tank contains 1,000,000 gallons.

The Holland Submarine Boat.—An elaborate series of tests are being made with this boat at Little Peconic Bay, Long Island, by United States naval officers. The first tests, it will be remembered, were made about a year ago in Staten Island Sound, and since then the boat has been completely overhauled, and several changes have been made in her machinery. Little Peconic Bay was selected because of its level bottom, and because of its quietness. The principal test will be over a two-mile course, and will consist of diving and running under water, running awash, and the discharge of torpedoes. She has already been noted to dive below the water in from five to ten seconds. She is now equipped with a 150 H.P. gasoline engine, which propels the boat when running on the surface, and it also drives a 50 H.P. dynamo for charging the storage batteries, which weigh in all some 40,000 lbs. Compressed air works the storage engines, and discharges the water from the submerging tanks when the vessel is to be brought to the surface. The air pressure is 2,000 lbs per square inch, and it is supplied to the storage engines through valves which reduce the pressure to 50 lbs. The gasoline carried gives her a cruising radius of 1,500 miles at a speed of six miles an hour. It is said to make better time under water than on the surface.

Electrical Measurement of the Oscillation of Ships.—This instrument is made on the gyroscopic principle. It consists of a small electric motor mounted in gimbals, like a ship's compass, with its armature running in a vertical position at high speed. As the ship rolls the armature maintains the original direction of its position, whilst the frame supporting the gimbal rings follows the motion of the ship. There are scales and pointers for indicating the oscillation.

Electric Siren.—Mr. A. G. Trudeau, of Ottawa, has invented and constructed an electric siren. It consists of two large funnels made of ¼ in. copper. Each of the funnels projects 6 ft. 6 in. from the stand at right angles to each other. In each of these funnels a vibrator is placed, the object being to use alternately or simultaneously. The diaphragm is secured in a frame by a circular clamp, and acts like the ring of a drum on the skin The amplitude of the vibration is regulated by a screw at the middle. Electromagnets made by laminated cores are fixed in the frame. The horns project from a large hollow sphere mounted in the stand. The sphere is in two parts, and the vibrator is self-contained and can easily be replaced. It is worked by alternating currents.

Wireless Telephony.—Marconi has brought his system of wireless telegraphy to considerable perfection, and now we have Sir Wm. Preece bringing in a system of wireless telephony. The experiments have been made near Carnarvon. Four high poles have been erected near Llanfaglan Church. At a distance of half-a-mile four similar poles have been put up. A high pole has been erected at Belan Fort, half a-mile further on, which supports a coil of wire, one end of which is dipped in deep water. Sir William has been able to send between these points the sound of taps, and it is his intention to introduce the Morse system. Messages have been sent, and the system enables the messages to be sent much more quickly than by Marconi's.

HOW A BROKEN SHAFT WAS REPAIRED.

(BY W. J. PAGE, 2ND OFFICER).

THE *Perthshire* left Sydney on the 26th April with 1,200 tons of frozen meat and 600 tons of produce, bound for the Bluff, New Zealand. We experienced strong S.E. gales from the day we started until the 28th April, and then the weather moderated. At six p.m. on that date the tail-end shaft broke. The ship was then about 391 miles S.E. of Sydney, latitude 38 degrees 37 minutes S., and longitude 156 degrees 48 minutes E. All sail was at once bent, and it was set that night with the hope of sailing or drifting towards Sydney. The sail, however, proved useless; the ship would not even steer with every stitch of canvas that we could put on. Then there remained nothing for us to do but to drift in the hope that shortly some vessel would sight us and take us in tow. On April 30th the engineers on board turned to to ascertain the exact vicinity of the break, and came to the conclusion that it was too far aft to allow them to connect with the coupling. So all idea of temporary repairs was abandoned. Now there commenced on our part a series of daily driftings whose like has never been previously recorded in this vicinity. We tried all means and ways of tacking or wearing ship, but we never succeeded. We encountered gale after gale, and this drove us more and more in varying directions, but generally to the north-east. So as to alter the vessel's course, or at least get her head on to the seas, we rigged heavy drags over the stern with as much as 180 fathoms of line, but all to no purpose. We could not alter her course at all. These drags, after repeated trials, were given up as useless. On May 13th we sighted the timber-laden schooner *Whangaroa*, from New Zealand. The skipper came aboard, got all information as to our position, and the manner in which we were drifting, and promised to tell any steamers he met. From the time he met

THE NEW … PUBLIC LI… ASTOR, LENOX, TILDEN FOUNDA…

us till May 21st we had comparatively calm weather, though all the time our general drift was to the north-east and further away from our port, that is to say, from Sydney. On May 22nd there commenced a series of gales lasting a week, and blowing from all points of the compass in succession with mountainous seas. The ship was in splendid trim and behaved very well, although she rolled very heavily and strained considerably. On the 25th May, in the height of the gale, we spoke to the barque *Northern Chief.* This was the second vessel we had seen in 30 days, although a topsail look-out was kept night and day. By Sunday, 28th May, we had travelled in all 930 miles in a straight line. Of course the actual distance covered was much greater, and our direction also taking it in a straight line was north-east from the point where we broke down. The course had been zig-zag, and sometimes altogether backwards, but the latter was not frequent,

During all this time rockets and other distress signals were sent up whenever we came to within 30 miles of a steamer's track, but it was all of no use. We were now out of the regular track of all steamers between New Zealand and Australia, and were drifting in a direction which would take us into the unpleasant vicinity of the South Sea islands and their dangerous coral reefs, and into waters which are unfrequented by ships save perhaps an occasional schooner, which to us would be useless, because by the time she had reported our whereabouts to any Australian or New Zealand port we would be from 100 to 300 miles from the spot, and our manner of drifting would be unknown. As a last resource it was decided to break away the stern tube, and endeavour to couple the broken shaft. 200 small holes were consequently bored into the tube in such directions as it was wanted to split. At the same time chains were with great difficulty passed round the propeller outside the ship, and after the gear had carried away twice it was eventually lifted into its proper position. The approximate weight of the propeller is 13 tons, so that you can see that it was no easy matter. Parcelling was also got round the propeller shaft, so as when heaving it into the hold we could keep the water out. Then came the task of splitting the tube and cutting away the brass off the shaft. After six days of hard toil in the shaft chamber, where we had scarcely elbow room and where we always worked constantly saturated with water, the engineers cleared off the last piece of brass from the shaft and pronounced it ready for the coupling. You must know that our work all this time was extremely dangerous. The chamber in which we were had to be kept fully on the pumps the whole time to keep the water down, and if they had got choked there was only one manhole for the men to scramble out of. As soon as the shaft was ready the coupling, in three parts, each of which weighed 10 cwt., was lowered down with great care, and it was fitted on to the broken end of the shaft. This occupied another three days, and was, you may be sure, a time of much anxiety to us. On the 7th June we sighted the *Verajean.* At the time it was comparatively calm, but before she could speak to us it came on a howling gale again, so her captain could not board us. We were still working on the temporary shaft coupling, and on the 11th June, after 14 days of hard work, which had lasted right through the 24 hours, the first few turns of the propeller were taken You can imagine our feelings of joy and excitement when we once more heard the throb of the engines, which had been silent for six weeks or more. The temporary structure worked all right, and we got steerage way on the boat, and it was not a moment too soon. At that time we were within 46 miles of the rock-bound coast of Norfolk Island, and we were driving straight towards it at two or three knots per hour. It was not more than a day's drift from us. What made our drift so fast was the heavy gale that was raging, and it was accompanied with a mountainous sea. If it had not been for the repaired shaft we would have been absolutely helpless. That day we went slowly ahead with the engines all day, stopping them two or three times to adjust the couplings. So easy did we go ahead, for we were afraid to take too much out of her for fear the coupling would split off, that we did not make more than two or three knots an hour, but those two or three knots were in a direction to take us clear of the island. The next day the engines still continued revolving, and we steamed 83 miles to the westward. This distance was accomplished in spite of several stoppages which were made to inspect the broken shaft, and further adjust the couplings. At 3 a.m. on the 13th June we sighted the steamer *Talune.* She stood by us till daylight, when a hawser was passed aboard and we proceeded along towards Sydney. Here I cannot do better than tell you of the masterly manner in which Captain C. Spinks, of the *Talune*, managed his vessel. He brought her alongside the *Perthshire* as if she had been a little tug-boat instead of an inter-colonial trader. Our position when picked up by the *Talune* was latitude 29 degrees 14 minutes S., and longitude 167 degrees 6 minutes E. Now although we were under steam, and were getting two or three knots an hour out of the vessel, with the possibility of getting more, we were bound to take the offer of the *Talune*, because we did not know the moment the shaft might go again. We had, too, to consider the length of time that we had been out, and the fact that our passengers were women and children. The only other instance of cutting away a stern tube in the annals of shipping is that of *Tokio Maru.* But she was in the regular course of many lines of steamers, and so could make her own terms. We, on the other hand, if we had refused the tow of the *Talune*, might have broken down the following day, and there would be very little chance of us falling in with another steamer, at least so it seemed at that time, for the *Talune* would naturally have reported speaking us under "easy steam," and so no further search would be made for us. Our provisions were getting very low. We had plenty of meat aboard without broaching the cargo, for we had home stock in the freezing chamber, but our coffee and bread and vegetables had for some time been exhausted. After we had been in tow for two days, that is to say, on June 15th, at 9 a.m., we parted the hawser, and it was seven hours before we got fast again. A heavy sea was running, so we could not have the *Talune* alongside of us, but eventually we got a line on her by means of rockets, and then heavier lines were hauled from one to the other. This time the towing-line consisted of the anchor chains of each steamer with 60 fathoms of wire chain between them. Then we made the Australian coast without further mishap. Our steaming assisted the *Talune* considerably. It kept steering way on the *Perthshire* and was also of assistance in making headway. If we had been helpless it would have been three or four days longer. Off Newcastle our coupling began to slip considerably, and we stopped for the purpose of fixing it up again. The pumps were set going once more to clear out the shaft chamber, and the engineers got to work. This was done; but not till one of the engineers had gone below water and driven some wedges into the steam bush. We then resumed the voyage to Sydney under very easy steam, so as not to reach here till daylight. We entered the heads at 7.5 o'clock, and brought up off Robertson Point shortly after eight oclock.

Atmospheric Silent Ash Hoist.—We hear on very good authority that the Crompton Atmospheric Silent Ash Hoist is making progress, and steadily pushing its way with shipowners. We understand that over 800,000 tons of shipping of all classes are now using this simple and effective apparatus, and from entirely independent sources we hear of the satisfaction they are giving. We believe last month's crop of orders amount to 22 vessels to fit, nearly half of which emanate from one of the largest of the Continental mail companies who have previously proved their value in several of their steamers. Most of the leading British and foreign shipping companies are now adopting this invention for their steamers, as its previous record for absolute safety, effectiveness, and non-liability to breakdowns stands without a rival or competitor. The hoists are also being extensively used for land and stationary work, electric lighting stations, gasworks, factories, &c., where ashes and refuse from boilers are below the ground levels.

Messrs. Alldays and Onions.—We have just received an illustrated catalogue of improved fans, manufactured by Messrs. Alldays & Onions, of the Great Western Works, Birmingham, and Sherborne Lane, London. The catalogue is well illustrated, diagrams being given of the different classes of fans made, whether for workshop application or ventilation, or forced draught on board ship. Each type has a very concise and useful table, giving the various dimensions, tables of speeds, capacity in cubic feet per minute, and pressure in inches of water; and charts are included showing the different relative positions of base and inlet and outlet passages. The types particularly applicable to marine work are fully dealt with

NAVAL ENGINEER APPOINTMENTS.

The following appointments have been made at the Amiralty, from August 26th to September 25th, 1899:—

Adams, W. H., chief engineer, has been advanced to the rank of staff engineer in her Majesty's fleet.

Andrew, G. E., engineer to the *Resolution*, to date August 28th.

Apps, W. R., chief engineer, has been advanced to the rank of staff engineer in her Majesty's fleet.

Aston, S., staff engineer to the *Pembroke*, for the *Ajax*, to date August 28th.

Barr, E., engineer in lieu of chief engineer to the *Revenge*, for the *Boxer*, undated.

Brown, H. A. (probationary), assistant engineer to the *Arrogant*, for training, to date August 31st.

Brown, W. J., fleet engineer to the *Pembroke*, for the *Irresistible*, to date August 28th.

Campbell, C. J. R. (probationary) assistant engineer, to be lent to R.N. College, for course of study, to date October 1st.

Clayton, F. A. (probationary), assistant engineer, to be lent to R.N. College for course of study, to date October 1st.

Clegg, H. J., engineer to the *Duke of Wellington*, for the *Ranger*, to date September 11th.

Cole, E. (probationary), assistant engineer, to be lent to R.N. College for course of study, to date October 1st.

Crabtree, E., engineer to the *Vivid*, for Keyham College, to date August 28th.

Cummings, G. R. T., staff engineer, has been advanced to the rank of fleet engineer in her Majesty's fleet on the retired list.

Curgenven, L. W. (probationary) assistant engineer, to be lent to R.N. College for course of study, to date October 1st.

Davis, H., assistant engineer to the *Vivid*, supernumerary, to date September 1st.

Davis, H., assistant engineer to the *Vivid*, for charge of reserve stores, and engineer of torpedo-boats, &c., to date October 5th.

Davis, W. H., inspector of machinery to the *Royal Arthur*, to date September 24th.

Dawson, T. J., acting engineer to the *Rupert*, to date August 28th.

Denbow, W., engineer to the *Icarus*, to date August 31st.

Eckford, P. G., to be assistant engineer R.N.R.

Edmonds, G. L. (probationary) assistant engineer, to be lent to R.N. College for course of study, to date October 1st.

Edwards, W., engineer in lieu of chief engineer to the *Hood*, for the *Bruiser*, undated.

Ellis, J. H. W. Howard, staff engineer, has been advanced to the rank of fleet engineer in her Majesty's fleet.

Everitt, A. E., assistant engineer, to be engineer in her Majesty's fleet.

Ewart, A. E., assistant engineer, to be lent to R. N. College for course of study, to date October 1st.

Ford, H. L. M., assistant engineer to the *Pelorus* (temporary), to date August 28th.

Gallery, E., chief engineer, has been advanced to the rank of staff engineer in her Majesty's fleet.

Glen, J. M., engineer R.N.R. to the *Duke of Wellington*, for instructional course, to date October 3rd.

Graham, J. E. D., fleet engineer to the *Pembroke*, for the *Imperieuse*, to date September 7th.

Haddy, F. C., assistant engineer to the *Hermes*, to date October 5th.

Haggarty, G. A., chief engineer, has been advanced to the rank of staff engineer in her Majesty's fleet,

Hall, C. R., engineer to the *Duke of Wellington* (supernumerary) to date August 14th.

Hamilton, J. (probationary) assistant engineer, to be lent to R.N. College for course of study, to date October 1st.

Hammond, H. T., fleet engineer to the *Duke of Wellington*, for the *Pallas*, to date September 7th.

Harding, C. A., staff enginer to the *Hermes*, to date October 5th.

Head, E. A. William, engineer has been promoted to the rank of chief engineer in her Majesty's fleet.

Highton, F. W., chief engineer, has been advanced to the rank of staff engineer in her Majesty's fleet.

Hobbs, L. M., assistant engineer to be lent to R.N. College for course of study, to date October 1st.

Hocken, J. H. (probationary) assistant engineer, to be lent to R.N. College for course of study, to date October 1st.

Howlett, W. A., fleet engineer to the *Pembroke*, for the *Grafton*, undated.

Hughes, J., (probationary) assistant engineer to the *Furious*, for training, to date August 31st.

Hyde, T. H., fleet engineer to the *Duke of Wellington*, for the *Hercules*, to date September 7th.

Jackson, L., assistant engineer to the *Vivid*, for the *Magpie*, to date September 18th.

Kimber, J. L., engineer to the *Wildfire*, for the *Reserve*, to date September 8th.

Lawrence, W. G., engineer to the *Widgeon*, undated.

Lawton, W. R., engineer to the *Tamar*, for charge of machinery of torpedo-boats, to date September 11th.

Lester, A. E. (probationary) assistant engineer to the *Niobe*, for training, to date August 31st.

Macnicoll, A. D., engineer R.N.R. to the *Duke of Wellington*, for instructional course, to date October 3rd.

Mann, W. S. (probationary) assistant engineer, to be lent to R.N. College for course of study, to date October 1st.

Manning, H L., chief engineer to the *Pembroke*, for the *Scylla*, to date August 28th.

Martin, G. R. (probationary) assistant engineer, to be lent to R.N. College for course of study, to date October 1st..

McKinlay, A. W. (probationary) assistant engineer to the *Furious*, to date August 28th.

Michell, W. H. (probationary) assistant engineer, to be lent to R.N. College for course of study, to date October 1st.

Nicholson, J. B. (probationary) assistant engineer to the *Pelorus*, for training, to date August 31st.

O'Dougherty, H. B. O. (probationary) assistant engineer to the *Pactolus*, for training, to date August 31st.

Paris, W. de, engineer to the *Pembroke*, for the *Audacious*, to date August 28th.

Parnall, W. R., assistant engineer, to be lent to R.N. College for course of study, to date October 1st.

Perkins, G. L. Roberts, chief engineer, has been advanced to the rank of staff engineer in her Majesty's fleet.

Phillips, R., chief engineer, has been advanced to the rank of staff engineer in her Majesty's fleet.

Read, H. C. (probationary) assistant engineer, to be lent to R.N. College for course of study, to date October 1st.

Reynolds, T. R., chief engineer to the *Barham*, to date October 3rd.

Riley, J. S., engineer R.N.R. to the *Duke of Wellington*, for instructional course, to date October 3rd.

Robins, L. (probationary) assistant engineer, to be lent to R.N. College for course of study, to date October 1st.

Ryan, J., chief engineer, has been advanced to the rank of staff engineer in her Majesty's fleet.

Sands, J., assistant engineer to the *Ramillies*, to date August 26th.

Sadler, T., engineer R.N.R. to the *Duke of Wellington*, for instructional course, to date October 3rd.

Scott, E. B. (probationary) assistant engineer to the *Diadem*, for training, to date August 31st.

Shea, E. S., engineer R.N.R. to the *Duke of Wellington*, for instructional course, to date October 3rd.

Shirvell, J., fleet engineer to the *Vivid*, for the *Highflyer*, to date September 8th.

Stuart, M., chief engineer. has been advanced to the rank of staff engineer in her Majesty's fleet.

Talbot, J. C. (probationary) assistant engineer, to be lent to R.N. College for course of study, to date October 1st.

Thorne, C. W. fleet engineer to the *Vivid*, for the *Pique*, to date September 7th.

Vibert, J. E., engineer in lieu of chief engineer to the *Royal Oak*, for the *Dragon*, undated.

Watson, L. J., engineer to the *Pembroke*, for the *Goliath*, to date September 7th.

Westmoreland, F. G., engineer R.N.R. to the *Duke of Wellington*, for instructional course, to date October 3rd.

Wheater, P., engineer to the *Barfleur*, for the *Fame*, in lieu of a chief engineer, to date September 8th.

Wheatley, T. E., to be assistant engineer R.N.R.

Whebby, T., fleet engineer to the *Cleopatra*, to date September 7th.

Wilson, J. D., engineer to the *Hermes*, to date October 5th.

Wood, A. O., assistant engineer to the *Majestic*, to date October 5th.

Wyles, E. (probationary) assistant engineer, to be lent to R.N. College for course of study, to date October 1st.

INDUSTRIAL AND TRADE NOTES.

THE CLYDE AND SCOTLAND.

(*From our own Correspondent.*)

DURING the month of September, or as much of it as has passed at the date of writing, 23rd ult., exceptional activity has prevailed throughout the yards and engine shops of the Clyde and other Scottish districts. Measured by the output of new shipping, indeed, the month has proved—or gives every promise of proving - a record period. All told, about 55,000 tons have been added to the world's mercantile fleet; and should, as is expected, the Allan Line twin-screw steamer *Tunisian* be sent off the stocks, by Messrs. Alex. Stephen & Sons, of Linthouse, another 10,000 tons will fall to be added to the aggregate. There is just a chance, however, that the send-off of this important vessel may be postponed until early in the present month.

Launches, more than is usually the case, occurred in batches, or lots, as large an output as 17,500 tons being recorded in two separate days. In point of size the largest vessel was the *Ranee*, 8,200 tons deadweight, launched by Messrs. Charles Connell & Co., Whiteinch, for the Asiatic Steam Navigation Co., Liverpool, followed closely by the *Urlana* of 8,000 tons, by Messrs. A. & J. Inglis, Pointhouse, she being the second of four steamers at present under construction by the same firm for the British India Steam Navigation Co.

As to fresh contracts, there has been a continuation of the flow of important orders which began to set in about two months ago, and notwithstanding the large output, there is no apparent diminution of new keels. Altogether some 30,000 tons of fresh shipping have been ordered, only a small proportion of which is naval work. It is, moreover, pretty certain that a number of owners have specifications ready to place before builders immediately the price of materials shows signs of breaking, it being stated that as many as 15 or 16 steamers, most of them of large size, are definitely in prospect on that contingency.

The Fairfield Shipbuilding and Engineering Co., Limited, Govan, have during the month been entrusted by our Admiralty with an order for two additional torpedo-boat destroyers of 30 knots speed, to be named the *Falcon* and *Ostrich* respectively; and the same company have been commissioned by the Indian Government to build and engine a large and fast twin-screw troopship to be delivered next year The vessel is to be 420 ft. long, 51 ft. beam, and 31 ft. deep, and is to steam 18 knots on a six hours' run at the loaded draught. Sir E. J. Reed, K.C.B., &c., is the naval architect and engineer. The Fairfield Co. are progressing satisfactorily with the Government contracts they have at present on hand—these comprising two first-class cruisers *Cressy* and *Aboukir*, of 12,000 tons displacement; the mighty armoured cruiser *Africa*, of 14,500 tons, 30,000 I.H.P., and 23 knots speed, ordered in January last; the 9,800-ton cruiser, *Bedford*, ordered in May last; and two 30-knot torpedo-boat destroyers, the latter of which are now wholly in frame.

Messrs. Robert Napier & Sons, Limited, Govan, launched on the 20th ult. the *Trent*, the second of two steel-screw steamers which they have on hand for the Royal Mail Steam Packet Co., London. Specially designed to suit the requirements of the company's West India mail service, the dimensions are:—425 ft. length; 50 ft. breadth; 35 ft. depth; gross tonnage about 5,500. The earlier vessel, the *Tagus*, has coaled, and will shortly leave the Clyde for London.

The London and Glasgow Shipbuilding and Engineering Co., Limited, having recently handed over to the Admiralty, after satisfactory trials, the gunboats *Thistle* and *Dwarf*, are now busily occupied on the 9,800-ton cruiser of the modified *Cressy* class, the order for which was received at the same time that the Fairfield Co.—above noticed—received theirs for a similar vessel. As no other Admiralty work is at present on the stocks of the London and Glasgow Co., this vessel, which is to be named the *Monmouth*, should rapidly assume shape, although the delay in obtaining material is, in this as in other similar cases, a serious drawback. In the river, opposite the yard, the second-class cruiser *Hyacinth*, 5,600 tons, still lies undergoing outfit, though to all appearances nearing thorough completion.

Messrs. D. & W. Henderson, Meadowside Yard, Partick, who have already built so many of the Anchor Liners, have received instructions to proceed at once with the construction of two steamers of about 6,000 tons each for the Atlantic branch of the well-known Anchor Line fleet

Messrs. John Brown & Co., Limited, Clydebank Shipbuilding and Engineering Works, is now the officially announced title by which the Clydebank concern must in future be known, although, doubtless, long habit, use, and wont, and perhaps a touch of regret and sentiment, may as often as not cause the title "Clydebank Shipbuilding Co.," or the still older and more popular "Thomson's Shipyard" to be used. A circular dated September 1st was issued by Mr. A. McMillan, secretary of the Clydebank Engineering and Shipbuilding Co., Limited, in which it was stated: "We beg to inform you that the negotiations for the purchase of the business of this company by Messrs. John Brown & Co., Limited, are now completed, and that company take possession of the works to-day. The business will in future be carried on under the name of John Brown & Co., Limited, and it is requested that all communications respecting the shipbuilding and engineering business at the Clydebank Shipyard be addressed to that company at Clydebank." In connection with the purchase of this renowned yard by the Sheffield firm. a rumour, which one can only stigmatise as silly, was set about to the effect that in consequence of the purchase Messrs. John Brown & Co. intended to transfer the manufacture of armour from Sheffield to their newly acquired works. This rumour the great Sheffield firm has taken the trouble to semi-officially deny. The plant at Sheffield represents more than half a million of capital, and over £200,000 have been spent comparatively recently in adapting it for the new Krupp process.

Messrs. William Denny & Brothers, Dumbarton, who have been credited during the month with having received an important order from the Russian Volunteer Fleet for a twin-screw steamer of dimensions, speed, and accommodation similar to vessels previously built for the same owners, contradict in a local paper that this is the case; and they also deny that they have been entrusted, as previously reported, with the order for a repeat of the twin-screw *Bavarian* quite recently handed over to the Allan Line. It would appear however, that this firm have, in common with Messrs. R. W. Hawthorn, Leslie & Co., of Hebburn-on-Tyne, received the order for a twin-screw steamer of about 8,000 tons gross register for the New Zealand Shipping Co., Limited, London. The vessels are to be 457 ft. long, 58 ft. beam, and are to steam 12 knots at sea. Like the *Paparoa* presently being completed for the same company by Messrs. Denny, they are intended for the frozen-meat trade between New Zealand and the home country, and, besides carrying a limited number of first and second-class passengers, will have accommodation for considerably over 100,000 carcases in their cold chambers. They are to be built to the scantlings, and under the special survey, of the British Corporation registry, and are to be ready for delivery in the autumn of next year.

Amongst the other work at present under way in the large shipyard of Messrs. Denny & Brothers is the magnificent twin-screw steam yacht of high speed and great splendour of internal fitment, ordered some time ago by Mr. Bennett, proprietor of the *New York Herald*, through the noted Glasgow designers, Messrs G. L. Watson & Co. There is also in course of construction, to be ready for next season's trade, a paddle-passenger steamer for the Belle Steamers and Coast Development Co., London. This vessel, which is to be named *Southwold Belle*, will in appointments and speed be one of the finest passengers steamers yet built for this company's coasting service.

Messrs. William Hamilton & Co., shipbuilders, Port-Glasgow, have received an order from Continental owners for the construction of two steamers of about 7,000 tons deadweight capacity, the engines for which are to be supplied by a Glasgow firm.

Messrs. Carmichael, McLean & Co., shipbuilders, Greenock, who began business four years ago—the two partners Mr. John Carmichael and Mr. A. McLean, having both been connected with the Fairfield Co.—and who have turned out a considerable number of important vessels during the period, have been under the necessity of signing a trust deed in favour of Mr. Patrick Rattray, accountant, Glasgow, with an advisory committee of the firm's principal creditors. Messrs. Rattray Brothers & Co., Glasgow, have stated in a circular addressed to the creditors that their firm was requested by some of the creditors to ascertain the position of the firm. There is a cor amount of work on hand, or on order from the firm, and the eventual out-turn is almost wholly dependent on the completion of these contracts. Some arrangement as to subletting the yard and work on hand may shortly be entered into; but meantime the yard is closed. The stoppage was intimated by a notice posted on the yard gates when the workmen turned out as usual at six o'clock on the morning of the 21st ult. The notice stated: "These works are now closed until further notice. Wages will be paid to night (Thursday) at five o'clock." Several hundreds of workmen have thus been thrown idle, but most of them are hopeful that work on the unfinished vessels will be resumed shortly. (Since above was written the notice in question has been taken down, and work resumed.)

An advance in their wages is now being agitated for by the blast furnacemen in Scotland, although since January of this year they have had their wages advanced 35 per cent. Notwithstanding this substantial increase, the men seem to think that they are still underpaid as compared with their fellows in the North of England. They assert that, although twelve-hour shifts are wrought in Scotland—as against eight-hour shifts in the South—less money is actually earned by the men in the North. Accordingly on the 20th ult. the Amalgamated Society of Steel and Iron Workers sent out circulars to all the owners of blast-furnaces in Scotland demanding an advance of 10 per cent. on the existing rates of wages. The Scottish pig-iron industry has this year had, without doubt, a spell of almost unparalleled prosperity, but there is a growing opinion in the trade that this condition of affairs will not much longer obtain. Masters have indeed recently been accepting prices for crude iron which even a few weeks ago they would not have looked at. Under these circumstances it is not likely that the masters will accede to the present demand unless compulsion in some form is resorted to. Unfortunately there is no conciliation board for this particular branch of the iron and steel trade, so that prolonged negotiations will likely ensue before a settlement is effected.

In the September report of the Clyde District Committee of the Boilermakers and Iron and Steel Shipbuilders' Society, several points of special interest to employers and workers alike are touched upon. The report states that "the use of pneumatic caulking machines is becoming very prevalent, and the vibration therefrom entails hard, laborious labour on the operator, for which he ought to be recompensed over and above the ordinary rates. If the firms who have such machines in use are approached in a rational manner, we have no doubt that the claim of our members will be recognised." The scarcity of rivet-heaters is a problem that will have to be solved sooner or later. There is no inlet for such a class nowadays; at one time the ranks were filled from blower boys, but these have been abolished. As a rule rivet-heaters become apprentice riveters, and, as matters are at present, when such a change takes place the squads of riveters are thrown idle. It would be beneficial to employers and employees alike if some scheme could be adopted whereby learners could be introduced.

Messrs. W. C. Martin & Co., electrical engineers, Glasgow, have secured the contract to fit the large Cunard liner *Invernia*, launched from the shipyard of Messrs. Swan & Hunter, Limited, Wallsend-on-Tyne, on the 21st ult., with electrical plant for lighting and power. The electric lighting of the vessel is to be on a very extensive scale, the plant consisting of two compound engines coupled direct to two dynamos, each set capable of supplying current to light 1,500 eight-candle-power lamps. A powerful search light giving 20,000 candle-power is to be fitted at the bow of the steamer for navigating purposes, and a thorough system of heating and ventilating all the rooms, machinery, and cargo spaces will be installed. Ten 3-brake H.P. electric motors, and ten 30-in. fans driven direct will be fitted, five of the fans to drive cold air through Stewart's patent thermo tanks heated by steam, when the air will be heated to a certain temperature, and then carried into each room by ventilating trunks. The other five fans will exhaust the foul air from the holds at the rate of 12,000 cubic ft. per minute. Electric motors will also be used for driving the hair brushes in the barber's shop, and for other purposes.

The Stewart system of thermo-tank ventilation above referred to is intended to obviate as far as possible the various objections to the ordinary system of steam heating generally in use on board ship, and it has been already adopted in a number of large passenger-carrying steamers, notably in two built for the Russian Volunteer Fleet by the Clydebank Shipbuilding Co. The system combines an efficient ventilating system with an improved arrangement of heating. An efficient form of heater is combined with a steam or electrically driven fan, and placed on deck or outside the compartments to be heated and ventilated. This heater is connected to the ventilating trunk through the compartments and rooms and any required volume of air at any required temperature can be delivered to the compartments. By a suitable arrangement of valves on the connections to and from the thermo-tank, air may be exhausted from the compartments to the atmosphere; or may be circulated in the compartments through the heater, thereby raising the temperature very rapidly; and it may also be delivered direct into the ventilating trunks without passing through the heater. In a future issue a fuller description of the system, with details of the construction and arrangement of heater, valves, trunkways, &c., will be given; but, as indicating the great efficiency of the system as compared with ordinary steam-heating by pipes, one result may be stated of comparative trials made by the officers of the Russian Volunteer Fleet on two steamers belonging to that fleet. The steam supply pipe was the same size in both cases, but whereas in the ordinary pipe heating system the stop-valve was full open, in the case of the thermo tank it was only one turn open; so that, in addition to a greatly increased heating power, there is a large saving in steam consumed.

Messrs. Hawthorn & Co., Limited, shipbuilders and engineers of Leith and Granton, have contracted to build a steam yacht of 650 tons and 200 ft. in length, to the order of his Imperial Highness the Archduke Charles of Austria. She is to be constructed of steel to Lloyd's highest class, and from the designs and under the superintendence of Mr. Alfred H. Brown, of London.

Messrs. Ramage & Ferguson, shipbuilders and engineers, Leith, have received the order for a steel steam yacht of 100 tons, yacht measurement, and 100 ft. length, from Messrs. Cox & King, London, the owner being Mr. Thomas L. Aveling, of Rochester. The vessel will be fitted with triple-expansion enegines to develop 280 I.H.P. In my last month's notes it may be recollected intimation was made of the fact that Messrs. Ramage & Ferguson had received the order for an 800 ton twin-screw steam yacht for Mr. Harry McCalmont, M.P. Although, as from this it is apparent, and as is well known, Messrs. Ramage & Ferguson make a speciality of steam-yacht building, the firm is frequently requisitioned for the production of large merchant ships. Not very long ago they sent off the stocks the largest vessel ever produced in Leith, and now they have received an order for a still larger vessel—a steamer of about 6,000 tons deadweight from Messrs. William Thomson & Co., Leith, intended for that company's Eastern trade.

Messrs. Andrew Campbell & Co., Springfield Quay, Glasgow, have secured the contract to construct a new hauling-up slip on the shores of Loch Katrine, to be used for the reconstruction and launching of the new steamer *Rob Roy*, now being built at Dumbarton. The slip, which is to be about 350 ft. long, with gangways, cradle, winch, and other necessary gear, will afterwards be used for cleansing and repairing purposes connected with the *Rob Roy* and other boats plying in the loch. The slip is to cost £1,500, and is to be laid down under an agreement between the Duke of Montrose and neighbouring proprietors and the Corporation of Glasgow; Loch Katrine, of course, as is well known, being the vast repository from which the city of Glasgow draws its magnificent supply of water. It is worthy of note that the new *Rob Roy* will be fitted with a water-tube boiler of the type being introduced by the well-known firm of Messrs. G. & J. Weir, of Cathcart.

The Prince's Dock, Glasgow, is now almost wholly equipped with double warehouse sheds around the several basins, and provided with railway lines, &c., along its extensive quays For some time past a pile foundation for the rails on which the massive steam coaling crane along the south quay of the southmost basin is propelled has been under way, and when this work is completed the scope of the crane for coaling purposes will be greatly increased. The railways lyes are being extended at the same time, and, when the improved outside communication is opened up, this will become one of the most useful parts of Glasgow Harbour. It is expected that the scheme for electrically lighting the whole harbour will be completed during the present month. Most of the small cranes in the Prince's and Kingston Docks will be wrought by electric power.

The burgh of Renfrew is naturally quite well pleased with itself and its staunch friends over the success attained in Parliament with the Burgh and Harbour Extension Bill, which is now, of course, an Act. Provost Andrew Brown (of Messrs. William Simons & Co.), in submitting the Parliamentary Committee's report on the securing of the Act—which, of course, means the breaking down of the monopoly of the Clyde Trust in providing docks on the river—indulged in no unnecessary jubilation; although a little of this would only have been natural, nor yet in any overstrained forecasting of the future in store for the burgh when the new dock, and the new condition of things thereby brought about, will have become accomplished facts. That the direct communication which will in due time be established between the burgh and the three great Scottish railway systems, and consequently with all parts of the kingdom, will, as Mr. Brown declared, "work a great revolution in the history and fortunes of Renfrew" is undoubted; but Mr. Brown must sufficiently realise that, even when the new dock has been fully constructed and equipped as a going concern, Renfrew must look for something like a struggle before it can secure trade for it sufficient to do more than make ends meet, especially on the assumption that the Clyde Trust are as determined to proceed with the dock for which they have obtained powers at Yoker on the north bank of the Clyde as the Renfrew promoters are to go ahead with theirs on the south bank. Provost Brown clearly announced that "no time will be lost in making necessary arrangements for proceeding with the harbour extension and the new dock." This is as it should be. The burgh has committed itself to a big scheme, and success will depend largely on early and vigorous application to the task taken in hand.

The new graving dock for Leith, which the dock commissioners had at first intended to lay down at the east, or far, end of the new wet dock, now in progress, and within measureable distance of being completed, will now be constructed at the west, or harbour, end of that dock, a situation which should better suit ship repairers at least. The length of the graving dock is to be 500 ft., and it has also been resolved by the Works Committee to increase the length of the wet dock now under way from 750 ft., as hitherto arranged, to 800 ft. The larger sizes have naturally commended themselves to shipowners and shippers, those of them at least having to do with ships in oversea as distinguished from mere coasting or cross-channel vessels.

Aberdeen will shortly be provided with a pontoon dock, intended mostly for the docking of trawlers and other small vessels up to 430 tons. This pontoon dock, which is being constructed on the Thames by Messrs. Clark, Stanfield & Co., at their building premises at Tilbury, is of the L shaped or offshore design, on to which a vessel may be floated either from the ends or broadside. It is 126 ft. long by 37 ft. width, and the pumping and other apparatus will be worked by electricity, and eight powerful arc lamps provided, all supplied with current from the corporation mains. The total cost will be somewhat over £8,000.

Amongst the recent winners of Whitworth scholarships is Mr. W. W. Shearer, Glasgow, who secures £125 a year for three years. There are only four of this value, the others having gone to students in London, Bradford, and Oldham.

THE TYNE.

(From our own Correspondent.)

Shipbuilding.—Since last month a limited number of orders for vessels of a special class have been booked by builders on the Tyne, and a good proportion of the Admiralty work lately given out has also found its way to this district. Messrs. Hawthorn, Leslie & Co. have secured orders in both the mercantile and warship lines, amongst the former being a boat of over 8,000 tons carrying capacity, to be employed in the New Zealand meat trade, and two of an almost equal capacity that are intended for the South African service. The first-mentioned vessel is to have duplicate engines, and will, we understand, be the first steamer engaged in the colonial meat carrying service, to receive such an equipment. The experiment is undoubtedly an expensive one, but in view of the continually recurring accidents to tail shafts, which in single-screw vessels are usually of such fatal import, there can scarcely be a doubt that it will pay. The probability is, indeed, that for meat ships and other vessels of a more than ordinarily valuable class, duplicate engines will become the fashion ere long, and that before many years are past every vessel above the rank of a common tramp steamer will be provided with two sets of engines. This arrangement will give them a practical immunity from such accidents as those mentioned above (it would be strange, indeed, if both engines failed simultaneously), not to speak of the possibilities in the direction of higher speeds. The Admiralty work secured by the firm consists of some torpedo-boat destroyers, and a vessel of a more important class; and, taking all things into account, there is reason to believe that this firm are provided with enough work to keep the machinery fully going over the whole of next year. We understand that the firm have adopted the system of "joggle" plating introduced by Messrs. W. Doxford & Sons some four years ago, and which has since been adopted by Messrs. Armstrong, Whitworth & Co., Sir James Laing, Messrs. J. L. Thompson & Sons, and other firms of importance. The purpose of "joggle" plating is to dispense with "packing" between the frames or angles, and the plating, and this is achieved by "joggling" the overlapping edges of "outside" strakes, so as to admit of the whole area of the plating being brought into contact with the structure, leaving no apertures between the "outside" plates and the framing, and consequently rendering "packing" unnecessary. The advantages of the system are obvious, and difficult, as it apparently is, to break through the immobility of many shipowners and shipbuilders in anything involving a departure from old methods, there is not the least reason to doubt that this system will eventually force its way into general adoption.

The Palmer Co. have also secured a share of the Government work, and have besides been commissioned to build two exceptionally large vessels for Messrs. Elder, Dempster & Co. The company's Howden yard is not likely to be again used for shipbuilding purposes, and in confirmation of this view it may be stated that the scaffolding uprights have been taken down, and the greater part, if not all, of the machinery has been removed. The site is an excellent one, however, and is certain to be utilised for the purposes of some other industry before long.

The Tyne Shipbuilding Co. have three vessels in the plating, framing, and keel-laying stages, and one in the river fitting out; and the Northumberland Shipbuilding Co. have four vessels in various stages of progress, and are about to commence the construction of another. The company have recently disposed of a vessel, now in an advanced state of construction, to Messrs. H. Evans & Co., of Liverpool. The vessel, which will be launched very shortly, is 350 ft. long, and has a carrying capacity of 6,500 tons.

Messrs. Wood, Skinner & Co., of the Bill Quay Yard, have four good-sized vessels on the stocks, and are understood to have secured a good order for trawlers. The firm have, at all events, invited tenders for a number of trawler engines, to be delivered, as the ships become ready. Messrs. Dobson & Co. have one or two large vessels in hand, and also some small steamers of a special type. They have also one or two vessels in the river receiving their machinery equipments.

Messrs. R. Stephenson & Co. have received instructions from the Spanish Government to proceed with the construction of the pontoon dock, ordered some three or four years ago, but the work of which had been discontinued during the progress of the war between Spain and the United States. The pontoon was originally intended to be located at a port in the Philippines, but owing to the changes that have taken place a different destination will now have to be found for it. The work of completing the pontoon is now in active progress, and will afford employment to a large staff of hands for several weeks to come. The large cattle ship *Montauk Point* having been launched early in the month, there now remains but one vessel on the stocks, this being the second of two steamers of moderate size, ordered last year by the United Steamship Co., of Copenhagen. It is considered probable that the company will not trouble much about securing any further work in shipbuilding until the changes contemplated have been fully carried out.

Messrs. C. S. Swan & Hunter have booked an order for a large vessel to be added to the Harrison Line, Liverpool. The vessel is of the same design as the s.s. *Politician*, built for the same line a couple of years ago, and will be similarly equipped. There are rumours of other orders having been secured, but of these we cannot speak definitely.

An event referred to in our Notes last month has come to pass, namely the launching of a Cunard liner from one of the covered berths at this firm's yard. This is, without doubt, the largest vessel ever built on the Tyne, and is perhaps, also the most remarkable. We have had telegraph ships, oil ships, and warships; and we have had ice-breaking steamers such as the world had never seen, and the performances of which in clearing icebound waterways, and releasing vessels, are simply marvellous; but never before has there been produced on the Tyne an

Atlantic passenger steamer of the first-class, which will not, we confidently believe, suffer in comparison with the best productions of the Clyde or Belfast. The launching of this vessel is therefore an event of the rarest interest, and marks a big forward step in the shipbuilding capacity of the district. The launch, which was in every respect successful, was witnessed by a large concourse of people, and amongst the invited visitors were many gentlemen of note in shipbuilding and commercial circles. Congratulatory speeches were delivered at the luncheon, which was provided for the guests immediately after the launch, and the function as a whole was one to be remembered by all who had the good fortune to take part in it.

Messrs. Armstrong, Whitworth, & Co. have launched an oil-carrying steamer from their Low Walker yard, and a Japanese cruiser from their Elswick establishment during the month. They have still several berths occupied at the latter yard, and others in the water fitting out, whilst at Low Walker all the available building space is occupied, some of the vessels in hand being of special importance and exceptionally large dimensions. Messrs. Wigham, Richardson & Co. have laid the keels for a couple of vessels lately, and have now five on the stocks. They have also several vessels being fitted out or repaired in the river. Repair contracts are pretty numerous just now, and all the graving docks and slipways are occupied.

Engineering.—Within the past couple of weeks an increase of inquiries has been noticeable, especially for machinery intended for the equipment of superior vessels. Some contracts have also been placed, amongst them being the engines for a large steamer to be built at Messrs. C. S. Swan & Hunter's, and the propelling machinery for three very costly dredgers, to be built by Messrs. Armstrong, Whitworth & Co. The engine works connected with Messrs. Palmer and with Messrs. Hawthorn, Leslie & Co. have, of course, been reinforced with the machinery contracts in connection with the vessels booked respectively for their shipyards.

The North Eastern Marine Engineering Co. have a large amount of work in hand, including the machinery for two vessels building by Messrs. Craggs, of Middlesbrough, for the Adria Co., of Fiume. It may be here noted that a number of vessels built at Middlesbrough have been engined on the Tyne lately. Amongst these may be mentioned the s.s. *Philippeville*, built by Sir Raylton Dixon to the order of Messrs. Elder, Dempster & Co., and intended to run as a mail and passenger steamer between Antwerp and the Congo. The vessel has twin-screw engines of large power and four single-ended boilers to work at a pressure of 180 lbs. On coming from Middlesbrough to the Tyne the vessel met with a slight accident to one of her propellers, which necessitated dry-docking for a brief period.

The torpedo-boat destroyer *Viper* is now beside Messrs. Parsons's new yard at Wallsend receiving her equipment of Parsons's steam turbine machinery. Excepting the experimental boat *Turbinia*, this, we believe, is the first vessel that has been fitted with machinery at the works. There is some talk of a large vessel being built with a view to giving further scope for ascertaining the capabilities of the turbine engines, but it will doubtless depend upon the results obtained from the *Viper* machinery whether the project mentioned is carried out or not.

Messrs. R. Stephenson & Co. are now engining at Newcastle Quay a large vessel recently launched from their Hebburn Yard. The engines are of large power, and the boilers are fitted with Howden's forced draught. These boilers, as also a large marine type accessory boiler (for the deck machinery), are constructed to work at 180 lbs. pressure. There is a probability that Messrs. Stephenson will erect marine engine shops in contiguity to their yard at Hebburn, so as to minimise to the greatest possible extent the difficulty of putting heavy machinery on board ships.

The Combination Metallic Packing Co., of Hillgate, Gateshead, and Lombard Street, Newcastle, have largely increased their sales this year, and are now so busy in fulfilling urgent orders that a resort to nightly overtime in the workshops is found necessary. The popularity of the packing is evidently on the increase, or this exceptional and long continued briskness would not exist

The works of Messrs. H. Watson & Sons, Walker Gate, are extremely busy, orders for the firm's various specialities for steamship service being plentiful.

At Messrs. Clark, Chapman & Co.'s works business is also good, and the production of deck accessories quite up to the average of recent months. In the electrical departments work is plentiful, and the boiler shops are as busy as possible. Messrs. Emerson, Walker & Thompson Brothers are having their full share of business, and both their forging and iron-founding departments are running full time. The smiths' shops and also the fitting shops are extremely busy, and in some departments the working of a double shift is found necessary.

Messrs. Thomas Boydell & Co., manufacturers of ship and engine-room telegraphs, Prudhoe Street, Newcastle, are, like most other firms in the same line of business, just now very busy, amongst the contracts in hand being several for the equipment of ships building on the Tyne and Wear.

Mr. T. Beynon, of 9, Dean Street, Newcastle, has been appointed agent for the North-East Coast, of the "Dexine" Patent Packing Co., and Rubber Co., Limited, Stratford. The products of the companies are understood to have very special merits, and are said to be peculiarly applicable to marine engines. We hope to refer to them at greater length in a future number.

THE WEAR.

(*From our own Correspondent.*)

Shipbuilding.—In the Wearside yards business is still at high pressure, and is likely to be continued so, till (at least) the end of the year. We hear that Messrs. Doxford have been commissioned to build two more steamers (in addition to the six mentioned last month) for the owners of the "Clan" line, to whom they have already supplied some dozen vessels, many of them of very large capacity. They have all been "turret" ships, and the preference of the "Clan" owners for this type of vessel, is pretty decisively shown by the number of repeat orders given.

Messrs. J. L. Thompson & Sons are reported to have booked orders lately; but at present we are not in a position to say whether the report is correct or otherwise. The firm have their five berths filled, as usual, three of the vessels being in the framing and plating stages, and two only recently commenced. A very large new steamer is being fitted out at the firm's Manor Quay repairing works, and there are also some repair contracts in hand.

Sir James Laing & Sons are reported to have been commissioned to build two vessels for Messrs. Bucknall Bros, a firm for whom they have built many vessels in previous years. This firm—through extensions made within the last couple of years—have now seven building berths, all of which are, at the time of writing, occupied.

Messrs. Robert Thompson & Sons continue to have abundance of work for their Southwick yard, and are also pretty busy in their repairing department, at the Bridge Dock. There is at present an exceptionally important contract in progress at the last named establishment, this being the lengthening, by nearly 20 ft., of the Dutch steamer *Rijnstroom*. The fore part of the vessel was cut away immediately forward of the machinery compartment, and subsequently "launched" the required distance. The breach made is now being rapidly "built in," the new structure being, of course, exactly in harmony with the lines of the ship, so that when the connection is completed, there will be no deviation from the natural curve or "shear." The last contract of this kind carried out in the Bridge Dock, was the lengthening of the s.s. *Concrete*, belonging to the Wear Commissioners.

Messrs. Priestman & Co. launched early in the month a large cattle ship ordered by Hamburg owners, and have a duplicate ship well advanced towards completion. It is reported that the firm have a third ship of the same size and type to build; but of this we are not in a position to speak definitely.

Messrs. Blumer & Co. have their berths fully occupied, and the same may be said of the Sunderland Shipbuilding Co., and Messrs. Bartram & Sons. The latter firm have material being delivered for other vessels besides those on the stocks. Messrs. Austin are very busy in both new and repair work, and the Strand Shipbuilding Co. have also a full supply of work in both lines. The latter firm have received from the Wear Commissioners the contract to supply the "roundhead" required to complete the end of the new north pier. It may be here stated that some other items in the Wear Commissioners' programme of improvements are approaching completion, notably the new coal shipping staiths, where vessels of almost any tonnage can be brought alongside, and the new quay at the south side of the river. Other items of still greater importance have, however, yet to be commenced, including the addition of some four acres to the water area of the south dock, and the making of a new graving dock equal to the accommodation of any ship afloat. Many other improvements are contemplated, and when the whole programme is completed, the port of Sunderland will, as far as shipping facilities are concerned, be entitled to take rank as one of the first ports in the kingdom.

Engineering.—A slight diminution of activity was noticeable in some of the local engine works lately, and night shifts were either discontinued or the staffs reduced We do not think the temporary slackness arose from a want of orders, but was simply the result of the engineering work being slightly ahead of the ship work. This, it will be remembered, is the reverse condition to what existed towards the close of 1897. We understand that Messrs. MacColl & Pollock have received an order to supply the machinery for two vessels building at Middlesbrough. The firm have discontinued night work for a time.

Messrs. Wilcox Brothers have had a very marked success with their Radio Mundel evaporator, recently put upon the market. It has been fitted in a number of steamers, amongst which may be mentioned the s.s. *Queen Wilhelmina*, the *Olive Branch*, and the *Ohio*, and is now being fitted on another boat belonging to the owners of the last named. In every case where it has been fitted excellent results are reported, and these good reports are fully borne out by the number of repeat orders given.

Messrs. James Speeding & Co., Whickham Street, Monkwearmouth, are doing a large business as ship merchants and engineering furnishers, and have found it necessary to add to their premises a new warehouse of considerable extent. Since making this addition they are in a position to meet customers' requirements very promptly.

The Hartlepools.—At this centre the activity in shipbuilding is fully maintained, and its extent may be judged from the fact that Messrs. Gray & Co. launched three vessels of an aggregate carrying capacity of 14,000 tons in August.

Messrs. Furness, Withy & Co. have some very big work in hand, and at Messrs. Irvine's yard an array of full berths is to be seen .

In the engineering works business is still brisk, whilst at the steel works the machinery is kept running night and day.

Stockton.—Messrs. Ropner & Son launched on the 20th inst. a vessel of 5,500 tons capacity—ordered by Hartlepool owners, and have four others on the stocks of somewhat similar capacity. At the other yards there is also a plenitude of work in hand. Messrs. Blair & Co. continue to be exceedingly busy, and other firms engaged in the manufacture of ship accessories are having as much work as they can deal with.

Middlesbrough.—Sir Raylton Dixon & Co. are said to have secured some important orders, and at Messrs. Craggs's establishment briskness continues to exist. Boiler shops continue full of work, and foundries are still quite brisk. Steel works continue as active as ever, and engineering works of all kinds are participating in the general good trade.

Darlington.—The Darlington Forge Co. have a number of important contracts in hand, and their output this year has, so far, been unprecedentedly large.

THE MERSEY.

(*From our own Correspondent.*)

ALTHOUGH it can scarcely be said there is any actual falling away in the present activity at engineering works generally in this district, there are still unmistakable indications that the exceptional briskness that has prevailed since the commencement of the year has touched the maximum point. Reports from most branches of trade are now to the effect that, although the leading establishments have still sufficient orders on their books to keep them fully going into next year, there is an undoubted slackening off in the weight of new work coming forward, and in the majority of cases the contracts that are being completed are not being replaced by new work in equal quantity. No doubt the very considerable advance in prices during the past few months has had its effect in checking new undertakings that are not of any pressing need, and it is probable that a very large amount of work is simply "pigeon-holed" for the present, but will come forward eventually, either when it is evident prices are not likely to be lower or when there has been some substantial giving way upon the high quotations that just now have to be made for new orders that engineering firms are in a position to entertain. The recent indications of some revival in the shipbuilding trade of the North, however, tend to give a more encouraging outlook to this branch of industry on the Mersey, and for the present the yards on the Birkenhead side continue fully engaged on work in hand.

Referring more particularly to the various sections of engineering, it may be noted that the leading machine-tool makers continue well employed, with a fair amount of new work coming forward, but some of the general branches are not in so satisfactory a position. In the locomotive building trade there are signs of returning animation, and boiler makers report no diminution of activity, but stationary engine builders are scarcely so well off for orders, and in the textile machine-making trade there is a continued absence of new work going out sufficient to replace that which is being completed. Electrical engineers continue in a more than satisfactory position both as regards work in hand and coming forward.

The usual monthly returns of the leading trade unions show a continued low unemployed list, the general tendency being towards a further slight reduction in the number of out-of-work members on the books. The Amalgamated Society of Engineers has only 2,073 out of 84,293 members on donation benefit, representing less than 2½ per cent., whilst in this immediate district the proportion is about the same. In the Steam Engine Makers' Society there are now only about ¾ per cent of the total membership on benefit, and in the Lancashire branches practically a clear book is reported. The United Machine Workers' Association has about 2½ per cent. of the total membership on donation, but in the Manchester district there are not more than 1½ per cent. receiving support; in Birkenhead only one member is on benefit, whilst in Liverpool there are no members on trade donation. Reports as to the state of trade continue generally of a satisfactory character. During the past month the pattern makers in the Amalgamated Society of Engineers at St. Helens have obtained 1s. advance, and at Horwich the "demarcation" dispute between the engineers' and boiler makers' societies has been referred to the two executives. The award in the Mid-Lancashire engineering trades arbitration has now been given in favour of the men, who will consequently retain the advance in wages of one shilling per week which pending the decision of Lord James had only been granted temporarily and conditionally.

On September 2nd the paddle steamer *Mabel Grace* had a very satisfactory trial trip. She has been built and engined by Messrs. Laird Brothers for the South-Eastern Railway Co. for their service between Folkestone and Boulogne. Messrs. Laird's connection with this service commenced as long ago as 1846, when they turned out the s.s. *Princess Clementine*, *Princess Helena*, and *Lord Warden* for the South-Eastern Railway. These vessels were amongst the fastest and most successful of their day, and the *Princess of Wales*—the last steamer the firm built for this service — has also given exceedingly satisfactory results.

The Unbreakable Pulley and Mill-Gearing Co., West Gorton, Manchester, have recently completed a special order for countershafts for machinery requiring great exactness in speed, ratio, and frequent and easy stopping and starting. The shafts are carried in the company's standard bearings, the self-adjusting properties of which ensure absolute alignment and evenness of pressure, whilst economy is also secured in erection, lubrication, power, and repairs. The countershafts carry one of the company's patent equal-pressure friction clutches, in which the power from the sliding sleeve on the shaft is transmitted to the clutch in such a manner that the force given to each of the two friction blocks is mathematically equal, and it is claimed that these clutches overcome all the difficulties of unequal wear, and the trouble of engaging and disengaging incidental to this class of mechanism.

Messrs. W. Bailey & Co., Oxford Street, Manchester, have designed a new form of search-light to burn acetylene gas, which will be found very useful for illuminating purposes in works, shipyards, docks, and other places where a strong, steady, and brilliant light is required. In this search-light the generator is on the double principle, so that a continuous supply of gas can be maintained for any length of time, as the recharging can be performed whilst the machine is in action; and the apparatus is also so constructed that the rate at which the gas is consumed regulates the feed of water to the carbide, thereby preventing any excessive production of gas. The reflector of the search-light is detachable, and can be readily fixed in any convenient position, and connected wi generator by indiarubber tubing. The apparatus is portable, and requires no attention whilst working. The standard sizes range from No. 1, to give 500 candle-power for 18 hours, to No. 3, to give 2,000 candle-power for 14 hours.

During the past month a steadier tone has come over the iron market here. With regard to pig iron, Lincolnshire makers early in the month reduced their list rates 2s. per ton, but with this exception makers have held pretty firmly to their quoted rates, and, although there has been only a very slow hand-to-mouth sort of inquiry stirring, they are generally so well sold that they are under no necessity to press sales. In the open market, however, prices are very irregular, merchants under-quoting makers for any orders that are to be got, and in many cases they continue exceedingly low sellers for delivery next year. Local makers' quotations remain nominally at 77s. 6d. less 2½ for foundry, delivered Manchester. Lincolnshire makers report a fair inquiry for foundry, and they are firm at their reduced quotation of 71s. 6d. net, whilst special prices, ranging from 77s. to 78s. net for some brands, are being quoted by Derbyshire makers for delivery Manchester. Forge qualities are in active request, with prices tending to harden on the rates ruling in the early part of the month, Lancashire being quoted 72s. 6d. to 73s. less 2½, and Lincolnshire 70s. 8d. to 71s. 2d. net cash, delivered Warrington. Middlesbrough has hardened up if anything, 76s. 4d. net being now the average quotation for delivery by rail Manchester. Prices for Scotch iron vary considerably; but the average figures for Eglinton and Glengarnock, delivered Manchester Docks, may be given at about 78s. to 78s. 6d. net per ton. Quotations for American pig rion are practically withdrawn until it is seen what quantities are likely to come over.

In the finished iron trade a good demand comes forward generally, and prices all round have been advanced. Bars are 5s. up, Lancashire qualities being now £8 10s., delivered Manchester or Liverpool; and North Staffordshire, £8 15s, delivered here. Sheets are also dearer, and for good qualities £9 17s. 6d. to £10 is asked. For hoops list rates have been raised 10s. per ton, making the basis £8 15s. f.o.b., Liverpool, and £8 17s. 6d. for random to £9 2s. 6d. for special cut lengths, delivered Manchester district.

In the steel trade makers' prices for hematites receded about 2s. at beginning of the month but have now got back to 87s. 0d. and 88s. 0d. less 2½. Billets have hardened up, and now average £6 12s. 6d. net, whilst for bars local makers are 5s. dearer, £8 and £8 2s. 6d. being now quoted, with special qualities up to £8 15s. 0d. Steel hoops have been advanced 10s., making the basis £9 10s., and boiler plates are firm at about £9 10s. to £9 12s. 6d., delivered Manchester district.

Manufacturers of metal goods report an active inquiry for marine and general engineers' and boiler makers' and locomotive builders' requirements, and list rates are firm at late quotations. Delivered Manchester district, solid drawn brass boiler tubes remain at 9d.; condenser tubes, 10½d.; copper tubes, 11½d.; brazed copper gas and steam tubes, 11¼d.; brazed brass tubes, 10d.; common rolled brass, 8¾d.; common brass wire, 8½d.; and copper wire, 10¼d per lb.

The timber trade is active, and values of most of the leading articles have shown an improvement. The import has been large, but deliveries generally good, and stocks, though increasing, are with few exceptions not excessive. Teak squares have arrived in small quantities, and the demand is fair, with prices firm, and stocks not large. Planks are in moderate request at steady prices, but stocks are increasing. One cargo of greenheart has arrived; the stock is still too heavy.

In the coal trade there is a general advance in prices with the close of the mouth, round coals being put up 10d. to 1s., and burgie and slack 5d. to 6d. per ton. In anticipation of this upward move there has been a greatly increased demand, consumers evidently having been anxious to get in supplies before the rise. The increased enquiry has been chiefly noticeable in house coals, which had previously been hanging, and the output of these has been moving away, although pits have gone on to full time. The lower qualities of round coal have continued in brisk demand, for steam and forge purposes, and with the extra enquiry for domestic consumption supplies for manufacturing requirements have been necessarily restricted. For engine fuel business has also been very pressing, with supplies, notwithstanding the large quantity of round coal now being screened, barely adequate to meet the wants of customers. At the pit's mouth prices now average about 12s. 6d. to 13s. 6d. for best Wigan Arley; 11s. to 12s. Pemberton four feet and seconds Arley; 10s. to 10s. 6d. common house coal; 10s. steam and forge coal; 7s. to 7s. 6d. best slack; 6s. 6d. to 6s. 9d. for medium, and 6s. for common sorts at the pit.

Shipping is tolerably brisk, with steam coal averaging 10s. 6d. to 11s. delivered Mersey ports.

Coke is steady at about 18s. to 20s. for furnace sorts and 26s. to 27s. for foundry qualities at the ovens.

THAMES.

(*From our own Correspondent.*)

Babcock & Wilcox.—The full trials have now been made of the machinery of the *Sheldrake*, H.M. torpedo gunboat of the *Salamander* class, which has twin screws and triple-expansion engines of 3,500 I.H.P. collectively. The cylinders are of the following dimensions: 22 in. high pressure, 33 in. intermediate, and 49 in. low pressure, the stroke being 21 in. The boilers are in two compartments, which are divided by a watertight bulkhead, two boilers being in the forward compartment, and two in the after compartment. Each pair of boilers is placed back to back, each boiler having its own stokehold. The boilers are fired fore and aft. The total heating surface in each boiler is 2,356 square ft., and the grate surface 63 square ft. The boilers are worked at 200 lbs. per square inch, which is reduced by reducing valves to 150 lbs. per square inch at the engines, and the steam on its way to the engines passes through separators. The boilers are composed of 19 sections of tubes. The tubes are of solid-drawn steel, galvanised on the outside by the electro-deposition process in accordance with the usual Admiralty requirements. The tubes connecting the headers are 7 ft. 6 in. long. The uptake headings are connected to the steam and water drum, and connected to a wrought-iron mud-box, this box being provided with blow-off drain valves. The level of the water in the drum is regulated by Thornycroft's feed regulators. Four 6 ft. double-inlet fans are arranged, driven by engines 6½ in. by 5 in., and capable of making 600 revolutions per minute, so as to increase the draught. There is a common uptake, and a funnel for each pair of boilers, the inside diameter of the funnel being 5 ft., and its height above the grate bars, 45 ft. The guarantee of the makers to the Admiralty was that each boiler would evaporate with natural draught from 11,000 to 12,000 lbs. of water per hour, with Welsh coal, and with the feed-water at 110 degs. Fahr. With forced draught not exceeding 3 in. of water, the guarantee was an evaporation of from 18,000 to 19,000 lbs. of water per hour from 110 degs. Fahr. for two hours. Different trials were made of the boiler under the direction of the Admiralty officials. A steam jet was first used in the funnel to produce a draught, and with a pressure equivalent to ¼ in. of water the evaporation was 19,577 lbs. of water per hour, from 70 degs. Fahr.—the equivalent from 110 degs. Fahr. would have been 20,250 lbs. During this trial the rate of combustion per square foot of grate surface was 40·7 lbs. The weight of refuse taken from the ashpans in a wet state was 14 cwt. 2 qrs., or about 20 per cent. of the total fuel put in the grate. The temperature of gases in the funnel was 650 degs. The pounds of water evaporated per square foot of heating surface per hour were 8·3, and the pounds of water evaporated per pound of combustible per hour from and at 212 degs. were 11·28.

In another trial, when the draught was ·2 in., and the quantity of coal burnt per square foot of grate surface was 22·5 lbs., the evaporation per square foot of heating surface was 5·18, and the pounds of water evaporated per lb. of combustible from and at 212 degs. were 12·72. The temperature of the gases in the funnel was 550 degs. On her first sea-going trial of eight hours the consumption of coal was fixed at 15 lbs. per square foot of grate per hour. The pressure of steam in boilers was 152½ lbs., and in high-pressure cylinders it was 122 lbs., the vacuum was 25·8 in.; draught, ·2 in.; temperature of gases in funnel 550 degs.; average I H.P., 2,642; revolutions, 242; speed of gunboat, 7·9 knots; coal consumed per I H.P., 1·429 lbs.; heating surface in square feet per I.H.P., 3·5. With a full-power trial the pressure draught ½ in. of water, at furnace and at base of funnel it of steam in boilers was 151 lbs.; high-pressure casing, 137; was 3 in. of water; temperature of escaping gases, 550 degs. Fahr.; the average I.H.P., 4,050; revolutions, 280; speed in knots per hour, 20·6; coal per I.H.P., 1·57; heating surface in square feet per I.H.P., 2·3.

We have just been supplied with the results of the official trials of H.M.S. *Sheldrake*, consisting of nine 1,000-mile runs at various rates of steaming:—

Date.	Nature of Trial.	Duration in Hours.	Steam Pressure.	I.H.P.	Air Pressure.	Coal per I.H.P. all purposes.	Coal per sq. ft., Grate.	Water per lb. Coal.	Ashes per lb. Coal.	Grate surface.

At the finish of the thousand-mile trials, several experiments were made. The first one was made on the forward boiler, when the time required to raise steam at 140 lbs. pressure from cold water was taken; the temperature of the water at the start was 70 degs., and steam was raised to 140 lbs. pressure in 23 minutes. After that a stopping and starting test was made; the engines were going full speed and suddenly stopped. The front tube doors and uptake doors were immediately opened and the ashpit doors closed; the steam gauge was then watched and the pressure did not rise more than 5 lbs., neither did the safety valves lift.

The next test was made to ascertain how soon the operation of drawing a tube could be commenced after the fires were pulled out of the furnace. No 4 boiler was used for this purpose. This boiler was worked at full power, suddenly the fires were drawn and the water blown out; in 24 minutes after drawing the fires several caps were taken off ready for drawing tubes. Then a test was made to show how quickly a tube could be taken out of a boiler. Three tubes were drawn one after the other; the first took 11 minutes, the second 10 minutes, and the third 9 minutes.

At the conclusion of these experiments, the *Sheldrake* had completed the whole of the Admiralty programme and returned to Devonport, where a careful examination was made of the boilers which were found to be in as good a condition everywhere as when they left the works.

Vauxhall Iron Works Co.—This company has on hand a number of sets of compound engines of their usual type, and they have also one set of large triple-expansion engines.

Tolch & Co. have completed the oil launches for the coastguard service of the Egyptian Government. These launches are large, and can easily accommodate 20 people. They are 33 ft. in length and 7 ft. 9 in. wide, with 3 ft. draught. The engines are of a strong and massive construction, giving 12½ I.H.P., and on the brake 10 H.P. The two cylinders are each 8 in. diameter, and the stroke is 8 in. When going at her normal speed the engines made 240 revolutions. The boats are intended to make 9 knots an hour. The firm have some new work in prospect, and intend to extend their premises.

Auxiliary Steam Power Co.—This company are fitting up their arrangements at the waterworks, Romford. It is known that they use a mixture of C O_2, which they force under pressure into the water to be used in the boiler. Results of trials have shown that a considerable economy is affected by the arrangement. Anyway the gases will be thoroughly tried at Romford.

Thompson Brothers, of Fenchurch Street and Millwall, have lately introduced a new feed-heater. This is a novel kind of feed-heater, quite unlike the ordinary forms. There is a cylindrical shell, and a number of pipes let into it. These pipes are stopped at the bottom end, and a diaphragm goes down the middle. Just below the top cover there is a branch pipe at the side for the admission of the water. Passages are cut at the top ends of the pipes, and the water flows down one side of the pipe, flows round the bottom, and up the other side of the pipe. When the water gets to the top of the first pipe it goes into the next in order, down one side and round the bottom and up the other side of the diaphragm, and so on. When the water comes out of the last pipe it flows out by a branch into the boiler. The temperature of the water after it has gone through this feed-water heater is easily 270 Fahr. and it keeps that temperature with regularity. It has reached in some instances 300 degs. and even has gone above that, but the makers prefer it to go into the boiler at a temperature of about 270 degs. Fahr. One of these heaters has been fitted on a steamer, the engines indicating 1,000 H.P. The length of the heater is 2 ft. 8 in., and diameter some 14 in. Before the heater was fitted, the steam was difficult to keep up at the pressure required, and it was spoken of by the engineers as a hard job to stoke. Since, however, the feed heater has been fitted on, the condition of things has changed. The engineer says he has obtained one and a quarter more revolutions per minute, and several pounds of steam higher on the gauge, and the stoking is considerably easier.

Maudslay & Field.—This old firm (is it the oldest engineering firm on the Thames ?) is at last leaving the Westminster Bridge Road, and going to settle at Ipswich. It has made some of the very largest of marine engines. Engines of as much as 20,000 H.P. have been built in these shops. But the locomotive department of the London and South-Western Railway have had longing eyes on the place, and at last have persuaded the company to part with them.

John I. Thornycroft & Co.—The great international yacht race, in which this country will be represented by the *Shamrock*, built by this firm, comes off on October 3rd. There will be five races over courses of 30 miles in length, and with a time limit of six hours. The probable point of start will be off Sandy Hook Lightship to and from a mark 15 miles to windward or to leeward. The first race will be round an equilateral triangle. one leg being to windward. The present is the tenth contest for the cup. Some important figures have been lately published by the *Times* with respect to the dimensions of the two vessels:—

	Shamrock ft. in.	*Columbia.* ft. in.
Length, over all	127 9	131 4
Breadth, extreme	24 6½	24 2½
Length, on load water-line	89 2	—
Length of overhanging aft	21 5	—
Area midship section	130 sq. ft.	120·48 sq. ft.
Co-efficient of midship section ..	·278	·258
Area of lateral plane	970 sq. ft.	885 sq. ft.
Co-efficient of displacement ..	·134	·1206
Area load water-plane	1,493 sq. ft.	1,509 sq. ft.
Wetted surface, total	2,916 "	2,670 "
Tons per inch immersion	3·34	3·59
Draught	20 ft. 3 in.	20 ft. 3 in.
Displacement..	160 tons	145 tons.

The sail area of the *Shamrock* is 13,850 square feet. It is built of steel, aluminium, and bronze; the frames of steel angle, they are spaced about 20 in. The deck beams are special torpedo-boat steel angle-bulbs, and attached to the frames with gusset pieces. The stem and stern are bronze castings, and the rudder is of the same material. The fin is hollow and just sufficient to allow a man to get in. A lead casting of 80 tons weight is bolted to the bottom. This casting is rectangular, and so trims its centre of gravity.

BELFAST.

(*From our own Correspondent.*)

MUCH has been said and written regarding the *Oceanic* for months past, and we have now to chronicle her departure from her birthplace on the 25th of August. If fine weather during her gala days can be taken as an omen for her future prosperity, then indeed she has been fortunate. As this big leviathian left Victoria Wharf, and proceeded down the Belfast Lough for a trial and adjustment of compasses, the sun shone out brilliantly, and she was watched from both sides of the river by many hundreds of people. She was accompanied by three of the largest Liverpool tugs, and the channel was kept entirely clear of shipping for two hours during her progress down the river. On reaching broader waters she was put under her own steam, and during her trial everything in connection wrought very satisfactorily. After getting some finishing touches she left for Liverpool on August 26th. She has now made her maiden voyage across the Atlantic, and, although not a record for speed, still she has accomplished all that her owners and builders desired of her. So much has been said and written regarding this large and magnificent vessel in the past, we can only hope that in the future she may prove a source of both pleasure and profit to all concerned with her.

On the 7th September Messrs. Harland & Wolff launched another very large vessel, named the *Persic*. She is a sister ship of the *Afric* and *Medic*, and is intended for the White Star Australian service, her length being 550 ft.; beam, 63 ft.; depth, 44 ft.; and about 12,000 tons gross register, and her displacement will exceed 20,000 tons. We may mention that the Chambers of Commerce Association meeting being held in Belfast at this time, many of the members and their friends availed themselves of the opportunity of witnessing the launch of so large a vessel, which was most interesting: the *Persic* being constructed in the south end of the Queen's Island, and having to be launched into Abercorn Basin, this space was so limited that the vessel had to be brought up immediately on being afloat. This, however, was accomplished in the firm's usual masterly style without a hitch. Afterwards the members of the above association were shown over the large works by Mr. Wilson and Mr. Carlisle, and finally were entertained to luncheon by Mr. and Mrs. Wilson.

In regard to Messrs. Harland & Wolff, many rumours, both in the Press and elsewhere, have been afloat concerning the removal of part of their works to other ports, due to the want of ground accommodation here, which, it is alleged, the Belfast Harbour Board have refused to give. We hope there may be no truth in regard to these reports, but certainly after the Musgrave channel, or dock, is finished at the back of Messrs. Harland & Wolff's works, it will be impossible for them to obtain more ground unless at a very great disadvantage. It is to be regretted that the Belfast Harbour Board cannot see their way to let Messrs. Harland & Wolff have the required ground, since it is well known that Belfast owes her position in the commercial world to the shipbuilding and engineering industries carried on here. However, we hope that some amicable arrangement may be arrived at.

Messrs. Workman, Clark & Co., Limited, launched another addition to the Allan Line, of Glasgow, during the past month. She is the second of three large cargo steamers which this firm have in hand for this line, and is named the *Sicilian*. At present she lies at the large crane receiving her masts and machinery, and will shortly be ready for sea, when we hope to give a more detailed account of her dimensions.

The s.s. *Star of Australia*, built by Messrs. Workman, Clark & Co., went down the Belfast Lough on the 7th September for adjustment of compasses and trial trip.

The s.s. *Turkoman*, lately called the *Lord Erne*, has been in the hands of Messrs. Harland & Wolff for almost two months receiving extensive alterations and deck fittings of the newest style, suitable for carrying cattle in the Atlantic Transport Co. service, which recently purchased her. She is about ready for sea, and will leave here in a few days.

The smaller engine works and foundries are feeling the dulness in the building trade, they being very much quieter than they were some months ago.

NORTH-WEST OF ENGLAND.

(*From our own Correspondent.*

Barrow.—There is not much that is new to report in connection with the shipbuilding trade of this district. Messrs. Vickers, Sons & Maxim are very busy on an important number of big orders, and they are making considerable progress with the work. They are, however, severely handicapped by the scarcity of skilled workmen, and the cause for this is found in the great want which is still felt for houses for workmen in Barrow. I have previously notified that in order to find homes for their men this firm adopted the unique idea of buying the old Atlantic liner *Alaska*, with the view of utilising her as a floating house for their workmen. She will accommodate about 400 men, and already upwards of 100 are housed on the ship, and preparations are being made for an additional 100 forthwith. This ship is found to be a very popular home, and the men who are housed in her speak of the great comforts they enjoy, the liberal bill of fare which is provided for them, the cleanliness of the ship, and of the care that is taken of them in the washing of their clothes, and the mending of the same. The modest sum they pay, and the convenience they experience, render their lot a much happier one than would be possible in ordinary lodgings in the town, but of these there are very few to be had.

Yet the *Alaska* will not provide for all the needs of workmen, and therefore the firm are about to build 1,000 houses. Already tenders are being received for the first 200 of these, to be built on Walney Island. Some delay has been caused in getting out the plans, laying out the estate, and in a thousand and one preliminaries incidental to such an enterprise, but things are now getting into shipshape. A brickmaking plant is being put down, which will produce about 25,000 bricks per day. Many men who are engaged to start work at Barrow go away again because the town is so full, and the difficulty of getting housed is so great. In other parts of the town about 200 houses are in course of erection, and as much speed as possible is being exerted in order to get these houses ready for early tenancy. Not until this difficulty of house accommodation is removed will Messrs. Vickers be able to make that progress with business it is their desire and their intention to make. Gradually, however, the men will get housed, and by that time it is expected the population of Barrow, which a few years ago was at 55,000, will have reached from 70,000 to 75,000 souls.

Notices have been issued by the dock authorities at Barrow that the Ramsden Dock lock sill is about to be lowered 6 ft., so as to make a fairway into the docks 30 ft. in depth. The docks will then be able to take in the largest ships afloat, and thus Messrs. Vickers will be able to build the largest possible ships and get them safely docked and undocked. The work in hand at present by Messrs. Vickers will in itself demand this deep water accommodation, and it is certain the ships to be built at Barrow in future for the Admiralty, for foreign Governments, or for the mercantile marine, will be in very many cases as large, for instance, as the 15,000-ton battleship now building here for the Japanese Government. The improved accommodation for shipping will also draw to Barrow larger vessels in the way of commerce, as well as the largest ships afloat to come here for repairs. The first-class cruiser *Hogue* is beginning to lift her upper ribs. She is in a much more forward state than her sister ship, the *Eurylas*, or the still more recent order, the *King Alfred*. These cruisers, together with the Japanese battleship, will not be launched until the deep water sill has been built in the Ramsden Dock. This important engineering work, which will be commenced in November, will probably take six months to complete. In the meantime deep-draught shipping will be accommodated in the Ramsden Dock entrance basin, and smaller craft will enter and leave the Barrow docks by means of the Devonshire Dock basin. This work of deepening the sill will be of great importance to the trade of Barrow in the future and to the shipping business as well; but it does not represent the ultimate enterprise of the Furness Railway Co. as one of the largest and deepest graving docks in existence is to be built at a future date. This in itself will bring commercial and Admiralty repairs to Barrow when completed.

The Pacific Steam Navigation Co.'s steamer *Ortona* is approaching completion. She will be ready for her trials in November. Her engines have already been at work, and her internal fittings are in a very forward state. She is magnificently fitted up, and will certainly be the handsomest as well as the largest Orient liner in the service.

Mr. Zimmermann, the general manager of the Vulcan Shipbuilding Yard in Germany, paid a visit to Barrow last month to see his many friends who were employed with him by the now defunct Barrow Shipbuilding Company. He is very proud of Barrow and of the Lake District. He has made great progress in his profession since leaving here, and he has the honour of having built the *König Wilhelm der Grosse*, which holds the Atlantic record until the White Star liner *Oceanic* takes it from her. Then he proposes to go one better even than the new Cunarder. He is at present building two Atlantic liners larger than the *König Wilhelm der Grosse*.

West Cumberland. — The shipbuilding trade of West Cumberland is busily employed, and both at Workington and at Maryport the yards are as full of work as their capacity of production will justify. On September 7th Messrs. Williamson & Sons launched from their yard at Workington the screw steamer *Gipsy* built to the order of the Waterfold Steamship Co. The firm has several other ships in course of construction. Messrs. Ritson, of Maryport, have several small vessels on the stocks, and report a fair enquiry for the class of tonnage they usually build. Prospects of West Cumberland shipbuilding are very good, and hopes are entertained at Whitehaven, now that the harbour authorities are about to dredge the harbour, that the old shipbuilding yard at this place will be resuscitated. As I have before said, the only way by which this can be done is for local capitalists to raise the necessary funds and put the business in the hands of a competent manager.

Shipbuilding Material.—Although no great amount of new tonnage is being ordered from shipbuilders, they maintain a very brisk demand for all classes of shipbuilding material. The fact of the matter is that makers have been so largely sold forward for some time that they could not accept orders for the delivery of many specifications required by builders, and these are being taken according to the urgency of their needs. Ship-plates of both heavy and light classes are in large output, and the orders held will keep the mills going for many months to come. Heavy plates are firm at £7 12s. 6d. per ton, and light plates realise about £8 15s. to £9. Angles are at £7 2s. 6d., but the production in this district is not large. A good business is, however, being done in sections. Boiler plates are in very full demand at £8 15s. per ton. There is a brisk demand for steel forgings, and it is probable some attention will be devoted to this branch of trade in the early future, as they are largely required by shipbuilders here. Heavy steel castings find a very good market, and the recently enlarged foundries here are not yet fully equal to the demand made upon founders. Miscellaneous steel products are in brisk request all round.

The Hematite Trade.— Business in hematite pig-iron has been on a large scale during the month, and the presence of American buyers in the district has tended to give firmness and life to the market. Some large parcels have already been bought by buyers from the United States and Canada. A parcel of over 6,000 tons has already been dispatched, others are on order, and buyers are endeavouring to make arrangements for large forward deliveries. The value of pig-iron has gone up, and is now quoted at 77s. 6d. for mixed Bessemer Nos. net free on board, whilst warrant iron sellers are at 74s. 6d. net cash, and buyers at 74s. 5d. The market shows buoyancy. Forty-six furnaces are in blast, as compared with 41 in the corresponding week of last year. Warrant stocks have been increased during the year by 56,457 tons and are now standing at 232,436 tons. Makers do not hold more than about 30,000 tons of iron in stock, and much of this is bespoken for steel manufacturing purposes. There are indications that the hematite pig-iron trade will remain brisk for some time to come, as not only are orders very largely held, but the wants of steel-makers are considerable and likely to be so, and the American demand is likely to be supplemented by a general foreign demand for Bessemer descriptions of metal.

Shipping.—Business in the shipping trade of this district has not been so briskly maintained as during the previous year. The total exports are shown to have reached 355,160 tons of pig-iron and 350,329 tons of steel, as compared with 375,615 tons of pig-iron and 396,461 tons of steel in the corresponding period of last year, showing a decrease of 20,455 tons of pig-iron and 46,132 tons of steel. Freights are very satisfactory, and shippers experience no scarcity of cargoes. Trade is of such volume, although less than last year, that shippers are not hesitating in increasing their tonnage of carrying capacity.

RIPOLIN PAINTS.

WE have lately had the opportunity of inspecting some work executed with the paints which are manufactured and sold by Ripolin, Limited, of 110, Fenchurch Street, London; Amsterdam and Paris.

The Ripolin paint is prepared ready for use, and is designed to combine with great glossiness a high power of resisting atmospheric influences, steam, heat, ammonia vapours, &c. We understand it does not crack, split, or scale off, and can be washed without losing its porcelain-like gloss. It is stated that even in the tropics Ripolin paint has proved durable under the most unfavourable conditions of sun, wind, and weather.

As an evidence of its efficiency it may be stated that several of the well-known yachts are painted with Ripolin, as the s.s. *Erin*, *Valiant*, &c.

As a decorative agent its capabilities are considerable, and its effect is really splendid, as its appearance is as handsome and solid as enamelled tiles. From a sanitary standpoint it is decidedly good, as it fills up all the crevices and cracks in which microbes and dust can collect, and will bear washing with strong antiseptic solutions. By reason of its high gloss, varnishing is dispensed with. It is very elastic, and therefore does not become detached or scale off. It can be made if desired to give a flat surface instead of a glossy one. It dries in about 10 to 12 hours after application.

The Ripolin Co. manufacture two compositions for submarine work under the title of Rieps compositions. One composition is anti-corrosive, and the other anti-fouling. We have had the opportunity of reading a number of testimonials, and it is interesting to note what the marine superintendent of one of our largest railway companies, says of these paints. He states that he has been using the Rieps composition for the last 12 months on the bottom of the steamers under his supervision, and it has given such entire satisfaction that after this trial its use will be continued on all the vessels. He has also used Ripolin paint on enclosed and exposed surfaces, and, although subjected to considerable wear and tear and severe weather tests, it has worn exceedingly well, has not cracked, and has given such satisfaction that its use is to be continued and extended.

Correspondence.

[*We do not in any wav pledge ourselves to the opinions proffered under this heading.*—Ed. M.E.]

THE SHANGHAI ENGINEERING, SHIPBUILDING, AND DRY DOCK CO., LIMITED.

To the Editor of The Marine Engineer.

Dear Sir,—Permit me to bring to your notice the fact of the opening of the Shanghai Engineering, Shipbuilding, and Dock Co's. "Oriental" Dry Dock, Shanghai, which dock is now in constant use. As you are doubtless aware, it has hitherto been considered unsafe to dock very heavy ships in Shanghai. This difficulty is, however, now removed, as the "Oriental" Dock, owing to its strong construction, is capable of taking the heaviest steamers which can use the port.

Amongst the steamers already docked are s.s. *Palatinia* of 3,620 tons, and the Norddeutscher Lloyd s.s. *Königsberg* of 4,855 tons. The *Königsberg*, when docked, had on board about 2,500 tons of cargo, giving a total weight on the blocks of over 7,000 tons. In addition to these vessels, an Italian man-of-war has also used the dock.

From these particulars it will be apparent that no hesitation need be entertained in docking the largest steamers, even should these have several thousand tons of cargo on board. In connection with the dock are extensive and conveniently arranged workshops, equipped with the most modern plant and contrivances for the expeditious and economical executing of light and heavy repairs to hulls, engines, and boilers.

I am,
Yours faithfully,
E. G. Constantine.

17, St. Ann's Square, Manchester,
September 16th, 1899.

[We give in this issue, on page 310, an illustrated article on the "Oriental" Dry Dock and Works, Shanghai.]

LAUNCHES AND TRIAL TRIPS.

LAUNCHES—English.

Persian Empire.—On August 21st there was launched at Hull for the Cargill Steam Trawling Co., Limited, Hull, an iron steam ketch, named the *Persian Empire*.

King Edgar.—On August 23rd there was launched at Grimsby for the Monarch Steam Fishing Co., Limited, Grimsby, a steel steam trawler, of about 185 tons gross, named the *King Edgar*.

Bristol City.—On August 24th there was launched by Messrs. Charles Hill & Sons, at Cumberland Road, Bristol, a fine steamer built for the Bristol City Line of steamers, owned by Messrs. Hill & Sons, and running between Bristol and New York. This vessel is the 16th steamer built for the above line. She is 310 ft. long, 40 ft. 6 in. broad, 26 ft. moulded, and is the largest ship that has ever been built in the old city of Bristol, as she will carry close on 4,000 tons deadweight. She is fitted with triple-expansion engines by Messrs. Blair & Co., Stockton-on-Tees, with cylinders 24 in., 40 in., and 66 in. by 45 in. stroke, and two boilers 16 ft. in diameter and 10 ft. 9 in. long, with a pressure of steam equal 160 lbs., which will develop 1,400 H.P. She is built in advance of Lloyd's requirements to suit the Atlantic trade. The new steamer, which was christened the *Bristol City* by Lady Hill, is a sister ship to the *Bath City*, built for the same firm, and which was launched from Messrs. J. L. Thompson & Sons' Sunderland Yard, in July of the present year.

Isel Holme.—On August 24th there was launched from the shipbuilding yard of Messrs. Joseph L. Thompson & Sons, Limited, Sunderland, a handsomely modelled steel screw steamer, built to the order of Messrs. Hine Brothers, of Maryport, and the 18th vessel built by this firm for these owners. The principal dimensions are:—Length, between perpendiculars, 368 ft.; breadth extreme, 45 ft. 10½ in.; and depth, moulded, 28 ft. 4 in. She has been built under special survey on the three deck rules for Lloyd's highest class, the requirements for same having, in many important particulars been exceeded. She is built on the deep-frame system, dispensing with hold beams, thus facilitating the rapid loading and discharging of steel rails and timber cargoes; she has a cellular double bottom right fore and aft, for water ballast, which is also carried in the fore peak, the tank under the engines is fitted with watertight centre dividing plate for trimming purposes, and for carrying fresh water for cattle. The accommodation for saloon, captain, and a limited number of passengers is fitted in a large steel midship house placed on top of the bridge at the forward end, the chartroom and steering house being fitted above this. The accommodation for the officers and engineers is in side houses at the after end of the bridge, the crew, firemen, and petty officers being berthed in the topgallant forecastle. The deck machinery consists of eight steam winches; a large steam windlass on the forecastle head, and the steam-steering gear fitted at the after end of the engine casings, connected by controlling gear to the fore end of the bridge. This deck machinery is supplied with steam by a multitubular donkey boiler. The vessel is rigged as a two-masted fore and aft schooner with telescopic topmasts to suit the Manchester Canal. She has a clipper stem, with figurehead and elaborately carved trailboards. The engines and boilers have been built by Messrs. George Clark, Limited, of the Southwick Engine Works, having cylinders 24 in., 40½ in., 68 in. by 45 in. stroke, supplied with steam by two large multitubular boilers working at 180 lbs. pressure. The vessel and machinery have been constructed under the personal supervision of Captain George Brown, the owners' superintendent. The vessel was gracefully christened and launched by hydraulic power by Mrs. J. L. Thompson, of Winston-on-Tees. There were also present at the launch: Mr. J. McL. Hine, Captain George Brown, Mr. Robert Thompson, the managing director of the builders' firm, Mr. Charles E. Thompson, Mr. James Marr, Mr. P. Phorson, &c. After the launch, which was most successful, the company adjourned to the firm's luncheon room, where the usual toasts were duly honoured.

Shieldrake.—On August 26th the s.s. *Shieldrake*, which is being built by Wigham-Richardson & Co., Limited, to the order of the Cork Steamship Co., Limited, of Cork, was launched from the Neptune Shipyard. The steamer, which is a sister vessel to the *Jabiru*, finished a few months ago, is destined for the Continental service of the Cork Steamship Co. She is 260 ft. in length by 34½ ft. beam, and will have very comfortable accommodation for a limited number of passengers. Her engines, which are on the triple-expansion principle, are, as well as her boilers, being constructed by Wigham-Richardson & Co., Limited. The owners were represented at the launch by Mr. R. Reynolds, of Cork, their secretary, Captain Hore, of Liverpool, their marine superintendent, and Mr. J. A. Flockhart, of Liverpool, their superintending engineer, and the christening ceremony was gracefully performed by Miss Lillie Reynolds, daughter of Mr. Reynolds.

Arnage.—On September 2nd there was launched by Messrs. William Dobson & Co., at Newcastle, a steel screw steamer, to the order of the Adam Steamship Co. The vessel has the following dimensions:—Length, 337 ft.; breadth, 45 ft.; depth, 20½ ft.; and she has been built to take Lloyd's highest class. She will be fitted with triple expansion engines by the Wallsend Slipway and Engineering Co., Limited, and was christened the *Arnage* by Miss Aline Ritson, the granddaughter of the owner.

Lydie.—On September 4th Messrs. Richardson, Duck & Co. launched from their yard a steel screw steamer of the following dimensions:—Length, over all, 323 ft.; breadth, extreme, 44 ft. 6 in.; depth, moulded, 23 ft. 1 in.; tonnage, gross, about 2,680 tons. This vessel, which has been built to the order of Messrs. Burdick & Cook, of London, will class 100 A1 on Lloyd's register, and has been built under special survey. She is of the single-deck type with deep framing, and has a cargo poop, long bridge, with accommodation for captain, officers, and engineers in iron deckhouses on bridge deck, and topgallant forecastle for crew. A cellular double bottom throughout and after peak tank are fitted for water ballast, and the equipment includes extra large multitubular donkey boiler, eight steam winches, double derricks to hatches, steam-steering gear, steam windlass, stockless anchors, and all modern improvements for facilitating loading and discharging. The engines, by Messrs. Blair & Co., Limited, have cylinders 24 in., 40 in., and 65 in. by 42 in. stroke, steam being supplied by two single-ended boilers, having a working pressure of 160 lbs. On leaving the ways the vessel was named *Lydie* by Miss Lydie Burdick. There were also present at the launch: Mr. and Mrs. Cocquerel Mr. and Mrs. Ellis, of London, Madame Ratheau, of Paris Mr. T. J. Templeman, Mayor of Weymouth, Mr. and Mrs. J. Burdick, Miss Ethel Burdick, and Mr. Cook.

H.M.S. Viper.—On September 6th there was launched by Messrs. R. & W. Hawthorn, Leslie & Co., at Newcastle, H.M.S. *Viper*, a torpedo-boat destroyer of 31 knots guaranteed speed. The vessel is being fitted with Parsons's steam turbine machinery, whilst the hull and boilers have been constructed by Messrs. R. & W. Hawthorn, Leslie & Co., Limited, to the order of the Parsons Marine Steam Turbine Co., Limited, to whom the contract for this vessel was entrusted by the British Admiralty last year. She is expected to be ready for her official trials in the course of about six weeks. The Hon. Mrs. Parsons performed the christening ceremony.

Sunningdale.—On September 6th Messrs. Austin & Son, Limited, launched at Sunderland the steel screw steamer *Sunningdale*, which has been built to the order of Sir James Joicey, Bart., M.P., and partners, to be placed under the management of Messrs. John Fenwick & Son, of Gracechurch Street, London. This vessel is built of steel to class 100 A1 under special survey in Lloyd's register, her dimensions being as follow:—Length between perpendiculars, 268 ft.; breadth, extreme, 37 ft. 7 in.; and depth, moulded, 19 ft. 9 in.; and is estimated to carry a total deadweight of 2,600 tons. She is to be employed largely in the coal trade, and the hatchways are fitted for self-trimming. The machinery, which will be supplied by Messrs. George Clark, Limited, Southwick Engine Works, is of the tri-compound type.

Trevessa.—On September 6th there was launched from the shipbuilding yard of Messrs. John Readhead & Sons, West Docks, South Shields, a new screw steamer built to the order of Messrs. Edward Hain & Son, St. Ives, Cornwall. The vessel, which is 353 ft. long, 46 ft. 6 in. broad, and 27 ft. 4 in. in depth, is of the improved single-deck type, and classed 100 A1 at Lloyd's under special survey. She has a cellular double bottom fore-and-aft for water ballast, and is fitted with all modern improvements for rapid loading and discharging of cargo. The vessel will be fitted with triple-expansion engines, also constructed by Messrs. John Readhead & Sons, having cylinders 24 in., 40 in., and 65 in., with 45 in. stroke, steam being supplied by two large steel boilers working at a pressure of 160 lbs. per square inch. The steamer was named the *Trevessa*, and is the 35th vessel built for the above firm by Messrs. John Readhead & Sons.

Saxoline.—On September 6th this vessel, built to the order of Messrs. Lane & Macandrew, on behalf of MM. Fenaille & Despeaux, by Sir W. G. Armstrong, Whitworth & Co., Limited, was successfully launched from the builders' yard at Walker-on-Tyne. The principal dimensions are: 335 ft. long, 45 ft. broad, and 29 ft. 6 in. moulded depth. The *Saxoline* is the last of three sister ships building by Messrs. Armstrong for Messrs. Lane & Macandrew, and has been specially constructed for the carriage of petroleum in bulk under the direct supervision of Messrs. Flannery, Baggallay & Johnson, of London and Liverpool, and to the highest class of Bureau Veritas, and conforms to the Suez Canal regulations. After the launch the vessel proceeded to the engine builders' yard to take her machinery, which has been built by the Wallsend Slipway and Engineering Co., Limited. The cylinders are 24 in., 40 in., and 66 in., with a stroke of 48 in., and will take steam from two large single-ended boilers at a working pressure of 160 lbs. In addition she will be supplied with all the latest appliances for this class of vessel, including steam-steering gear, steam winches, steam heaters, electric light, and a powerful donkey boiler, &c.

Gipsy.—On September 7th there was launched from the yard of Messrs. R. Williamson & Son, Workington, a finely modelled screw steamer, built to the highest class at Lloyd's, for the Waterford Steamship Co., of Waterford. Her dimensions are:—Length, over all, 189 ft.; length between perpendiculars 181 ft. 6 in.; breadth, 27 ft. 9 in.; depth, moulded, 13 ft. 5 in., and designed to carry 800 tons on Lloyd's freeboard. The engines are to be supplied by Messrs Ross & Duncan, of Govan, and are of the triple expansion type, having cylinders 15 in., 25½ in., and 41 in., with a stroke of 30 in. As she left the ways she was gracefully named *Gipsy* by Mrs. R. H. Hodgson, Mayoress of Workington.

Montauk Point.—On September 7th there was launched from the yard of Messrs. Robert Stephenson & Co., Limited, Hebburn-on-Tyne, the second of two large steel screw steamers for the Norfolk and North American Steam Shipping Co., Limited, managed by Messrs. Simpson, Spence & Young, of 1, Crosby Square, London, and Newcastle-on-Tyne. The vessel is of the following dimensions:—Length, between perpendiculars, 375 ft.; breadth, 50 ft.; and depth 38 ft., moulded, to top of shelter deck. The vessel is built on the three-deck rule to Lloyd's highest class and has a long shelter bridge, poop and forecastle. The framing is on the deep-girder frame system in lieu of hold beams, so as to facilitate the stowage of cargo. The main deck is of steel; the upper deck, shelter deck, and forecastle are of iron. There is a cellular double bottom fore and aft for water ballast, also a deep tank abaft engine-room bulkhead extending from floors to main deck, also water ballast in after peak. The arrangement for the rapid loading and discharging of cargo is very complete, there being nine powerful steam winches to work the cargo, and 15 derricks. The vessel is also provided with a powerful steam windlass, steam-steering gear, and a steam warping capstan aft. Accommodation is provided for captain, officers, engineers, and passengers on top of shelter deck amidships. The crew are berthed in poop aft, and the forecastle is fitted up for the accommodation of the cattlemen. Steam heating is provided throughout all the cabin accommodation. The engines are of the triple-expansion type, having cylinders, 26 in., 43 in., 71 in., by 48 in. stroke, steam being supplied by two large multitubular boilers, which are fitted with Howden's patent system of forced draught. The working pressure of the boilers is 180 lbs. A large marine type donkey boiler, working at 180 lbs. steam pressure, supplies steam to the deck machinery. The engines and boilers are also constructed by Messrs. Robert Stephenson & Co., Limited. The whole of the work has been under the supervision of the owners' superintending engineer, Mr. John Baxter, of Newcastle-on-Tyne. On leaving the ways the vessel was gracefully named the *Montauk Point* by Miss Lovibond, daughter of one of the directors of the Norfolk and North American Steam Shipping Co., Limited.

Venetia.—On September 7th Messrs. Cochrane & Cooper, Limited, launched from their Grovehill Shipyard, Beverley, a new steam trawler of the following dimensions: 112 ft., by 21 ft., by 11 ft. 6 in. depth of hold, built to the order of the Arctic Steam Fishing Co., Limited, Grimsby. Engines of triple-expansion type are being supplied by Messrs. C. D. Holmes & Co., Hull, and the vessel will be fitted out with the most modern appliances for trawling. Mrs. E. Bacon, jun., of Grimsby, named the vessel *Venetia*, and after the ceremony the company adjourned to the offices of the builders for luncheon.

Paddle Steamer.—On September 8th Messrs. Allsup & Co., Limited, of Preston, launched a light-draught steel paddle steamer, which will be fitted by them with compound surface-condensing engines and boiler. She is intended for opening up trade in the rivers of North Russia, is built under special survey to class with the Bureau Veritas.

Nedenaes.—On September 8th Messrs. Short Brothers launched from their shipbuilding yard at Pallion a handsomely modelled steel screw steamer built to the order of Mr. C. T. Boe, of Arendal, of the following dimensions, viz.:—Length, 255 ft.; breadth, 36 ft. 9 in.; and depth, moulded, 20 ft. 4 in.; with a deadweight carrying capacity of about 2,550 tons. The vessel, which is classed A1, Det Norske Veritas, has been built for the general trade. There are four large hatchways with a powerful steam winch at each. The bottom of the vessel is constructed on the cellular principle for water ballast throughout, and is subdivided into various compartments for trimming. The captain's, officers', and engineers' accommodation is in a large house on bridge deck amidships, the saloon being handsomely fitted up in polished hardwoods and the crew in the topgallant forecastle. Every modern appliance has been fitted for the convenience of loading and discharging. On leaving the ways the vessel was named *Nedenaes*, the ceremony being gracefully performed by Mrs. Svenningsen, wife of Captain Svenningsen. The vessel is fitted with triple-expansion engines and boilers by Messrs. William Allan & Co., Limited, of Sunderland, with all modern improvements in marine engineering, the cylinders being 19 in., 31 in., and 51 in. diameter with a stroke of 36 in., the working pressure being 160 lbs. During the construction the vessel and engines have been superintended, on behalf of the owners, by Captain Svenningsen, who will take command,

Pearl.—On September 9th Messrs. Cochrane & Cooper, Limited, launched from their Grovehill Shipyard, Beverley, a new steam trawler of the following dimensions: 115 ft. 4 in., by 21 ft., by 11 ft. 6 in. depth of hold, built to the order of Messrs. T. C. & F. Moss, Grimsby. Engines of triple-expansion type will be supplied by Messrs. C. D. Holmes & Co., Hull. The vessel will be completed ready for sea with the most modern appliances for trawling. Miss Elsie Moss named the vessel *Pearl*, and after the ceremony the company adjourned to the offices of the builders for luncheon.

Stryon.—On September 9th there was launched at Hull for the Standard Steam Fishing Co., Limited, Grimsby, an iron steam ketch, of about 198 tons gross, named the *Stryon*.

Granada.—On September 9th Messrs. John Priestman & Co. launched from their shipbuilding yard at Southwick a large steel screw steamer, built to the order of Messrs. A. C. de Freitas & Co., of Hamburg, for the Argentine and Canadian cattle trade. The principal dimensions are:—Length, 410 ft.; breadth, extreme, 52 ft. 2 in.; depth, moulded, to shelter deck, 38 ft. 7 in., having a total displacement of about 11,000 tons. This vessel is intended to take the highest class in Lloyd's registry, being built to the three-deck rule grade. The water ballast is provided in a cellular double bottom right fore-and-aft, and, together with the afterpeak tank, gives a capacity of over 1,100 tons. The vessel has three fully laid decks, and on the upper and shelter deck are cattle fittings built to the new Argentine regulations for over 800 head of cattle. The electric light will be fitted, together with several electric fans, at different parts of the ship, to ensure complete ventilation, and special attention has been given to an efficient water service for the live stock. The arrangements for loading and discharging are of a very powerful and complete description. The engines and boilers will be supplied by Messrs. T. Richardson & Sons, Limited, West Hartlepool. The sizes of the cylinders are 27 in., 43 in., and 72 in., with a stroke of 48 in. Steam will be supplied by three extra large boilers, each having a working pressure of 180 lbs. per square inch. The launch was a complete success, and as the huge vessel glided down the ways she received the name of *Granada* from Mrs. Priestman.

Hillglen.—On September 19th there was launched from the yard of the Northumberland Shipbuilding Co., Limited, at Howden, a spar-deck steamer built to the order of Messrs. Hugh Evans & Co., for the Liverpool and Maranham Steamship Co., of Liverpool. The vessel is designed to carry 6,500 tons deadweight on a moderate draught, her dimensions being: 352 ft. by 48 ft. by 30 ft. dead measurement, built to the highest class at Lloyd's on the spar-deck rule. She will carry a large quantity of water ballast in peak and double bottom and after tanks, and the accommodation for captain, officers, engineers, &c., is in steel houses on the bridge deck; whilst every facility has been provided in the way of deck discharging machinery, steam winches, windlass, &c. The steamer was christened *Hillglen* by Mrs. Austin Taylor, the wife of the principal partner of Messrs. Hugh Evans & Co.

Idzumo (Japanese cruiser).—On September 19th Sir W. G. Armstrong, Whitworth & Co. launched at Elswick the Japanese first-class armoured cruiser *Idzumo*. The principal dimensions are:—Length between perpendiculars, 400 ft.; breadth, 68·6 ft.; depth, 41 ft.; draught, 24·3 ft.; displacement, 9,750 tons. Accommodation is provided for an admiral, 52 officers, and 430 petty officers and men. The armament consists of four 8-in. breech-loading guns twin-mounted in barbettes; 14 6-in. quick-firing guns—10 in casemates—six on the main deck and four on the upper deck, the remaining four being on the upper deck protected by shields; 17 12-lb. quick-firing guns—eight on the shelter decks, two on the main deck forward, four on the bulwarks, and three in the military tops; four submerged torpedo tubes—two forward and two aft. The vessel has a complete water-line belt of Harveyed nickel-steel armour 7 in. thick amidships, reduced at the ends. The machinery is of the twin-screw vertical triple-expansion type, to develop 14,500 I.H.P., and the speed guaranteed is $20\frac{3}{4}$ knots, the boilers being of the Belleville latest type. She has a bunker capacity for about 1,600 tons of coals. The vessel was named the *Idzumo* by Lady Victoria Grey, daughter of Lord Grey.

Bylands.—On September 19th Messrs. Ropner & Son, of Stockton-on-Tees, launched a steel screw steamer of the following dimensions, viz.:—Length, between perpendiculars, 325 ft.; breadth, extreme, 46 ft. 6 in.; depth, moulded, 27 ft. The vessel will take the highest class at Lloyd's, and is built off the three-decked rule, having poop, bridge, and topgallant forecastle. She has been built to the order of Messrs. Jos. F. Wilson & Co., of West Hartlepool. The accommodation for the captain and officers will be fitted up in the poop, the engineers in iron houses on the bridge-deck, and the crew in the forecastle as usual. She has double bottom on the cellular principle for water ballast, and will carry a deadweight cargo of about 5,500 tons. She is fitted up with all the most recent appliances for expeditious loading and unloading, has direct steam windlass, steam-steering gear amidships, with powerful screw gear aft, six large steam winches, supplied with steam from two donkey boilers. The vessel will be fitted with a set of triple-expansion engines by Messrs. Blair & Co., Limited, of Stockton, of about 1,200 I.H.P. The christening ceremony was gracefully performed by Miss Wilson, of West Hartlepool, daughter of the managing owner, who gave the vessel the name of *Bylands*.

Arechondo.—On September 20th Messrs. Craig, Taylor & Co. launched from their Thornaby Shipbuilding Yard, Thornaby-on-Tees, a handsomely modelled steel screw steamer of the following dimensions, viz.: 299 ft. by 43 ft. by 21 ft. 3 in. moulded, built to the highest class in Lloyd's under special survey to the single-deck rule, with bulb angle frames, giving large clear holds for stowing cargo. The deck erections consist of poop, bridge, and topgallant forecastle, and she is fitted with water ballast in double bottom fore-and-aft, and in peak. The vessel is equipped with four double-powered steam winches, patent direct steam windlass, patent steam-steering gear, large donkey boiler, screw gear aft, telescopic masts, and all modern improvements. Her engines have been constructed by Messrs, John Dickinson & Sons, Limited, Sunderland, the cylinders being 21 in., 35 in., and 57 in. by 39 in. stroke, two large steel boilers working at 160 lbs. pressure. This vessel has been built to the order of Mr. Antonio Uribe, of Bilbao, and under the superintendence of Captain Jose R, Bollar. She is a duplicate of a number of others which Messrs. Craig, Taylor & Co. have built, and are building, and remarkably good performances have been obtained. On leaving the ways she was gracefully christened the *Arechondo* by Miss Netta Hopper.

Bloomfield.—On September 20th there was launched from the yard of the Tyne Iron Shipbuilding Co., Limited, a steel screw steamer, built to the highest class of Lloyd's on the spar-deck rules for carrying petroleum in bulk. She is of very large size amongst the vessels built for carrying oil in bulk, being 350 ft. by 50 ft. by 31 ft., and is divided into 32 separate oil-tight compartments, and in addition has six separate water-tight compartments, besides her machinery space, cross bunker, cargo hold, and pumproom. She is fitted with all the most recent improvements for her intended trade, including a double installation of powerful pumping machinery, a ventilating fan for exhausting air from the oiltight compartments, electric lighting throughout, steam winches, direct acting-steam capstans, direct-acting steam windlass with capstans, powerful steam-steering gear, and steam heating throughout. The engines, which are to be supplied by the North-Eastern Marine Engineering Co., Limited, of Wallsend-on-Tyne, are of good power, having cylinders 27 in., 45 in., and 74 in. by 48 in. stroke, with three very single-ended boilers, working at 180 lbs. pressure. On leaving the ways the vessel was named the *Bloomfield* by Mrs. Brunton, of Tynemouth.

Clumberhall.—On September 21st Messrs. Irvine's Shipbuilding and Dry Docks Co., Limited, launched from their shipyard at West Hartlepool a finely modelled steel screw steamer built for the West Hartlepool Steam Navigation Co., Limited. She is of the following dimension:—Length, 352 ft.; breadth, 48 ft.; and depth, 27 ft. 9 in.; and of a measurement cargo capacity of 8,000 tons. She is of the single-deck type, with poop, bridge, and forecastle. The vessel is built to Lloyd's highest class under special survey, and capable of carrying a large cargo on a light draught. A double bottom is fitted throughout on the cellular principle for water ballast, and the after-peak is arranged as a trimming tank. She is constructed with deep frames, web frames, and longitudinal stringers, thus dispensing with hold beams, which gives clear holds for the storing of bulky cargoes. Six watertight bulkheads divide the holds into seven watertight compartments, and each hold is fitted with iron grain divisions. She also has extra large cargo hatches, and is equipped with double derricks, which have been specially designed by the firm, at each hatch, six steam winches, and is replete with all the latest improvements for rapid loading and discharging. A powerful direct steam windlass is fitted forward for the working of the cables, and steam-steering gear is fitted amidships. The saloon and captain's, and officers' accommodation is provided in a house at the fore end of the bridge, and the engineers are berthed on the bridge at the side of casings. The seamen and firemen are housed under the forecastle. The sanitary, ventilating, and lighting arrangements have received special attention, and have been effected on the most approved lines. Engines of the triple-expansion type are being supplied by Messrs. Thomas Richardson & Sons, Limited, Hartlepool, with cylinders 24 in., 39 in., and 66 in. in diameter, with a stroke of 45 in., steam being supplied by two single-ended boilers constructed to work at a pressure of 160 lbs. The construction of the ship and engines has been supervised by Mr. R. Craig, owners' superintendent. As the vessel left the ways the christening ceremony was gracefully performed by Mrs. J. E. Guthe (wife of the managing director of the company), who named her *Clumberhall*.

Sheppy Allison.—On September 21st Messrs. William Gray & Co., Limited, launched a fine steel screw steamer, which they have built to the order of Messrs. J. S. Allison & Co., of West Hartlepool. She will take Lloyd's highest class, and is of the following dimensions, viz.:—Length over all, 312 ft.; breadth, 43 ft.; and depth, 22 ft. $3\frac{1}{2}$ in., with full poop, bridge, and topgallant forecastle. The saloon and captain's and officers' rooms will be fitted under the poop. The hull is built with deep bulb angle frames and cellular double-bottom and aft peak tank for water ballast, four steam winches, steam-steering gear amidships, hand-screw gear aft, patent quick-warping steam windlass, two donkey boilers, grain divisions, stockless anchors, and a complete outfit will be provided for a first class cargo boat. Three cylinder triple-expansion engines of over 1,000 H.P. are being supplied by the Central Marine Engine Works of Messrs. William Gray & Co., Limited. The cylinders are 22 in., 35 in., and 59 in. diameter, with a piston stroke of 39 in., and large steel boilers having a working pressure of 160 lbs. per square inch. The construction of the ship and machinery have been under the superintendence of Captain T. Morris on behalf of the owners, and the ceremony of christening the steamer *Sheppy Allison* was gracefully performed by Mrs. Sydney Hogg, West Hartlepool. Amongst those present at the launch were: Mr. and Mrs. J. S. Allison, Mr. and Mrs. M. H. Horsley, Mr. Sydney Hogg, Mr. Cecil Hogg, Miss Daisy Hogg, Mr. John Coverdale, &c.

Ivernia.—On September 21st there was launched from the shipbuilding yard of C. S. Swan & Hunter, Limited, Wallsend-on-Tyne, a very large passenger and cargo liner, for the Cunard Steamship Co., Limited. This large steamer, which was named the *Ivernia*, is one of two sister vessels ordered by the Cunard Co. in the autumn of last year, one on the Tyne and the other on the Clyde. The *Ivernia* is intended for the company's line between Liverpool and Boston, and is designed to carry a large number of passengers. Of first and second-class passengers she will carry about 170 of the former, and about 200 of the latter. Of third-class passengers she will carry about 1,000; 500 of these are accommodated in two, four, and six-berthed staterooms. Stalls will be fitted for about 800 head of cattle and 80 horses. The leading particulars of the vessel are:—Length, overall, 600 ft.; length, between perpendiculars, 580 ft.; beam, extreme, 64 ft. 6 in.; depth, moulded to upperdeck, 41 ft. 6 in.; depth, moulded to shelter-deck, 49 ft. 6 in.; gross tonnage, about 13,900 tons; speed on trial, 16¼ knots. Her engines are being supplied by the Wallsend Slipway and Engineering Co., Limited, with an I.H.P. of 10,000; the diameters of the cylinders being 28½ in., 41 in., 58½ in., and 84 in. respectively, with a stroke of 54 in. The first two cylinders have piston valves, the two others slide valves; and the arrangement of cylinders from the forward end is somewhat unusual—high-pressure, low-pressure, first intermediate, second intermediate. Each cylinder, which has two bodies, and also double covers, is carried on two cast-iron columns of box form with separate faces, and the usual pumps are worked from the crossheads, the condenser being behind. The sole-plate is of cast-iron, and, like the columns, very massive. The propellers are three-bladed and of manganese bronze, with cast-iron bosses. There are for the ship nine boilers, all single-ended, and they are to work at 210 lbs. pressure. So big is the ship that they will all go into one boiler-room, six being placed back to back in double rows across the ship, with three boilers at the after end, so that there will be three rows and two stoking-platforms, from one of which six boilers will be fired, and from the other only three will be fired. There is a separate donkey-boiler. There will only be one funnel, but it will be 140 ft. high from the keel, and it is 15 ft. in diameter. The steam pipes are of wrought iron, lap-welded, with expansion joints. There are in the ship two of Weir's main-feed pumps and a Weir's feed-heater, two centrifugal pumps and engines of Gwynne & Co.'s make, two large Quiggin's evaporators and condensers, three of the well-known Cameron pumps, fitted for auxiliary feeding, fire, bilge, and other duty. There are four complete steel decks, lower, main, upper, and shelter; also a steel orlop deck from the boiler-room forward to the stem, and a bridge deck 280 ft. long above the shelter-deck. The space between the orlop and lower decks forward is insulated for carrying chilled beef, three large refrigerating engines being fitted in a house on the upper deck, and also a smaller one for the ship's own stores. The whole of the space forward of the engine room on the main deck is utilised for the accommodation of the third-class passengers, three rows of staterooms being fitted on each side in the three after of these compartments, the dining accommodation being between. On the same deck aft are the stalls for the cattle, which will be fitted on the latest approved principle to pass the American Cattle Regulations. On the upper deck at the forward end is a clear covered promenade for the third-class passengers, also their baths, lavatories, &c. Here also are the hospitals, surgery and bar. At the sides of the engine and boiler space, and for a short distance aft on this deck, are the berths for the engineers, crew, firemen, and stewards, and aft to the stern the stalls for the horses. At the forward end of the bridge on the shelter deck is the third-class entrance in the centre, with a ladies' room on the starboard, and a smokeroom on the port side. Continuing aft, first come the cabins for the officers, then the first class dining saloon, main stairway, pantry, galley. The remainder of the bridge is to be fitted for the second class with their dining saloon across the after end. Above the bridge deck in a large deckhouse will be accommodation for the first class, the deck over this being carried to the side for carrying the boats and for promenade. On this is a deckhouse containing the captain's rooms at the forward end, then the library, main entrance, and staircase; then at the after end the smoke room with a passage way at each side of the engine and boiler casing connecting it to the library and entrance. On top of all is the navigating bridge, wheelhouse, and charthouse. The keel was laid on December 6th of last year, and considering the difficulty the builders have had to contend with owing to the scarcity of men and the short time that the men obtainable are working, the work has been done very expeditiously, and it is expected that the *Ivernia* will take up her station on the Liverpool and Boston service early next year. On leaving the ways the vessel was named *Ivernia* by the Countess of Ravensworth.

Wearside.—On September 23rd Messrs. William Gray & Co., Limited, launched the large side ballast tank steamer, *Wearside*, which they have built to the order of Messrs. J. & E. Kish, of Sunderland. The *Wearside* is somewhat similar to the *Mancunia* and *Claudius*, the first side-tankers which were sent out by the same builders. In both these vessels when making passages in ballast, the beneficial effects of the side tanks have been very considerable, the speed and behaviour of the ships having been greatly improved, and the racing of the machinery reduced to a minimum, whilst efficient ballasting under easy control is provided without the cost and inconvenience of having to ship rubbish ballast. The *Wearside* is built to Lloyd's highest class; her dimensions are:—Length over all, 350 ft.; breadth, 51 ft.; depth, 27 ft.; deadweight capacity, 6,200 tons; with large measurement capacity and area on deck for carrying cattle or timber, &c. The arrangements throughout the ship including a special outfit of steam winches, derricks, &c., will enable cargo to be dealt with most expeditiously. A cellular double bottom extends throughout, and with a very large after peak tank contains 1,140 tons of water ballast, whilst the side tanks contain 720 tons more, or a total of 1,860 tons The side tanks (McGlashan's) extend through the main and after holds and engine room for a length of 191 ft. in way, of which the ship has double sides, adding greatly to her strength, and also to her safety. These advantages are secured without extra material being required in the construction of the side tanks, lower decks, and other parts used in strengthening ordinary ships, and which greatly impede stowage, being dispensed with, so that the new type loses nothing as a cargo carrier. The machinery consists of a fine set of triple-expansion engines of over 1,400 H.P., having cylinders 25½ in., 40½ in. and 67 in. diameter, and 45 in. piston stroke, with three main boilers to work at a pressure of 160 lbs. per square inch, all by the Central Marine Engine Works of the builders. Mr. M. Metcalfe has superintended the building of the ship on behalf of the owners, and the ceremony of christening the *Wearside* was gracefully performed by Miss Meggie Tully, of Sunderland.

Verona.—On September 23rd Messrs. Furness, Withy & Co, Limited, launched from their Middleton Shipyard, West Hartlepool, a large steel screw steamer, built to the order of Sir Christopher Furness, J.P., D.L., and she will be either disposed of or added to the Furness Line fleet. She is a fine type of a modern cargo vessel, measuring over 382 ft in length, and built throughout of Siemens-Martin steel, has a deadweight capacity of about 7,425 tons, and a cubic capacity of 409,734 cubic ft., and takes Lloyd's highest class The vessel is of the three-deck type with cargo poop, long bridge, and topgallant forecastle. All deck erections, skylights, bulwarks, &c., are constructed of steel and iron, with cellular double bottom fitted all fore-and-aft for water ballast, the after peak being also available as a tank. Permanent iron grain divisions are also fitted in connection with the ship, Eight powerful steam winches, direct steam patent windlass, combined hand and steam-steering gear worked from the bridge, stockless anchors, and all the most modern appliances are provided for the handy working of the vessel. The hatches of this vessel are of a large size to facilitate the quick manipulation of cargo. There is a fine saloon and cabin, which will be finished in polished hardwood; the crew will be berthed under the topgallant forecastle. The machinery will be supplied by Messrs. Sir Christopher Furness, Westgarth & Co,, Limited, Middlesbrough, having cylinders 25 in, 40 in., 68 in. by 48 in. stroke, steam being supplied by three single-ended boilers 13 ft. 6 in. diameter by 10 ft. 3 in. long, and 180 lbs. pressure. A large evaporator and feed heater will be fitted in connection with the engines. The vessel will be rigged as a two-masted fore-and-aft schooner.

Alpha.—Lately Messrs. Charlton & Co., Limited, launched from their shipbuilding yard at Great Grimsby a trawler, built of iron, and classed 100 A1 at Lloyd's, and of the following dimensions, viz.:—Length, 107 ft.; breadth, 21 ft.; and depth, 10 ft. 9 in. She was named the *Alpha*, by Miss Brunyee, of Hull. This being the first vessel launched since the formation of the company, special interest was manifested in the event.

Providence. — Lately Messrs. J. P. Rennoldson & Sons launched at South Shields a steel screw cargo steamer, built to the order of Mr. Fortius C. Svorono, Mariupel, for serv the Black Sea. The vessel—the dimensions of which are 225 ft. between perpendiculars, 32 ft. beam, 13 ft. moulded depth—has been built to class Div. 11 with Bureau Veritas, and to carry a deadweight of 1,050 tons on a load draught of 11 ft. This exceedingly light draught is to meet the exigences of the ports in the Sea of Azof. The engines, which are fitted by the builders, are of the triple-compound type, capable of developing 500 I.H.P., the cylinders being 15 in., 25 in. and 40 in. by 24 in. stroke, and the working pressure 160 lbs.,on the square inch. The vessel was named the *Providence*.

LAUNCHES—SCOTCH.

Marchioness.—On August 22nd the Ailsa Shipbuilding Co. launched from their shipbuilding yard at Troon a steel screw steamer, classed 100 A1 at Lloyd's, for Messrs. J. Hay & Sons, of Glasgow. The steamer is intended for the coasting and Continental trade, and is of the following dimensions:— Length, 184 ft.; breadth, 27 ft.; and depth, moulded, 13 ft. 5 in. Compound surface-condensing engines, with cylinders 21 in. and 44 in. diameter by 30 in. stroke, will be fitted by Messrs. Muir & Houston, Limited, Glasgow. The ceremony of naming the vessel the *Marchioness* was performed by the Marchioness of Ailsa.

Syriam. — On August 23rd the Grangemouth Dockyard Co. launched at Grangemouth a steel oil-tank steamer for carrying petroleum in bulk. Dimensions: — 235 ft. by 32 ft. 6 in. by 24 ft. moulded. Engines are placed aft, and the holds are subdivided into 14 oiltight compartments. The vessel will have the highest class at Lloyd's, and is provided with all the most modern machinery for a vessel of her type. Triple-expansion engines will be fitted with boilers having an arrangement for burning oil fuel, which the vessel is to use when she arrives at her destination, and with which she is expected to attain a high rate of speed. The vessel has been built to the order of Messrs. Jacobs & Barringer for clients in the East. As the vessel left the ways she was gracefully named *Syriam* by Mrs. J. T. Cargill, of Westbourne Gardens, Glasgow. This is the fifth steamer for carrying oil in bulk which the Grangemouth firm have built, and of which they make a speciality, and they have at present a duplicate vessel to the above on hand for the same owners.

Penguin.—On August 25th there was launched at Rutherglen for the Manchester and Liverpool Transport Co., Limited, Manchester, a steel steam cutter, named the *Penguin*.

Rostrevor.—On August 25th Messrs. John Fullerton & Co. launched at Paisley a steel screw steamer of about 350 tons, which has been built to the order of Messrs. Joseph Fisher & Sons, Newry, for their extensive coasting carrying trade. The steamer is largely in excess of Lloyd's requirements, and has the most modern outfit for working both ship and cargo. Compound engines of 450 I.H.P. are being supplied by Messrs. Hall-Brown, Buttery & Co., Govan. The steamer was named *Rostrevor* by Miss Bost, Adelphi House, Paisley.

Niels Ebbensen.—On August 26th there was launched at Renfrew for Forenede Dampskibs Selskab, Copenhagen, a steel schooner-rigged steamer of about 1,150 tons gross, named the *Niels Ebbensen*.

St. Blaize.—On August 26th there was launched from the Bute Slip Dock, Ardinaleish, Rothesay, a screw towing steamer, built of wood, to the order of the Mossel Bay Boating Co., Limited, South Africa. The vessel, which was named *St. Blaize*, is 66 ft. in length, 15 ft. in breadth, and 8 ft. deep. She is to be fitted with engines of 11 in. and 20 in. cylinders by Messrs White & Sons, Greenock, and is to be sailed out to her destination by Captain Alister M'Intyre, under whose superintendence she has been constructed.

Una.—On September 5th there was launched by Messrs. John Scott & Co., at Kinghorn, a finely modelled steel screw steamer, built to the order of Messrs. Bailey & Leetham, Limited, of Hull and London. The vessel has been built to Lloyd's highest class for well-deck steamers. Her dimensions are:—Length, 237 ft., between perpendiculars; breadth, moulded, 34 ft.; and depth, moulded, 17 ft. 9 in.; gross tonnage, 1,444 tons. The vessel has accommodation for 58 first-class passengers in staterooms on main deck amidships, and a large saloon and ladies' boudoir handsomely fitted up in oak in a deckhouse on bridge. Accommodation for crew is fitted forward in forecastle, and the engineers and officers are accommodated aft in poop. The captain's cabin and smoking-room and chart-house are placed immediately over main saloon, and are fitted up in style similar to saloon. She has four large hatches, and four powerful steam winches by Messrs. Roger & Co., Stockton; large steam windlass. The steam steering gear is placed at aft end of engine casing, and is by the builders, and of their latest type. The ship is rigged as a fore-and-aft schooner, and has telescopic masts. She has been fitted with electric light by Messrs. Holmes & Co., Newcastle. The machinery is also by Messrs. John Scott & Co., Kinghorn. The cylinders are 20 in., 32 in., 54 in., by 39 in. stroke, and two boilers, 14 ft. 6 in., and 11 ft long, and 180 lbs. pressure, fitted with Howden's forced draught. The interesting ceremony of launching was very gracefully performed by the Dowager Duchess of Sutherland cutting the ribbon that secured the dog-shores, and the christening was gracefully performed by Miss Blair, daughter of her grace, who gave the name *Una*. The new steamer afterwards proceeded under her own steam to Burntisland to load for her official trial. She leaves for St. Petersburg under Captain Grant after her trial trips.

Axinite.—On September 6th Messrs. A. Rodger & Co. launched at Port-Glasgow, a steel screw steamer named *Axinite* to the order of Mr. William Robertson, Glasgow. The steamer will carry 2,650 tons deadweight, and measures—Length, 260 ft; breadth, 37 ft.; depth, 19 ft. 5 in. The machinery will be supplied by Messrs. Muir & Houston, Glasgow.

Tento.—On September 6th there was launched at Aberdeen a steel steam ketch, of about 149 tons gross, named the *Tento*.

Urlana.—On September 7th Messrs. A. & J. Inglis launched at Pointhouse the second of four steamers of 8,000 tons capacity for the British India Steam Navigation Co. This vessel, which is the fiftieth built at Pointhouse for the British India Co. and its allies, was, on leaving the ways, named the *Urlana* by Miss Lily Reed, Seevis, Lee, Kent.

Aira.—On September 7th Messrs. Scott & Sons launched from their shipbuilding yard at Bowling a screw steamer of the following dimensions, viz.: 180 ft. by 30 ft. by 14 ft. moulded, which they have built to the order of Swedish owners. The vessel will be supplied with triple-expansion engines, which are to be fitted on board by Messrs. Ross & Duncan, of Govan. On moving down the ways the steamer was named *Aira* by Miss Charlotte Isobel Scott, Dunarbuck, Bowling.

Progress.—On September 7th there was launched from the yard of Messrs. Hawthorns & Co., Limited, Leith, the first of two beautifully modelled steel screw steam carriers of the following dimensions:—Length between perpendiculars, 140 ft.; breadth, moulded, 22 ft. 3 in.; depth, moulded, 11 ft. 8 in. She will be fitted out by the builders with triple-expansion engines, having cylinders 13 in., 22 in., and 37 in. diameter by 27 in. stroke, working at a boiler pressure of 200 lbs. per square inch. The hull and machinery have been constructed to the highest class at Lloyd's, and as the vessel left the ways she was named *Progress* by Miss Mary J. Leyman, daughter of the chairman of the Great Northern Steamship Fishing Co., Limited, Hull, for whom the vessel has been built.

Andrei Stempinsky.—On September 7th Messrs. William Simons & Co., Limited, Renfrew, launched complete from their yard the *Andrei Stempinsky*, a powerful barge-loading dredger for the Russian Government. This vessel has been constructed under the inspection of, and is also classed by, Bureau Veritas. Independent steam hoisting gear is provided for manipulating the bucket ladder, and also independent steam winches are fitted at bow and stern of vessel for manœuvring the vessel when at work. Electric light is fitted on deck and throughout the vessel, for working day and night. There are separate cabins for the officers and crew, and a private cabin on deck is also provided.

Atlanta.—On September 7th Messrs. Ramage & Ferguson, Limited, launched from their yard the third steam trawler they have built for Messrs. The Newhaven Trawlers, Limited. The dimensions are 105 ft. by 20 ft. 6 in. by 11 ft. 10 in. depth, moulded, and the propelling power being supplied by triple-expansion engines having cylinders 12 in., 19 in., and 30 in. diameter by 21 in. stroke, steam being supplied from a large multitubular boiler working up to 180 lbs. pressure. The christening ceremony was gracefully performed by Mrs. Walker, naming the vessel *Atlanta* as she left the ways.

Don Hugo.—On September 7th Messrs. David J. Dunlop &

Co., engineers and shipbuilders, Inch Works, Port-Glasgow, launched from their works a finely modelled steel screw steamer of the following dimensions and particulars:—Length over all, 310 ft.; breadth, moulded, 38 ft.; depth, moulded, to main deck, 20 ft. 6 in. The vessel, which is of the "well deck" type, has been built in accordance with Lloyd's rules for 100 A1 class in their registry, and also to obtain the Board of Trade passenger certificate for foreign-going steamers. Under the full poop aft accommodation is provided in state-rooms for 10 second-class passengers, entering from the raised quarter-deck through a large dining saloon, whilst ample provision is made for the comfort of those passengers, both as regards ventilation and lighting of cabins and the necessary sanitary fittings. At the fore end of quarter-deck, which extends from fore part of poop to engine-room bulkhead, a bridge-house is fitted over the main deck for a length of 128 ft., containing accommodation at the after part alongside engine and boiler casing next ship's side for officers, engineers, stewards, petty officers, pantries, &c., and a large saloon for first class passengers right across the vessel immediately forward of fiddley casing. The entrance to this saloon is from a large deck-house on bridge-deck, which is fitted up as a smoking-room in the after part, and double entrance companion at the fore part, all finished in hard wood, French polished, and the saloon is chastely finished in solid oak paneling, oak dining-tables, revolving chairs, handsome oak namelled-decorated open fireplace, with ornamental mirrors, helves, &c. The upholstery work includes sofas in rich velvet, Brussels carpet and runners, draped damask berth and window curtains, &c. The first-class state-rooms are placed along ship's side forward of dining saloon for 20 passengers, and are fitted up with the most modern requisites, including fold-up lavatories, spring mattresses, &c. From the fore part of bridge to after part of forecastle is a 40 ft. "well," the topgallant forecastle shelters the accommodation for firemen, seamen, quartermasters, lamp-rooms, store-rooms, &c.; whilst the other deck erections consist of an upper bridge, on which is placed a large teak deck-house fitted up as captain's room and chart-house; over this, again, is fitted the flying bridge, for navigation of steamer. The rig of the vessel is that of a two-masted fore-and-aft schooner, and the masts are arranged to telescope in the event of passing under canal bridges. The outfit of the steamer includes teak deck, Harfield's steam capstan windlass, Caldwell & Co.'s steam-steering gear, complete electric lighting installation by Patterson & Cooper (of Paisley), four steam winches of Clark, Chapman & Co.'s special make, pumping machinery to discharge the double bottom and peak tanks in four hours, Lord Kelvin's compass, &c. Immediately after the launch the vessel was moored in the builders' wet dock under their powerful steam derrick crane to receive her machinery, which consists of one set of triple-expansion engines, having cylinders 24 in., 40 in., and 66 in. diameter by 48 in. length of stroke, steam being supplied at a working pressure of 180 lbs. per square inch by two single-ended boilers fitted with Howden's system of forced draught, auxiliary boiler for driving deck, &c., machinery. The outfit includes Weir's pumps, Mr. Dunlop's steam and pneumatic governor, evaporator, feed heater, feed filter, and bronze propeller blades. The *Don Hugo* is built to the order of the Rio Tinto Co., Limited, of London, whose agents are Messrs. Matheson & Co., of that city, and during the construction of the vessel Mr. Roberts, the owners' adviser, has been directly represented by Mr. A. J. Barrett, inspecting engineer. The new steamer will be commanded by Captain Jones. The ceremony of naming the steamer *Don Hugo* was gracefully performed by Miss Matheson, of London. Amongst the company who witnessed the launch were Mr. Keswick, the chairman of the Rio Tinto Co., Mr. McFarlane, Mr. Sartoris, and Mr. Hugh Matheson, directors. Huelva was represented by the Rev. John Jeffrey, chaplain for the company, and Mr. Anderson.

Ino.—On September 8th the Campbeltown Shipbuilding Co. launched from their yard at Trench Point a finely modelled steel screw steamer of 1,900 tons, built to the order of the Bristol Steam Navigation Co. The vessel is a sister ship to the *Cato* and *Silvio*, recently completed by the same builders for the Bristol Co. Her engines will be supplied by Messrs. Hutson & Son, Glasgow. As the vessel left the ways she was gracefully named *Ino* by Miss Morrison, Altnacraig, Greenock.

Claverdon.—On September 12th Messrs. William Hamilton & Co. launched from their Glen Yard, Port-Glasgow, a steel screw steamer for Messrs. Edmund Haslehust & Co., Billiter Buildings, London, for their general and Eastern trade. The dimensions of the vessel are as follow:—Length, between perpendiculars, 330 ft.; breadth, 45 ft. 6 in.; depth, moulded, 26 ft. 6 in; with poop, long bridge amidships, and topgallant forecastle, and is classed at Lloyd's 100 A1. She is designed to carry over 5,400 tons deadweight on a light draught, with a net register tonnage of about 2,100 tons. A feature of this vessel's construction is the joggling of the shell, deck, and tank top plating, thus bringing all the strakes of plating close to the frames and beams without the use of filling slips. The propelling machinery, which is being supplied by Messrs. David Rowan & Co., of Glasgow, consists of one set of triple-expansion engines, having cylinders 24 in., 40 in., and 65 in. diameter respectively by 42 in. stroke; steam is supplied by two large boilers constructed for a pressure of 180 lbs. As the vessel left the ways she was named the *Claverdon* by Mrs. Parker, wife of the captain. Immediately after the launch, which was most successful, the vessel proceeded to Glasgow to receive her machinery.

Japura.—On September 12th Messrs. Murdoch & Murray launched at Port-Glasgow the steel twin-screw steamer *Japura*, for the Amazon passenger service. The dimensions are:—Length, 140 ft.; breadth, 27 ft.; depth, 15 ft. 6 in. Messrs. Lees, Anderson & Co., Glasgow, will supply compound surface-condensing engines.

Doon and **Cairness.**—On September 16th two trawlers were launched at Aberdeen: the *Doon*, built by Messrs. J. Duthie & Sons to the order of the Deen Line of steam trawlers, Grimsby; and the *Cairness*, built by Messrs. Hall, Russell & Co., Limited, for the Fraserburgh and North of Scotland Steam Trawling Co., Limited. Both vessels are about 180 tons gross register.

Trent.—On September 19th Messrs. Robert Napier & Sons, Limited, launched at Govan the second of two steel screw steamers which they have on hand for the Royal Mail Steam Packet Co., London. The vessels have been specially designed to suit the requirements of the company's West India mail service, and as speed is an important element, they have been constructed on fine lines. They are fitted with the latest improvements for the comfort of passengers. The general dimensions are:—Length, 426 ft.; breadth, 50 ft.; depth, 35 ft.; gross tonnage, about 5,500. The vessels are built to Lloyd's highest class, under special survey, and completed in accordance with the Board of Trade regulations for passenger steamers, and also to meet the Admiralty requirements for armed cruisers. The upper decks and fittings are of teak, and the most modern appliances have been introduced for the efficient working of the ship and the rapid handling of cargo. Luxurious accommodation has been provided for a large number of first-class passengers, and all the details have been carefully considered for a service in a tropical climate. The dining saloon on the main deck is a very handsome apartment, exceptionally high, and furnished with great elegance. On the promenade deck is a reading room and ladies' boudoir, and farther aft a commodious smoking room. A feature of the passengers' accommodation is the extra large staterooms. The shade deck, on which the boats are stored, forms an admirable shelter to the spacious promenade deck, which is reserved for the first-class passengers. Very superior accommodation, scarcely inferior to the first, is provided for 40 second-class passengers. The machinery consists of a set of triple expansion engines of 7,000 I.H.P., with six single-ended steel boilers for a working pressure of 180 lbs., and supplied with the most recent improvements for efficiency and economy. The launching ceremony was performed by Miss Norton releasing, and Mrs. T. Constantine naming the ship the *Trent*.

Active and **Eclipse.**—On September 20th there were launched by the Irvine Shipbuilding and Engineering Co., Limited, at Irvine, two steel screw steam trawlers, built to the order of the Peterhead Trawling Co., Limited, Peterhead. The vessels were built to Lloyd's highest class under special survey, and are fitted with the latest appliances for fishing in the North Sea. A special feature is their large bunker capacity, which will enable them to reach the newer and more remote fishing grounds. Dimensions: 117 ft. between perpendiculars by 21 ft. by 11 ft. 9 in. moulded. The vessels are being supplied by W. V. V. Lidgerwood, of Coatbridge, with triple- [illegible] engines of about 400 I.H.P., having cylinders 12 [illegible] 32 in. in diameter by 22 in. stroke, [illegible] case from a large steel boiler [illegible] the vessels left the ways they [illegible] respectively by Miss Smith and [illegible]

Bothnia.—On September 20th there was launched from the yard of Messrs. Murdoch & Murray, Port-Glasgow, a finely modelled steel screw steamer to the following dimensions:—Length, 230 ft.; breadth, 33 ft.; depth, moulded, to main deck, 17 ft. 3 in. She has been built to the order of the Wasa Nordsjo Angbats Aktiebolag, Finland, and is the fifth steamer which Messrs. Murdoch & Murray has built for the company. She is of the partial awning deck type, classed 100 A1. at Lloyd's, besides being exceptionally strong in the bows for working amongst ice. The saloon, captain's room, and state-rooms are in a steel house on the awning deck, surmounted by a neat chart-room and flying bridge. On leaving the ways the vessel was gracefully named *Bothnia* by Miss Maud Macfarlane, Port Glasgow. Triple-expansion engines and two boilers will be supplied by Messrs. Kincaid & Co., Greenock. During construction the vessel has been superintended by Captain W. Bergstrom, Wasa, and the machinery by Mr. G. S. Horne, Glasgow.

Ranee.—On September 20th Messrs. Charles Connell & Co. launched from their shipbuilding yard at Scotstoun the second of two large steamers they have built for the Asiatic Steam Navigation Co., of Liverpool. These vessels are built to Lloyd's highest class and to the Board of Trade requirements for a passenger certificate, and are fitted in a very superior manner to suit the special requirements of the company, and with accommodation for a limited number of first-class passengers. The dimensions are:—Length, 420 ft.; breadth, 51 ft.; depth, moulded, 32 ft. 6 in.; the deadweight carrying capacity being 8,200 tons. The engines are 26 in., 43 in. and 71 in. by 48in. stroke, and are being supplied by Messrs. Dunsmuir & Jackson, Govan. As the vessel left the ways she was named *Ranee* in the customary manner by Miss Corkhill.

Toward.—On September 20th the Caledon Shipbuilding and Engineering Co., Limited, launched at Dundee a handsome steel screw steamer of 1,250 tons gross, built to the order of the Clyde Shipping Co., Limited. The new steamer is a handsomely constructed vessel, and is intended for the company's passenger and cargo traffic between Glasgow and London. Her dimensions are as follows:—Length, 260 ft.; breadth, 35 ft.; depth, 17 ft. 3½ in. Accommodation is provided for 90 first-class passengers amidships, whilst there is ample accommodation for steerage passengers forward. In view of the large cattle trade carried on by the company, stalls have been fitted on the main deck and upper and lower holds. Her engines are of the triple-expansion type, having cylinders of 25 in., 40 in. and 65 in. respectively, with a piston stroke of 48 in. There are two single-ended cylindrical boilers, with a working pressure of 160 lbs. per square inch. A separate boiler supplies steam for the cranes and winches. There was a large attendance of spectators at the ceremony, the vessel being launched by Miss Audrey Renshaw, Barrochar. The christening ceremony was performed by Miss Renshaw, the vessel being named *Toward*.

Federica.—On September 21st Messrs. Russell & Co. launched at Port-Glasgow a steel spar-decked screw steamer of 5,800 tons deadweight for Messrs. Fratelli Cosulich, of Trieste. The steamer is of the following dimensions:—Length, 340 ft; breadth, 46 ft.; depth, 28 ft. 6 in. Machinery will be supplied by Messrs. Rankin & Blackmore, Greenock. The ceremony of naming the vessel *Federica* was performed by Miss Clapperton, Greenock.

Volcano.—On September 21st there was launched from the shipyard of Messrs. Barclay, Curle & Co., Limited, Whiteinch, a steel paddle tug, built to the order of the British Admiralty, and intended (like the *Dromedary* and *Diligent*, also constructed by the same builders for Her Majesty's Government) for the towing of battleships and general service. With this view, she is furnished with towing gear of the strongest description. The vessel is fitted with commodious cabin, sleeping accommodation, &c., and has numerous watertight compartments. The dimensions are: 144 ft. by 27 ft. 3 in. by 15 ft. 8 in., with a gross tonnage of 411. The vessel was named the *Volcano* by Miss E. M. Trounson, Partick. After the launch the vessel proceeded to the harbour to receive her engines, which are being constructed by the builders. The machinery consists of two sets of compound oscillating paddle engines, arranged with disconnecting gear, so that each wheel has a complete pair of engines attached to it for easy manœuvring. Being intended to act as a fire vessel, she is fitted with two large double-cylinder pumping engines. The high-pressure cylinders are 31 in. diameter and the low-pressure cylinders 55 in. diameter, all having a stroke of 5 ft. Steam is supplied by two large single-ended boilers, and the whole of the main and auxiliary machinery is fitted up in the usual Admiralty style.

Hylas.—On September 21st Messrs. Archibald McMillan & Son, Limited, shipbuilders, Dumbarton, launched the steel screw steamer *Hylas*, of dimensions, 390 ft. by 48 ft. by 29 ft., with a gross register of about 4,300 tons. This vessel has been built to the order of Messrs. Raeburn & Verel, Glasgow, and has since been purchased by Messrs. R. P. Houston & Co., of Liverpool, for whom Messrs. McMillan have recently delivered two steamers for their River Plate trade, and for whom they have still in hand other two steamers, all of which are on fine lines and have good power, with a view, principally, to speedy passages. The *Hylas* is built to Lloyd's classification, and is fitted with poop, long bridge, and topgallant forecastle, and has a complete shelter deck above the main deck. All the accommodation for captain, officers, and engineers is on top of shelter deck, and the outfit is of the most complete description, with a view to the expeditious handling of ship and cargo. The christening ceremony was gracefully performed by Miss Gladys Hopkins, 3, Highfield South, Rock Ferry, Birkenhead.

LAUNCHES—Irish.

Sicilian.—On August 25th Messrs. Workman, Clark & Co., Limited, Belfast, launched from their South Yard a large steel screw steamer named the *Sicilian*, built to the order of the Allan Line Steamship Co., Limited, Glasgow. The vessel has been specially designed to meet the requirements of a passenger, cattle, and cargo boat, and is intended for the trades between Liverpool, Glasgow, and the principal Canadian ports. The *Sicilian* is of the following dimensions:—Length between perpendiculars, 430 ft.; breadth, 54 ft.; depth, moulded, 31 ft., with a gross tonnage of 5,400. She has been built under the special survey of the British Corporation of Shipping, Glasgow, and is provided with Board of Trade passenger certificate. The bottom of the vessel is framed on the cellular system for carrying water ballast, this manner of construction adding considerably to the safety of the ship. Water ballast for trimming purposes can also be carried in the forward and after peaks, and in a deep tank abaft the machinery space. Seven bulkheads extending to the upper deck subdivide the ship into eight watertight compartments, and there are three complete decks extending the entire length of vessel, with an additional tier in the forward hold. Between the upper and shelter decks and under the shelter bridge are the cattle stalls, accommodating about 600 head. The holds are arranged for the maximum stowage of cargo, and are discharged through five cargo hatches, each worked by two powerful steam winches and two derricks. Accommodation for the first-class passengers is provided on the upper bridge deck at the forward end, and will be fitted up and upholstered in the most luxurious and comfortable manner. It comprises state-rooms, lavatories, dining saloon, smokerooms, &c. The officers' and second-class rooms are placed at the after end of the bridge deck; the crew are berthed forward in the forecastle, and the cattlemen and petty officers have their quarters aft under the poop. A complete installation of electric light has been introduced throughout, including the machinery and cattle spaces. After the launch the *Sicilian* was towed to the finishing berth to receive her machinery, and will shortly be ready to take her place in the trans-Atlantic service of the Allan Line.

Persic.—On September 7th Messrs. Harland & Wolff launched from the Queen's Island Yard, Belfast, the new twin-screw steamer *Persic*—sister to the *Medic* and *Afric*—for the Australian service of the White Star Line. The dimensions of the *Persic*, like those of her predecessors, are:—Length, 550 ft. between perpendiculars, 570 ft. over all; breadth, 63 ft.; depth, 40 ft.; gross tonnage, 12,000. In her passenger accommodation, fitted for one class only, as well as regards her cargo and refrigerating appliances, she will, in all respects, resemble the *Medic* and *Afric*.

LAUNCH—German.

Itzehoe.—On Saturday, August 26th, the Flensburg Shipbuilding Co., Limited, Flensburg, launched the fifth of eight sister-ships which this firm are building for the Deutsch-Australische Dampfschiffs-Gesellschaft, of Hamburg. Her principal dimensions are:—403 ft. 8 in. by 47 ft. 8 in. by 31 ft., with a deadweight carrying capacity of about 6,500 tons. She is built to Lloyd's highest class special survey, "spar deck rule," with long poop, bridge, and forecastle. Accommodation for captain, officers, and engineers is fitted up in steel deck-houses on top of bridge, whilst the crew is housed in forecastle. These vessels are in every respect completely fitted out with all modern improvements suitable for first-class cargo boats, including a sufficient number of large steam winches, derricks, steam steering-gear, &c. The engines, which are also being constructed by this firm, will be of the triple-expansion type, having cylinders 28½ in., 47½ in., and 78 in. by 65 in. stroke, with four large boilers capable of supplying the necessary steam. As the vessel left the ways she was gracefully christened *Itzehoe* by Miss Wiengreen, the daughter of the superintendent engineer.

TRIAL TRIPS.

Tangaroa.—In July last the twin-screw steamer *Tangaroa*, built for the New Zealand passenger trade, underwent a most successful trial trip. After a pleasant cruise, the boat made two runs on the measured mile, giving an average hourly speed of about 10¾ knots. The *Tangaroa* is built of New South Wales hardwood, with deckhouse and engine room of iron. She has two sets of compound engines by M'Kie & Baxter, of Glasgow, with cylinders 11 in. and 22 in. in diameter, and a stroke of 16 in., giving 400 H.P. She has one of Thom's patent water-tube boilers of the diagonal straight-ended tube class, the first put in any Sydney-built vessel. The fan engine is one of the Challenge type, made by the engineers. The vessel's dimensions are:—Length, 108 ft.; beam, 22 ft. 10 in.; and depth, 9 ft. 8 in.

Blanche.—On August 24th the s.s. *Blanche* proceeded up the firth from Ayr to the measured mile at Skelmorlie for her trial trip. The *Blanche* is a fine screw steamer of the raised quarterdeck type, constructed in accordance with the most modern ideas for the coasting trade. She has been built by the well known firm of S. McKnight & Co., Limited, of Ayr, for Mr. William Rowland, Liverpool. The registered dimensions of the vessel are 145 ft. by 24·15 ft. by 10·05 ft., and she is capable of carrying over 400 tons of cargo on the small net register tonnage of 64 tons, whilst at the same time her capacity is such as to give her a large ratio of cubic feet per ton deadweight. The *Blanche* has been constructed in excess of the highest class at Lloyd's under their special survey, and her bottom has been extra strengthened so as to obviate any danger from grounding in port. She is fitted with powerful steam-steering gear on the bridge amidships, also steam winches, steam-warping capstan aft, and windlass for anchor gear forward. She has excellent steering capabilities, the trials in this respect showing that when going full speed she was able, with her helm hard over, to make a complete circle in about twice her own length, this being a necessity for the owner's trade when passing up canals, &c. In order that a true measure of the vessel's steaming qualities when in service might be obtained, it was arranged between the owner and builders that a loaded trial should be given. The vessel therefore received her cargo at Ayr, and on the measured mile four runs were taken at the highest speed, two with and two against the tide, when a mean speed of 11 knots was obtained. The machinery has been supplied by Messrs. Ross & Duncan, engineers, of Govan, and has also been constructed under Lloyd's rules for the highest class. It consists of a set of compound surface-condensing engines, having cylinders 18 in. and 40 in. by 27 in. stroke, supplied with steam from a large horizontal return tube marine boiler, the ample capacity of which was shown by the fact that steam was blowing off at the safety valve during the whole of the trial. The workmanship generally is of the highest class, in fact, in many respects in excess of what is usual in this type of vessel, and during the trial the machinery worked with exceeding smoothness. The owner and a large party of interested friends were on board, and expressed their satisfaction at the results attained. After completion of the speed, &c., trials, the vessel proceeded on her maiden voyage to Liverpool.

Hydra.—On August 24th the new steamer *Hydra*, built by Messrs. Wood, Skinner & Co., Limited, Bill Quay, for Messrs. Bruusgaard, Kjosterud & Co., of Dram, Norway, left the Tyne for her official trial trip. This vessel, which is a sister ship of the steamship *Hugin*, recently built by Messrs. Wood, Skinner & Co. for the same owners, is of handsome appearance, and is built on the improved single-deck type, with bridge and top-gallant forecastle, rigged as a fore-and-aft schooner with telescopic masts, and has all the latest improved appliances for facilitating the rapid loading and discharging of her cargo. The engines, which have been constructed by the North-Eastern Marine Engineering Co., Limited, Wallsend, are of their latest triple-expansion type, having cylinders 18½ in., 30 in., and 49 in. diameter by 33 in. stroke, steam being supplied by a large steam boiler working at a pressure of 160 lbs. During the trial the machinery worked with the utmost smoothness, and the performance of both the vessel and engines gave every satisfaction to all concerned. After the trial the vessel sailed under the command of Captain Gabriello. This is the fifth vessel built by Messrs. Wood, Skinner & Co., Limited, and engined by the North-Eastern Marine Engineering Co., Limited, for the same owners.

Maristow.—On August 24th the new steamer *Maristow*, built by Messrs. J. Blumer & Co., North Dock, Sunderland, for Messrs. Bellamy & Co., of Plymouth, ran her trial trip from the Wear, when a speed of 11¾ knots was obtained, everything working satisfactorily. The vessel is 341 ft. long, 46½ ft. beam, and 24½ ft. depth of hold, and will carry 5,800 tons deadweight. The engines are by Messrs. Blair & Co., Limited, of Stockton, and have cylinders 24½ in., 40 in., and 66 in. by 45 in. stroke, the boilers working at 180 lbs. pressure. The steamer afterwards proceeded under the command of Captain Prout to Newport, there to load for Rio Janeiro.

Minto.—On August 25th the new powerful ice-breaking steamer *Minto*, just completed by Messrs. Gourlay Brothers & Co., Dundee, for the Canadian Government's winter mail and passenger service between Prince Edward Island and the mainland of Canada, underwent her contract trial trip on the Tay, under the official supervision of Captain McElhinney, the Canadian Government's nautical adviser, to whose ideas she has been specially designed, and Mr. N. MacNicoll, M.I.N.A., of MacNicoll & Co., Glasgow, under whose superintendence she has been constructed. She is built to Lloyd's highest class and Board of Trade requirements—225 ft. between perpendiculars by 32 ft. 6 in. by 20 ft. 6 in., moulded, with extra heavy scantlings, &c., for cutting through the heavy ice on her route, and water ballast in cellular double bottom and in large deep tank to 'tween deck aft for giving her the proper ice-breaking trim; flush-decked, with long citadel deck-house luxuriously fitted for passengers and officers, having wheel-house and captain's room on top forward, Mason's patent pivoted side-scuttles (of large size) fitted throughout, steam-steering gear, steam windlass, steam capstan aft, McGregor's standard binnacle compass, electric light throughout and large search-light, and an armament of four 6-pounder quick-firing Hotchkiss guns to enable her to act as an auxiliary cruiser in time of war. The engines are triple-expansion, with cylinders 26 in., 41 in., and 65 in. by 39 in. stroke, two double-ended cylindrical return tubular boilers for 170 lbs. working pressure, suited for both natural and forced draught—all designed to give not less than 2,900 I.H.P., and fitted with all the latest improvements to ensure efficiency, durability, and economy in coal consumption. The speed attained was 16¼ knots, and the machinery worked smoothly and satisfactorily. The vessel, with her handsome model, fine lines, and expensive fittings, is practically a large modern steam yacht, and will be a valuable addition to the Canadian Government's fleet.

Manchester Importer.—On August 26th the *Manchester Importer*, built by Messrs. Irvines' Shipbuilding and Dry Docks Co., Limited, to the order of the Manchester Liners, Limited (of which we gave full particulars in our Launch columns, July issue, page 171), proceeded to sea for her trial trip. After the adjustment of the compasses the vessel ran the distance between Hartlepool Heugh and Souter Point lights, and then proceeded to run over the measured mile, when it was ascertained that a mean speed of 12½ knots had been attained, which was considered very satisfactory, the engines working smoothly throughout. There was a large company on board, including Alderman Southern (director and vice-chairman of the Manchester Ship Canal), Mr. W. H. Collier and Mr. H. M. Gibson (respectively manager and traffic manager of the Manchester Ship Canal), Mr. F. F. Vaughan and Mr. T. M. Greenip (respectively secretary and superintendent Manchester Liners, Limited), Mr. and Mrs. Charles Cooper, Councillor and Mrs. Lohden, Major D. G. and Mrs. Irvine, Fräulein Fredriechs, Mr. W. Allan, jun. (of William Allan & Co., Limited), Mr. H. Harrison (representing the engine builders), and Mr. A. S.

Purdon (the ship builders). The vessel proceeded to the Tyne under the command of Captain Walker, late of the *Manchester Trader*.

North Sea.—On August 26th the steel screw steamer *North Sea* (of which we gave full particulars in our Launch columns, August issue, page 234) proceeded on her trial trip in the Tees Bay, when a mean speed of 12 knots was obtained. Mr. Sanders, Mr. Wake, and Mr. Carter, who were out on the trial trip, all expressed themselves as being highly pleased with both the ship and engines. The vessel left for Archangel in the course of a few days under the command of Captain John Stephen.

Riverton.—On August 29th the s.s. *Riverton*, built by Messrs. Ropner & Son, of Stockton-on-Tees, left for her official trial trip in the Tees Bay. The steamer is built on the awning-decked rule. The saloon and cabins for the captain and officers are fitted aft, and the engineers' in iron houses on deck. She is fitted with every recent appliance for expeditious loading and unloading, and she has a full general outfit. The engines are supplied by the well-known firm of Messrs. Blair & Co., Limited, Stockton, of about 1,500 I.H.P., and she averaged 11½ knots per hour on trial. The trip was satisfactory in every respect, and, after the adjustment of compasses, she proceeded on her voyage to the U.S.A.

Tanagra.—On August 29th the steamer *Tanagra*, built for Messrs. William Thomson & Co., of St. John, New Brunswick, by Messrs. Russell & Co., Port Glasgow (for further particulars see September issue, page 285), ran her trial trip on the Clyde, making a speed of 10¼ knots, at Skelmorlie, and sailed the same evening for St. John.

Alderney.—On August 31st the fine large steel screw steamer *Alderney*, built by Messrs. William Gray & Co., Limited, West Hartlepool, was taken to sea for her trial trip. Her owners are Messrs. A. N. Hansen & Co., of Copenhagen, for whom Messrs. Gray have previously built a couple of steamers of similar capacity. The vessel takes Lloyd's highest class, and is of the following dimensions:—Length, over all, 336 ft.; breadth, 48 ft. 6 in.; depth, 24 ft. Triple-expansion engines having cylinders 24 in., 38 in., and 64 in. in diameter, with a piston stroke of 42 in., and large steel boilers working at a pressure of 160 lbs. per square inch, have been supplied from the Central Marine Engine Works of William Gray & Co. The trial was highly satisfactory, a mean speed of 12 knots being maintained. The vessel (which was in ballast trim), after disembarking her visitors, proceeded on her voyage to St. John's, Newfoundland.

Mabel Grace.—On September 2nd the paddle-steamer *Mabel Grace*, built and engined by Messrs: Laird Brothers, Birkenhead (of which we gave particulars in our Launch columns, April issue, page 40), underwent her official trials on the Clyde with satisfactory results, a mean speed of 20·23 knots being attained on six consecutive runs on the measured mile.

Bernicia.—On September 5th the new steamer, *Bernicia*, built by Messrs. R. Craggs & Sons, Middlesbrough, to the order of Messrs. J. E. Bowsher & Sons, Newcastle-on-Tyne, and engined by the North-Eastern Marine Engineering Co., Limited, Wallsend-on Tyne, left the Tees for her official trial trip. The vessel is of handsome design, her principal dimensions being as follow:—Length, 350 ft.; breadth, 47 ft.; and depth, moulded, 26 ft. 7 in., and with a cargo capacity of 5,850 tons; her loaded draught is 21 ft. ½ in: She is built to Lloyd's highest class, and is of the improved single-deck type. The propelling machinery, which has been constructed at the Wallsend works of the North-Eastern Marine Engineering Co., Limited, consists of a set of their latest type of triple-expansion engines, having cylinders 25 in., 41 in., and 67 in. in diameter, by 45 in. stroke, and two large single-ended steel boilers, working at a pressure of 160 lbs. The trial of both ship and machinery proved in every way satisfactory, a mean speed of 11¾ knots being attained.

Star of Australia.—On September 7th this steel screw steamer proceeded down the river to Belfast Lough on her trial trip, having on board a party representing the owners and builders and accompanied by some friends. This vessel is the fifth built by Messrs. Workman, Clark & Co., Limited, for Messrs. J. P. Corry & Co., of London, and is of the following dimensions:—Length, 440 ft.; breadth, 55 ft.; depth moulded, 33 ft.; with a gross tonnage of 7,198. She has been constructed under special survey to class 100 A 1 at Lloyd's, and to the Board of Trade requirements for a first-class cargo steamer. There are three complete decks extending from stem to stern, and seven watertight bulkheads dividing the vessel into eight separate compartments, viz., five cargo holds, machinery spaces, and two peaks. Water ballast is carried in the after peak and in a double bottom, which extends the entire lengths of holds and machinery spaces. As the *Star of Australia* will be chiefly engaged in Messrs. Tyser & Co.'s frozen meat trade to Australia and New Zealand, the forward holds and 'tween decks have been insulated, and are capable of stowing over 100,000 sheep's carcases. The refrigerating machine, by Mr. Benjamin Goodfellow, is a duplex tandem, putting through 240,000 cubic feet per hour, and is considerably the largest cold-air machine yet fitted on board any vessel. Accommodation is provided in a bridge house amidships, forward of the boiler casings, for the captain and officers, and round the engine casings, convenient to their work, are the engineers' staterooms, the crew being comfortably berthed forward on the upper deck. The vessel is rigged as a brigantine, the fore lower mast and yard being of steel. The deck machinery and cargo gear have been arranged for the minimum waste of time in the discharge of cargo, and for easy handling of the vessel; it embraces ten derricks worked by ten powerful steam winches, steam and screw steering gears, and a patent windlass, all by the best makers. The engines are of the triple-expansion type, supplied with steam at a pressure of 200 lbs. from four large steel boilers. The speed trials proved highly satisfactory. In the evening the *Star of Australia* left the lough for London, to load for her maiden voyage and proceed in command of Captain John Simpson, commodore of the Star fleet.

Rowena.—On September 8th the large steel screw steamer *Rowena* was sent to sea by Messrs. William Gray & Co., Limited, for her trial trip. She has been built to the order of Messrs. Herskind & Co., of West Hartlepool (of which we gave full particulars in our Launch columns, July issue, page 173). There was no hitch or trouble, the trial being in every way satisfactory. The vessel proceeded to the Tyne to load for Genoa.

Una.—On September 9th the steel screw steamer *Una*, launched on September 5th (of which we give full particulars in our Launch columns) from the shipbuilding and engineering works of Messrs. John Scott & Co., Kinghorn, went on her official trial trip. The engines worked smoothly during the trial, and the vessel attained a mean speed of about 14 knots over the measured mile, which is very creditable to Mr. Weir, the engineering manager of Messrs. John Scott & Co. There was a large company of ladies and gentlemen on board during the trial, including the Duchess Dowager of Sutherland. The *Una* returned to Burntisland after the trial, where she will coal prior to leaving for London.

Balakani.—On September 9th this vessel, built to the order of Messrs. Lane & Macandrew, of London, by Messrs. Sir James Laing & Sons, Limited, of Sunderland (of which we gave full particulars in our Launch columns, September issue, page 282), was taken for trial at sea, when the average speed attained was over 10½ knots, the machinery and boilers, built by Messrs. George Clark, of Sunderland, working satisfactorily. The vessel returned to Sunderland to coal for her voyage.

Avondale.—On September 11th the screw steamer *Avondale* recently launched from the shipbuilding yard of Messrs. Short Brothers, Sunderland, to the order of Messrs. G. H. Elder & Co., of Newcastle-on-Tyne (of which we gave full particulars in our Launch columns, September issue, page 282), went out on trial with very satisfactory results. After adjusting compasses the vessel was taken a series of runs over the measured mile, when a mean speed of 10½ knots was attained. After the trial the vessel proceeded to Archangel under the command of Captain Fothergill.

Philippeville.—On September 11th the fine twin-screw mail and passenger steamer *Philippeville*, built by Sir Raylton Dixon & Co., Limited, Cleveland Dockyards, Middlesbrough, to the order of Messrs. Elder, Dempster & Co., of Liverpool, for the Société Maritime du Congo, proceeded to sea for her official trials under the command of Captain Meinertz. This vessel is intended to run in the Belgian mail line between Antwerp and the Congo, and is similar to the *Anversville*, lately built by Sir Raylton Dixon & Co., for the same trade. Her dimensions are: 382 ft. by 46 ft. by 25 ft. moulded. Accommodation is provided in most spacious and handsomely fitted cabins for 108 first-class and 70 second-class passengers, with large dining-room in house on deck panelled in marble and inlaid wood. The first-class smoking-room, second-class smoking-room and cabin entrances are elaborately fitted and decorated, and the vessel is lighted throughout with electric light. A powerful refrigerating machine with large cooling chambers is also provided for the conveyance of fresh meat, provisions, &c. Twin-screw triple-expansion engines have been fitted by the Wallsend Slipway and Engineering Co., Limited, Newcastle-on-Tyne, having cylinders 21½ in., 34 in., 59 in. by 42 in. stroke, supplied with steam by four large single-ended boilers working at 180 lbs. pressure, and fitted with Howden's system of forced draught. The hull and engines have been built under the supervision of Mr. Butterworth. A number of friends were on board during the trial trip, which passed off most successfully. This is the sixth vessel built by Sir Raylton Dixon & Co., Limited for this service, and another is now in course of construction.

Robert Irvine.—On September 12th the s.s. *Robert Irvine*, built by Messrs. Irvine's Shipbuilding and Dry Docks Co., Limited, for Messrs. Robert Irvine & Co., Tower Chambers, West Hartlepool (of which we gave full particulars in our Launch columns, September issue, page 281), proceeded on her trial trip. After the compasses had been adjusted the vessel proceeded at full speed, and on completion of the trial it was ascertained a mean speed of 12 knots had been attained, which was considered very satisfactory, the engines working smoothly. The owners were represented by Mr. C. Clark, marine superintendent, the shipbuilders by Major D. G. Irvine and Mr. A. S. Purdon, and the engine builders by Mr. Urquhart.

Montezuma.—On September 12th the twin-screw steamer *Montezuma*, built by Messrs. Alexander Stephen & Sons, Linthouse, for Messrs. Elder, Dempster & Co., Liverpool, made her official trial trip in the Firth of Clyde with results that were all that could be desired; and Mr. Ward, who represented the owners on the occasion, expressed his satisfaction with the exceedingly successful trial. A mean speed of 13·16 knots was maintained. The *Montezuma* is classed 100 A1 three-deck rule in Lloyd's, and is considerably in excess of their requirements. She is 500 ft. long over all, and her measurement capacity is about 20,000 tons. She has sailed for New Orleans, and is expected to load the largest cotton cargo ever taken from a cotton port. Besides two complete decks with lofty space between, she has a shelter deck all fore and aft, and an upper bridge. The shelter and upper bridge spaces are arranged to carry cattle when desired, an excellent water service being provided. The saloon, staterooms, and accommodation for officers and engineers are on top of upper bridge. Water ballast up to about 3,600 tons can be carried. Tanks are also set apart for carrying fresh water for cattle or boilers, and these can be replenished by condensers of ample power. The vessel is rigged with four pole masts, and presents a very fine appearance. All her working appliances are modern and effective. Her engines embrace two sets of cylinders 22½ in., 36 in., and 61 in. diameter by 48 in. stroke, and three boilers 15 ft. 7 in. by 12 ft., working at 180 lbs. pressure, and fitted with Howden's forced draught. The propeller blades are of manganese bronze. She has 13 large steam winches by Lynn & Co., and her auxiliaries include two Weir's feed pumps with feed heater, two Drysdale's centrifugal pumps, two Carruthers's ballast pumps, Quiggin's combined evaporator and winch-exhaust condenser, Quiggin's feed filter, Alley & McLellan's ash-hoisting engine, &c. A complete installation of electric light, by Allen, is fitted throughout the vessel.

Ferndene.—On September 12th the screw steamer *Ferndene*, built by the Northumberland Shipbuilding Co., Limited, Howdon, for the Dene Steam Shipping Co., Limited (of which we gave full particulars in our Launch columns, August issue, page 234), was taken to sea for her trial trip over the measured mile off Whitley, with satisfaction to all concerned, a mean speed of about 12 knots an hour being attained, notwithstanding that the steamer was in ballast trim. The steamer proceeded on her maiden voyage to Philadelphia, under the command of Captain John Jones.

Lucifer.—On September 16th the s.s. *Lucifer*, which has been built to the order of the Bear Creek Oil and Shipping Co., Limited, of Liverpool, of which company Messrs. C. T. Bowring & Co. are the managers, by C. S. Swan & Hunter, Limited (of which we gave full particulars in our Launch columns, September issue, page 282), was taken out to sea on her trial trip, when everything worked smoothly, and the vessel made a mean speed of 10 knots on the measured mile, and afterwards proceeded on her first voyage to Philadelphia.

Lynton.—On September 16th the new steamer *Lynton* left the South Dock for a series of runs over the measured mile. She is a fine screw steamer, specially designed for the cargo and cattle trade, and built by Messrs. Robert Thompson & Sons, Southwick Yard, to the order of the Liverpool Shipping Co., Limited, of Liverpool, of which Messrs. Johnstone, Sproule & Co. are the managing owners (for further particulars see September issue, page 282). After a succession of runs over the measured mile, a mean speed of 11 knots was attained. Amongst those present were Mr. Sproule, the managing owner, and Mr. Sinclair, consulting engineer, who expressed themselves highly satisfied with the results of the trial, the engines working smoothly and without the slightest hitch.

Neto.—On September 16th the *Neto*, belonging to Messrs. Strong, Reid & Page, went on her trial trip. She was in light trim, and some little difficulty was experienced in getting her head round, but after the *Nelson's* tow rope had carried away twice, the steamer was headed for sea, favoured a little by a somewhat sluggish ebb tide, but in the teeth of half a gale. Under these circumstances her performance of passing the measured mile at a speed of just under 10 knots was considered to be very good, and a distinct improvement on any previous performance. She had been in the hands of Messrs. D. Rollo & Sons, Fulton Engine Works, Liverpool, for some time back, having her engines altered to the high-pressure compound system, and being fitted with a new boiler of 200 lbs. pressure, under Howden's system of forced draught. The new engines have cylinders of 20 in. and 50 in. diameter, with a stroke of 36 in., boiler-heating surface of 1,720 sq. ft. The old boilers were two in number, carrying a pressure of 90 lbs. By the conversion a considerable bunker saving has been effected, and a saving of space generally, as in the case of one boiler the coal can be carried on both sides. Whilst the vessel was lying up during these alterations advantage was taken to renew the deck, and to bring the hull generally up to date. The double bottom tanks in the machinery space were renewed, whilst the machinery, to get the full benefit of the higher pressure, has been fitted with all the latest improvements. By the substitution of the single boiler economy of coal and of stores has been secured. A steam feed-heater and evaporator and feed filter have been supplied. The work has been carried out under the direction of Messrs. George Hepburn & Son, the company's superintending engineers, and has been under the personal supervision of Captain Brown and Mr. J. B. Hepburn, the company's marine overlooker and superintending engineer. On her trial the working of the engines gave every satisfaction, and in every respect fully answered expectations.

Commander Cawley.—On September 19th the Humber Pilots' new steamer went for her trial trip off the Tyne. The vessel, which is named the *Commander Cawley*, in compliment to the president of the United Kingdom Pilot Association, has been built by Messrs. J. T. Eltringham & Co., South Shields. The dimensions are as follow:—Length over all, 129 ft.; breadth, 23 ft.; depth, 11 ft. 6 in. She takes Lloyd's highest class as a steam yacht. The design embodies all the most modern devices for the efficient working of a steam pilot vessel. She is fitted with extra large rolling chocks and special arrangements for getting out the boarding boats by machinery. The saloon provides sleeping accommodation for 24 pilots. The vessel is heated by steam and lighted by electricity throughout. A powerful cluster light is arranged to facilitate the working of the boarding boats at night, and the signal lights are all controlled from the captain's cabin. Triple-expansion engines are fitted by Mr. G. T. Grey, having cylinders 12¼ in., 19½ in., and 32 in., with 22½ in. stroke, and the auxiliary machinery includes a centrifugal pump for working the condenser when the main engines are not running. A speed of 10½ knots was easily maintained during the trial.

Clan Macfadyen.—On September 21st the screw steamer *Clan Macfadyen*, built and engined by Messrs. Blackwood & Gordon, Port-Glasgow, for the Clan Line Steamers Co., of whom Messrs. Cayzer, Irvine & Co., of Glasgow, are the managers (of which we gave particulars in our Launch columns, September issue, page 284), went down the firth on her official trial trip. The day was rather unfavourable for testing the speed, but notwithstanding this a speed of fully 13¼ knots was attained, which was considered highly satisfactory. The steamer proceeds to Glasgow, where she will load for the East Indies. The company were represented on the trial trip by Mr. John Lyall, the superintending engineer, who has supervised the building of the steamer.

British Princess.—Lately the finely modelled steel twin-screw steamer *British Princess*, built by Palmer's Shipbuilding and Iron

Co., Limited, Jarrow-on-Tyne (of which we gave full particulars in our Launch columns, August issue, page 235), was taken out to sea for her official steam trials, during which the engines worked in a highly satisfactory manner at 76 revolutions per minute, and a mean speed of 13·24 knots was attained on the measured mile. The vessel has been built to the order of the British Shipowners' Co., Liverpool.

Dredgers.—The two powerful twin-screw dredging vessels, launched by William Simons & Co., Limited, of Renfrew, for Talienwan, have completed their dredging and steaming trials with very satisfactory results. During the dredging trials, when running 18 buckets per minute, 1,050 tons of ordinary free soil were raised per hour, and when running 12 buckets per minute in harder material 450 tons of spoil were raised per hour, both results being considerably in excess of the contract requirements. The centrifugal discharge pumps on their trials dealt with and discharged on shore through their respective lengths of steel piping the full amount of dredgings raised up by the buckets. The sand suction pumps, working on a maximum depth of 40 ft., are each capable of raising at least 1,000 tons of sand per hour. During a two-hours' run on the measured mile with and against the tide a mean speed of over eight knots was obtained, being fully one knot in excess of the speed stipulated in the contract. The owners were represented at the trials by Messrs. Totshyski, Gooseff, Johnson, and Lees. The vessels were being prepared for the voyage under steam and sail to North China, to be despatched on an early date.

BOARD OF TRADE EXAMINATIONS.

NOTE.—1C denotes First Class; 2C Second Class.

The Missions to Seamen.—We have received from the Rev. T. S. Hatfield, the association's secretary, at Harrogate, an advance proof of the Churchman's Almanack for 1900, which contains a calendar of events connected with the sea, ships, and sailors. This compilation contains, besides the calendar, leaves for memoranda for every day of the year, and a lot of information of an interesting character connected with the society. It is estimated that our seafaring population is over 600,000, and to minister to this large number the society employs 190 chaplains, readers, &c., working in 69 home and foreign ports, furnished with 69 mission vessels, and 91 seamen's churches and institutes. In 1898 over 900,000 publications were placed on board ships, and about 44,326 boxes, bags, or parcels of reading matter sent to sea, whilst 6,073 sailors enrolled as total abstainers. In 1898 the income of the society was £43,284, a sum, however, quite inadequate to meet he urgent calls for help.

Messrs. T. Richardson & Sons, Limited.—We have received a catalogue just issued by this firm relative to the lockfast iron shafts which are one of their specialities of manufacture. This publication contains a most interesting description of the manufacture of propeller shafts, both in the usual manner and that adopted by the above firm in making these lockfast shafts. The reasons to which the fracture of shafts is attributed are fully explained, and the manner in which the difficulties can be overcome is set forth. The catalogue is beautifully illustrated with views of the works and specimens illustrative of the descriptive matter. A sheet also accompanies it illustrating Morison's surface feed-heater. Both are magnificent specimens of colour-printing, and the letterpress of the catalogue is up to the best style of printing.

For want of space we are obliged to hold over our Patent List, Reviews, &c.—ED. M.E

The Marine Engineer.

LONDON, NOVEMBER 1, 1899.

IN former issues we have stated that in our opinion any further increase of speed, and even the present record speeds of the trans-Atlantic service, with its increased cost due to such excessive speeds, could only be made commercially payable by separating the high-priced first-class passenger service from the mass of the cheaper passenger and goods traffic. We see that the Hamburg-American Company are about to test this theory by providing a yacht 400 ft. long, fitted for carrying first-class passengers only. The new essay is, however, we believe, to be made only in trips to Norway, the Mediterranean, and the Orient; and, if successful, the owners propose to build other vessels on the same lines, and with even faster speeds than that of the present vessel, which it is said is not to exceed 16 knots. The accommodation for passengers is proposed to be on a most fastidious scale of luxury. Each passenger is to have a separate stateroom to himself, and, for those who are willing to pay, complete suites of chambers with separate bathrooms are to be provided. As those who desire especially high-speed travelling accompanied with every obtainable comfort and luxury, and who are well able and willing to pay high prices for such accommodation, are on the increase year by year, we are strongly of opinion that such a venture will pay provided the first-class passenger vessels are of sufficient tonnage to be safe and comfortable.

WE are glad to see that the Belfast Harbour Commissioners have apparently at last realised the probable harm, from an industrial point of view, that they would have done to their city, had they persisted in their arrangements so as to prevent Messrs. Harland & Wolff from extending their works to meet increased trade by the acquisition of adjoining land. Such obstructive policy might have resulted in the driving away both from Belfast and Ireland of one of the most magnificent industries of modern times, and one which, whilst located at Belfast, reflects the greatest honour upon both the town and country, besides bringing most material support in wages to the welfare of the town and population. It would appear that the proposed works in the harbour relating to a new cut, or channel, in the county Down side of the harbour, and to a new tidal dock at the south-westward termination of the said cut, can be carried out without crippling the desired extension of Messrs. Harland & Wolff's yards and slips; and, if so, it would be a pity if the Commissioners could not see their way both to carry out their own proposed works and yet to admit of such extension of Messrs. Harland & Wolff's yards as may serve still further to prolong and rivet the connection of that firm with the city of Belfast. We see that at last, after much obstinacy on the part of the Commissioners, the matter has been referred to the chairman, Sir James Musgrave, to consult with the firm as to the ground wanted, and that power has been given him to adjust a friendly settlement. This looks as if the matter was now going to be considered in a friendly light, and should quickly bring about a satisfactory settlement.

THE disaster to the engines of the *Bullfinch*, which was occasioned by the breaking down of a connecting rod, has caused considerable attention to be given to those in use, which were of steel, and of course as of light dimensions as the designer dare use. The general design of this rod, with its crutch or fork end, was a very usual one, and would not appear to give rise to any criticism as to strength from its appearance to the eye, which is so often the gauge as to strength with practical engineers. The large size, however, of the crank and crosshead pins, relatively to a short rod in such high-speed engines with great steam pressures, causes the spread of the fork, or crutch (estimated from centre to centre of the crosshead bolts), to be excessive compared with the diameter of the body of the connecting rod. In ordinary connecting rods the crosshead or big ends have so little swell beyond the adjoining body of the rod that any vertical strains or stresses upon the fork ends may be almost considered to be shearing strains relatively to the body of the rod. In the type of rod, however, used in the *Bullfinch*, and in many rods of similar classes of engines, the overhanging wings of the fork may be considered as cantilevers on either side of the body end of the rod. In such cases the transverse breaking moment due to the longitudinal pull or thrust of the crosshead bolts may be multiplied as many times as stress per square inch on the arms of the fork close to the end of the rod, as compared with the direct tensional or compressional stress in the body of the rod or in the crosshead bolts. If the depth of the crutch cantilever close to the body of the rod is only 2⅜ in., whilst the bending moment of the cantilever is 5⅛ in. from the line of the crosshead bolt to the centre of the rod, it is obvious that the longitudinal pull or thrust of the crosshead bolt may be multiplied about four times upon approximately half the section of the fork, and this may be more than sufficient to stress the metal beyond its limit of elasticity, and thus sooner or later to break it. The lower parts of the fork, or crutch, of such connecting where the spread is wide enough to convert them into cantilevers, should be thickened or deepened as they join the body of the rod, as would be the case in a properly designed cantilever.

THE near completion of the two new U.S. battleships, *Kearsage* and *Kentucky*, which are nearly ready for their trial trips, have drawn considerable attention to these latest products of the American constructors' skill. The greatest novelty in the construction of these vessels, viz., superimposed turrets containing 8-in. guns, above the lower turrets carrying 13-in. guns, has been the cause of the greatest diversity of opinion as to their possible usefulness. Each pair of turrets, carrying two 13-in. guns in the basement, and two 8-in. guns on the first floor, has only a single turning gear. Any disablement of this turning gear will thus put all four guns out of action. The 8- and 13-in. guns must also be loaded, pointed, and fired simultaneously, and it is difficult to imagine that all operations can be carried on so simultaneously that one gun will not have to wait for the other. The higher elevation also of the upper turret will give the recoil of its gun immense leverage to break away the relative fastenings of one turret to the other. It is not an improbability that this might serve entirely to disrupt the upper turret; and the addition of the shock of the recoil of the upper gun at such an extreme leverage, or moment, from the base of the main turret, when occurring at the same time as the recoil shock of the heavier gun in the lower turret, might even serve to disorganise the attachments or the turning gear of both. We understand that the upper turrets are but experimental, and are fitted so as to be easily removed; but, if so, can the loss of armament and the loss of weight so removed be utilised elsewhere in the vessels, which were originally designed for the specific armament of the vessels as they are now designed. It is well known that our American cousins are the most inventive people upon earth, but we trust that their craze for novelties will not lead them too far away from tried and acknowledged types of vessels in their new Navy armaments, as some day we may see them arrayed with our own battleships for the maintenance of liberty and unfettered commerce.

SOME NOTES ON THE APPLICATION OF ELECTRICITY IN SHIPBUILDING YARDS.

By SHERARD COWPER-COLES.

Electric Drilling Machines.

ONE of the most useful applications of electro-motors is for drilling machines, which are now being extensively used in all classes of engineering shops, especially shipbuilding yards, which must necessarily extend over a considerable area, and contain many points remote from one another where a drilling machine is required. The efficiency of a well designed motor is about 80 per cent.; provided the conductors are of sufficient size, 70 per cent. of the power applied can safely be relied upon in the case of electrical transmission in shops.

At the works of Messrs. Siemens Bros., at Charlton, where a continuous current is used, 5 per cent. less is found to occur in the conductors, and 10 per cent. less in conversion from electrical into mechanical energy, the cost per brake power being 1·71d.

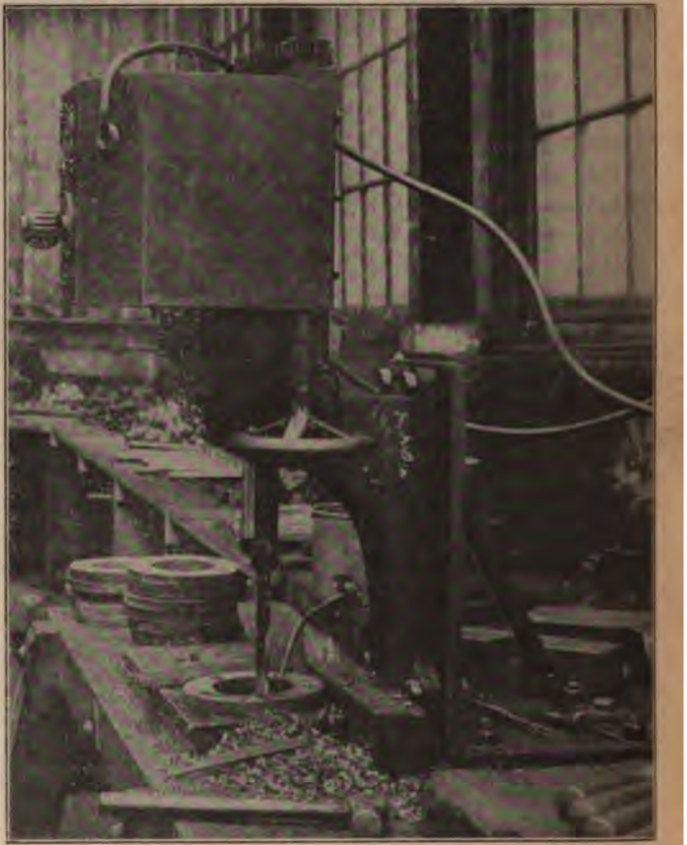

Fig. 1.

The repairs on a good enclosed motor, when carefully inspected at frequent intervals by a competent man, are very small indeed. Fig. 1 illustrates an electric drilling machine as adapted for bench work, and is suitable for pipe flanges and other small bodies. The use of this machine has also been suggested for the drilling of electric rails for bonding whilst being laid. Fig. 2 is a portable machine adapted especially for awkward work—not only does the carriage on which it is mounted provide the maximum portability, but the motor itself is swung on trunnions so as to work at any angle: this machine is also suitable for the sinking of key-ways in large propeller and crank shafts, which has always been a slow operation, but by using an electric drill, a series of holes can be rapidly drilled and the intervening metal easily removed. Fig. 3 illustrates a machine which is coming into favour as a portable drilling tool. As a rule it is provided with a telescopic shaft instead of a lexible shaft, and change wheels to alter the speed of he machine, so that it can be used for a large range f work. Fig. 4 represents an electric drilling machine sed for drilling and countersinking holes in ships' ecks. The machine is mounted on a barrow, so that t is easily moved about, and there is a lever for lifting the drilling part with its electro-magnets clear of the decks ready for transport. When countersinking, such machines can be quickly moved from hole to hole; one man can readily countersink from 900 to 1,000 holes in a day.*

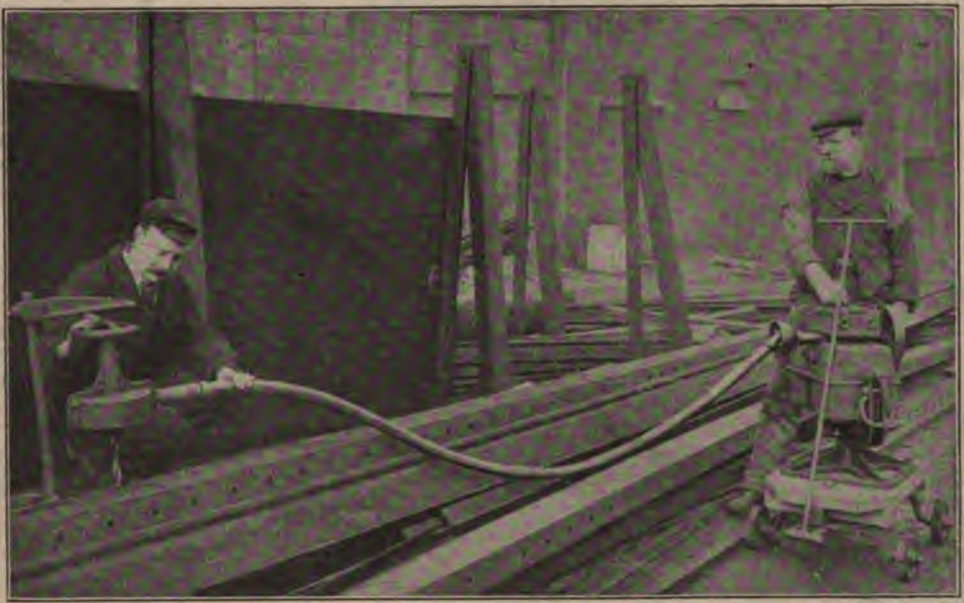

Fig. 2.

ASTOR, LENOX AND
TILDEN FOUNDATIONS

Fig. 3.

Electric Deck Planer.

Electric motors are also being applied to the planing of wooden decks, with considerable success. Fig. 5 illustrates Messrs. Mavor & Coulson's deck planer. A small electro-motor is mounted on a frame having revolving cutters underneath, actuated by the motor through gearing. The machine is controlled through a resistance by means of a switch on one of the handles; when in use it is pushed along the deck. The depth of the cut is regulated by rollers, upon which the machine runs, the rollers being adjusted by means of a lever. About 3 H.P. are required to drive the apparatus.

---

* The author is indebted to the Thames Iron Works and Shipbuilding o., Ltd., for the illustrations of the electric drills.

ELECTRO-MAGNETS FOR LIFTING PURPOSES.

Electro-magnets are being employed for lifting such objects as shells and pipes: the magnets are attached to the end of the lifting chain, and controlled from any convenient point. The economy effected in time and labour is found to be very considerable.

ELECTRO-MAGNETS FOR EXTRACTING IRON FILINGS.

Electro-magnets are also being used in engineering shops, with pointed poles for extracting iron filings or splinters that have got lodged in the eye of a workman. The instrument has a drawing force of about 14 lbs. The eye of the patient is held near the point until the magnetic power begins to draw upon the splinter. If not too deeply embedded, the splinter will leave the eye and become attached to the magnet. Electro-magnet machines are extensively used for separating iron borings and turnings from brass turnings.

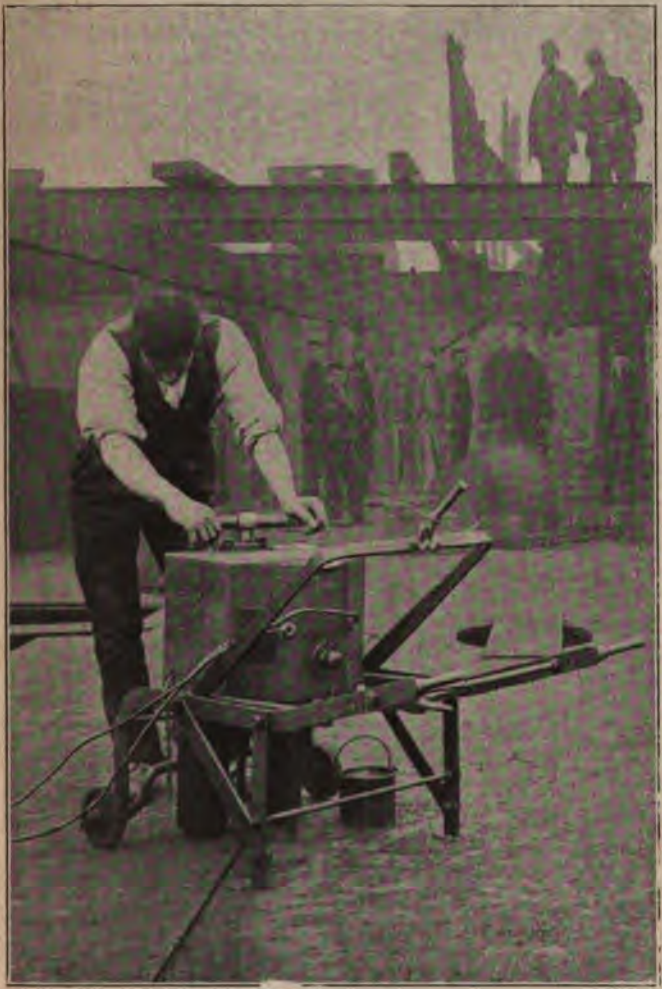

FIG. 4.

MAGNETIC LATHE CHUCKS.

Magnetic lathe chucks are now being made in America, so as to do away with bolting, strapping, or otherwise fastening down work by the usual methods. The mechanism consists of an electro-magnet made in box form completely enclosing an electric coil. A switch is provided to manipulate the current, which may be taken from the shop-lighting current. Magnetic friction clutches are also being employed now in many engineering works. Another interesting application of electro-magnets is for the removal of mill scale from pickling solutions.

THE REMOVAL OF MILL SCALE BY ELECTRICITY.

The removal of mill scale is a matter of considerable moment with many large engineering firms. The ordinary pickling process is tedious and costly, so electricity is now being used to hasten the process. The removal of scale from forgings and plates has always been a matter of difficulty, the scale in many cases being over 1-64th in. in thickness, and very adherent. The usual practice is to place the iron in a solution containing one part of hydrochloric or sulphuric acid to 10 parts of water, for a period varying from half-an-hour to 24 hours: half-an-hour for close annealed sheets, 24 hours for plates and forgings such as are employed for ship and bridge building.

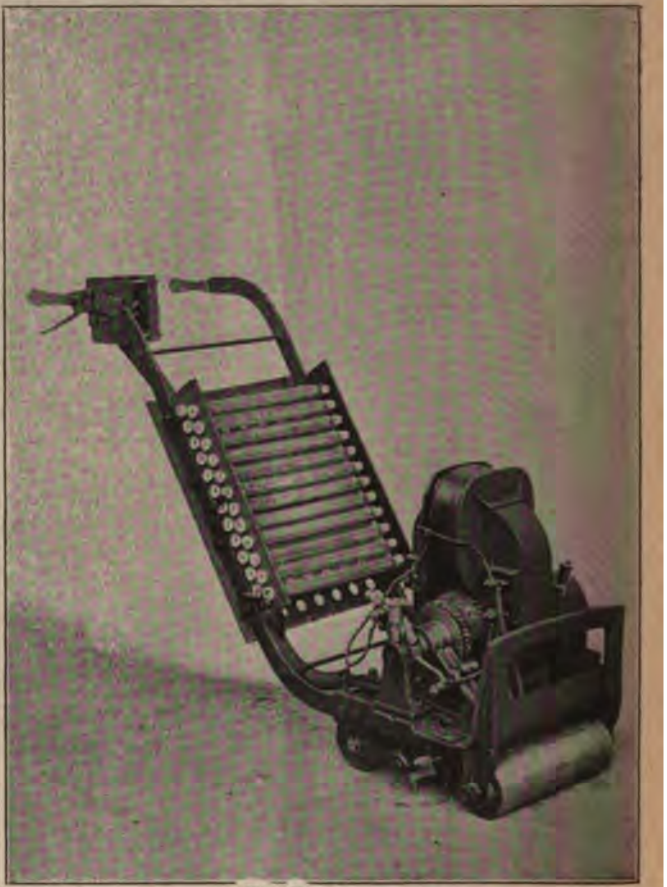

FIG 5.

One of the first experiments was to make the iron to be pickled the anode in an acid bath, but this was found to pit the plates, as the iron which was not protected by the mill scale was more readily dissolved than that covered by the magnetic oxide. To overcome this difficulty, the current was reversed every few minutes, the iron being alternately made anode and cathode. To quicken the process, and to reduce the electrical resistance of the solution, it is found advantageous to heat the pickling solution or electrolyte, which can be done by means of a lead pipe, through which live or exhaust steam passes.

A device for catching the scale soon after it is removed from the plates, so as to prevent the further unnecessary consumption of acid by dissolving the mill scale after removal, has been tried with satisfactory results. The solution is circulated by means of a small pump, through a lead-lined box or chamber, behind which are placed electro-magnets, the result being that, as the solution flows past the poles of the magnets, the magnetic iron in suspension is retained, and can be removed from time to time.

In America, an electrical pickling process has been tried, the solution used being sulphate of soda or sulphuric acid. The plates to be cleansed form the negative electrode, and an iron plate is the positive electrode. The hydrogen set free from the surface of the plate reduces the oxides on the surface and decomposes any grease that may be present. A voltaic method is stated to do the work with more certainty and with less danger to the surface of the metal in the way of pitting. The articles to be cleansed are used as the positive pole of the battery, the negative pole being either carbon or wire gauze electro-plated with silver, and covered with amorphous platinum black. The bath consists of dilute sulphuric acid, containing a depolariser, such as nitric or chromic acid. The use of the latter agent is claimed to completely prevent the evolution of offensive gases.

Attempts have been made to remove the mill scale by drawing it away from the plates with powerful electro-magnets, the scale having been previously loosened by a short immersion in an acid bath or by heating.

ELECTRIC WELDING AND BRAZING.

Electric welding, brazing, and soldering is not as extensively used as it might otherwise be, on account of the heavy royalties asked for the use of the apparatus by the owners of the various processes. One of the most striking features of the process of electric welding is the precision with which heat is localised at the spot required; there is comparatively little waste of heat in the welding process itself.

The apparatus used in the Vortex system of electric welding and brazing consists of a carbon holder and a pair of carbon electrodes. In using the apparatus, an arc is struck between the electrodes, and owing to the material of which these are made and the arrangement of the holder—the carbons making with each other an angle of about 90 degs.—a flame like that of a gas blow-pipe, but with a greater range of temperature, is projected from between the adjacent ends of the electrodes, and is directed upon the material to be heated.

The portion of the blow-pipe flame close to the carbon points is of the highest temperature obtainable by known artificial means, and the temperature gradually decreases as the distance from the electrodes increases.

When using the apparatus, a mask is used provided with eye-holes covered with dark glass to protect the eyes and the face from the intense light and heat radiated from the arc. The current usually employed for heavy work is about 150 amperes at 50 volts. The following are the comparative figures of the cost of brazing and filing up a cycle frame as given by the owners of the Vortex process.

By gas and coke process—with gas at 2s. 10d. per 1,000 cubic feet:—

	s.	d.
320 cubic feet of gas	1	1
Wages 1½ hour for brazing at 9d. per hour	1	1½
Wages 4 hours and 20 minutes filing off at 8d. per hour	2	10½
Wear and tear of files, air blast and coke	0	8
	5	9

By Vortex process:—With electricity at 3d. per Board of Trade unit:—

	s.	d.
1½ unit of electricity	0	4½
Wages 50 minutes for brazing at 9d. per hour	0	7½
Wages 1 hour for filing off at 8d. per hour	0	8
Consumption of carbon electrodes and wear and tear of files	0	2½
	1	10½

New teeth have been successfully built up on cast steel pinions and driving clutches by the Vortex process.

Zeroner's process of electric welding and soldering, is somewhat similar to the Vortex, but the flame is drawn out by means of a magnet. If the magnet lines of force of a horse-shoe magnet, and the lines of the electric arc, cross each other horizontally and rectangularly in a plane, the arc becomes vertically diverted to this plane, and resembles a blow-pipe flame. To ensure a steady flame, the carbons are of a very hard quality.

Electric welding is being used by several makers of steel barrels, the longitudinal seam being welded by the Barnados system. A bent sheet is clamped with its two opposing edges some ¼ in to 3-8ths in. apart. Small fragments of steel are placed over the opening, and melted by means of the arc, whilst an attendant hammers it as soon as ready. By welding on successive fragments in the manner named, the whole joint is finally completed, and the cask is finished by adding its heads and bung-bosses, which are also welded on in a similar manner.

In the Barnados system, the article to be operated upon constitutes one pole, and a carbon pencil attached to a portable insulated holder constitutes the other pole, an electric arc being struck between the two poles.

When steel and iron are being welded, it is usual to make the carbon the negative pole, but for other metals the poles are sometimes reversed. This process is being used by Messrs. Lloyd & Lloyd, of Birmingham, in connection with their tube business.

Steel pipes have been successfully welded [illegible] process for a length of about 10 ft., [illegible] the tube being 13 in., and the thick [illegible]

¼ in. The rate of working is about one foot in seven minutes. The dynamo used for this class of work is usually of the compound-wound type, having a capacity of 250 to 300 amperes at a pressure of about 85 volts.

An electric welding chain apparatus, designed by Mr. Taylor, who is working under licence from the Thompson-Houston Co., is said to produce chains at a cheaper rate, and the breaking strain is found to be considerably higher than hand-made chains. The Thompson-Houston process is one of the best known. No arc is used in this process, the metal being heated by passing a heavy current through the portion it is desired to weld or forge. The apparatus employed consists of :—

1. An electric generator for producing a low pressure alternating current.

2. A reactive coil or rheostat or both, for compounding and regulating the exciter, dynamo, and generator.

3. Fuse-blocks or cut-outs to prevent damage, to the generator and welder.

4. A transformer provided with suitable clamps to tightly grip and hold in place the pieces to be welded—the mechanical, hydraulic, or other device by which the abutting ends or surfaces of these pieces are forced together.

In the larger types of machines provision is made to maintain a circulation of water in the copper contacts. Amongst other applications of the Thompson-Houston resistance-heating system of welding is the welding of bicycle pedals, printers' chases, carriage fittings, and hub bands.

This system has also been used for the heating of pipes for bending and locally softening the hardened surfaces of steel plates, to allow of their being drilled. Special welding machines have been constructed for welding hubs and spokes for agricultural wheels.

ELECTRICAL FORGE.

An electrical forge, which has been put into practical use, consists essentially of a tank containing an aqueous solution of some salt, preferably sodium carbonate and borax, which is used as one electrode, and an insulated metallic bar for the other electrode. The work to be heated is placed upon a rest, and the other ends brought into contact with the surface of the liquid.

An arc is produced at the point of contact with the solution accompanied by great heat, the piece to be worked becoming white hot in a very few seconds. The heating effect can be confined to the end of the rod or piece to be worked, or extended over a length of several inches.

THE FLEETS OF THE MAIL LINES.

(From our own Correspondent.)

In War. In Peace.

FROM Messrs. Richardson, Spence & Company I have received, under the above title, a little volume whose perusal will repay all those who are interested in the fleets of the mail lines. It will also be most instructive and convincing to any of those who, whilst asserting that the reliance of the British Admiralty on the auxiliary armed cruiser system is a mistake, still keep an open mind. The book in question is profusely illustrated with the finest specimens of American magazine art. There are illustrations of the four vessels of the American Line which took part in the American-Spanish war, both as they appear when pursuing their peaceful vocations as mail and passenger steamers, and as they were when they were doing such good service to assert their country's will, and to extend the freedom of the Anglo-Saxon race to the fairest of the West India Islands. But one faint criticism can be made against the methods of the artists who are responsible for the adornment of the volume in question. It is this: Each chapter of the book has very artistic head and tail pieces, as indeed have most such volumes *de luxe* produced on the other side. American artists are wont, it would appear, to work these designs over the letterpress at the head of the chapter. The effect of the designs is greatly enhanced, no doubt. But I venture to think that facility in reading the matter of the book is thereby sacrificed, and no beauty of design will excuse that. The artist's work should ever be explanatory of and subsidiary to the work of the author. The description of the two pairs of sisters, the Clyde-built *Paris* and *New York*, and the Philadelphia-built *St. Louis* and *St. Paul*, are already well-known to the readers of the MARINE ENGINEER; but the interest in their war experience is enhanced to those who best know them as merchant vessels, and the book would have been decidedly wanting in balance had it not dealt with them in both aspects. The work they did, when so quickly recalled and mobilised for war, seems to be of a character which no other vessels, save mail steamers, could have undertaken. Their power to maintain full speed for long periods of time, and to carry enormous quantities of fuel, so that they could hold the sea for weeks, are not within the usual range of design of warships, and these points stood them in good stead indeed. They managed, too, to show themselves good fighting ships against vessels which might well have been considered too dangerous for them to stand up to. This fact, however, seems to speak more for the men who handled than for their construction. The book as a whole is a record of what private enterprise and members of the merchant marine can do for their country in times of national emergency; and not the least pleasant part of the book is the appendix which gives the name of every man, however humble his position, who remained in his ship and saw active service when the vessels were taken up by the Navy Department. To the engineers' department, who kept their machinery in high condition under such circumstances as fell to their lot, especial praise must be given by all those who are able to appreciate the actualities of their service. The book is a record of episodes of which all English-speaking people—especially those connected with the sea—may well be proud.

An Amusing Rumour

has been circulated in regard to the new White Star service to Australia. It is said that the P. & O. directorate is so annoyed at the entry of the White Star Line into a trade which they look upon as a preserve of their own that they contemplate retaliating by starting opposition to Messrs. Ismay Imrie & Company's New York service! It would be curious to know how they would go about this. Will they put the *Shannon*, now good enough to carry the Indian mails, on in competition with the *Oceanic*; or will their crackest boats, the *Arabia* and the *India* be withdrawn from the Australian service for the New York trade? Fifteen knots is the sea-speed even of these modern ships, and in Atlantic weather the *Cymric*, the White Star passenger and cargo boat, would give a very good account of any of them. I do not think carrying war into the enemy's country is quite the policy of Leadenhall Street. It is but the other day that the directors of P. & O. purchased the three Hall Line boats with the stipulation—as reported—that their late owners should retire from competition in the passenger trade. The stifling of opposition in this way is much more consonant with P. & O. traditions than the cutting into established and powerful trades.

The "Gaspesia."

The great venture which was to render antiquated the route to New York and teach the crack Cunarders and the new *Oceanic* that their paces were shown all in vain will, it would appear, never carry out its programme. The Canadian Steamship Company, Limited, was unable, as we have already seen, to obtain the accession of strength which it contemplated by the purchase of the old Norddeutscher Lloyd express boats *Werra* and *Fulda*. Its sole acquisition, the *Gaspesia*, is now again announced for sale. After her long continued adventures in the ice—outside the port which it was boasted was always accessible throughout the year—she went to St. John's, Newfoundland, where she was the subject of a salvage action and of a sale. Thence she proceeded to Bathurst, where she shipped a cargo of deals and these she is now discharging in Glasgow. She is an iron screw steamer of 26 years of age, built on the Clyde by Messrs. Robert Napier & Sons. She was then called the *Galicia*, and her owners till a couple of years ago were the Pacific Steam Navigation Company, of Liverpool. The names of her builders and original owners are a sufficient guarantee of what she once was. But Paspebiac now awaits further exploitation.

The Transport Service.

The newspapers and men's thoughts are now fully occupied with the Boer war. With this the fleets of the mail lines are fully concerned, and, indeed, the part which they are taking in the matter is one which has never been played before either by them or any other marine in any time or country. The task which they have willingly taken upon themselves to perform could only be taken up by the British Mercantile Marine, and that only at the close of the present century. An army corps comprising some 50,000 men has to be transported 6,000 or 7,000 miles, and the task is being commenced with few and inconsiderable hitches and without any disorganisation of the ordinary trade of the country.

The Union Company and the Castle Line to the Cape are naturally playing a very important part in the work. Not a steamer leaves Southampton of either of the two lines but she is very fully occupied with troops and equipments. Before the declaration of war, for example, the former company's steamship *Gaul* took out the Northumberland Regiment on the 16th September, and the mail steamship *Tantallon Castle*, sailing the same day, had on board Sir George White and his staff. The *Norman*, following a week later, had a number of officers, whilst the *Kinfauns Castle*, on her maiden trip from Southampton, on the 30th September, took out 300 men, and made a very rapid passage with them. That day, too, the Union intermediate boat *Gaika* sailed with a heavy complement of military. Perhaps it is unnecessary, with regard to their Saturday's work, to do more here than to remark that each Saturday the mail boats and the intermediate steamers of the respective lines find themselves busy indeed in consequence of the war. Beyond all this the two companies have chartered all the tonnage they can spare from the weekly service for the work of the nation. Seven Union ships are officially returned as being employed. Of these the *Spartan* and *Trojan* have been fitted up as the two most complete hospital ships ever sent to sea. They have been despatched, and their work will be to carry wounded from Natal to Capetown. The others in this line taken are the mail steamer *Mexican* and the four "G's", *German*, *Gaika*, *Goorka*, and *Gascon*, the two last-named sailing on the 21st October. Of the Castle Line six steamers are taken, including the new twin-screw mail steamer *Kildonan Castle*, on which the Fairfield Company is at work night and day to complete her fittings for a troopship. On the 20th October the *Lismore Castle*, *Roslin Castle*, and *Harlech Castle* all left Southampton with large drafts of the Army Corps, the *Braemar Castle* having preceded them by a week, and the *Hawarden Castle* following them at a three days' interval. Of the Atlantic companies, Cunard's responded to the country's invitation by giving up six vessels. The first of these was the *Carinthia*, then at Boston, which proceeded early in October to New Orleans to load mules for South Africa. Then followed the *Servia* and the *Catalonia*, the *Cephalonia*, the *Pavonia*, and the *Aurania*. Of these the two last departed with the first contingent of the Army Corps from England. The White Star Line afforded three ships. One was the new steamer *Medic*, then opportunely at Sydney. She was taken to bring over the New South Wales troops; the *Nomadic* went from the Thames with a large number of horses, for whose carriage she was peculiarly adapted, with the first contingent. The third is the reserve mail steamer *Britannic*, which left Liverpool on the 24th October, calling at Queenstown. The West India and Pacific Company supplied the *Columbian*, *Antillean*, and *Jamaican*. The Harrison Line provided their *Dictator*; the Leyland Line, the *Armenian*; the Johnson Line, the *Templemore*, and the *Ismore*: the Wilson Line, the *Chicago* and *Idaho*. Messrs. Harland & Wolff sent the *Englishman*, which has been running the Dominion Line; Messrs. Houlder Brothers the *Florence*, *Southern Cross*, *Langton Grange*, and *Urmston Grange*. Messrs. Houston's was a large contingent, and the enterprising owner, of these ships saved much time in the work of preparing them for duty by the introduction—as is believed for the first time on record—of the telephone from the Central Liverpool Exchange to the ships in dock. From his fleet there were sent the *Hyades*, the *Hellopes*, and the *Herminius*, with the new steamer *Kelvingrove*, which he had just chartered. Mr. A. L. Jones provided the *Arawa*, just engaged for his Bristol mail service, the *Mount Royal*, the *Montezuma*, the *Montfort*, the *Monarch*, and the *Prah*. Of the Allan Line, there is engaged the new *Bavarian*; one of the largest ships to be employed, and also the *Mongolian* and the *Siberian*. Of Messrs. Houston's, Jones's, and Houlder's vessels, several will be employed in the carriage of mules from the States, Italy, and South America; of the Anchor Line, the *Persia* and the *Algeria*; of Messrs. George Smith & Co.'s fleet, the *City of Cambridge*, the *City of Vienna*, the *City of Venice*, and the *City of London*; of Messrs. Bibby's Line, the *Yorkshire* and *Cheshire*; of Messrs. Brocklebank's, the *Pindari*; of the Pacific Steam Navigation Company, the *Orcana*; of the National Line, the *America*; of the Orient Line, the refitted *Orient*; of the Thomson (of Dundee) Line, the *Hurona* and the *Devona* of the Asiatic Steam Navigation Company's, the *Ranee*, *Nairung*, and *Nurani*; of the P. & O. Company's there are eight ships, the *Oriental*, *Malta*, *Nubia*, *Manila*, *Formosa*, *Simla*, *Sutlej*, and *Sumatra*. But the British India Steam Navigation Company supplies the largest number of bottoms, the total is twenty-two vessels. Of these, the principal are the *Avoca*, *Linoula*, *India*, *Dunera*, *Dilwara*, and *Jelunga*. But there are also included in the list the *Zayathla* and the *Zibenghla*—these were formerly, under other names, of the New Zealand Shipping Company. The change of ownership was chronicled in these notes but a short time ago. The two ships in question have caused some comment in the press in that they are the only vessels which have so far been reported as being delayed by the necessity of repairs. It would seem at least a curious coincidence that two ships whose history, both ancient and modern, is very similar, should be the two by the failure of which the transmission of men and material whose presence in Natal is urgently needed for Imperial purposes should have been delayed. The list I have given, though very lengthy, is by no means exhaustive, but it may be of use to our readers. Perhaps the best idea of what is being accomplished as a whole by the Government and the shipowners may be gathered from the statement that between the 30th September and the 24th October no less than 16 big transports were, according to programme, got away from the two ports of London and Southampton. The shipowners, if they are getting good employment through the war, are not slow to show that they are willing to share their good fortune with those who are ruined by the state of affairs in the Transvaal. For the Refugees Fund the Union and Castle Lines have each contributed the sum of one thousand pounds. Other shipowners, too, have put their names down for very handsome sums. Besides giving money, however, there are offers which will be valuable indeed to the poor people who are suffering from the tyranny of the Transvaal Republic. Messrs. Lamport & Holt, who have but one steamer chartered, and Messrs. Ismay, Imrie & Company, who have several, have each instructed their Capetown agents to afford free passages to England in their returning transports to deserving cases. Again, the Atlantic Transport Company, which has but one vessel (the *Mohawk*) chartered, has made a noble offer of their steamship *Maine*, with her officers, to the Government for use as a hospital ship.

The Condition of the River Thames

is becoming scandalous. Attention has been frequently drawn of late to the fact that, though the size of steamships is constantly and quickly increasing—that though New York talks of making a channel to its port with a minimum depth of 40 ft.—nothing is being done in the Thames. This neglect has been carried too far. The Atlantic Transport Company's experience with their steamship *Marquette* is a very fair example. The steamer named, though a fine modern vessel, is by no means as large as some that cross the Atlantic, and when she reaches the Thames she is obviously drawing considerably less water than when she crossed New York bar on sailing. The *Marquette*, however, drawing 27 ft. 6 in., on a recent trip was kept nine hours waiting for water at the Nore, and after that had to wait another three at Gravesend for the same cause. Thus half-a-day was lost to her owners and their customers. With the engagements which vessels plying in our big lines now have for forward shipments (especially with regard to cattle and dead meat) such delay is most costly, since it may happen, if unduly prolonged, to upset the whole organisation of the line. The sooner the Thames Conservancy awakes to its responsibilities, and turns its attention to matters of this urgent kind, the better for itself and for the port of London. No doubt it prefers making itself objectionable on the Upper Thames to buckling to serious work below London Bridge. But, if it fails to do its duty, it will very soon find its authority transferred elsewhere.

Le Repertoire Generale de la Marine Marchande,

in its thirtieth edition, just now being published, gives an interesting *resume* of the state of the world's shipping in respect of numbers of bottoms and tonnage. Having regard to sailing-ship tonnage, in vessels of 50 tons and upwards, the present return shows a decrease of 1,018 vessels and 346,143 tons on the figures which were presented a year ago. Of the sailing vessels which "Le Répertoire" regards, there are now but 27,867, with a measurement of 8,347,626 tons. The British decrease is, of course, the largest, our marine being so much the greatest. The shrinkage is very little under a quarter of a million of tons. Norway has shrunk 187,000 tons, Greece has lost 40,000 tons, and Spain 11,000; whilst Germany has gained 92,000 tons, France 30,000 tons, Italy 29,000 tons, and Turkey 9,000 tons. In steam tonnage the process is very different. The world's total here is 11,456 vessels, with a gross tonnage of no less than 19,711,382 tons, reckoning only vessels of 100 tons gross and upwards. A year ago the tonnage was 824,250 tons less; but it was contained in 120 more bottoms, so that there is a distinct, if not very great, increase in average size marked. Great Britain has 5,453 steamships, against 900 in the case of Germany, the next in the list. Norway is third in point of numbers with 657, the United States fourth with 551, and France fifth with 526. Sweden has 497, Russia 435, Spain 377, and Japan 332. Regarding tonnage instead of mere numbers, the order is somewhat different, Great Britain still heads the list with over eleven millions of tons, her figure of the previous year being increased by about 95,000 tons. Germany again comes second with 1,873,000 tons. She has increased her total by 248,000 tons. France, though she has fewer steamers than the States, has a better average in size. She comes third in steam tonnage with 986,000 tons—an increase of 33,000 tons. The States have 971,000 tons, against 810,000 tons the previous year. The decrease here is probably owing to the fact that the present figures show against those of a year exceptionally swollen by the exigences of a naval war. Norway is fourth with 672,000 tons, against 628,000 tons a year before. Spain has increased her figure by 31,000 tons to 552,000 tons. Japan, with an increase of no less than 114,000 tons, shows a very big jump. Italy is up 23,000 tons, and Russia 49,000 tons. The figures would be interesting in any event; but in connection with the work which we see the British Mercantile Marine fulfilling in the transportation of the Army Corps, the figures seem peculiarly suggestive.

Bristol and its Docks.

One does not know whether it is worth while to spend more ink on the discussion of the plans of the Bristolians in regard to dock extension. So much discussion has gone on in the City Council, so much writing has been made in the press as to the three rival schemes of (1) dockisation of the Avon, (2) improvements at Portishead, or (3) extensions at Avonmouth, only to see everything dropped, that little attention should be given to what is said, and a pause should be made by outsiders till something is done. But it may be well, for the sake of completeness, to mention that Alderman Baker, the chairman of the Docks Committee, has informed the Town Council that, if they will set their hands to something which will afford promise of better accommodation for the larger class of mail steamships characteristic of the day, the name of Bristol will be inserted, as an alternative port, in certain proposals which he is about to submit to Government. The anonymous gentleman would wish to be enabled to state on authority that, within two years, the required better accommodation should be available. And in consequence of the shortness of time all that could be offered him was an improved Portishead. That he is said to be prepared to accept, and so Alderman Baker becomes an adherent of the Portishead scheme. The lock is to be lengthened so as to admit big vessels, and an additional £25,000 is to be spent on giving long ships room to turn within the dock itself. Altogether the cost involved would be something about £375,000. The City Council adopted the recommendations by a majority of 13 votes. It was stated that the income to be derived from the visit in each week of one such liner as was contemplated would give revenue sufficient to make the investment directly remunerative. The only observation to be made in the matter is, Where will the city be if the other alternative port to Bristol be selected by the Government? Possibly the answer to this is that the provision of larger and better docks is absolutely necessary if Bristol is to keep the trade she has; and that, if she once has advantages for dealing with big ships—having the trade she has—she may confidently look for expansion to recoup her for her outlay.

The Dangers of the Canadian Coast.

In connection with the recent losses of big liners, such as the *Scotsman*, the *Bay State*, and the *Prodano*, on the coasts of Canada, and the determination of the owners of the first-named ship never to allow their vessels again to pass through the Straits of Belle Isle, a very interesting table has been prepared by the energetic secretary of the Liverpool Underwriters' Association. It regards all the important casualties to steamships which have occurred on these coasts or in the River St. Lawrence. From it we see that Belle Isle is a dangerous place enough; but it is hardly responsible for more disasters than the neighbourhood of Cape Race, which is a danger to those vessels which ply to northern United States Atlantic ports, as well as to such ports as St. John, New Brunswick. There are not enough statistics available to show what may be the risks of the passage of the Cabot Strait, which is the entrance to the St. Lawrence alternative to the Straits of Belle Isle. But one thing is abundantly clear. If the St. Lawrence itself has a good many accidents to vessels navigating its course, it also has a practical monopoly of the partial losses in the cases under notice. What Cape Race and Belle Isle get they usually keep. The bad weather and the currents which prevail in these vicinities give little opportunity for salvage. Stranded vessels soon go to pieces or slide off the rocks into deep water. But in the St. Lawrence itself conditions are naturally far otherwise. At the same time, as Sir Louis Davies, the Canadian Minister of Marine and Fisheries, recently pointed out, the Canadian Government is well alive to its responsibilities in regard to the navigation of its great river. It has taken the management of the affairs connected with its safety into its own hands. It has recently built a new lighthouse at Belle Isle. It is building another in a dangerous part of the St. Lawrence, and the whole question of lighting and buoyage is being attended to.

The Mersey Docks and Harbour Board

is taking every opportunity of doing all it can to bring its graving dock accommodation up to date. Having recently completed the biggest dry dock in the world, adjoining the Canada Dock, it is now about to spend just over £200,000 in the construction of one which will only be inferior in size to this one of their own. The new structure is to be named the New Sandon Graving Dock. It will lie immediately to the south of the branch No. 1 of the Huskisson Dock. The sill is to be 18 ft. below the level of the old dock sill; the length will be 1,000 ft. and the width at entrance 95 ft.

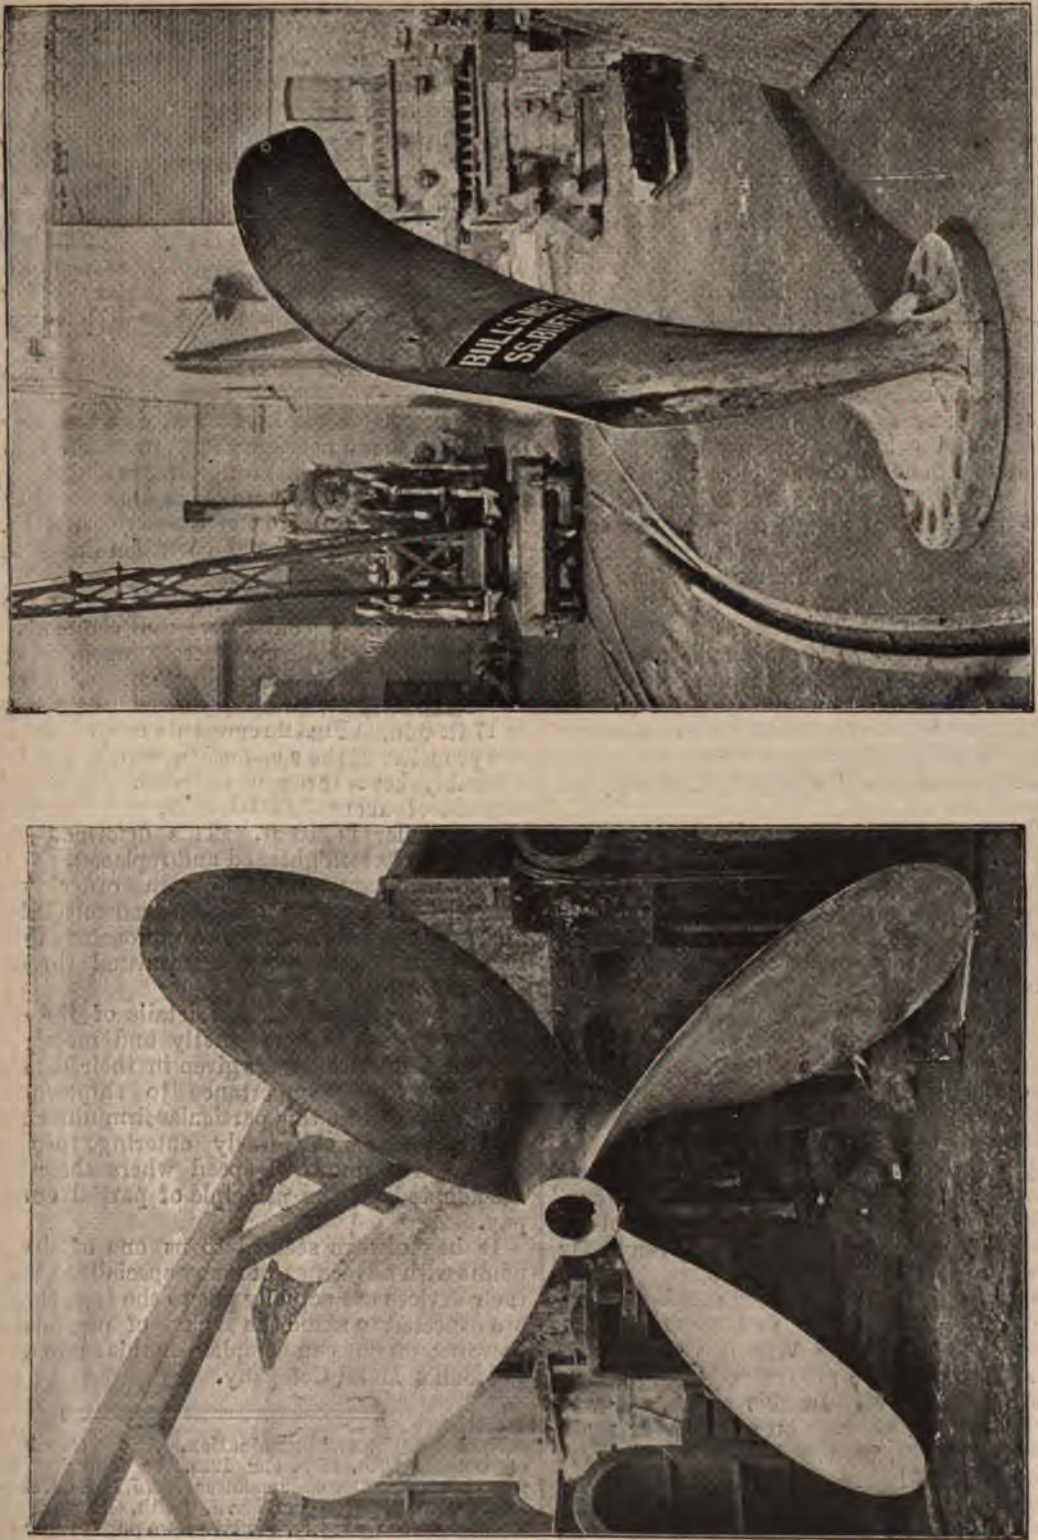
On the Continent

Bremerhaven

has the distinction of having, in the new Kaiser Dry Dock, opened in September, the biggest graving dock yet constructed outside of this country. It is also the only stone dock of the kind in Germany. It is chiefly designed for the accommodation of the vessels of the Norddeutscher Lloyd fleet. Its length is 721 ft. 9½ in., its breadth is 90 ft. 6½ in., and the sill is 34 ft. 8 in. below the highwater mark of the River Weser at ordinary tides. Four cranes, all worked by electricity, are provided. The largest of these is equal to a duty of 120 tons. The whole cost amounts to about £295,000, of which £120,000 is paid by the Imperial Exchequer. A lease of the dry dock has been taken for 25 years by the Norddeutscher Lloyd Company at an annual rent of something under £6,000, but the dock will be available on payment to vessels outside its fleet, and of course to German men-of-war. A repairing basin and other dry docks are also comprehended in the scheme, of which the present is merely an instalment.

Mr. Ismay,

who was not well enough to be present at the view of the new steamship *Oceanic*, or to fulfil his desire to cross with her on her maiden trip, still remains in a very serious state. His strength does not seem to come back to him in the way in which those who know the vigour of his constitution, and who are anxious to see his complete restoration to health, would desire. I had left all notice of his illness to the end of these notes in the hope



BULL'S METAL
SS. BUFF

Fig. 1.

Fig. 2.

Bull's Metal Propellers.

that some better news might have been given, but I fear as yet there is none. The feeling in Liverpool, and indeed on both sides of the Atlantic, towards him, especially at this time, is very warm and anxious. The German Emperor, who is perhaps famous for telegrams, sent a very gracious message to the devoted wife, who is nursing the invalid with such tender solicitude at Dawpool, and he expressed in a very happy way the anxiety with which those who know Mr. Ismay regard his illness, and the high appreciation with which every one who has met him—be they high or humble in rank—esteem his force of character.

BULL'S METAL PROPELLERS.

SOME time since we drew attention to the results obtained from propellers manufactured by Bull's Metal and Melloid Co., Limited, of 6, Jeffrey's Square, St. Mary Axe, London, E.C., and we have now before us a new edition of the company's catalogue just recently published, which contains a considerable amount of most interesting information relative to propellers, and shows by the copies of testimonials set forth that excellent work has been done by the company during its short independent existence; and, further, that the claims originally made by the company in their first catalogue as regard the improvement in speed or economy with their propellers have been fully substantiated.

Although the company do not pose as specialists in the design of propellers, and are not bound to any particular type or class of design, yet it is obvious from the argument and suggestions presented in their catalogue that they think considerable advantage is to be gained by the solid propellers, which is, no doubt, founded on experience gained with propellers supplied by them.

It is stated by the company that the loss in speed entailed by the use of a loose-bladed propeller, as compared with a solid one, is fully quarter of a knot on an average boat, besides the disadvantage that the extra strain on the shafting with the loose blades must be fully 25 per cent. higher. Of course it is the individual shipowner who is the best judge as to whether, in his particular trade, such a loss of speed or avoidable increase of risk to his shaft, and the matter of prime cost, are balanced by the undeniable advantages of the loose blades in case of breakages.

In the testimonials, a number of interesting facts in respect of actual speed improvement are given, and the company are so confident as to the merits of their goods that an absolute guarantee of speed improvement is frequently given to their customers, and we are informed that satisfaction has been given so far in every case with a single exception.

We think the case of the propeller supplied to s.s. *Eldorado*, of 1,515 tons gross and 2,000 I.H.P., belonging to Messrs. Thomas Wilson, Sons & Co., is the most interesting; the guaranteed improvement in speed was half a knot. In this steamer it was found that the record passage on a particular route during several seasons, with a cast-iron propeller, was 369 knots in 26·47 hours, giving an average speed of 13·77 knots per hour; whilst, with the new Bull's metal propeller, between the same points, the same distance was covered on the first voyage in 25·11 hours, which gives an average speed of 14·652 knots per hour, showing an improvement in speed over the cast-iron propeller of ·88 knots per hour. The improvement obtained was fully one knot when comparing an average of a number of sea passages.

Those interested in cargo steamers will, however, be more interested in the reports in respect of the vessels s.s. *Planet Mercury* and the s.s. *Blanefield*.

In the case of the former, a speed improvement of fully two-thirds of a knot per hour, on the same coal consumption as with her cast-iron propeller, is proved by the superintendent engineer's report, and it may be added that after five years' work this propeller continues to do equally good, or rather better, service. This result tends to prove that the pitting and corroding of cast-iron or steel propellers is one of the most potent factors in the falling off in the speed of new or newly-repaired vessels which so frequently forms a complaint amongst shipowners.

It may further be remarked that the s.s. *Planet Mercury*, like various other vessels using Bull's metal propellers, has never been fitted with the zinc plates, which are found necessary for protection against galvanic action with most other bronze alloys.

Careful painting when docking has proved sufficient to protect the hulls, in the cases referred to, against any prejudicial amount of corrosion due to the Bull's metal.

We illustrate in the adjoining diagrams two specimens of work executed by the company. Fig. 1 represents the solid Bull's metal propeller, supplied to a vessel of 6,000 deadweight tonnage. Her engines are 2,100 I.H.P., and the diameter of the propeller is 17 ft. 3 in. Fig. 2 represents one of the blades of the propeller of the s.s. *Buffalo*, which has been considerably bent through collision. This vessel has engines of about 3,000 I.H.P., and the diameter of the propeller is 19 ft. This deformed blade was subsequently straightened and replaced.

The company have now in order two solid propellers, each of which is to transmit 9,500 H.P., and, as far as we know, powers approaching this amount has never before been transmitted through solid bronze propellers.

We have given such full details of the company's labours for two reasons: firstly and mainly, because we think the actual facts given in their catalogue are of interest and importance to shipowners; and, secondly, because this particular firm differ from most of their rivals by freely entering into absolute guarantee of improved speed where their propellers are adopted, on the principle of partial cure, partial pay.

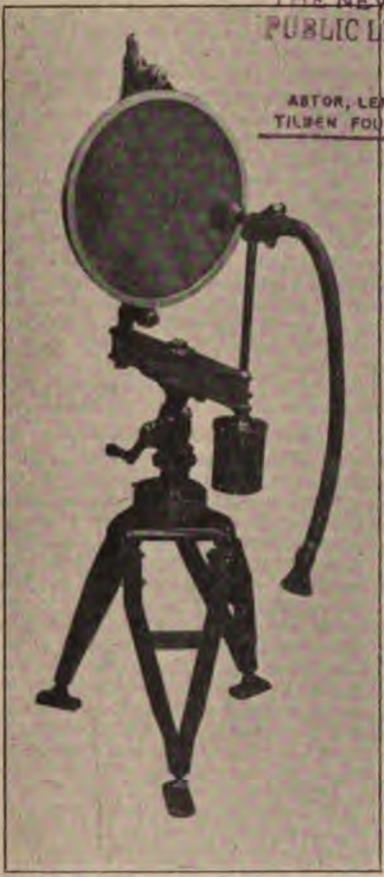
It has always seemed to us one of the weakest points with advocates of many specialities that, when their devices are actually put to the test, their clients are expected to stand the racket of possible failure; however, no one can complain on this score as regards the Bull's Metal Company.

Marine Engineers' Examination.—At the examination held on October 10th, 11th, and 12th, the following candidates passed for extra first-class engineer: Mr. J. R. Reid, Sunderland; Mr. L. Parker, Leeds; and Mr. J. Smith, Glasgow. All passed the first time of going up, the latter two pupils being instructed entirely by correspondence. They were prepared by Mr. W. H. Thorn, 5, Waterville Terrace, North Shields. Sixty-three pupils have passed in the above grade from this establishment, a record unattained by any other existing school.

COWPER-COLES SOUND LOCATOR AND PROJECTOR.

THIS instrument is for the purpose of readily locating the direction of a sound, and for projecting sound long distances. The instrument consists of a reflector, which is made entirely by electro-deposition, mounted on an arm which can be readily turned on its centre, and depressed or elevated by the operator. When it is desired to ascertain the exact direction from which a sound emanates, the apparatus is turned on its axis; and, as soon as the reflector is opposite the source of sound, it is heard much intensified in the receiver.

THE NEW YORK
PUBLIC LIBRARY
ASTOR, LENOX AND
TILDEN FOUNDATIONS.



When it is desired to carry on a conversation between two distant ships or points, two instruments are used, so that the beam of sound is thrown from one reflector to the other and focussed in the receiver of one instrument: one operator speaks into the flexible tube, whilst the operator working the other instrument places the tube attached to the receiver to his ear. Conversation can thus be carried on at long distances without unduly raising the voice.

Some experiments have recently been made at St. Margaret's Bay, near Dover, with this instrument. The ticking of a watch when placed in the focus could be distinctly heard by observers about 20 ft. away, even with a strong breeze blowing across the line of direction of sound.

NAVAL MATTERS—PAST AND PROSPECTIVE.

(From our own Correspondents at home and abroad.)

Missing Signal Books.

MANY theories have been put forward to account for the loss of two signal books from the *Duke of Wellington*, but up to the present no clue has been found as to who took the books or where they have gone to. The volumes were Nos. 1 and 2 of the Fleet Signals, and were heavy, bulky books, so that considerable care must have been taken in their removal to prevent detection. One theory put forward is that they were stolen for the purpose of disposal to a foreign Power, but it is questionable whether any foreign Power is in ignorance of the contents of these books. In time of war an entirely different code would be used to that set forth in the missing volumes. Of course, many useful "wrinkles" could be learned from them by other Powers. The second theory put forward is that they were extracted and destroyed in order to gratify malice cherished against the officer responsible for their safe custody; and the third theory advanced is that a signalman, wishing to improve his chances at the next examination, took them home for private study, but, finding that their absence had been discovered, destroyed them. Time will perhaps show whether any of these guesses are correct. This is not the first time that signal books have been missed, and it is hoped that it will be the last, and that in future a stricter watch will be kept on these volumes. It is regrettable that suspicion should be cast upon the Signal Corps, for these men are on the whole honest and hard-working. It is worthy of mention here that a signal book belonging to one of the officers of a destroyer was dropped overboard in Falmouth Harbour early last month, and, although divers were sent down to find it, they were unsuccessful in their quest.

A Lower-Deck Grievance.

It is almost a tradition in the navy amongst the younger seamen, stokers, and marines afloat that their canteens are mismanaged. The majority of these men entertain a belief that there are very few who gain any benefit from such an institution, and that the greater part of the profits is spent in paint and gold-leaf for the decoration of the ship. The regulations lay down that the establishment of dry canteens shall rest with the captains, who shall cause proper rules to be framed for their administration, and submit these rules to the Commander-in-Chief for his approval. The rules also say that the affairs of the canteen shall be administered by a representative committee, but subsequently state that the first lieutenant shall be *ex-officio* president; whilst, at least, one other executive officer shall have a hand in the management of the canteen. The question is whether the commissioned officers know sufficient about the buying and selling of such things as groceries and other goods as to conscientiously carry out the duty imposed upon them. It would be ridiculous to credit the imputations made of officers accepting bribes from tradesmen, but that some of those who come into direct contact with the vendors of the goods sold to the canteens have countenanced a little "jobbery" is certain. A well-managed canteen should never have to record the loss of nearly £200 in a single quarter; but this is so in the case of that of the *Warspite*, and, therefore, there is plainly something wrong in the management which calls for redress. The president of the committee appears to have on one occasion used his position to make a cook buy the flour from the canteen which could have been purchased much cheaper from local tradesmen. This was certainly to prevent any greater loss, but such a state of things should not have come to pass. Canteen goods ought to be as cheap, or cheaper, than those that the men can purchase off the ship. The remedy seems to be to give the lower deck a freer hand, and not to allow the senior non-commissioned officers of the ship so much liberty as they at present have when connected with the canteen committee. If the various tradesmen dealt with submitted samples and prices which the whole of the lower-deck hands could see, the latter could easily judge by the price and quality of the goods retailed to them from the canteen whether the committee understood its work, and could act accordingly when the committeemen were elected.

Portsmouth Dockyard.

The most interesting part of the inspection by the Lords of the Admiralty last month at this yard was the review of the combined divisions of marines on Southsea Common. As the

3,000 men marched past they looked as fine a body of military men as could be found anywhere in England, or for the matter of that, in the world. The First Lord's private secretary, Captain W. H. Fawkes,has stayed on in order to superintend the completion of the new battleship *Canopus*, in which, on December 15th, he is to hoist his pennant. Although she is being pushed on as rapidly as possible, it does not look at present as though she would be ready for sea by that time. Three of the ships commissioned at this yard for the Naval Manœuvres were to be taken in hand in order to have repairs done to them. In the *Europa* and *Gladiator* some alterations were to be made in the bunker doors, as they do not work satisfactorily, but whether this work will be done yet awhile is doubtful, as most of the ships are being prepared for sea in case of emergency. It is at present uncertain whether the ships will be sent to the Cape or not. In connection with the trouble in South Africa, it may be mentioned here that the Government has decided to keep open the places vacated by dockyard labourers who have been called up as reservists, thus setting an excellent example to private firms. The periodical trials which are carried out with the ships in the Fleet Reserve have shown that several of them have not improved by keeping. The *Isis*, for instance, was half-a-knot short in speed, and the *Glatton* also failed to reach her nominal sea speed. She reported a mean speed of 9·7 knots, but the coal consumption was not reported. The best speed of the older ships was that attained by the *Sultan*, which reported a mean speed of 13½ knots. Considering the amount of money spent upon her, she certainly ought to do better than the *Iron Duke*,

A Naval Brigade for the Cape.

The announcement has been made that Sir Robert Harris is making preparations for the landing of a naval brigade at Simon's Town. Sir Robert has a total force of 14 ships under his command, the majority of which, however, are small craft, and altogether about 3,500 men. The strength of the brigade has not been mentioned, but it will probably consist of about 1,500 seamen, with a number of field pieces. Amongst the force there will probably be some of the best gunners in the Navy, for the admiral on the Cape Station is an enthusiast on the subject of efficiency in naval gunnery, and may be relied upon to send against the Boers men who can shoot as straight as any artillerist in the world. Of course all the ships are not at Simon's Town, the headquarters of the station, there being at the latter place only the *Doris* (flagship), third-class battleship *Monarch* (guardship), the cruisers *Forte*, *Magicienne*, and *Barrosa*, with the gunboats *Widgeon* and *Thrush*. The *Philomel* is at Delagoa Bay, and the *Tartar* at Durban, the first watching the Portuguese coast. It is well known ihat Sir Robert Harris intends keeping a strict watch on all vessels bound for South African ports, in order to prevent any munitions of war being landed for the Boers, and it was the knowledge of this that probably caused the captain of the German ship *Kaiser* to land her cargo at Port Said, he not caring to risk the chance of capture at Lorenzo Marques. However, large profits are to be made from the sale to the Transvaal Government of guns and ammunition, and, therefore, other owners may decide to take the risks. In connection with the despatch of the transports, several cruisers of the Channel Squadron will leave England; but not, as has been stated, to convoy the troopers. They will go to the coaling stations on the route for the purpose of guarding against any delay in the expediting of the troopships.

Skilled Mechanics for the Navy.

A difficulty is still being experienced by the Admiralty in obtaining a sufficient supply of skilled mechanics, and in this connection it has been stated that the Amalgamated Society of Engineers has decided to hamper the recruiting of mechanics as much as it possibly can. This action has been taken on account of the refusal of the Admiralty to grant the concessions asked for by the engine-room artificers, such as improved mess places, washing accommodation, &c. Considering that at present every available inch of space on a modern warship is occupied, it is not likely that the Admiralty will consent to disarrange the accommodation in warships for the engine-room artificers. The engine-room artificers claim eligibility for promotion to warrant rank at the age of 21, and strongly object to the rule which delays selection until the age of 35. They would also like to be pensioned as warrant officers at the age of 50, which is five years earlier than is at present fixed by the regulations. The union, although it received such a severe set-back a few years ago, may still prove troublesome to the Admiralty. Mr. Allan's scheme for obtaining recruits is being warmly taken up by the Admiralty. The kingdom is to be mapped out into five engineering districts, to each of which an Admiralty recruiting agent is to be appointed. These recruiting agents, who are to be engineers, will receive regular salaries for their work, and in addition capitation grants. The scheme is to be given a twelve-months' trial.

Devonport Dockyard.

The launch of the battleship *Bulwark*, by Lady Fairfax, was the most important event at this yard during the past month. Within the last sixteen months three such vessels have taken the water from this yard—the *Ocean* in July of last year, and the *Implacable* in May of the present year. The *Ocean* has given a good deal of trouble since she commenced her steam trials, and has occasioned not a little anxiety to the officials here. On her 30-hours coal consumption trial at four-fifths full power she obtained a mean speed of 16·5 knots, with a coal consumption of 1·6 lb. per I.H.P. per hour; the *Canopus*, it may be mentioned, attained a speed of 17·2 knots with precisely the same coal consumption, whilst the *Goliath* reached 17·3 knots with a coal consumption of 1·5 lb. per I.H.P. per hour. Thus it will be seen that the *Ocean* does not compare well with her sister ships. The *Ocean's* failure is attributed by some to the neglected condition of her underwater fittings. The story of the *Hermes* being attached to the command here for three weeks for the purpose of experimenting with wireless telegraphy turns out to be an official hoax. Why the story was printed at all on official paper is not properly understood as yet, but it is believed that it was circulated to discover the culprit who communicated such tit-bits of news to the press. The *Hermes* will eventually relieve the *Talbot* on the North American and West Indies Station. She is of the same displacement as the *Talbot*, but is superior in H.P. and armament. The most interesting experiment was that carried out by the *Arrogant* recently in towing the *Ganges* from this port to Sheerness. Ordinary dockyard tugs could have done the work quite as well, but the reason that the *Arrogant* was selected for the work was probably to discover whether vessels of the class to which she belongs could undertake such work as towing disabled warships when coming to grief themselves.

The Transport Service.

The transporting of the Army Corps to South Africa has progressed with smoothness and despatch. It was the first time that such a large operation had been undertaken by the Admiralty, and out of all the ships that were sent away the only delay that occurred was that caused by the breakdown of the transports *Zibenghla* and *Zayathla*. That this was a serious delay it must be admitted, as it kept back the artillery from the Cape, but the importance of the mishap has been in many cases exaggerated. Altogether more than 80 vessels will be necessary to convey such a large body of men to South Africa, and it must be expected that a hitch will occur when such a great undertaking is in progress. The blame for the delay of these two vessels, we are told, will have to be borne by the heads of the Transport Department, but that remains to be seen. The transporting of the Army Corps has necessitated the employment of 35 naval officers, amongst whom are five captains. There is also the shipment of mules and horses from Spain, Italy, and the United States to be looked after. The transporting of the troops to the Crimea in 1854 called forth the admiration of the German military leader Moltke, but if he had been alive to-day to see the moving of over 40,000 troops, nearly 100 guns, 16,600 animals, and 2,150 vehicles to a country, as far distant as South Africa, the warmth of his admiration would have been more than doubled. The breakdown of the *Zibenghla* and *Zayathla* called forth a letter from the chairman of the British East India Co., in which he said that there was certainly no lack of supervision, inasmuch as the engineers from the Admiralty and Board of Trade, and the shipbuilding engineer of his own company inspected the engines, and the only thing that was wrong was the delay in inspecting the new furnaces. The War Office would like to have the Transport Department in its own hands, and this, it is believed, could easily be effected by a mutual friendly arrangement. It is to be hoped, however, and there is really very little chance of its coming to pass, that the transfer will not be made on account of mistakes attributed to the officials at Whitehall.

French Navy Estimates.

The French Navy Estimates for 1900 have now been prepared, and from them it appears that the exact sum to be voted is

315,012,750 francs, an increase of 11,412,240 francs upon that of 1899. The votes for naval construction amount to 120,270,000 francs, but only a little more than 2½ million francs of this amount is to be devoted to new work in the coming year. No new programme of work has been foreshadowed. With the exception of two small cruisers, all the vessels intended to be laid down in 1899 have already been commenced, or orders for their immediate construction sent out. These vessels are as follow:—Armoured cruisers, *Marseillaise* (Brest) and *Amiral Aube* (private yard); submersible boats, *Sirene* and *Triton* (Cherbourg); sea-going boats, *Bourrasque*, *Rafale*, *Boree*, and *Tramontane*, and 11 first-class boats (private yards); four destroyers. *Pertuisane*, *Escopette*, *Flamberge*, and *Rapiere* (Rochefort); vedette boat, *Libellule* (private yard); submarines, *Francais* and *Algerien* (Cherbourg); river gunboats for China, *Argus* and *Vigilante* (in England); and submarines, *Farfadet*, *Gnome*, *Korrigan*, and *Lutin* (Rochefort). A number of changes are to be made in the French Mediterranean and Channel Squadrons, and on the foreign stations a few obsolete craft will be replaced by modern gunboats. To all appearances, however, the struggle for naval supremacy which has been maintained unceasingly between this country and France for so many years past is to be continued.

Chatham Dockyard.

A great deal of overtime has been worked at this yard during the past month fitting out vessels for foreign service, and to catch up the arrears of work for the current financial year. The repairs on the *Blenheim* are being effected as quickly as possible, as it is desired to test her new armament of quick-firing guns as quickly as possible. The *Archer*, too, is to be ready for commissioning by the middle of this month, and much overtime has been resorted to in order to get her ready for this event. She is, it will be remembered, being refitted and rearmed. The *Arethusa* is also to be ready for the pennant by about the same time, when she will leave for the Pacific Station to relieve the *Leander*, a sister ship. On the 1st of next month the *Diana* is to be brought forward, and a little later the *Apollo* and *Sappho* are to be ready for commissioning. Two other vessels which are undergoing refits are the *Immortalite* and the *Imperieuse*. £30,000 are to be spent upon the first-named, and £25,000 upon the latter. The engine-room artificers attached to the steam reserve at this yard are dissatisfied with the messing and bathing accommodation afforded them on the *Pembroke*. It is said that for the 300 men on the depôt only three baths and about a dozen towels are provided in three small washhouses, so that the majority of the men have to perform their ablutions in the stokeholds and engine-rooms, or wherever they can find a convenient spot. The Amalgamated Society of Engineers has interfered in the matter, and it looks as though some ill-feeling would result. It would be as well if a little more attention were given to the comfort of this class of men, especially as there is some difficulty at present in obtaining recruits in sufficient numbers. The *Dreadnought* has at last passed into the Fleet Reserve, having completed her refit.

The Relative Importance of Guns, Armour, and Speed.

Often as this question has cropped up, it has never, and probably never will be, settled to the satisfaction of all. A reviewer in the *Engineering Magazine* deals with the question in a most lucid manner, and the conclusions which the writer arrives at are interesting. Early in the article he expresses the opinion that the battle of Santiago was not a battle at all in the accepted sense of the term; it was a chase. In this case speed is the prime factor for either side, but when it comes to a pitched battle the writer's opinion is that success depends upon manœuvring ability almost as much as anything else. This is obvious, as is also the fact that a fleet of greater speed can seldom, if ever, be forced into action by a fleet of inferior speed. The writer also remarks that, if the enemy puts on speed in order to join or combine with another fleet, it would hardly be desirable then to catch it unless guns and armour were good enough to secure victory. However, the majority of the statements are sound enough, as, for instance, when he says that: "It is most important that a squadron should be homogeneous in the matter of speed if concerted action is to be possible; that at the present time the only navy in the world that can put a homogeneous squadron into action is the British Navy; that a 15-knot squadron of homogeneous ships stands, when these are steaming together in station, to better a swifter fleet of various units, because these last will not be able to perform evolutions together at high speed; that, as a matter of fact, 12 knots is the highest speed at which fleet evolutions have yet been done, and that has only recently been accomplished; that the next trials will be made at 14 knots, but that such a speed in evolutions is only possible in a highly trained, regularly commissioned, and homogeneous fleet." The conclusion arrived at in the end is that, whilst speed is a very important qualification for all naval vessels, it must not take first place for battleships, but must come after the questions of guns and armour. It is impossible, and, perhaps, even undesirable, to put two such contradictory qualities both in the first place. The heavier vessel cannot be the swifter, nor can the swift ship be so heavily armed. Each has its place and function; and in the one, speed comes first; in the other, fighting power. The battleship should be a battleship, and the armoured cruiser an armoured cruiser.

The Launch of the "Bulwark."

A couple of weeks ago the launch took place of the new battleship *Bulwark*, from Devonport Dockyard, after having been in hand for less than seven months. She has created a record in having the greatest weight built into her in the time mentioned, and it will be some time before France, or any other nation, can complete such a feat, try as they will. She is 400 ft. long between the perpendiculars, and has an extreme breadth of 75 ft.; her draught of water (forward) is 26 ft. 3 in.; aft, 27 ft. 3 in.; whilst her load displacement is 15,000 tons. She will be fitted with two complete sets of engines of the vertical triple-expansion type of 15,000 I.H.P., and is expected to attain a speed of 18 knots. The engines have cylinders of 31½ in., 51½ in., and 84 in. diameter, and a stroke of 51 in. Each set, built in a separate room, is to be capable of developing 7,500 H.P., with 108 revolutions per minute. There will be 20 boilers of the Belleville type. The armament will comprise four 12 in. breech-loading guns, worked in two barbettes, twelve 6-in. quick-firing guns in casemates, sixteen 12-pounder 12 cwt. quick-firing guns, six 3-peunder. Hotchkiss quick-firing guns, one 12-pounder 8 cwt. boat gun, one 12-pounder. 8 cwt. field gun, and eight 45-in. Maxim guns. She will also have four submerged torpedo tubes. Her complement is 773 officers and men. The *Bulwark* and her sister ships are identical in form, dimensions, and displacement with the *Formidable* class, but differ slightly in the distribution of armour protection. In the *Venerable* class the belt of side armour is carried much nearer the bow than in the *Formidable* class, whilst the fore-armoured bulkhead, which is a feature in the *Formidable* class, has been dispensed with.

Sheerness Dockyard.

The two new sloops preparing to build at this yard, the *Fantome* and *Espiegle*, will probably be commenced before the sloops *Vestal* and *Sheerwater* are floated out. One, we are told, is to be commenced in Dock No. 4, and the other on the slip recently vacated by the *Pomone*. When these two vessels are taken in hand, there will be altogether six sloops in various stages of construction at this yard; two, the *Condor* and *Rosarie*, building; two, the *Vestal* and *Sheerwater*, which were begun on February 1st, completing, and almost ready to take the water; and the two new ones mentioned above. These are to be twin-screw vessels, so that in this respect they will differ from the other four sloops building here. One, the *Espiegle*, will be engined by contract, but the engines of the *Fantome* are to be constructed at Devonport. The machinery of the *Rosarie* was also constructed at Devonport, and the machinery of the *Vestal* is now being built there. The *Condor* is to carry out her trials next month. She is the first of the new sloops fitted with Belleville boilers. An I H.P. of 1,400 will be expected from her triple-expansion engines under forced draught, with a speed of 13·25 knots. With natural draught she will be expected to develop 1,100 H.P., with a speed of 12·6 knots. The trials of the *Rosarie* will take place a few week later. This establishment has recently been revalued for assessment purposes by officials from London, and the total value has been put down at £13,747. The *Speedy* is to be transferred to the A division of the Medway Fleet Reserve, pending the decision of the Admiralty to employ her on active service.

Trafalgar Day.

About a week ago the 94th anniversary of the victory obtained by Lord Nelson over the French at Trafalgar was celebrated in London and the provinces as well as at all the great centres throughout the Empire; in fact, several of the Colonies had the day specially selected for the departure of the volunteer contingent bound for the Cape. The day afforded opportunities for displaying Imperial sentiment, which was taken full advantage of in London, for Trafalgar Square was, for nearly a week, literally packed with visitors intent on viewing the decorated monument of Nelson. The Navy League authorities, who were responsible for the decoration of the column, had had it festooned from top to bottom with thick cords of laurel wreaths lit up in the evening by electricity, and the base of the column was lavishly decorated with wreaths from all parts of the world. There were several wreaths on view from the descendants of the men who fought at Trafalgar. At the Royal United Service Institution, a most interesting exhibition was held of miniatures, relics, and trophies connected with the life of Nelson, and was visited by hundreds of people. The anniversary was also celebrated in suitable manner on board the *Victory* in Portsmouth Harbour. Nelson's signal, "England expects that every man will do his duty," was hoisted in this ship for the first time since the battle of Trafalgar, and laurel wreaths were suspended between each of the *Victory's* masts, and one was placed on the spot where the great admiral fell. The majority of the daily papers, in referring to Nelson's signal at Trafalgar, make it "England expects every man to do his duty," which is, of course, incorrect. The proposal to establish a Nelson Museum on the *Victory* has met with success, and a deck-house will probably be built to accommodate the large collection of Nelson relics and memorials. The idea of housing in the upper deck, as in the depot ships, has been abandoned.

Pembroke Dockyard.

Work at this yard is now in full swing under the new Superintendent. It is noteworthy that just before Rear-Admiral Burges Watson relinquished this post he issued the following minute:—"I wish to thank the officers and men of this dockyard for their loyal support, and to express my satisfaction at the way the work has been done from the time I have been in charge." Overtime has been resorted to in order to assist the progress of the new Royal yacht, and shipwrights have been transferred from the *Essex* to work on her. The trouble about the non-inflammable wood has not yet been properly overcome, and the opinion prevails that it would have been much wiser to have used ordinary wood. It is rumoured that in April next Captain the Hon. Curzon-Howe will relieve Rear-Admiral John Fullerton in the command of the Royal yacht. Failing health is the cause attributed to Sir John's desire for retirement. The new yacht is to be hurried forward as much as possible, and instructions have been given to use all possible expedition in completing the work in the interior of the vessel, even at the expense of other branches of work in other parts of the yard The *Essex* is practically at a standstill, and as regards the *Spartiate*, the progress that is being made at present upon her is not very great, and she will not have any extra hands at work upon her until the departure of the Royal yacht.

The late Admiral Colomb.

The sudden death of Vice-Admiral Philip Howard Colomb has deprived us of a thinker and writer on naval subjects second to none, and a man who has probably done more towards bringing before the country the true conditions of national defence than any other naval writer. He will also be remembered as the originator of the idea of flashing night signals, which, in one form or another, are now used in nearly every navy in the world. Several appreciative tributes to the deceased have been published, notably in the *Times* and *Army and Navy Gazette*. The latter says:—"We are appreciably poorer than in the recent day in which we knew that a keen and vigorous intellect was ever awake to detect a flaw in the reasoning or policy of those who direct the naval affairs of the country, or in the arguments of those who are, or claim to be, the instructors of the people in the things that should be its most serious concern." Admiral Columb saw service in all parts of the world during the time he was on the active list, being compulsorily retired on account of age in 1886. His signalling invention, although practically completed in 1861, was not finally adopted in the Navy until 1867. He recently remarked to a friend that, in his opinion, the Marconi system of wireless telegraphy would before long entirely supersede the system with which his (Admiral Columb's) name was associated. Admiral Columb lectured for many years on the subject of collisions at sea and how to prevent them, his views being finally adopted in principle by the National Convention at Washington in 1889. He produced under official authority, in 1874, the new "Manual of Fleet Evolutions," and in 1891 his elaborate and extensive work on "Naval Warfare" appeared, "In which," says the *Times*, "almost for the first time in modern naval literature, he enunciated and illustrated from history the true principles and conditions of sea power and its exercises." "His memory," says the *Army and Navy Gazette*, "will ever be honoured for the unflagging zeal and lucid discernment with which he sought out and made conspicuously clear the supremely important teachings of our naval history."

Gunnery in the French and English Navies.

The publication of the official gunnery return, showing the results of the target practice carried out by the ships of the French Mediterranean Squadron, has given rise to some unfavourable comparisons being published between the British and French naval gunnery. Facts can be made to prove anything, although the return in question does not need a great deal of study to prove the superiority of British over French naval gunners. It is not well to be too optimistic and to assert in an all round manner that British gunners are superior to those of all other nations, for that is the surest way to lull people into the belief that special exertions towards accurate shooting are necessary, and gunnery practice can never be too good. French shooting has certainly improved, and efforts are being made to make this department of the Navy still further efficient, but in the French returns neither the size nor shape of the targets is given, nor the speed at which the vessels steamed whilst firing. Out of all the ships engaged, the number of shots fired was 1,321, out of which 600 hits were made, the average time of a shot being 23 seconds. The best average was that attained by the crew of the *Cassard*—72 per cent. of hits in nine minutes—and the lowest average that of the *Jemmapes*, which only managed to get on to the target five times with 24 shots, which took a quarter of an hour to fire. The pay of English captains of guns and turrets may not be as high as that of the French Navy, but it is extremely problemmatical if the *esprit de corps* of the latter in any way approaches that of the British gunners. The news, however, that French gunners are improving their shooting will most probably lead to further effort on the part of our own men.

JOHNSON & PHILLIPS.

THIS firm is at present building additions to its works, especially in the cable manufacturing department. Like many older works about London which have been built up by degrees and in consequence of the energy of one man the shops are considerably spread about Old Charlton.

The chief controlling mind of the establishment is Mr. Johnson. He was articled as an apprentice to an English locomotive works. Afterwards he applied himself to the study of science at King's College, London. When he had finished he applied himself to cable laying, and now he manufactures most of the machines for use in the construction of cable.

It was in 1875 that he, along with Mr. S. E. Phillips, decided to start a little factory for the construction of electric machines, and they did so at Charlton, in Kent. Gradually, bit by bit, it rose until the partners found their premises so far extended that they had to pay £30 a year. Now that rent only represents the rental of one of the very smallest workshops which goes to make up the establishment.

The work of the establishment is by no means confined to cable making. There is a large electrical meter manufacturing shop. And another where huge central station dynamos are built. Mr. Johnson is also the principal shareholder in the "Dujardin-Planté Accumulator," which is better known as the D. P. Battery, and he is managing director of the company. He also owns and works two gold mines in Dolgelly, Wales. This might be sufficient scope for any man's energy, but it is not for Mr. Johnson. He

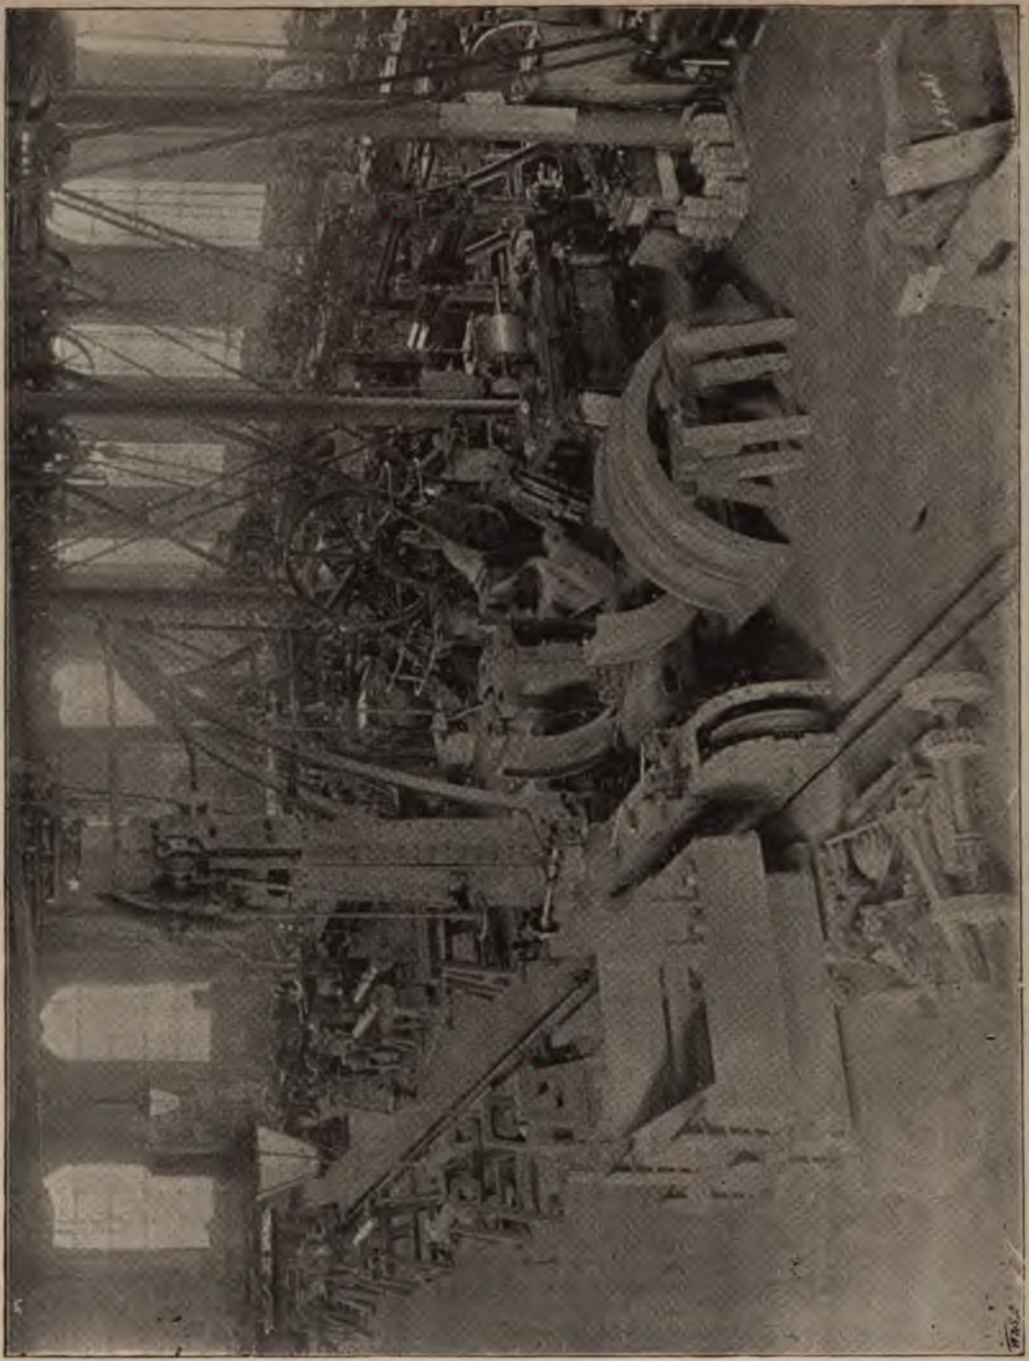
Dynamo Testing Shop, Messrs. Johnson & Phillips. Fig. 1.

is also the leading director of the Electrical Development and Finance Corporation, a director of the Bell's Asbestos Co., and a director of both the British and Continental Jandus Arc Lamp Co.s.

One of the principal manufactures of the works is the gear for dealing with submarine cable. They constructed the gear for paying out and picking up the cable for the Japanese Government cable steamer *Okinawa Maru*, and also the gear accessories and stores for the *Tutanekai*. They have also fitted a merchant vessel as a cable-laying and repairing steamer with all necessary cable tank accessories and stores, for the French. There is a huge shop full of cable making machines all engaged in the construction of large cables. And in the same yard another shop which is worked with boys. This shop is used for dealing with the insulation of smaller electric wires.

Across the road is another large shop for the manufacture of the Johnson and Phillips's arc lamp. It is used in Government departments, the post and telegraph offices in London, Birmingham, Manchester, Glasgow, Leeds, Hull, and other places, and for street lighting in the following, amongst other towns:—London, Oxford, Dublin, Brighton, Edinburgh, Tun-

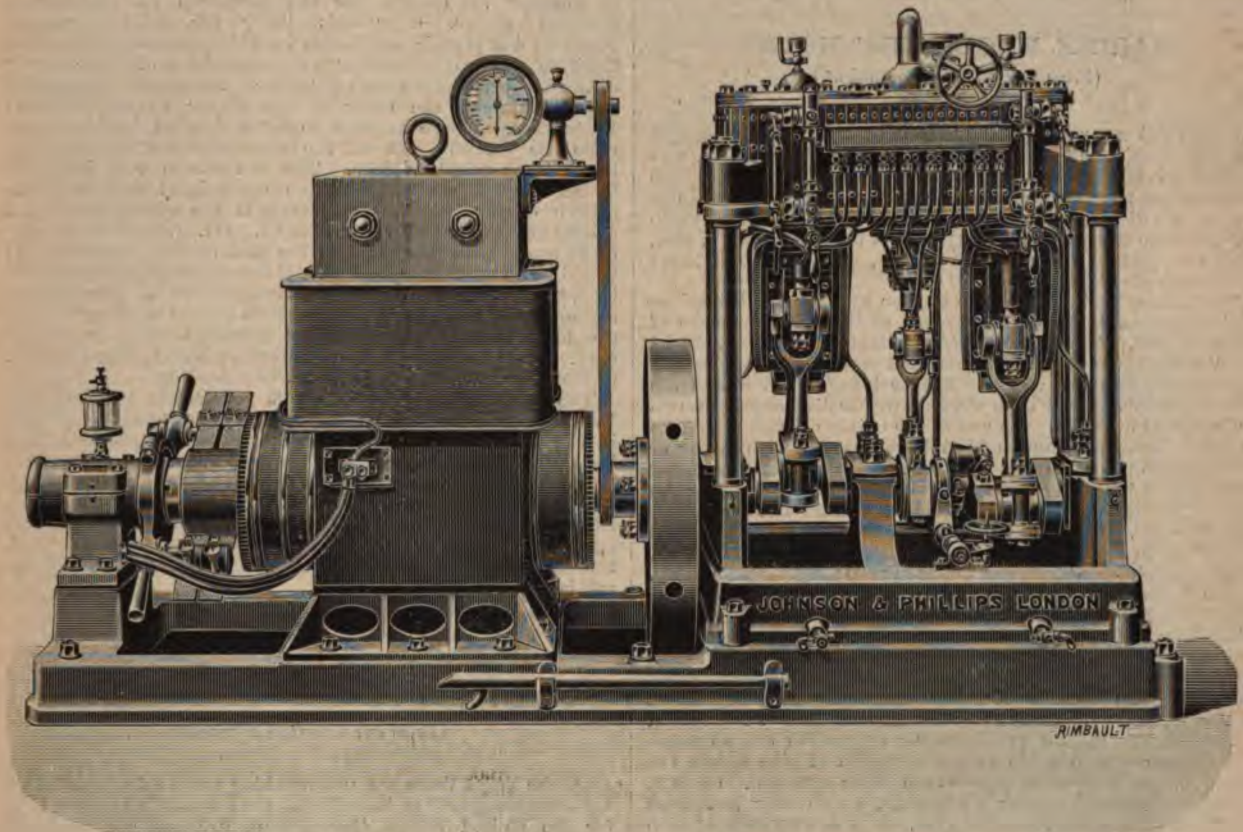


MACHINE SHOP, MESSRS. JOHNSON & PHILLIPS, FIG. 2.

bridge Wells, Bristol, Portsmouth, Stafford, South Shields, Blackpool, Aberdeen, Londonderry, &c. Over 20,000 of these lamps are in use.

To marine engineers the main interest in the works are the sets of combined engines and dynamos for ship electric lighting. We show an illustration Fig. 3 of a combined set—a direct coupled Johnson & Phillips's dynamo with a Bellis open engine. There is also their well-known alternator. In this the armature which carries the high pressure current is stationary, and is not thus subjected to centrifugal strains. Also the armature coils are furnished with laminated iron cores, to which they are securely attached, these cores being independently bolted to a cast-iron ring, and the whole forming a strong mechanical structure. In this feature the design is considerably superior to machines which have long and narrow coreless coils with only a fixing at one end, which have proved unsuitable for prolonged work under racking strains. Each coil is independent, and can be replaced in a few minutes without touching the adjacent coils, and without any preliminary preparation. The construction also admits of increasing the thickness of the insulation between the coils and cores to any required extent without any addition to the air space, or increase in magnetising force. By reason of the excessive insulation which can be employed the breakdown of a coil to frame is a thing unknown. The coils are not endangered by reduction of clearance, which may result from some of the journals, as there are no conductors in the air gap.

The armature circuit is terminated in two gun-metal blocks mounted on a plate of insulating material fixed in a convenient position on the machine. These terminals are furnished with a protecting cone so that nothing may accidently touch them.



Ship Lighting Set, Messrs. Johnson & Phillips. Fig. 3.

The exciting current is conveyed to the field by a double set of brushes resting on two contact rings of gun metal, mounted side by side, on, and thoroughly insulated from, a substantial cast iron bush, which in turn is kept upon the shaft. The brush-holders are provided with suitable terminals to take the conductors carrying the exciting current.

The transformer made by the firm is characterised by great simplicity of construction, the proportions which have given such good results having been suggested by long experience. The iron used for the cores is the best. The drop in both from no load to full load is small. Great care has been taken with the insulation. The primary and secondary coils are wound in separate cylinders of hard and indestructible materials, and have, when placed concentrically on the core sheet, ebonite interposed between them. This method of insulation is so perfect that a breakdown between primary and secondary or between coil and core is unknown. The apparatus is enclosed in a cast-iron watertight case provided with gunmetal ebonite bushed glands for both primary and secondary conductors. There is no fixing whatever in the case, so the transformer when the core is removed can be lifted out bodily if desired. The transformers are made in all sizes.

In the transmission of power plants, they are rather famous, being the first to successfully cope with long distance transmission. The power house was situated on a river where three turbines working under a 30 ft. fall furnish power through countershafting to these two-phase alternating current generators, and then direct current exciters. The pulleys on the countershaft are each provided with clutches, so that one or other generator or exciter can be readily stopped without shutting the pressure off the main. Each machine has a capacity of 175 E.H.P. and runs at a speed of 400 revolutions per minute. The machines generate two currents in quadrature at 3,300 volts p. d., with 6,000 alternations per minute. There is a complete system of self-lubrication. They are also the original inventors, patentees and sole makers of the fluid insulator, and it has been reported that even with a pressure of 2,000 volts, delicate means of observation have been able to discover only a trace of leakage.

The number of men employed by the firm is about 600. Mr. Johnson appears to have the faculty of instilling in his assistants and men an interest in the business, and especially is this shown in the secretary, Mr. Hughes. His conversation and manner would lead one to believe that the success of the firm is very much a matter of his concern. And he appears to inspire in his assistants similar views of their duties to the welfare of the firm.

We illustrate two views of the shops. The dynamo testing shop is shown in Fig. 1, and the machine shop in Fig. 2.

MARINE ENGINEERS' NOTES.

(From our own Correspondent.)

A PAPER was read at the Institute of Marine Engineers on the subject of "Feed-water Filters." The paper was written by Mr. Walter W. Houfe (member). The paper was the result of the experience of the writer during the last five years. He divides the objectionable matter which may get into the feed into two classes: 1. Oxygen and carbonic acid; 2. Oils, fatty and mineral and abraided metals, packings. The latter division he classifies as dirt.

The author is of opinion that oxygen and air of themselves will not cause continuous corrosion without the presence of carbonic acid. Along with the air and carbonic acid he thinks that hydrochleric acid will be formed from the decomposition of magensic chloride, and the former being 1½ times and the latter 1¼ times heavier than air, both will be discharged through the hot well overflow. He was of the opinion that it would be better to have the pumps inlet kept covered with water or drowned, and to effect this had an automatic float made, but could not claim any advantage from this arrangement over the plan of preventing everything being admitted but feed water and pure air. He thinks that the presence also of internal feed pipes in the boiler was an important factor. The author gives the opinion of Sir John Durston as to the grease difficulty. "The whole of their troubles came from grease. He did not think there was a filter which was of any use whatever." He next deals with exhaust steam separators, and points out that one American firm found that "it is essential for exhaust steam filters to have their inner surfaces wet, and the steam saturated steam." They used a jet condensing spray in their exhaust steam separators. Filters he classifies as follows:—Class 1. Those having special provision for separating out as much "dirt" and oil as possible in consideration of size before the water comes into contact with the filter medium. Class 2. Those not possessing such a chamber, which may be termed the common medium chamber type. He came to the conclusion that the filtering material which had to arrest dirt should not be expected to stop grease, since the dirt soon clogged up the material. He proposes that there should be a separating chamber, which should have a practically constant water line, and contain a considerable quantity of water, so that the heavy matter may fall to the bottom of it, and the light oil rise to the top. The author tried one, and after a few days' working there was considerable deposit at the bottom and scum of oil at the top. A plan adopted by someone was to take a barrel and divide it down the middle with a board not quite reaching the bottom, then filling it with sponges, and allowing the hot water to pass through the sponges down through the bottom and up through the sponges on the other side. A great quantity of oil was syringed out of the sponges. The second class of filters are closed to the atmosphere, and provide means for drawing off oils and solids. They are objectional when they are made to work in both directions, since the filtering material is reduced to a pulp. For the filtering material, he says, woollen fabrics are disapproved of on account of shrinkage and imperviousness to water, cotton materials rot easily, and pure flax is the only material that gives satisfaction. The author inclines to the use of Turkish towelling. He finds that two thicknesses give good results when under a pressure of about 12 in. of water. With regard to media arrangements, he classifies them under different headings:—(1) Mass media; (2) horizontally placed media; (3) vertically placed media; (4) angularly placed media. The latter three are exclusively of the cloth type. In the first kind he thinks the inlet ought to be at the top and the outlet at the bottom. With horizontally placed media the media assists itself to frustrate the object of the filter. With vertically placed media the motion of the water to the top unobstructed should allow the oil to rise to the surface easily. With obliquely placed media there is partial obstruction to flotative force. The Admiralty have several filters with media placed at 45 deg. It was the opinion of Mr. Hulme that the above kind of filter was of little purpose. That grease-oil and solid matter were skimmed easily from the surface of the fire water heater, and that solid matters precipitated themselves out as the temperature of the water rose in the heater. The dinner of the institute takes place next month, and there is another at Cardiff for the members of the British Channel centre. Over this latter Sir John Fortescue Flannery will preside, and it may be said that no president of the institute was more attentive or more solicitous of the interests of the institution than was Sir John. Sir James Mackay, of course, occupies the chair at the dinner at the Holborn Restaurant. There appears to be a decided inclination to raise the institute out of the little club feeling, and lay its basis on scientific lines. The institute is very fortunate in securing a gentleman of the educational and scientific calibre of Mr. Boyle. Mr. Boyle is the embodiment of a cause, not of ambition for himself. Mr. Lawrie is another force whose presence is all to the good of the institution, It would be an advantage, however, if the meetings were attended by a greater number of the members of council. Surely some arrangement might be made whereby a certain number of them should be present at each of the meetings when papers are read. And what has come of Alderman Kidd? His presence in the chair was wont to make a lively meeting.

The work in the laboratory is proceeding satisfactorily. Further experiments have been made on the effects of circulation in the evaporation of water; and very curious results indeed have been obtained; results which might have been foreseen, but which are contrary to all accepted views on the matter. Messrs. Sir M. Samuel & Co. have, through Sir John Fortescue Flannery, sent a cask of oil fresh from the Borneo Oil Wells to be experimented with. And there is a Capell fan being sent to the institute to be experimented with. The results of these will be given in due course.

ELECTRICAL NOTES.

(From our own Correspondent.)

ON the Volga there are now working suction dredgers whose motive power is electricity. One named the *Beta*, built for the United States Government, dredged and removed 7,800 cubic yards in an hour. Another dredge, built for the Volga, is in two parts, and can be worked separately. Each half measures 216 ft. by 31½ ft. wide and 9 ft. deep. At light draught the hull draws 4 ft., the working draught being 8 in. greater. When worked as a whole she is 62 ft. wide. The electric installation consists of a 600-kilowatt generator directly connected to a fore-and-aft triple-expansion engine. It supplies two stern motors and two bow motors, each of 125 H.P., actuating 4-ft. screw propellers. The generators also supply power to two 30-H.P. motors, mounted in the distributing pontoon and arranged to control the position of the pontoon line. The lighting of the dredger is done separately. The control of all motors is centralised in the pilot house. Quarters are provided for the crew and Government engineers on each hull. Each pair of compound cutter engines works four cutters. Each main pump engine can develop 1,500 I.H.P. The tender is a stern-wheel steamer with a speed of 10 knots an hour. There is a main centrifugal pump in each half. The runner is of cast steel, and the shaft is a steel forging, and makes from 150 to 180 revolutions per minute, and it is driven by a divided vertical triple-expansion engine, two cylinders being on one side of the pump and two on the other. The dimensions are:—High pressure, 21 in. diameter; intermediate pressure, 34 in.; low pressure, 39 in.; stroke, 24 in.; I H.P. from 1,425 to 1,600.

The engine weighs, complete, 45 tons. The engine driving the electrical generator is of the usual vertical marine type triple-expansion, three cylinders working on three cranks. The dimensions are: High pressure, 14½ in.; intermediate pressure, 22¾ in.; low pressure, 37⅜ in.; stroke, 24 in. The diameter of the main shaft is 7⅜ in.; I.H.P., 800; revolutions, 200 per minute, and weight 25 tons. The cutters are driven by means of a pair of horizontal, tandem compound engines placed side by side, with shafts coupled together to quarter cranks. A 10 in. centrifugal pump provides the circulation in the surface condenser. The boilers are of the Babcock & Wilcox type, of which there are four in each section; the total heating surface of the eight boilers is 17,200 square feet. They are fired with naphtha. There are four burners to each boiler in the dredger and two to each in the tender. At the full power trial the evaporation was about 8 lbs. per square foot of heating surface. The temperature of the funnel gases was about 500 deg. Fahr. In the pilot-house is a stand of levers for operating the friction clutches and brakes of a four-drum hoist below the steam valve of the hoist and the reversing gear. From the same place are operated the steam and trolling gear of the engine driving the cutters, and so everything is under the control of the engineer. There is also within reach a complete system of signal and alarm bells, with cords to three steam whistles, speaking tubes, and a telephone to the end pontoon. At the sides of the room are the switches and controllers for the electric motor. At the rear of the room is a marble panel switchboard, rheostat compensation, and other electrical appliances. For night work there is an electrical projector, or searchlight, above, which is controlled from below. In each hull is a 600-kilowatt, 550-volt, 24-pole generator driven by an 800 I.H.P. marine engine, running at 200 revolutions, and giving a frequency of 40 per second. The current is led to four motors in the dredger and two in the end pontoon. The pontoon motors are 30 H.P. each, have 10 poles, and run at 480 revolutions, with three shafts directly coupled to a four-bladed propeller 20-in diameter. The exciter is a 15-in. kilowatt, marine set, but it also supplies current for a searchlight on the roof, and for about sixty 16-candlepower incandescent lamps which light the dredger. There is an oil barge which carries six tanks of oil, having a total capacity of 130 tons, and it is 80 ft. long with 20 ft. beam, with load draught of four feet.

Electric Power in Engineering Works.—It will be interesting to those with large shops through which power is distributed to considerable distances, to learn that with central plant for electrical distribution, the amount of power for a given output is very considerably reduced, and by electric driving of special tools, the labour item in the cost of manufacture is reduced, and that special electric procesess and electric lighting improve the output by bringing about a better general *morale* of the shop.

Marconi Wireless Telegraphy at the Yacht Race.—The installation for this was fitted in the steamship *Ponce* which followed the racers. The foremast of the ship was lengthened by a spar lashed to it, so that its highest point, to which was attached the upper end of the vertical signal, was 140 ft. above the water. The apparatus consisted of an induction coil about 12 in. long, having an ordinary hammer interruptor, some 30 or more very large cells of dry battery, a key in the primary circuit of the coil, and the receiving mechanism. The vertical circuit consisted of a bare No. 10 copper wire hanging from an insulator on the masthead, and running through a section of ordinary rubber hose where it entered the door of the charthouse. The spark was about ½ in. long. The terminals of the coil, brass balls about an inch in diameter, were respectively connected to the vertical circuit described above and to the hull of the ship. When signals were to be received the sending apparatus was disconnected, and the receiving colures and its Morse receiver connected. More than 2,000 words were sent during the race. In the Commercial Cable Co.'s cable ship, anchored near Sandy Hook lightship, a set of Marconi instruments was installed in charge of Mr. L. Bowden, of London. The messages were sent at the rate of about 15 to 16 words per minute. The longest distance of transmission of course was when the yachts were at the furthest stake boat 15 miles away.

Submarine Telegraphy in the Navy.—Considerable difficulty has been experienced in obtaining suitable instruments on board ship to work submarine cables. Most of them require an expert telegraphist to make the signals. Mr. Sullivan, the inventor of the Sullivan galvanometer, has been giving his attention to the matter, and has simplified it so that it may be used by the ordinary operator with success. There are two ways, says the *Electrician*, for damping down the swing of the needle of the galvanometer. One is the electromagnetic damping due to the closed circuit of the metal coil on which the coil is wound nearing the magnetic field of the permanent magnet, and the other is a camel-hair brush laid against the phosphor-bronze strip on which the coil is suspended. The latter is only used when the galvanometer is being used as a "speaking" instrument, offering as it were a static friction, so that the coil does not start moving until the current has attained a certain value, and produced sufficient turning moment. This results in a sharper and quicker swing, compensating for the decrease in amplitude. The static friction is also increased by adding a second brush, so that there is a camel-hair brush surrounding the suspension on either side of the coil. A third modification is to increase the breadth of the strip, thus making the galvanometer far more robust than its predecessors, and likely to be unaffected by rough treatment that would completely destroy the suspensions of ordinary galvanometers.

The instrument has been tested in one of the Atlantic cables 3,000 miles long, and the signals were quite distinct, By adjusting the camel-hair brush, the signals can be made quite dead-beat. It can also be made to work directly on the cable without a condenser, or even a sending switch. By adjusting the suspension the operator can vary the sharpness to correspond to those given by short distances and long distances of cable.

H. E. Moss & Co.'s Steamship Circular.—Liverpool, October 24th, 1899.—In our last semi-annual Steamship Circular we expressed a belief that this would be a satisfactory year for shipping and all kindred trades, and these anticipations have been fully realised. In fact, the views of the most sanguine have been more than fulfilled, and we feel sure that for some considerable time yet the present prosperity in shipping is likely to continue. Our Board of Trade returns prove most conclusively that trade in general is increasing by leaps and bounds every month, and not only is it so with us, but also with Continental countries and the United States; and, though the amount of tonnage that has been added to the register of late years is large, we must not overlook the fact that, after allowing for losses, &c., it is fully justified by the general increase in population, and the development of trades, especially with the Far East, that were not before thought of. The demand for all classes of steamers is still great, and ready vessels especially are being very quickly disposed of at enhanced prices. Values of new and second-hand tonnage have increased this year at least 10 per cent., and those owners whose forethought and enterprise induced them to buy or contract ahead have realised very handsome profits. We are of opinion that even higher prices will prevail for some time yet, as shipbuilders, with few exceptions, have sufficient work to keep them going for at least twelve months, and in many cases even longer, and if, therefore, orders for cargo steamers are not being placed as freely as before, we do not think it will very much affect builders' prices. Present prices for building ordinary cargo steamers of say 7,000 tons deadweight, with fair power, average about £8 per ton, or 5,000 tons about £8 10s. to £8 15s., and 3,000 tons £9 to £9 10s. As we write this the aspect of affairs in the Transvaal is very serious, and war, unfortunately, has been declared against us by the Boers. Many of our manufacturers who deal with South Africa have suffered serious curtailment of their orders, and in the ordinary way we should expect this to reflect upon the prosperity of shipowners as well; but the loss in ordinary freight carrying has been much more than compensated by the large number of vessels, liners and others, which have been taken up by the Government for the transport of troops, stores, &c., amounting to over half a million tons; thus creating a great demand for tonnage in all directions, not only for purchase, but for charter. War with the Transvaal, disastrous as it must be, can only have one ending, namely, the predominance of Great Britain in South Africa; and with a return of confidence which such predominance will bring, we anticipate an unexampled boom in South Africa, from which we think the shipping trade will benefit materially, and we hope permanently.

NAVAL ENGINEER APPOINTMENTS.

The following appointments have been made at the Admiralty, from September 26th to October 25th, 1899:—

Baker, A., engineer, has been promoted to the rank of chief engineer in her Majesty's fleet.

Banister, C., engineer (in lieu of a chief engineer), to the *Pembroke*, for the *Niger*, to date October 5th.

Barber, J., staff engineer to the *Pembroke*, for the *Apollo*, to date October 12th.

Bardwick, W. W., chief engineer to the *Rodney*, for the *Sheldrake*, to date October 5th.

Beckett, W. H., chief engineer to the *Duke of Wellington*, for Portsmouth Yard, as second assistant to chief engineer, to date October 11th.

Berry, R. (probationary) assistant engineer to the *Melpomene*, to date October 18th.

Blakeman, M., chief engineer to the *Australia*, to date October 12th.

Bone, H., engineer to the *President*, for service at Admiralty, as assistant engineer, acting first class, to date October 11th.

Brown, A. R. (probationary) assistant engineer to the *Illustrious*, to date September 27th.

Brown, T. F., assistant engineer, has been promoted to the rank of engineer in her Majesty's fleet.

Butler, F. A. (probationary) assistant engineer to the *Arethusa*, to date November 14th.

Crowle, J. N., engineer, has been promoted to the rank of chief engineer in her Majesty's fleet.

Elgar, G. H., assistant engineer, to the *Vivid*, supernumerary, to date September 19th.

Frost, J. J., fleet engineer, lent for transport duties at Liverpool, to date October 2nd.

Garwood, H. T., engineer to the *Terror*, for the *Rocket*, in lieu of chief engineer, to date October 19th.

Gibson-Sugars, J. S., chief engineer, lent for transport duties at Liverpool, to date October 2nd.

Gibson-Sugars, J. S., chief engineer to the *Pembroke*, for the *Pioneer*, to date October 12th.

Graham, J. E. D., fleet engineer to the *Duke of Wellington*, for the *Imperieuse*, to date October 2nd.

Grant, A. R., engineer to the *Vivid*, as assistant to chief engineer for charge of drawing office at Devonport Yard, to date October 11th.

Grant, W. C. G. R. J. (probationary) assistant engineer to the *Pembroke*, supernumerary, to date September 29th.

Gregory, C. W., staff engineer to the *President*, for service at the Admiralty on staff of Director of Dockyards, to date October 11th.

Haddock, S. G., chief engineer to the *Pembroke*, for the *Audacious*, to date October 17th.

Hammond, H. T., fleet engineer to the *Victorious*, to date September 23rd.

Hicks, J. A. H., staff engineer, lent for transport duties in Thames district, to date October 2nd.

Highton, F. W., staff engineer to the *Vivid*, for Devonport Yard, as first assistant to chief engineer, to date October 11th.

James, C. J., chief engineer to the *Pembroke*, additional, to date October 12th, and afterwards to the *Arethusa*, on commissioning, to date November 14th.

Knight, G. G., engineer to the *Duke of Wellington*, for the *Spitfire*, in lieu of chief engineer, to date October 19th.

Lister, F. H., chief engineer to the *Pembroke*, for service in that yard as second assistant to chief engineer, to date October 11th.

Maudling, W. J., fleet engineer, lent for transport duties in Thames district, to date October 2nd.

Maxwell, J., engineer to the *President*, for service at the Admiralty as assistant engineer, second class, to date October 11th.

McGregor, W., engineer to the *Terror*, for charge of torpedo boats, engine room stores, and torpedo sub-depot, to date October 19th.

Moysey, J., fleet engineer to the *Duke of Wellington*, for the *Active*, to date October 12th.

Murray, G. W., engineer to the *Duke of Wellington*, for the *Hornet*, undated.

Paris, V. de, engineer to the *Pembroke*, for the *Porcupine*, to date October 17th.

Parrott, J. W. A., engineer, has been promoted to the rank of chief engineer in her Majesty's fleet.

Pearce, T., assistant engineer to the *Arethusa*, to date November 14th.

Rayner, A. E. E. (probationary) assistant engineer to the *Hermes*, to date October 5th.

Read, A. T. P., engineer to the *Tamar*, for charge of engineers reserve stores, and to assist the Inspector of Machinery at Hong Kong, to date October 10th.

Rider, S., engineer to the *Wildfire*, as assistant to chief engineer, for charge of drawing office at Sheerness Yard, to date October 11th.

Thornhill, E. C., engineer to the *Jason*, in lieu of chief engineer, to date October 19th.

Toman, R. W., chief engineer, lent for transport duties at Liverpool, to date October 2nd.

Torrance, W. S., assistant engineer to the *Benbow*, to date October 12th.

Ward, J. T. H., chief engineer to the *Pembroke*, for the *Cossack* to date October 12th.

White, W. H., fleet engineer, has been placed on the retired list, with permission to assume the rank of inspector of machinery.

White, W. W., staff engineer, has been advanced to the rank of fleet engineer in her Majesty's fleet.

INDUSTRIAL AND TRADE NOTES.

THE CLYDE AND SCOTLAND.

(From our own Correspondent.)

THE continued high prices of material, conjoined no doubt to the unsettling effect of the Transvaal war and its unknown possibilities, have been influences at work deterring shipowners from entering into any new contracts, with the consequence that hardly any order worth mentioning has found its way into the books of Clyde shipbuilders during the month of October, or as much of it as has passed at the time of writing—25th ult. Doubtless builders themselves, in the circumstances, have not seen fit to be very tempting in their responses to the inquiries as to fresh tonnage which have been made, and many of them are still too much taxed in getting on with the work they have on hand. The wilful loss of working time by workmen and the irregular delivery of material by the steelmakers have continued to be fruitful sources of annoyance, especially to the firms doing smaller classes of work. By many of these firms the system of weekly pays is felt to be anything but an advantage, however it may suit their employees generally. The working hours of the unsteady class of artisans are found to have become much less under the weekly pays. With money in pocket every Saturday too many members of the black squad have seen fit to make every Saturday a "wet" one, and Monday, in consequence, has been more or less an off-day. In one yard it is said that, in a week of 54 working hours, the average amongst the men is 35 hours per man, against 46 hours in the days of fortnightly payments. The smaller yards and shops, however, suffer most, and a change in the system is likely to be made at the end of the period of experiment.

In connection with the agitation for a further increase in wages amongst the steelworkers of the West of Scotland, it was intimated at a meeting of the Glasgow Trades Council on the 18th of October, by Mr. John Cronin, that the blast-furnacemen, about 4,000 in number, who had been organised within the last twelve months, had had a meeting through their delegates at which representatives of the manufacturers had attended. The conference was of a conciliatory character, and the employers had promised an answer within eight days. It was agreed to form a Conciliation Board for the regulation of disputes. The workers, it was stated, had received 35 per cent. of an advance since January. The men employed in steel manufacture had applied for 5 per cent. advance. They had received 25 per cent. advance since January, but they thought they were entitled to this 5 per cent., and believed that in view of the state of trade they would get it.

The outstanding direction in which shipbuilding activity has been evinced for the greater part of the month is in connection with the outfit of merchant ships chartered by the Government as transports for troops and munitions of war for South Africa. The Allan liner *Mongolian*, the City liner *City of Cambridge*, and the Castle liner *Kildonan Castle* have all been transformed from ordinary mail and passenger steamers into transport ships for troops within the month.

Fairfield Yard has created several records in connection with smart shipbuilding, but perhaps one of these, of which in the future the officials and workmen of that great establishment will be as proud as any, is the conversion within eighteen working days of the magnificent Castle liner above named from a mail steamer into a transport vessel capable of carrying 2,700 men, besides officers and full equipment—the largest troopship that has been requisitioned during the present crisis. When chartered by the Admiralty the *Kildonan Castle* was within a month of being completely finished, but all the fittings, including the first and second class passengers' accommodation, were speedily removed and the less elegant, but still elaborate and substantial, fittings for troop accommodation substituted. The accommodation provided was for 110 officers of the first-class berthed amidships, and 80 of the second class, berthed aft. On the main and lower decks accommodation was provided for 2,500 men, a place for each individual soldier, hammock hooks overhead, fittings for equipment of all kinds, provision rooms, canteens, hospitals, and dispensary, prisons and guardroom. Cooking accommodation was provided for 3,000 men, also baths, and a service of water throughout. The whole work of transforming her into a troopship kept 3,000 men employed night and day for eighteen days.

The Fairfield establishment progresses steadily with its naval work. The first-class cruiser *Cressy*, of 9,800 tons displacement, is approaching the launching stage, and she will be put into the water in the course of a month or so. A larger proportion of work than usual is being completed before she is sent off the stocks. Her sister ship *Aboukir* is plated and about to receive her outside sheathing. The name of the mighty 14,000-ton cruiser, for which the order was only given some months ago, and operations on which were practically only begun six weeks since, has already over 1,000 tons of material worked into her. Her name, by the way, which was at first intended to be the *Africa*, has recently been changed by the Admiralty to *Good Hope*.

A noteworthy feature in the hull structure of the *Cressy*, which is soon to be launched, is the Harveyised armour plating manufactured by Messrs. William Beardmore & Co., of Parkhead Forge and Steel Works. This enterprising firm have for a few years past supplied 6-in. armour plates of their special Harveyised manufacture for casemate and other purposes on board warships built on the Clyde and in the Government dockyards, besides supplying foreign Governments; but the *Cressy* is the first vessel in which the Parkhead plating has been worked so extensively into the regular armour-plating scheme of the hull of a naval ship for our own country. Hitherto, of course, Clyde builders of naval ships have had to resort to the great armour-making firms of Sheffield for most of their requirements in the way of heavy armour plating. The exception in the case of the *Cressy* is therefore regarded with something like pride by the Clydeside artisan, and it is hoped that the trade legend "All our own make" may apply to a growing number of Clydeside productions.

The new transport, for which the Fairfield Co. received an order last month from the Indian Government, is to be named *Hardinge*. In length she is to be 407 ft., with a beam of 50 ft. 10 in., and a depth of 38 ft. In sea-going trim she will draw about 19 ft. of water, and displace 6,520 tons. The builders have guaranteed a speed, on a six-hours' deep-sea trial, of 18 knots, although the real object sought to be attained is to ensure there being ample power for 17 knots to be easily and continuously realised with ordinary coal and inexperienced native stokers. The total I.H.P. is to reach 8,000, the engines being of the triple-expansion type, to be run at 110 revolutions per minute.

The Clydebank Engineering and Shipbuilding Co.—the staff of which has not undergone any alteration of note since its being acquired by John Brown & Co., Limited, of Sheffield—is to-day credited with having received an order from the Admiralty for the engines and boilers and auxiliary machinery for one of the first-class cruisers being built in the Government dockyards. The engines will be of about 22,000 I.H.P.

Messrs. Robert Napier & Sons, who have still on the stocks for the Royal Mail Steam Packet Co. a cargo-carrying vessel of 2,860 tons gross register, and about 1,400 I.H.P. took out on her speed trials, about mid-month, the splendid mail and passenger steamer *Tagus*, the first of two similar vessels they have on hand, also for the Royal Mail Co. The second of the pair, the *Trent*, is now opposite the builders' yard undergoing her outfit. These vessels, which are 410 ft. long by 50 ft. beam, by 35 ft. moulded depth, and about 5,100 tons gross, have been specially designed and equipped to suit the requirements of the company's West India mail service. As speed is an important element, they have been constructed on fine lines, with heavy triple-expansion engines of 6,800 I.H.P., and they are of course fitted with all the latest improvements for the comfort of passengers. The most modern appliances have been introduced for the efficient working of the vessels and the rapid and noiseless handling of cargo, including Brown's hydraulic cranes, refrigerating machinery, and chambers for frozen meat, &c., and a very complete installation of electric lighting, the plant including three dynamos. Including the three vessels above referred to, the fleet of the Royal Mail Steam Packet Co. now consists, all told, of 32 steamers of a total gross register tonnage of 97,800 tons and 107,850 I.H.P.

Messrs. Alex. Stephen & Sons, of Linthouse, will launch some time this month the screw steamer *Sicillian*, of 10,000 tons, for the Allan Line. This vessel is a sister ship to the *Bavarian*, recently handed over to the Allan Line by Messrs. Denny & Brothers, Dumbarton, and since chartered by the Government as a troopship. Two other vessels on hand at Linthouse are those intended for the new Jamaica Shipping and Transport Co., formed to conduct a direct fruit and passenger service between Jamaica and the United Kingdom. Four vessels altogether are now taking shape for this service. Besides Messrs. Stephen & Sons' two, one is on hand in the yard of Messrs. Ramage & Ferguson, at Leith, and one in the Caledon Shipbuilding Yard, at Dundee. Under the contract with the Government, which is for a period of five years, the steamers will run fortnightly at an average speed of 15 knots between Kingston and Port Antonia and Southampton. They will be arranged specially for fruit carrying, and will have storage for at least 20,000 packages of bananas, besides accommodation for 25 first-class and 12 second-class passengers. The company have undertaken to have the service working by the 1st of May next.

Messrs. William Denny & Brothers, Dumbarton, who for many years past seem never to have been without one or more high-speed mail and passenger steamers on hand—paddle or twin-screw—are shortly to launch the *Anglia*, a swift twin-screw vessel for the London and North-Western Railway Co. and are laying down at present a new crack paddle steamer for the "Belle" Line, to be named the *Southwold Belle*. Early in the month they launched the twin-screw *Hibernia*, a sister ship to the *Anglia* above mentioned. Both vessels are virtually sister ships to the *Cambria*, built by the firm for the London and North Western Co. in 1897. The length is 340 ft., beam 39 ft., and depth to the awning deck 24 ft. They will no doubt be as speedy as the *Cambria*, which on trial attained a maximum speed of 22 knots on the measured mile, and 21·35 on the 100-knot course. The *Hibernia* is the fifth vessel built by Messrs. Denny for the company, they having in fact been entrusted with the contract of practically renewing the company's fleet of mail steamers—the *Rosstrevor*, *Connemara*, and *Galtee More* being employed on the Holyhead and Greenore service, whilst the *Cambria*, *Hibernia*, and *Anglia* are, or will be, employed upon the Holyhead and Dublin passage. All the vessels have been built under the supervision of Captain Binnie, the able marine superintendent to the company.

Messrs. William Hamilton & Co., Port-Glasgow, are reported to have received an order to build a large four-masted steel sailing ship for Liverpool owners. The only other orders on hand for sailing craft on the Clyde are one for a three-master in the yard of the Ailsa Shipbuilding Co., of Troon, for Glasgow owners, and one for a three-masted fore-and-aft schooner in the yard of Messrs. Robert Duncan & Co., Port-Glasgow, for Mr. John Ena, of Honolulu. In this connection it may be of interest here to add that of the ninety odd vessels at present building on the Tyne not one is to be propelled by sails.

A not inconsiderable quantity of shipping turned out from the Clyde shipyards is ushered—not in the form of complete ships into its "native element"—but through the yard gates in pieces, much in the same way as the pieces of unworked material had entered through the same gates some time before. For this reason the records of "ship launches" from day to day, and the returns of tonnage output given each month, are apt to be short by the amount of such work completed, although account is no doubt duly taken of it in making up the total output at the end of the year. All such shipping, mostly for light-draught service in inland lakes or rivers abroad, is of course transported in pieces to its destination, and there reconstructed and launched.

A notable cargo of this character was shipped at Glasgow during the month per s.s. *Hollinside* to Chinde at the mouth of the Zambesi. This consisted of as many as three different steamers—or rather their component parts—destined for service on inland African waters. Two of the vessels, named the *Empress* and the *Duchess* respectively, are intended for the African Lakes Corporation, Limited, on the Zambesi and Shirè rivers between Chinde and Katunga, to run in conjunction with their sister ship *Princess* and six other steamers owned by the corporation, plying on both rivers and lake. The *Empress* and *Duchess*, like most of the previous vessels, were built by Messrs. Ritchie, Graham & Milne, Whiteinch, and after having been engined by Messrs. Campbell & Calderwood, of Paisley, and tried for speed on the Clyde, were dismantled, taken to pieces, and their shipment begun. The third steamer shipped per *Hollinside* was to all intents and purposes a floating college for the missionaries of the Universities Mission, and will ply upon Lake Nyasa as a missionary ship and training college for the black inhabitants along the shores of that lake. This vessel has been built and engined by Messrs. Alley & Maclellan, Polmadie, Glasgow, and is 126 ft. long by 20 ft. in breadth, and 6 ft. 6 in. load draught. She is fitted with a locomotive boiler adapted for burning wood and supplying steam at 150 lbs. pressure to compound jet condensing engines of 220 I.H.P. The two steamers just referred to are of 105 ft. and 95 ft. length respectively. They were all, of course, shipped in pieces, and when their destination is reached they will be re-erected, by native labour mostly, and at once put into their respective spheres of service.

It is of decided interest, in connection with the foregoing, to mention that mail advices just to hand from Nyasaland note the fact that the *Queen Victoria*, plying on Lake Nyasa, had just made the record passage from the south end to Karongas at the north end of the lake, a distance of 330 miles in 33 hours, exclusive of 3 hours' stoppage on the way to take on board wood fuel. This is the fastest passage ever made on Lake Nyasa, and is in striking contrast to the time taken to accomplish the same voyage even two or three years ago, not to speak of the many weary days it took in Livingstone's time.

The Ailsa Shipbuilding Co., of Troon, have now got the new graving dock in good going trim, and both in the matter of overhaul and repair work, as well as in regard to the production of new vessels in their enlarged building berths, the firm are very actively employed. At the present time they are having their premises, and the yard generally, equipped with the electric light

The Irvine Shipbuilding and Engineering Co., Limited, have booked an order for a steamer of 850 tons for Messrs. J. & P. Hutchison, Glasgow, intended for their Continental trade.

From the shipyard at Ardrossan, which was acquired sometime ago by the Ardrossan Dry Dock and Shipbuilding Co., Limited, there was launched during the month a steel quarter-deck cargo steamer, the first launch since the yard was acquired. The vessel, which was named the *Humber*, is owned by Mr. Hutchison, of Hull, and is to be employed in the Continental trade.

The Campbeltown Shipbuilding Co., who have as a rule two, and sometimes three, steamers under way, "on spec.," have recently sold one of the vessels at present on their stocks to an Australian firm, who will employ her in trade between Australia and the adjacent islands.

The Grangemouth Dockyard Co.—who have been making rather a speciality of steamers for the carriage of oil in bulk for some time—launched, on the 20th ult., the *Kokine*, being the second of two oil steamers built to the order of Messrs. Jacobs & Barringer, London, and the fifth steamer of this class turned out within the last few years. The vessel, which is for Eastern clients of the firm above named, is 355 ft. long by 32½ ft. beam, and 24 ft. moulded depth, has been built to the highest class at Lloyd's, and is provided with all the most modern appliances for a vessel of this type. She is subdivided into 18 compartments, of which 14 are oiltight, for the carriage of oil cargo in bulk.

Messrs. Menzies & Co., Limited, Leith, who some time ago took over the shipyard at Inverkeithing, formerly carried on by Messrs. Cumming & Ellis, are completing the vessels that firm had on the stocks, and are in treaty for several other important orders. They have engaged Mr. Ellis to manage the practical work of the shipyard, under supervision from their headquarters at Leith. The engineering and ship-repairing branches of the firm at Leith are being very briskly carried on, and, although greatly taxed, are executing overhauls and repairs of all kinds with dispatch and thoroughness. The situation of the firm's premises in the very heart of the dock system enables a ready and close personal supervision to be made of all the work under way.

The shipbuilding industry in Dundee is scarcely in such a satisfactory state as it might be, few, if any, orders of any consequence having been received of late. There has, as my notes have shown, been a fair amount of work on hand since the beginning of the year, but contracts have been gradually worked off without there being in every case anything fresh to begin. The Caledon Shipbuilding Co. have arranged with the Works Committee of the Dundee Harbour Trust to extend their shipyard riverwards a piece, and the driving of piles and necessary filling in is to be done by the Trust, the company being charged a percentage on the cost in addition to the rent of the ground.

A deputation appointed by the Clyde Navigation Trustees to visit the more important docks in England and Wales where mineral traffic is extensively carried on left Glasgow on the 12th ult. on their mission. The main object in view was to personally inspect, and obtain information regarding, the most efficient methods and latest improvements which have been introduced in connection with the handling of mineral traffic in the ports to be visited; all with special reference to the laying out of the new dock the Trust has been empowered to construct at Clydebank. The deputation consisted of: Sir David Richmond, Lord Provost of Glasgow; Dr. John Ure, Messrs. Gray, Chisholm, Mason, Clark, Robertson, Raeburn, and Mr. T. R. Mackenzie, secretary to the Trust. The deputation first went to Hull, where they spent all Friday inspecting the docks there. On Saturday the deputation proceeded to Gloucester, where they spent Sunday, and thence they went to Cardiff, Swansea and Barry, and afterwards returned northwards to Liverpool, arriving back in Glasgow on Wednesday, the 18th ult. The deputation were especially impressed with the immense increase in dock accommodation at the South Wales ports—viz., Newport, Barry, Port Talbot, Cardiff, and Swansea—and with the modern and highly capable character of the lifting and transporting appliances for dealing with minerals. This particularly applies to Barry, which of all the ports is the largest and most modern in regard to equipments for the shipment of coal. Another feature with which the deputation were much struck, especially seeing that it has a close bearing on the situation as far as the present Glasgow docks are concerned, was the enormous expanses of vacant ground and railway by-accommodation surrounding the docks—notably those at Barry, Port Talbot, and Cardiff.

During the end of the month the opening meetings of most of the engineering and scientific societies of Glasgow were held, and the proceedings of the session fairly entered upon. The opening meeting of the forty-third session of the Institution of Engineers and Shipbuilders in Scotland was held on the 24th ult., and was addressed by Mr. Robert Caird, F.R.S.E., of the well-known Greenock shipbuilding firm, who is the president of the institution for the next three years. Mr. Caird dealt in his address mainly with technical education in the branches of industry the institution represented, and the means presently existing, and those desirable, for its successful carrying out. He put in strong pleas for the frequently advocated engineering laboratory and experimental tank in connection with Glasgow University. Mr. Caird's address was followed by a paper "On Lighthouse Engineering at Home and Abroad," by Mr. J. A. Purves, D.Sc., F.R.S.E., and the presentation of premiums of books to various readers of papers during last session. Amongst other papers to be read during the session now entered upon, having reference more or less to shipbuilding and marine engineering subjects, the following may be named: "Bilge Keels and the Rolling of Ships," by Mr. W. J. Luke, naval architect at the Clydebank Works; "The Design and Construction of Yachts, as affected by Racing Rules," by Mr. J. R. Barnett, chief draughtsman with Messrs. G. L. Watson & Co., Glasgow; "Superheating," by Professor Watkinson, of the Technical College, Glasgow; "A new form of Piston Valve," by Mr. William O'Brien, formerly of the Fairfield Co.

The 1899-1900 session of the Glasgow Technical College Scientific Society was opened on the evening of the 21st ult., when Mr. David Home Morton, the president, gave an interesting and most comprehensive historical outline of the progress of "British Industries" during the 18th and 19th centuries. Amongst other papers to be read during the session are: "On Steam Engine Indicators," by Alexander B. Dobbie, B.Sc.; "On Repairs to Hulls and Machinery on Modern Steamships," by Mr. John White Boyd, M.I.N.A.; and "The Introduction and Development of Machine Riveting in Shipbuilding," by Mr. David Pollock, M.I.N.A. and a member of the Institution of Engineers and Shipbuilders.

The opening meeting of the present session of the West of Scotland Iron and Steel Institute took place on the 20th ult., when Mr. Joseph Beard, managing director of the Gartcosh Ironworks, delivered his presidential address, which took the form of a "Review of Sixty Years in the Ironworks," and proved most interesting and informative.

The next James Watt anniversary lecture, which rightly holds an important position in each year's course of lectures delivered under the auspices of the Greenock Philosophical Society, is to be delivered on the 19th January (the anniversary of the inventor's birth) by Professor Oliver J. Lodge, D.Sc., LL.D., F.R.S., of University College, Liverpool, his subject being "Various methods of Space-Telegraphy."

THE TYNE.

(*From our own Correspondent.*)

Shipbuilding.—The diversion of a number of large steamers from their regular trading services to the carrying of troops and general campaigning accessories for the Government cannot but have a stimulating effect in the placing of orders for new tonnage, and the favourable influence is already shown by an appreciable increase of enquiries. But for the fact that prices are somewhat of the prohibitive order, a good deal of business would now be going on in the estimating or contracting departments of most shipbuilding firms; but on account of the reason named, together with the circumstance that they are already well booked forward, the opposite condition of affairs appears at the moment to most largely prevail. As far as regards prices, it is pretty safe to say that they are not likely to lose any of their firmness just yet; and in some well informed quarters the opinion is held that no downward movement need be looked for until, at least, the first half of the year 1900 has run its course. We anticipate that the closing weeks of the present year will witness something like a "rush" on the part of shipowners to place orders where they can, and it is much to be feared that they will not have the opportunity of doing so, except at enhanced rates. There have now been two or three years of exceptional briskness in shipbuilding, and according to former precedents, the retrograde movement should now be within sight; but several circumstances have combined to put off the inevitable reaction, and it is quite on the cards that the present brisk period will turn out to be the longest on record.

We are this month in a position to speak definitely of the future of the Palmer Co.'s Howdon Yard, for the property has passed out of the company's hands, and will now be divided between two firms whose premises are adjoining. Messrs. Cookson & Co., lead manufacturers, have one portion (about half), and have already commenced to erect buildings suitable for the purposes of their business; whilst the Tyne Iron Shipbuilding Co. are understood to be in negotiation for the other portion. It is somewhat unfortunate that a public road runs between the Tyne Shipbuilding Co.'s yard and the premises to which we have been referring; and it is possible that the existence of this roadway may prevent or postpone this much needed extension of a prosperous concern. Municipal authorities are, however, now generally very willing to further the efforts of local firms in the direction of development, knowing that this is the surest way to encourage local trade; and we have no doubt that in the case under notice a way will be found for the removal of the difficulty, even if it involve the diversion of the public road.

We notice that, in addition to the three large passenger and cargo steamers that are on the stocks at Messrs. Armstrong, Whitworth & Co.'s Low Walker Yard, some half-dozen small vessels have just been laid down, and there is also a vessel of medium size in the framing stage. At the company's Elswick Yard there is a large amount of work on hand, and arrangements for the laying down of others (as soon as berths become vacant) are in progress. The calling up of the Army Reserve for service in South Africa has, it is understood, to some extent interfered with the operations of this company in the shipbuilding as well as in other departments. The hindrance, however, is only temporary, as the places of the men withdrawn from employment are being rapidly filled up.

Messrs. Wigham Richardson & Co. have just laid the keel for a large twin-screw steamer, and have three others in course of plating or framing, besides a couple in the water fitting out. It is understood that some time ago this company offered facilities to their workmen to become shareholders, the "unit" of the shares being 20s. These facilities have not been taken advantage of to the extent desired, and, speaking of this on a recent occasion, the chairman of the company attributed the disinclination to make application for shares to a supposed feeling of antagonism on the part of the leaders of trade unions. Assuming this opinion to be correct, it is another blot upon the escutcheon of trade unionism; for nothing surely can be more detrimental to the working classes than to prevent them becoming part owners of the works and participators in the business in which they are engaged.

Messrs. C. S. Swan & Hunter are preparing the covered berth, from which the big Cunard liner was launched a few weeks ago, for the laying down of another vessel of an important class. There are some half-dozen vessels in various stages of progress on the stocks, and the briskness of all departments is very fully maintained. We notice that a pontoon floating dock is moored in proximity to the yard, and we understand that it has been brought there to be repaired and altered.

The Palmer's Co., having definitely resolved to concentrate their shipbuilding operations at their Jarrow Yard, are further improving the equipment of that establishment by displacing some of the older machines and substituting others of an improved type and greater power. They are, in fact, doing everything that is possible to modernise all the departments of the yard, with a view to the attainment of the highest productive efficiency. They have not, like most other firms, been under the necessity of greatly altering the arrangement of their building berths to suit modern requirements, as their berths were already large enough for the building of almost any size of vessel, the original projectors of the enterprise having been sufficiently wise to allocate abundant space for constructional purposes. They have had, of course, to pile the berths set apart for the building of warships, but this was done pretty effectually some years ago, and warships of the very largest dimensions can now be put down without risk. Of the merchant ships in hand at the present moment, two are well advanced, and three in early stages, whilst all are of very considerable carrying capacity. A rumour has been current to the effect that the company had it in contemplation to enlarge the graving dock, which is already one of the largest in the district, being no less than 440 ft. long. We are not in a position to contradict or confirm this report, though we think it not outside the pale of possibility that the company may be disposed to go in for an enlargement of the dock if there is room.

Messrs. Hawthorn, Leslie & Co. have a large meat ship almost ready for launching, whilst two others are in the plating and framing stages. They are laying the keel for a torpedo-boat destroyer, and have one in the water receiving her final equipment of machinery. There is a good-sized vessel undergoing repairs in the graving dock. Messrs. Robert Stephenson & Co. are proceeding actively with the finishing of the Spanish pontoon dock referred to in a former number, and they have just launched the last vessel on the stocks, this being a boat of medium size for the United Steam Shipping Co., Copenhagen. It is understood that the making of a new graving dock, to be over 600 ft. long, and to be equipped in a very elaborate manner, will be commenced shortly, and that other improvements of a comprehensive and most important character will also be entered on. The owners of the Northumberland Yard are said to have received an order for a tolerably large vessel from Newcastle owners, and they have at present on the stocks three vessels of about 4,000 tons each. They have also a large boat in the water fitting out. Other firms that have not been specially mentioned still maintain a good show of work.

Engineering.—There is scarcely any perceptible falling-off of briskness at the larger engine works, though one or two of the smaller establishments are, perhaps, not quite as busy as at the beginning of the year. In Messrs. Stephenson's locomotive departments there is a distinct lessening of activity, but this apparently is not caused by any lack of orders, and need not be looked upon as an indication of declining trade. The fact that a big programme of alterations is about to be entered on has doubtless prevented the initiation of new contracts in the constructive departments, and we look forward to seeing this company, in the course of a year or so, far outdoing in both locomotive and marine work all their previous undertakings.

Messrs. Emerson, Walker & Thompson Brothers, Limited, continue to have an abundance of work for their various departments, and in many of the shops night and day shift is maintained. There is an increasing demand for the company's special anchors, and their patent windlasses and other deck accessories are also in great request.

The chain and anchor departments of Messrs. John Abbot & Co. are exceedingly busy, and in the ironfoundry—which has recently been enlarged—orders are plentiful. At the foundry of Messrs. Chapman & Carverhill, Elswick, there are just now in hand some exceptionally important contracts in marine work, and during the remaining months of the year several castings of unusually large dimensions will be turned out. Amongst the very recent products of the establishment is a low-pressure cylinder weighing over 13 tons, ordered by a Sunderland engineering firm. Though the two establishments mentioned are undoubtedly very fully employed, business in the ironfounding trade does not seem to be uniformly good, and we hear of more than one foundry which was busy in the summer months, as being now in the opposite condition.

Mr. W. F. Snowdon, 36, Side, is experiencing a large demand for his patent removable asbestos mattresses, which are found to constitute a most convenient and effective covering for marine boilers. Amongst the contracts now in hand is the covering of the boilers of the New Zealand Steam Shipping Co.'s fine steamer *Karamea*, which has been built and engined by Messrs. Hawthorn, Leslie & Co.

In electrical engineering business continues to be very brisk, Messrs. Holmes & Co. having a large number of ship installations in hand.

THE WEAR.

(From our own Correspondent.)

Shipbuilding.—The large steamer *Waroel*, which was built for the colonial meat trade by the Sunderland Shipbuilding Co., has been chartered by the Government to convey horses and troops to South Africa, and her interior arrangements have been altered to fit her for the new service. A large force of men was engaged on the work, and at the date of writing it was expected that everything would be completed in time for the despatch of the vessel to Southampton. Besides the "urgency" contract, the Sunderland Shipbuilding Co. have a good deal of work in hand, as is also the case with the neighbouring firm, Messrs. Bartram & Sons.

Messrs. J. L. Thompson & Sons, who have lately extended their frame-making department, have just put down two Crossley gas-engines of 180 I.H.P. each, which are to be utilised for the driving of dynamos. The firm have ordered from the Sunderland Forge and Engineering Co., Limited, a dynamo of large power, and other plant for the further application of electrical power in the frame-making and other departments. The firm have, as usual, their five berths occupied, and in the preparatory departments activity still continues to be noticeable.

Through the courtesy of Messrs. Doxford & Sons, we are enabled to give a full list of the firms—British and foreign—who have up to the present time adopted the principle of "joggle" plating, and provided themselves with the necessary "roller presses" for carrying out the process. The British firms are:—The Fairfield Shipbuilding and Engineering Co., Limited, Glasgow; W. Denny Bros., Dumbarton; Hawthorn, Leslie & Co., Limited, Newcastle; Sir James Laing & Sons, Limited, Sunderland; Earle's Shipbuilding and Engineering Co., Limited, Hull; R. Craggs & Sons, Middlesbrough; H. S. Edwards & Sons, South Shields; W. Doxford & Sons, Limited, Sunderland (three machines); Sir W. G. Armstrong, Whitworth & Co., Limited, Newcastle; Yarrow & Co., Limited, London; A. Stephens & Sons, Glasgow; J. L. Thompson & Sons, Limited, Sunderland; W. Pickersgill & Sons, Sunderland. The foreign firms who have adopted the system and bought machines are:—The Flensburg Shipbuilding Co., Flensburg; Société Anonyme des Forges et Chantiers de la Méditerranée La Seyne (two machines); Koninkligke Maatschappij De Schelde, Kissingen; Chantiers et Ateliers de Penhoet, St. Nazaire; Howaldtswerke, Kiel; Baltic Shipbuilding Co., Limited, St. Petersburg; Schiff-und Maschinenbau Actiengesellschaft "Germania," Kiel; Chantiers et Ateliers de Provence, Marseilles. It will thus be seen that 21 firms have adopted the system, eight of which are outside the United Kingdom. Of the 13 British firms that have availed themselves of the advantages afforded by this system, it will be observed that nearly all of them belong to the very first rank, as witness the Fairfield Co.; Armstrong, Whitworth & Co.; Sir James Laing; J. L. Thompson & Sons; Yarrow & Co., &c. The adoption of the system by such firms as these is a high tribute to its value, and a further testimony in the same direction is to be found in the circumstance that the great ice-breaker *Ermack*, whose power of crushing through the ice fields and releasing imprisoned vessels has excited so much wonder, is plated on this principle. Structural strength was one of the first essentials for a vessel of this kind, and it was evidently believed that "joggle" plating would contribute to the attainment of the greatest possible strength, with the designs and materials to be dealt with.

Messrs. Short Brothers have just launched a vessel 372 ft. long, ordered by a London company, and will shortly place the keel for another large vessel in the vacated berth. There are three vessels in various stages on the stocks, and at the repairing yard there are two or three vessels being repaired or fitted out. In the other yards a high rate of briskness is still to be noted, and in some instances repair work helps materially in the employment of labour.

Engineering.—We understand that at the Palmer's Hill Works (Messrs. Dickinson & Sons) there is now in an early stage of construction a set of engines larger than has hitherto been built at the works, or perhaps in the district. The boilers will, of course, also be exceptionally large, and improved hoisting, or lifting, apparatus is being put down. There are symptoms of incipient slackness at one or two of the other marine works; but the improvement that has recently been noticeable in the shipping trade may possibly tend to counteract any tendency towards retrogression.

Messrs. John H. Vaux & Co. will soon be in a position to commence productive operations at their newly erected marine engine works, near Sunderland Bridge. The machinery equipment is nearly complete, and we understand the firm has secured some orders to commence with.

At the Sunderland Forge and Engineering Co.'s Works business continues exceedingly brisk in both the electrical and the forging departments. Several heavy stern frames for ships being locally built are in progress, and the orders for single-plate-built rudders are very numerous. The forges at Pallion, and also the Anchor Works, are kept in steady operation. The Monkwearmouth Ironworks and also the Monk Street Foundry continue to be well employed.

The Hartlepools.—Shipbuilding is still brisk at this centre, there being a considerable amount of repair work in hand to supplement the new work. The engineering establishments are also showing well sustained activity, and Messrs. Richardson are experiencing a good demand for their new speciality, "lockfast iron." This material is specially recommended for propeller shafts, and it is understood to possess qualities which render it eminently suitable for the purpose. The Hartlepool Steelworks are kept very briskly going, and other local industries are fairly prosperous. At the docks, however, a slight diminution of activity is noticeable, the close of the timber importing season being near at hand.

Stockton.—Messrs. Craig, Taylor & Co. are now pretty well through with their extensions, a detailed account of which we hope to be able to place at an early date before our readers. The firm have just launched a handsomely designed vessel, ordered by Hamburg owners, and have three other vessels in different stages of construction on the stocks. Engineering establishments are very busy, and in the local boiler works there is quite a plethora of orders. Steel and iron works are going full time, and the one firm that is engaged in the manufacture of steering gears and other steamship auxiliary machinery is as busy as could be wished.

Middlesbro'.—Shipbuilding firms are still well off for orders, and at the principal yard all the berths—except one vacated on the 21st ult.—are occupied. Engineering works continue busy, Messrs. Furness, Westgarth & Co. having some exceptionally important contracts in hand. Boiler and bridge works are also actively kept going, and in the ironfoundries full activity is maintained.

Darlington.—It is understood that Messrs. Robert Stephenson & Co., of Newcastle, are negotiating with a Darlington firm for the purchase of a site on which to build new engine works at that centre. Should the negotiations be successful, it is probable that the works, when erected, will be devoted to the manufacture of oil and locomotive engines exclusively.

THE MERSEY.

(From our own Correspondent.)

WHATEVER indications there were some time back of a possible slackening down of activity in the engineering trades of this district, and which tended to encourage a good deal of very low selling on the part of speculative merchants in the open market for forward delivery, would now seem to have disappeared Notwithstanding the considerable advances in the Bank Rate and the war complications in South Africa, which, had there been any real foundation for such an unfavourable outlook, would undoubtedly have produced a very perceptible depressing effect, the tendency of the market, and also as regards new trade coming forward, has, during the latter portion of the past month, been decidedly in the direction of increasing activity and a steady hardening in prices. In one or two branches of the engineering trade where there were undoubted indications that new work was not coming forward in sufficient quantity to replace that running out, it is reported that orders have been given out much more freely, and generally throughout all sections of the trade the prospects are that the exceptional briskness that has prevailed during the past twelve months is more than likely to be fully maintained for a considerable time forward, and, in all probability, right through the ensuing year.

Machine-tool makers continue exceedingly busy, with new orders generally coming forward satisfactorily. In the locomotive building trade important orders are being placed, both by home and colonial railways; boiler makers in this district have booked a number of large contracts during the past month; stationary engine builders are securing an increased weight of new work, whilst electrical and hydraulic engineers continue exceedingly pressed with orders

The employment returns issued during the past month by the leading trade unions bear continued evidence of the active condition of the engineering industries. The Amalgamated Society of Engineers reports a further reduction in the number of out-of-work members on the books, who now represent about two and two-fifths per cent. of the total membership. In the Manchester district the proportion is about 2½ per cent., and there is a continued call for pattern-makers and tool fitters. The local officials also report that things are running smoothly all round, and are likely to do so for sometime. In the Steam Engine Makers' Society there are about one per cent. of the total roll on donation, whilst locally, practically a clear book is reported. In this society, it may be added, most of the unemployed members are connected with branches in the marine centres of the North-East Coast. The Machine Workers' Association has now only 1⅘ per cent. of its membership receiving benefit; and in the Manchester district the position is even more satisfactory, only one-third per cent. of the local membership being on out-of-work donation. Reports as to the state of trade continue generally of a favourable character. With regard to wages matters, it may be mentioned that the termination of the wages dispute in the Mid-Lancashire engineering trade has been followed by a settlement of the dispute with the smiths and strikers, on the basis of an immediate advance of 6d., and a further similar advance to be granted later on.

Messrs. Crossby Brothers, of Openshaw, Manchester, have just delivered to an English firm the largest double cylinder gas engine they have yet supplied, viz., one of 550 I.H.P. It is combined by means of coupling on the crank shaft with a dynamo, and will be worked by producer gas. In oil engines the firm have also several new designs. One of these is a portable 10 N.H.P. engine, capable of giving 16 I.H.P. It can be started in about five minutes, and left running for many hours at a time, and can be easily attended to by any ordinary labourer, after a little explanation. The oil consumption is about half pint per actual H.P. per hour. Another pattern is a new nominal eight-man-power engine running at 300 revolutions, giving 1½ B.H.P., or if arranged for electric lighting, and fitted with two heavy fly-wheels it runs at 350 revolutions, and gives two B.H.P. This engine only takes about half a pint of oil per H.P. per hour, and can be easily set going in a few minutes' time.

Several improved designs in ventilating apparatus are being introduced by Messrs. Matthews and Yates, Limited, of Swinton, near Manchester. Amongst these is the "Cyclone" electric fan, which is a modification of their patent "Cyclone" air-propeller, combined with an electric motor giving off a very high efficiency. This fan, which is very easily fixed, is fitted with self-oiling bearings, and has an efficient arrangement of armature and commutator which will run for many weeks without requiring the slightest attention. One special advantage of the design is that the parts additional to the fan, and which revolve, are close upon the axis, and not, as in the case of some fans, upon the periphery, so that the least obstacle is offered to the passage of the air. The "Cyclone" air propeller is also adapted to a double-acting steam engine. In this form it is very simple in construction and can be easily fixed, the engine being so combined with the fan that it dispenses with foundations. This design is applicable to places where shafting is inconvenient, but steam available, no belts or other method of transmitting power being required. The engine is constructed to work at a pressure up to 100 lbs. per square inch, but the valve on each engine is set before leaving the works at the most economical position according to the pressure of steam used and the number of revolutions at which the propeller must run.

The same firm also make a special water-heating apparatus, which they have termed the "Simplex," and which will be found very useful for providing clean boiling water for work-people's meals. The apparatus is divided into two separate compartments, one of which forms a reserve for the cold water supply, and is fitted with a ball-tap, while the other contains a steam heating coil, the condensation from which is drained to a steam trap. The water is heated to boiling point in a few seconds after steam has been turned on, and the supply can then be maintained continuously. A further advantage is that there is no risk to the person using the heater through an accumulation of steam issuing from the draw-off tap when the latter is turned on, as is often the case with other heaters. The outer case is made of strong sheet copper, carefully tinned on the outside.

The Rossendale Belting Co., West Moseley Street, Manchester, have brought out a new boiler covering (Lawson's patent), which has given very successful results in actual use, and is specially applicable for marine purposes. The covering is of a fibro-plastic material, and possesses adhesive properties that render binding, supports, or lagging of any kind altogether unnecessary. The composition is supplied in the form of a dry powder, which the addition of a little water brings into a workable condition, and it is free from any ingredient that would be liable to cause injury to the boiler surface. A ton of this composition would, it is estimated, cover with a 2-in. coating 400 square ft. of surface, and what has been once used can be removed and again applied after mixing with water. When required for emergency cases it can be supplied in a plastic form, and when once applied, it can only be chipped off by means of a hammer and chisel. It is porous, so that the slightest leak can be detected, whilst it presents a surface that can be enamelled, but it is generally covered with a couple of coats of tar, which renders it completely water proof and specially applicable to boilers and pipes in an exposed condition.

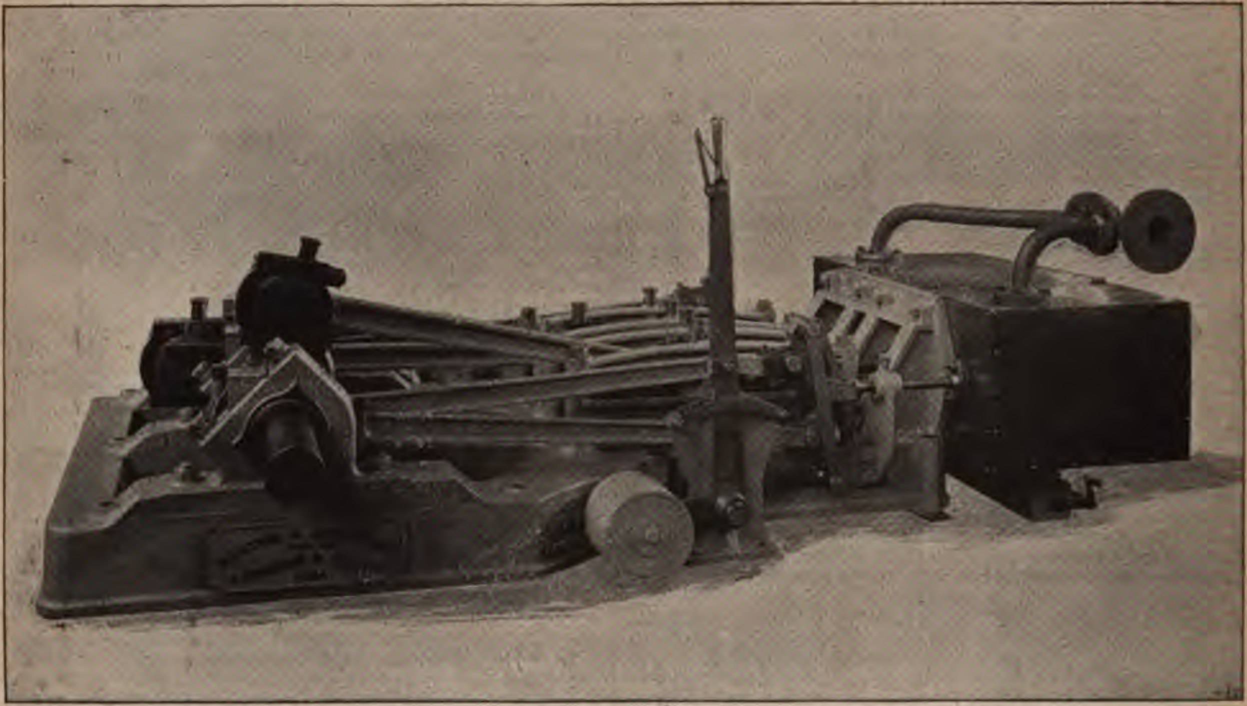
In the iron market here, the stronger tone referred to in last report has been more than maintained, and prices have shown a further hardening. For pig-iron a more active demand is coming forward, and although for the most part business is still confined to immediate wants, it represents on the whole a fair weight of buying, and certainly quite as much as makers and merchants—who are generally well sold—can entertain. Local makers have made no change in their quoted rate for foundry, which remains at 77s. 6d., less 2½ delivered Manchester, but, except for renewals of contracts with regular customers, they are practically out of the market. District brands have hardened up 6d. to 1s. per ton, Lincolnshire being quoted about 73s. to 73s. 6d. net, with Derbyshire makers asking about 77s. 6d. net, delivered Manchester. Forge qualities are also stronger, Lancashire averaging 73s. to 73s. 6d., less 2½, and Lincolnshire 71s. 8d. to 72s. 2d. net, delivered Warrington. Middlesbrough iron is about 1s. 6d. dearer, makers quoting 78s. 4d. net for good foundry brands, delivered by rail Manchester. Scotch shows a stiffening tendency, and is about 1s. dearer; Eglington and Glangarnock remaining at 79s. to 79s. 6d. net prompt cash; Manchester Docks, with American pig-iron about 77s. 6d. net.

In the finished iron trade, prices have been further advanced all round. Bars have been officially raised 5s. per ton, and Lancashire makers are now asking 2s. 6d. to 5s. above the official basis. Sheets are 5s. dearer, and hoops have been officially advanced 10s. per ton. Delivered Manchester district prices are now £8 17s. 6d. to £9 for Lancashire, and £9 for North Staffordshire bars; £10 2s. 6d. to £10 5s. for sheets

£9 7s. 6d. for random to £9 12s. 6d. for special cut lengths of hoops delivered Manchester district and 2s. 6d. less for shipment. Makers are well booked, in some cases up to March next, and business still comes forward steadily, although only in small quantities.

In the steel trade hematites are unchanged at about 87s. 6d. to 89s. 6d. less 2½ for No. 3 foundry, delivered here, but other descriptions of material have shown an upward tendency, and the prices quoted in some instances mean that makers have really nothing to offer. Local billets are not quoted under £6 12s. 6d. to £6 15s. net, with makers not offering. For bars the minimum quotation is now £8 15s. to £9, with boiler plates £9 10s. to £9 12s. 6d. delivered Manchester district.

An active demand is reported for manufactured metal goods, but list rates remain unaltered. Delivered Manchester district they are as under:—Solid drawn brass boiler tubes, 9d.; condenser tubes, 10½d.; copper tubes, 11½d.; brazed copper gas and steam tube, 11¼d.; brazed brass tubes, 10d.; common rolled brass, 8¾d; common brass wire, 8½d.; and copper wire, 8¼d. per lb.



Cable Machinery for H.M.S. Cable Ship "Monarch." Fig. 1.

Business in the timber trade has been fairly satisfactory, and values are generally steady with an upward tendency for some of the leading articles. Imports have not been excessive, and deliveries have been fair; stocks with few exceptions are only moderate. Teak squares have been imported in fair quantities, and the demand is quiet, but prices are firm and the stock is not heavy. Planks have come in freely and prices are rather easier, with stocks adequate. One cargo of greenheart has arrived, and the stock is too heavy.

In the coal trade, although there has been some easing down from the exceptional pressure of demand which preceded the advance in prices, an active business has been reported generally during the past month, and collieries, working full time, have not only moved away all their production, but have had to fill up out of stocks to meet the requirements of customers. Under these conditions, and in view of the movement amongst the miners for a further advance in wages, the question of prices is again being considered, and a further upward move, will not be long delayed. House coals have been in brisk request at the full rates. Steam and forge qualities continue in pressing demand, with supplies short to meet the requirements of customers. In engine fuel, notwithstanding the increased production of slack, supplies are still generally below requirements, and prices are strong at the recent advance on current sales, whilst in forward contracts 3s. to 3s. 6d. over last year's rates is being got. The shipping trade is fairly brisk, both for steam coal and house-fire descriptions; the quantities offering in this department are considerably restricted owing to the activity in the inland trade, and prices have shown a further hardening upon recent quotations. Current prices are about 12s. 6d. to 13s. 6d. for best Wigan Arley; 11s. to 11s. 6d. for Pemberton four-ft. and seconds Arley; 10s. 6d. for common house coal; 10s. steam and forge coal; 7s. 6d. best engine fuel; 6s. 6d. good medium sorts, and 5s. 9d. to 6s. 3d. common slack. Delivered Mersey ports or Ship Canal steam coal averages 10s. 6d. to 11s., and better sorts, suitable for house-fire purposes, from 11s. 6d. upwards.

Coke is in pressing demand, and good furnace qualities have stiffened up to about 20s. to 22s., but foundry cokes are without quotable change, best descriptions remaining at about 26s. to 27s. at the ovens.

THAMES.

(From our own Correspondent.)

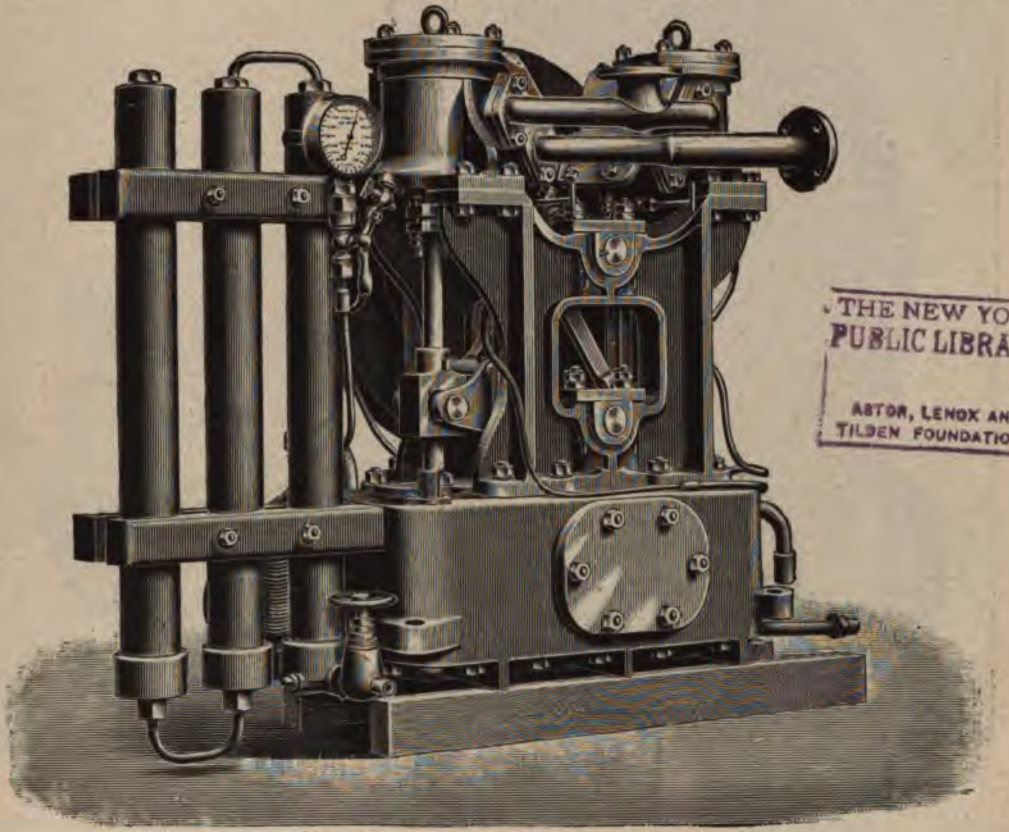
Easton, Anderson & Goolden, Limited.—This firm is still busy with its orders of Admiralty auxiliary machinery. The engines for H.M.'s. cable ship *Monarch*, are placed forward in the ship for driving the heavy machinery required for the picking up gear. The cylinders of these engines are 12½ in. diameter and 20 in. stroke, and are arranged to run at 120 revolutions per minute, with a steam pressure of 80 lbs. per square inch. The engines are made reversing and of a very massive and strong construction, to withstand the abnormally heavy strain occasionally coming on them when dealing with heavy submarine cables. They are placed on deck and had to be made of a sepcial design to bring them into the very small space at disposal; they had also to be kept as low as possible to clear the cables passing over them. We illustrate these in Figs. 1 and 2.

The air compressing engine and receiver formed part of a very extensive air-compressing plant supplied for the torpedo service of the Imperial Russian Government. The compressing engines are of the two stage type and the receiver is made of a series of tubes and the whole plant is made as compact as possible as space was of very great importance.

We also illustrate Fig. 3 an electric fan which is one made by this firm for ventilating purposes. It is driven by a motor of one standard 5 brake H.P. running at 800 revolutions per minute.

The latest order is one from the Admiralty for a set of large air-compressing beam engines for Portsmouth Dockyard.

In our last issue we referred to the pumping engines which this Company constructed for the Leicester Corporation Works. We had only space to give the general dimensions and could not give the results of the trials. The circulating pump drew and delivered into a cooling pond 400 yards away from the engine-house, the head in the pump being 8 ft. exclusive of friction in the pipes. This circulating pump was 6 in. diameter and 3 ft. stroke double-acting. There is a circulating condenser fitted to each engine having a cooling area of 298 square feet, the circulating pump water passing through the tubes. The ordinary working speed is 25 runs per minute, but the engines are designed to work up to a maximum speed of 30 revolutions.



Air Compressing Engine. Fig. 2.

THE NEW YORK PUBLIC LIBRARY
ASTOR, LENOX AND TILDEN FOUNDATIONS.

The trials were three in number:—

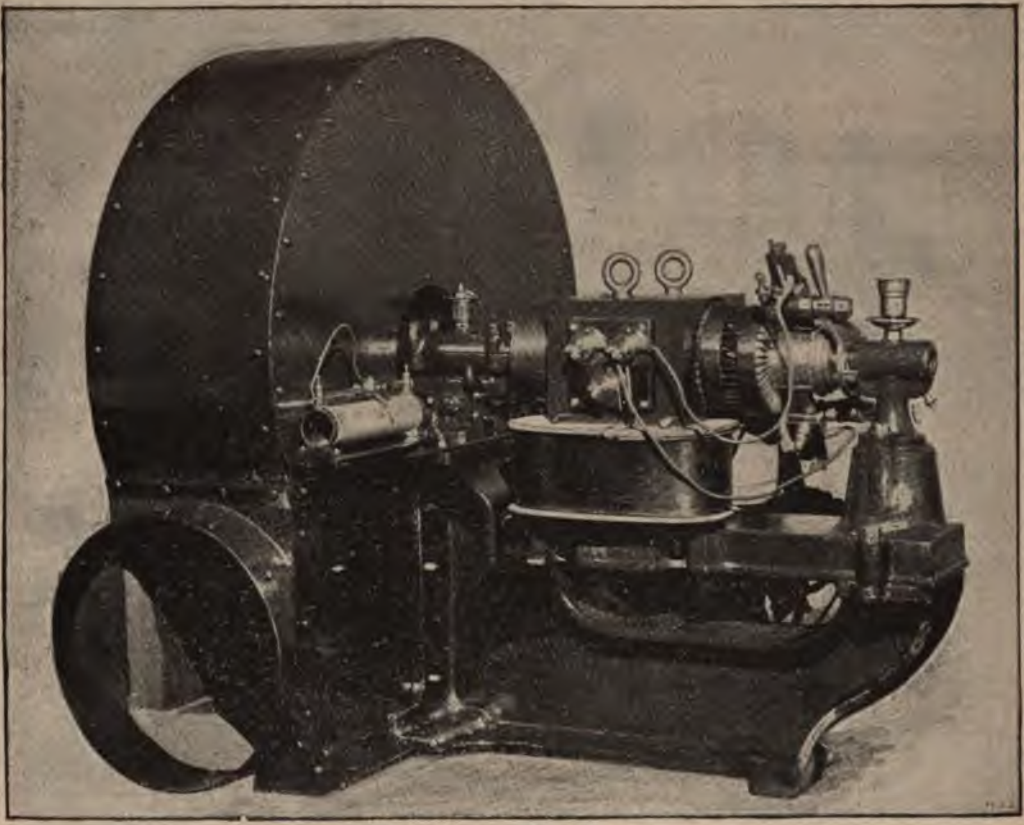
February 8th.	No. 1, Engine singly.
" 9th.	No. 2, " "
" 11th.	Nos. 1 & 2 combined.

The trials of the boilers were taken separately, but during the engine trials the evaporation of the boilers and the coal consumed were measured in order that results might be obtained of the evaporation and fuel under ordinary working conditions. The trials lasted in each case 12 hours, beginning at 9 a.m., and lasting until 9 p.m. The engines were started a short time previously to commencement of the trial, in order that everything should be under normal working conditions when the trial began. The steam used by the engines was ascertained by weighing the air-pump overflow and the water condensed in the cylinder jackets, and adding the two together the water from the cylinder and valve chest drain cocks was also included in the air-pump overflow. The head of water on the pumps was taken from the engine-room pressure gauge, which was afterwards tested against a mercury column, and the results corrected. The water pumped into the reservoir was measured by observing the height of water in reservoir every half hour; in addition, two small branches on rising main had Siemens water meters upon them, and the quantity registered by them was added to the total. During the trial, readings and diagrams were taken every half-hour; they were taken separately, both by the staff of the Corporation and by that of the contractor. The results of the trials of these engines will be given in our next issue.

Tolch & Co.—We illustrate, Fig. 4, another of this firm's oil launches.

John I. Thornycroft & Co.—The great international yacht race has at last come and gone. For several days, and with weather and wind favourable to the *Columbia*, the *Shamrock* showed that she could more than hold her own with her opponent. But one day came when there was sufficient wind, and the *Columbia* happened to come in first. After that the skipper of the *Shamrock* appeared to lose his head, for he crowded more sail on his topmast than it could carry, with the result that the topmast broke, and the rigging came down, with the consequence that the *Shamrock* left the course. Next day he did the next worse thing—added a heap of lead to the keel. He was, of course, beaten in sailing by a good distance. Sir Thomas Lipton has said he may challenge again in 1901, and that he will lend the *Shamrock* to the challenger of 1900 to try against it. Sir Thomas has said that Mr. Fife will again be the designer, and this probably means that the same firm will be the builders.

J. & E. Hall, Limited, Dartford.—This firm is exceptionally full of orders. The principle of action of these machines is the vaporisation of a volatile liquid at a temperature below that of the material to be cooled. The resulting vapour is then recompressed. There is first the compression-pump, which compresses the carbonic acid vapour by a pressure which is sufficient to liquefy the gas when it is cooled down by the water available. The gas so compressed is forced into a coil in the condenser through which water is made to run. When it has been cooled in this, and condensed, it is allowed to expand into the evaporator at a much lower pressure, where it becomes a gas again. The latent heat for this gas it extracts from the surrounding substance brine or water. The long coils fitted up in the cooling chambers through which the gas travels extracts the heat from the rooms, and leaves them cool. The gas then expands into the pump, gets again compressed to the high pressure of the condenser, and thus completes its cycle. The pressure put upon the gas by the compressor is, in some cases, over 900 lbs. per square inch. In some of the large machines it is 65 atmospheres. Where it expands into the evaporator the pressure is reduced to about 39 atmospheres. In such places as breweries the water surrounding the coils in the evaporator is drawn away at the temperature necessary for brewing purposes.



Electric Fan. Fig. 3.

BELFAST.

(From our own Correspondent.)

SHIPBUILDING and marine engineering news for the past month seems to be remarkably scarce, as work in both the large shipbuilding yards here seems to move along very slowly, and we are afraid the tonnage for the year will fall far short of expectation.

Many explanations are given for this condition of work, and no doubt the ironworkers are to blame for much of it, as it is said that as high as 75 per cent. has been lost by squads of these men for months past; other reports have it that there are fewer inquiries to hand and that builders are tapering off their work, and taking things more quietly, until prices of material moderate—no doubt this also has to do with the matter to a certain extent.

Messrs. Harland & Wolff, now have their second hydraulic gantry over one of their launching slips almost completed, and with these huge hydraulic tools in working order this firm should be enabled to fully cope with the riveting of their large class of vessels; and, as they have now in use electric and air drill and other appliances, this will also make them more independent of hand labour.

This firm have still the P. & O. steamer *China* in the Alexandria Graving Dock, and it will be some time yet before she is completed. The occupation of this large dock for such a length of time is causing great inconvenience, as many large vessels have to be accommodated elsewhere: this shows the urgent need of increased dry dock accommodation here to meet emergencies such as these.

The s.s. *Turkoman* (lately known as the *Lord Erne*) which has been in the hands of Messrs. Harland & Wolff for about two months back, receiving extensive alterations and being fitted up for the Atlantic cattle trade, left here last week to take up her station.

The s.s. *Persic*, as reported last month having been launched from the yard of Messrs. Harland & Wolff, is fast approaching completion in the Abercorn Basin and will soon follow her sister ships in the Australian trade, for which they have been specially constructed.

We understand that Messrs. Harland & Wolff, have recently booked two or three large orders for the Dominion and other lines.

The s.s. *Sicilian*, recently built and launched by Messrs. Workman, Clark & Co., Limited, for the Allan Line of Glasgow, would have left this port ere now but for the fact that she has been chartered by the British Government as a transport for the Cape. She is at present being fitted out for this particular service and in all probability will leave next week.

The smaller engine works, and especially the foundries, here are very quiet just now, which is probably due to the almost total collapse of the building trade; however, quite a number of new industries have recently sprung up in Belfast, such as the Ravenhill Ironworks, where structural ironwork, such as iron roofs, doors, &c., can be got.

We also have two new galvanising works in the city, and we hear that premises have been taken for the construction of tanks, ventilators, &c. Hitherto all goods of this class had to be imported from other towns, and great delay was sometimes felt in getting galvanising work done, as it had to be sent across channel after being fitted here, causing much loss of time.

NORTH-WEST OF ENGLAND.

(*From our own Correspondent.*)

Barrow.—The shipbuilding trade of this district is still very well employed, and there are indications that for a long time to come this industry will be a most active one in all its departments. No new orders have been booked by builders during the month, but they have no need of them at present, and when they have, there will be plenty available. Builders have their hands full at present on Admiralty account, and most of their orders require prompt deliveries. Every day, however, is improving the position of builders in this respect, and gradually a larger number of men are being employed, and the number would increase in a larger ratio if there were plenty of houses for the men to live in. This difficulty, however, is gradually being disposed of, and alongside of this disposal additional workmen are finding homes in Barrow, and the work in progress at the shipyards is being correspondingly accelerated. Great progress is being made with the first-class cruiser *Hogue*, which is well in frame, whilst the *Euryalus* and the *King Alfred* are gradually lifting their sides. Considerable advance has been made with the Japanese battleship, and a good idea can now be formed of her enormous size. She will probably be launched after the *Hogue*, as the Japanese are anxious to get her as soon as possible, and in the meantime Messrs. Vickers, Sons & Maxim will probably secure other orders for warship construction from other Powers, and possibly further business from the Japanese themselves. The torpedo-boat destroyer *Otter* has now been formally handed over to the Admiralty after very successful speed trials. The Barrow Co. has now had very useful experience in the building of torpedo-boat destroyers, and there is reason to believe in all other work of this class they will be able to secure the realisation of the most exacting conditions with satisfactory results alike to themselves and the owners of these smart and useful craft. The Barrow Co. is now building another 30-knotter for the Admiralty, the *Vixen*, and probably other work of this class will follow. There is almost an absence of labour troubles in the Barrow yard, and when they do arise they are easily arranged.

Oil Launch, Messrs. Tolch & Co. Fig. 4.

The speech delivered by Mr. McLaren, M.P., on the occasion of the annual meeting of the Palmer's Shipbuilding Co., in which he referred to the great loss of time on the part of several workmen engaged in the shipbuilding industry, by which work was very seriously delayed, applies with equal force to all shipbuilding yards; and certainly the experience of Barrow in this respect is not only very annoying to shipbuilders, but to shipowners, who are anxious to get delivery of new ships whilst trade is good, freights high, and profits large. It is difficult to understand why workmen, and mostly those in the black squad, should be content to earn £5 or £6 a week when they could easily earn 40s. a week more. The difficulty builders have to face is all the more aggravating because there is a great scarcity of men in the iron department of all shipbuilding yards at present, and when those who are employed do not put in more than two-thirds of their time the result is very disappointing, as work in other branches of the trade where more regular working hours are observed is delayed in consequence of laziness in others.

The Pacific Steamship Co.'s new steamer *Ortona*, which has been built at Barrow for the Orient Line, to trade between England and Australia, will be ready for delivery during the month of October. The ship has won general admiration from all who have seen her, and she will certainly be far the finest ship under the Pacific Co.'s flag. Her equipment is splendid in every department, and in her cabin accommodation she is vastly superior to any liner ever built at Barrow. She will, in fact, compare very favourably with a first-rank Atlantic liner, except in the matter of speed, and speed at a high rate on Australian voyages has never been considered an essential, on account of the difficulty of the coal supply. There has, however, in recent years, been a great improvement in the speed of Australian liners, in consequence of the modern triple-expansion engine, which gives such economic results in coal consumption on a given power. Thus on the same coal consumption per voyage it is possible to attain a much higher rate of speed. In the case of the *Ortona* advantage has been taken of this fact to give her a speed of 15 knots, but her builders anticipate being able to get out of her at least two more knots, so that in her voyages to the Australian ports the *Ortona* may be expected to break the record in the case of any of the ships of the same fleet, most of which were built at Barrow like herself. It will also be found that the *Ortona* is the largest and certainly the most luxuriant ship in the service, and in respect of her fittings and general finish she will certainly prove to be a very good advertment for Barrow. In the future Barrow builders will certainly devote themselves more to the work of building high-class merchant ships than has been the fact in the past.

West Cumberland.—A very steady and regular trade is being done by shipbuilders in the West Cumberland district, and, although the district is not engaged in the construction of heavy tonnage, it is busy in the building of light tonnage craft, for which there is a good demand. Makers have a good number of orders on hand, and are in a position to get more if they were able to undertake additional work to that which they have already. They are not in a position, however, to accept any of the orders for heavy tonnage ships that are now in the market; but, whilst larger builders are concentrating their energies on heavier shipping, the small builders of West Cumberland are contenting themselves with the building of small ships, on which, generally speaking, there is a good margin of profit. The shipbuilding yards at Workington and Maryport do not employ many hands, but their trade seems to be regular, irrespective of the ups and downs of the market generally, with the consequence that in good times and in bad they have plenty to do. Their position at present is satisfactory alike in the work they have in hand and the price they are getting for it. They have in some cases been hampered through the inadequate delivery of material, but, generally speaking, they have been kept very busy. They have not cared to overburden themselves with orders, but have maintained a steady tonnage output, just sufficient to keep them briskly employed and no more. They have good prospects of new orders when they are ready for them.

Barrow Docks.—Commencing with November, the Ramsden Dock at Barrow will be closed to shipping, that is temporarily, pending the work of deepening the lock sill. As we have pointed out in previous numbers of the MARINE ENGINEER, the sill of the Ramsden Dock is 6 ft. higher than the bottom of the Ramsden Dock entrance basin, and vessels of great draught are compelled at present to discharge part of their cargo in the entrance basin before being able to proceed into the series of docks for full discharge. But this is not the only reason of the necessity for lowering the dock sill. The construction at Barrow of the largest type of warships with the greatest draught of water necessitates the deepest possible dock accommodation. This will now be provided, and in the meantime this entrance to the docks will be closed whilst Messrs. John Aird & Co., the contractors, do the work. Heavy draught ships will in the meantime discharge and take in cargo at the Ramsden Dock basin, where four deep-water berths have been provided, and lighter-draught vessels will proceed to the Devonshire Dock, which will accommodate ships drawing up to 24 ft. of water. The deepening of the dock sill will probably take six or eight months to complete. In the meantime the work of completing the battleship *Vengeance* for Her Majesty's Government will be proceeded with, but she will not be able to leave Barrow until the dock sill is lowered, nor will Messrs. Vickers, Sons & Maxim be able to launch the Japanese battleship or the three first-class cruisers they are building for the Admiralty until this necessary engineering work is accomplished. It will thus be understood that the work will be pushed on with all possible speed, and with that object a very large number of men will be employed on night and day shifts. When the work is done, however, Barrow shipbuilders will be able to undertake the largest and heaviest classss of shipbuilding work, and will also be able to undertake heavy repair jobs; but even then a new deep graving dock will be required, and this in the course of time will be constructed, the Furness Railway Co. having already obtained powers for this purpose.

Shipbuilding Material.—The shipbuilding material trade is very brisk, and makers are extremely busy, the orders in hand representing deliveries a long way ahead. The mills are kept constantly employed night and day, and it is difficult to place orders for early delivery, as the engagements of makers are already so full. The value of heavy steel plates of ordinary specification remains very firm at £7 12s. 6d. per ton, and boiler plates are at £9 per ton. Angles are quoted at 5s. advance on the month, and it is expected there will be a general advance in prices all round. There is a good enquiry for all classes of shipbuilding material, and heavy castings for ship and engineering work are in full demand, makers being exceptionally busy on large orders already on hand. It is probable that new works will spring into existence before long, in which the production of heavy forgings will be the feature. During the past few weeks new works have been started at Barrow for the manufacture of bolts and nuts on some new patent. Other new industries of some importance are likely soon to be started in Barrow.

The Hematite Trade.—Very much firmness is shown in the hematite trade, and orders are coming to hand with considerable freedom. Buyers indeed are asking for fuller deliveries than makers can give, and this notwithstanding the fact that the output is greater than probably it has ever been in the history of the trade; as, although there are only 46 furnaces in blast, the production is larger than was the case years ago, when ten more furnaces were blowing, as the output per furnace is now greater because of the heavier blast. The feature of the output is of course Bessemer qualities of metal, which are in large consumption on the part of steelmakers, as well as by others who produce material in which the best descriptions of metal are essential. Makers are very firm in their prices, because they are so fully sold forward, and because the demand is so fully maintained, not only on home account, but on foreign account, and America is now one of the largest buyers in the market. Prices are steady at 80s. per ton for mixed Bessemer Nos., net, free on board, and warrant iron is at 77s. 6d. net cash sellers, buyers at a penny less. Stocks have been slightly reduced during the month, and now stand at 321,951 tons, being an increase since the beginning of the year of 55,072 tons. Makers have but small stocks on hand, as most of the iron they hold is intended for use in the manufacture of steel in the district. The prospects of the trade are very good, and it is probable that the present activity in the market will at any rate be maintained for fully another twelve months.

Shipping.—The shipping trade at West Coast ports is very busily employed, as much of the business being done by makers is on shipping account. The exports of pig iron since the beginning of the year have reached 423,174 tons, and steel 438,218 tons, being a decrease of 24,814 tons of pig iron and 46,797 tons of steel. The freight market is strong, and shippers get good prices for both coastwise and foreign cargoes. Indeed the prospects of a continuance of a brisk export trade are so satisfactory and promising that new tonnage is being built, and further orders are the subject of present negociation.

City of London College—On Wednesday, October 4th, the City of London College Science Society held its first meeting of the session, when Professor Henry Adams, M.Inst.C.E., delivered his presidential address. As one of the original founders of the society he had taken great interest in its progress, and, succeeding such well-known men as Sir John Lubbock and Professor Logan Lobley, he hoped to maintain unimpaired the reputation the society had achieved. After giving some statistics of the science work of the college, he proceeded to give an account of the development of marine engineering and steam navigation, from the time when steam was first applied to propulsion, in the year 1543, to the launch of the *Oceanic* in the present year, and by means of diagrams showed several interesting comparisons. The entire tonnage of the world in ships amounts to between 27,000,000 and 28,000,000 tons, of which 20,000,000 tons are propelled by steam, and Great Britain owns nearly 12,000,000 tons out of the 20,000,000. Continuing, he said the young marine engineer of the present day has larger problems to face than his forefathers had, but he has also larger opportunities of arming himself for the fray. The last generation had chiefly to rely upon common sense and the results of its own personal experience, which made it observant of facts and distrustful of theory; the present generation finds nearly everything reduced to rules and formulæ, and is apt to look upon a college course as containing all that it is necessary to know. In his opinion, the practical side of engineering can only be learnt in manufacturers' workshops under bread-and-butter conditions, and the colleges should confine themselves to theory, which can be imparted in evening lectures and class work. The working hours may need some further modification to produce the best result, but where overtime is not required there ought to be no difficulty in a healthy lad giving three or four evenings per week to study and yet make full time at the shops under the present régime.

Institute of Marine Engineers.—The ninth annual dinner in connection with this institute will be held on Wednesday, November 15th, in the King's Hall, Holborn Restaurant, when the President, Sir James Lyle Mackay, K.C.I.E., will preside and deliver the Presidential address. The date of this event is somewhat later in the year than usual, and it is hoped that the alteration will be more convenient to members and friends.

Shamrock.—There having been much speculation on this side as to who painted the bottom of the *Shamrock*, Messrs. Suter, Hartmann, & Rahtjen's Composition Co., Limited, inform us that they have word from their American friends, the Rahtjen's American Composition Co., that the work of preparing the bottom for the races was done by them, her lead keel having been coated with Messrs. Hartmann's Rahtjen's improved composition (the Red Hand brand), and the remainder of the bottom polished,

LAUNCHES AND TRIAL TRIPS.

LAUNCHES—English

Swallow.—On September 18th there was launched at Hull, for the Hull and Netherlands Steamship Co., Limited, a steel schooner-rigged steamer of about 1,010 tons gross, named the *Swallow.*

Sardius.—On September 21st there was launched at Selby, for Messrs. Smith & Bacon, Grimsby, an iron steam ketch, named *Sardius.*

Clan Alpine.—On September 22nd Messrs. Doxford & Sons launched from their Pallion Yard, Sunderland, a large turret steamer, the *Clan Alpine.* She is the eleventh vessel of this type built for the Clan Line of Glasgow (Messrs. Cayzer, Irvine & Co.), and the fifty-third turret steamer now afloat. Dimensions :—355 ft. by 45 ft. 6 in. by 27 ft. 3 in. moulded. Her deadweight is 5,450 tons, and her speed 12 knots. Her engines, $25\frac{1}{2}$ in., 42 in., and 69 in., by 48 in., were also built by the firm. The *Clan Alpine* is classed British Corporation highest class, and as she left the ways was gracefully christened by Miss Greta Doxford.

Ullapool.—On September 23rd there was launched at Hull, for the Grimsby Union Steam Fishing Co., Grimsby, a steel steam ketch, named the *Ullapool.*

Dorothy.—On September 27th there was launched at Middlesbrough, for Messrs. W. Page & Co., of Milford Haven, a steel steam trawler of about 160 tons gross, named the *Dorothy.*

Menter.—On October 2nd there was launched from the yard of Mr. Joseph Scarr, Grovehill, Beverley, a steel barge of the following dimensions: —Length, over all, 90 ft., between perpendiculars; beam, moulded, 24 ft.; depth moulded, 8ft. 6 in.. and She was built to the order of Messrs the London Grain Elevator Co., of London, and is the third built for that firm. She was christened *Menter* on leaving the ways by Miss Hasslehurst, of Beverley.

Exmouth.—On October 4th Messrs. Richardson, Duck & Co., launched from their yard a steel screw steamer of the following dimensions :—Length over all, 352 ft. ; breadth extreme, 48 ft. ; depth, moulded, 28 ft. 4 in. ; deadweight carrying capacity about 6,500 tons. This vessel, which has been built to the order of Messrs. Anning Bros., of Cardiff, will class 100 A1 on Lloyd's register, and has been built under special survey. She is of the three-deck type, one deck laid, with poop, long bridge from foremast to mainmast, and topgallant forecastle. Accommodation for captain and passengers is provided in poop, officers and engineers being berthed in iron houses on bridge deck and crew in topgallant forecastle. A cellular double bottom and forward and aft peak tanks are fitted for water ballast, and equipment includes six steam winches, large horizontal donkey boiler, steam windlass, stockless anchors, steam-steering gear, &c. The engines, by Messrs. Blair & Co., Limited, have cylinders 25 in., 42 in. and 68 in. by 45 in. stroke, steam being supplied by two single-ended boilers, having a working pressure of 180 lbs. As the vessel left the ways she was christened *Exmouth* by Lady de Blaquiere.

Hirundo.—On October 4th there was successfully launched from the shipbuilding yard of Messrs. Wood, Skinner & Co., Limited, at Bill Quay, Newcastle-on-Tyne, a handsome new steel screw steamer which has been built to the order of Messrs. Watts, Watts, & Co., of Newcastle-on-Tyne, for Mr. Conrad Blumer Hofgaard, of Tonsberg, Norway. The vessel is of the following dimensions, viz. :—Length, 290 ft. ; breadth, 42 ft. ; depth, moulded, 21 ft. 9 in. ; and she is constructed on the improved single-deck type, with poop bridge and topgallant forecastle. Water ballast is provided in the cellular double bottom, all fore and aft, and in after peak tank. In addition to being built to Lloyd's 100 A1 class, she will also take the highest class in Norwegian Veritas. The vessel has also been inspected during construction by Mr. Norman Burnett, consulting engineer, Newcastle-on-Tyne, and by Captain Godtfred Olsen, of Tonsberg, Norway, who will take command of her when ready for sea. She will be rigged as a fore and aft schooner, with telescopic topmasts, and will be fitted with all the most modern description of deck machinery and other appliances for facilitating the rapid loading and discharging of cargo and general working and navigation. The saloon, captain's accommodation, &c., are in a large house on the bridge deck, amidships, having chartroom and wheel-house on flying bridge above, the officers' and engineers' accommodation being in side houses amidships; whilst the crew are berthed in the topgallant forecastle. The propelling machinery has been constructed and will be fitted by the North-Eastern Marine Engineering Co., Limited, at their Northumberland Engine Works, Wallsend-on-Tyne, and consists of a set of their triple-expansion engines of improved design, having cylinders $21\frac{1}{2}$ in., $35\frac{1}{2}$ in., and 58 in. diameter, respectively, with a stroke of 39 in., steam being supplied by two large steel multitubular boilers working at a pressure of 160 lbs. per square inch. The machinery has also been constructed to the requirements and under the special survey of both Lloyd's and Norwegian Veritas, for their respective highest classification. The ceremony of christening the vessel was performed by Mrs. Thomas E. Ruddock, of Gosforth, Newcastle-on-Tyne, who named the steamer *Hirundo.*

Andromeda.—On October 5th there was launched by Messrs. Eltringham & Co. at South Shields the first screw trawler for the Vedra Steam Fishing Co., Limited, named the *Andromeda.* The vessel was towed to Stone Quay, South Shields, where she will receive her boiler and engines, the former being by the builders of the hull, and the latter by Mr. G. T. Grey, of South Shields.

Denbighshire.—On October 5th there was launched from the yard of the Sunderland Shipbuilding Co., Limited, a handsome screw steamer built to the order of Messrs. Jenkins & Co., Limited, of London, for their Shire Line of steamers. The length of the vessel between perpendiculars is 356 ft. ; breadth, 45 ft. 2 in. ; and depth, moulded, 29 ft. 4 in., having large topgallant forecastle in which are berthed the sailors and firemen, and long bridge amidships, on the top of which is provided accommodation for captain, engineers, officers, and a few passengers. The saloon is tastefully fitted in polished oak with tiled floor, and replete with every comfort, whilst the full poop is entirely devoted to cargo. The vessel is constructed on the deep-frame principle, thus dispensing with hold beams, and has cellular water ballast all fore and aft. Poop, bridge, and forecastle decks are of wood, the main and spar decks of steel, her class will be 100 A1 Lloyd's, spar deck grade, special survey, also Board of Trade certificate. The vessel's deadweight carrying capacity is 6,000 tons. Deck machinery consists of nine large steam winches, by Messrs. J. Lynn & Co., of Pallion, direct steam windlass by Messrs. Emerson, Walker, & Thompson Brothers, Limited, and Messrs. Alley & MacLellan's steam-steering-gear, which is placed in the engine-room and worked from flying bridge, together with all the usual appliances for handling cargo and working the ship with the greatest possible despatch. The main engines are upon the tri-compound principle, by the North-Eastern Marine Engineering Co., Limited, Sunderland, and have cylinders 24 in., 40 in., and 64 in. by 42 in. stroke, steam being supplied by two large steel boilers working at a pressure of 170 lbs. per square inch. During construction the steamer has been inspected, on behalf of the owners, by Mr. C. E. Hudson, and upon leaving the ways was gracefully named *Denbighshire* by Mrs. Frank Jenkins, of London, after which she was towed into the South Dock for the purpose of masting and shipment of machinery.

Harriet.—On October 5th Messrs. W. Gray & Co., Limited, launched a fine steel screw steamer of the following dimensions, viz :—Length over all, 250 ft. ; breadth, 35 ft. 6 in. ; depth, 18 ft. 2 in. She has been built to the order of Mr. Martin Carl, of Copenhagen, and will take Lloyd's highest class. The deck erections consist of a long raised quarter-deck with full poop on top, short bridge, and forecastle, a handsome saloon, stateroom and accommodation for the captain will be fitted up in the poop, comfortable quarters for the engineers and officers in the bridge, and for the crew forward. The machinery is placed aft, leaving large clear cargo holds amidships. The hull is built with deep bulb frames, cellular double bottom, and ballast tanks in the after and fore peaks. Five steam winches, large patent donkey boiler, steam-steering gear placed in engine-room casing, hand screw gear aft, direct steam windlass, three masts, boats on beams overhead, grain divisions, and all improved appliances for working the steamer will be provided. The engines are of the three-crank triple-expansion type, and are from the Central Marine Engine Works of the builders, the cylinders being 18 in., $28\frac{1}{2}$ in., and $47\frac{1}{2}$ in. diameter, with 33 in. piston stroke, and a large steel boiler to work at a pressure of 160 lbs. per square inch. The steamer has been superintended during construction by Captain A. V. Knudsen on behalf of the owners, and the ceremony of naming her *Harriet* was gracefully performed by Mrs. Clement Owens, of Beckenham.

Loire.—On October 6th there was launched from the shipbuilding yard of Messrs. Robert Stephenson & Co., Limited, Hebburn, a finely modelled screw steamer, the second of two to the order of the United Steamship Co., of Copenhagen. The ship, which is of the raised quarter-deck type, is of the following dimensions:—Length between perpendiculars, 250 ft.; breadth moulded, 35 ft.; depth moulded to main deck, 18 ft. 4 in., and depth moulded to quarter-deck, 22 ft. 4 in. The ship, which is built to the highest class in Bureau Veritas, is to be fitted out for the French wine trade. She has a cellular double bottom all fore and aft for water ballast, and has upper and lower decks of steel. The bow has been specially strengthened for ice to obtain Veritas P.R. class. She has a vertical donkey boiler, four powerful steam winches, a steam windlass, and hand-steering gear. The crew are berthed forward under the top-gallant forecastle, and the saloon and staterooms, also the officers' and engineers' rooms, are in an upper bridge above the main bridge. All the rooms throughout are heated by steam. The engines, which are of the triple-expansion type, supplied with steam by two large single-ended boilers, are also supplied by the builders. The ship has been constructed under the supervision of Captain Rabe, and the engines under that of Mr. Fricke, the representatives of the owners. As the ship left the ways she was gracefully named *Loire* by the Mayoress of Newcastle-upon-Tyne.

Barendsz.—On October 7th this vessel, one of two steamers built to the order of Messrs. Van Vliet & Co., of Ymuiden, was launched from the builders' yard, Messrs. Cochrane & Cooper, Limited, of Selby. She has been built for trawling, and all the auxiliary machinery and appliances for her intended trade will be fitted. The principal dimensions are:—Length, 115 ft. 4 in.; breadth, 21 ft. 6 in.; depth, moulded, 11 ft. 6 in. The engines, building by Messrs. Sir Christopher Furness, Westgarth & Co., Limited, of Middlesbrough, have cylinders 13 in., 21 in., and 34 in., with a 24 in. stroke, and will take steam from a large single-ended boiler at a working pressure of 180 lbs. The vessel throughout has been constructed to Lloyd's and Dutch Government requirements under the direct supervision of Messrs. Flannery, Baggallay & Johnson, of London and Liverpool.

Eros.—On October 7th there was launched from the Southwick Yard of Messrs. Robert Thompson & Sons, for Tomaso Cossovich, of Trieste, a first-class steel single-deck steamer, built for the cargo trade. Her dimensions are:—Length, between perpendiculars, 313 ft.; breadth, 44 ft. 2 in.; and depth, moulded, 23 ft. ½ in. She is built on the deep-frame principle, with one deck laid, thus leaving large holds clear of all obstructions of beams and stringers, and is classed 100 A1 at Lloyd's. The vessel is designed to carry a large deadweight on a light draught of water, and is fitted with a poop aft, long bridge amidships, both for the carrying of cargo, and a top-gallant forecastle. The captain and officers are accommodated in a large house on the top of the bridge at the fore end, and the engineers in two side houses on the top of bridge deck at the after end; the petty officers and crew have quarters in the forecastle. Ample water ballast is provided in the cellular double bottom and in the after peak. There are five hatches, each worked by a powerful winch, with steam supplied from a large multitubular donkey boiler, thus enabling the vessel to be loaded and discharged very rapidly. She is schooner-rigged, with two masts, and has four boats raised on high chocks; steam-steering gear at after end of engine casing, and worked by control shafting from wheelhouse amidships. The engines are of the triple-expansion type, with cylinders 22 in., 36½ in., and 60 in. diameter, with a stroke of 42 in., two steel boilers of 180 lbs. pressure, built by the North-Eastern Marine Engineering Co., Limited. Both ship and engines have been designed with all the most modern improvements for a first-class cargo steamer. During construction the hull and machinery have been superintended by Mr. Baird and Captain Buntielic, who will take command. As the vessel left the ways she was gracefully christened *Eros* by Miss Lowes.

Panaghi Vagliano.—On October 7th there was launched at North Shields, for Messrs. Constantine, Svorcno & Sons, of Marianople, a steel schooner-rigged steamer, named the *Panaghi Vagliano*, of about 650 tons gross.

Quassia.—On October 7th there was launched at Grimsby for the North-Eastern Steam Fishing Co., Limited, of Grimsby, an iron steam trawler of about 185 tons, named the *Quassia*

Islanda.—On October 7th, Messrs. Sir Raylton Dixon & Co. Limited, launched from their Cleveland Dockyards, Middlesbrough, a fine cargo steamer, built to the order of the British India Steam Navigation Co., of London, for their Eastern trade. She is built to Lloyd's highest class, three-deck rule, her principal dimensions being:—Length, 424 ft. 6 in. by 50 ft. 8½ in. beam, by 32 ft.; and has a deadweight carrying capacity of about 8,000 tons on a light draught of water. The principal decks are of steel and iron, the upper deck being sheathed with teak. The water ballast will be carried in cellular double bottom all fore and aft, also in fore and aft peaks, and large deep tank in No. 3 hold. The vessel will be fitted up for a Board of Trade passenger certificate, and lighted throughout with electric light. Triple-expansion engines will be fitted by Messrs. T. Richardson & Sons, Limited, Hartlepool, having cylinders 26½ in., 42 in., 66½ in., by 51 in. stroke, supplied with steam by large single-ended boilers, working at 160 lbs. pressure, fitted with Howden's system of forced draught. On leaving the ways, she was gracefully named *Islanda* by Mrs. Clark, wife of Mr. J. Clark, superintendent engineer of the company. The vessel has been built under the personal supervision of Mr. Peter Barr, the resident representative of the owners.

Ruby.—On October 7th Messrs. Cochrane & Cooper, Limited, launched from their Grovehill Shipyard, Beverley, a new steam trawler, of the following dimensions:—115 ft. 4 in. by 21 ft. by 11 ft. 6 in., depth of hold, built to the order of Messrs. T. C. & F. Moss, Grimsby. Engines of triple-expansion type will be supplied by Messrs. C. D. Holmes & Co., Hull, whilst the vessel will be replete with the most modern appliances for trawling. Mrs. Ethel Moss, of Grimsby, named the vessel *Ruby*, and after the ceremony the company adjourned to the offices of the builders for luncheon.

Spero.—On Saturday, October 7th, Messrs. S. P. Austin & Son, Limited, launched from their shipbuilding and repairing establishment at the Wear Dock Yard, Sunderland, the steel-screw steamer *Spero*, which has been built to the order of Messrs. R. S. Gardiner and Joseph Reay, of the Pelton Steamship Co., Limited, Newcastle-on-Tyne. The vessel has a poop for the accommodation of captain and officers, raised quarter-deck, bridge-house, full forecastle, and her dimensions are:—Length between perpendiculars, 235 ft.; breadth, 34 ft. 3 in.; depth, moulded, 17 ft. 3 in, with Lloyd's special survey class of 100 A1. The *Spero* is specially adapted for the coal trade, of a type which this company has made a special feature in their business, with large self-trimming hatches, and arrangements are made for carrying a large quantity of water ballast to enable the vessel to perform her voyages without stoppage, in all kinds of weather, when without cargo. She has four powerful steam winches by Messrs. R. Roger & Co.; multitubular boiler for working deck machinery, by Cochran & Co.; patent quick-warping steam windlass by Emerson Walker & Co., steam-steering gear by Donkin & Co., screw-steering gear aft by Crawford & Sons, and the deadweight carrying capacity is estimated at 1,675 tons on a light draught of water. The machinery to drive the vessel, at a speed of about 10 knots in regular work, will be supplied by Messrs. George Clark, Limited, of Southwick Engine Works, Sunderland, and the ballast-pumping arrangements will be of a special character. The launch was successfully carried out in the presence of a number of friends of the builders and owners, and the vessel was named by Miss Annie Reay, of Newcastle-on-Tyne.

St. Lawrence.—On October 17th there was launched at Hull, from the yard of Earle's Shipbuilding and Engineering Co., Limited, a fine steel steam trawler, built to the order of the Grimsby Victor Steam Fishing Co., Limited. The vessel is 118 ft. 9 in. long over all, 21 ft. beam by 11 ft. 8 in. moulded depth, and will be fitted by the builders with triple-expansion engines, supplied with steam by a large steel boiler working at 180 lb. pressure. As the vessel left the ways she was gracefully christened *St. Lawrence* by Miss Gladys Coulson, the daughter of one of the directors of the Grimsby Company.

Swan.—On October 17th there was launched at Hull from the yard of Earle's Shipbuilding and Engineering Co., Limited, a fine single-screw cargo and passenger steamer for the Hull and Netherlands Steamship Co., Limited. This vessel, which was named the *Swan*, is 240 ft. in length, 23 ft. in breadth, and 16 ft. moulded depth; built of steel to Lloyd's highest class, and has a double bottom for water-ballast tanks in the main and after holds, and the forward and aft peaks are also fitted for water-ballast. She is arranged with a raised quarter-deck aft, a bridge over the machinery and boiler space, and forward has a topgallant forecastle. Under the quarter-deck is accommodation for 12 first-class passengers, with dining saloon, entrance and staircase to the cabin, pantries, &c., in a large steel house above. The saloon is fitted in polished hardwood, and the whole of the accommodation is carried out in very good style and with all conveniences. The captain's room and the chartroom are on the bridge, and the officers' and engineers' cabins are under the same at the after-end, the crew being berthed in the topgallant forecastle. Comfortable accommodation is also provided under the deck forward for 10 second-class passengers. The cargo appliances are arranged to give quick despatch in handling goods, and comprises four powerful steam winches with extra strong derricks and the necessary lifting gear, and stalls for 40 horses are fitted under the bridge. The ship is fitted with steam-steering gear amidships in the engine-room, and screw gear aft. The boats and life-saving appliances will be all in accordance with the requirements of the Board of Trade. Her machinery will consist of triple-compound three-crank engines, having cylinders 19 in., 32 in., and 52 in., diameter by 36 in. stroke, and two steel boilers 13 ft. diameter, by 10 ft. 6 in. long, to work at 160 lbs. steam pressure.

Mariposa.—On October 17th, this vessel was launched by Messrs. Joseph L. Thompson & Sons, Limited, of the North Sands Shipbuilding Yard, Sunderland, and has been built to the order of Messrs. T. Hogan & Sons, of Bristol and New York, and is the fifth vessel built by this firm from these owners. Her principal dimensions are:—Length, between perpendiculars 390 feet; breadth, extreme, 49 ft. 9 in.; depth, moulded, 30 ft. 8 in. She is built to Lloyd's highest class on the spar deck rules, and is especially constructed for the owners' North Atlantic trade. There is a poop aft and a long bridge, both arranged for carrying cargo. The accommodation for saloon, captain, officers, and engineers and a few spare berths, is all in a large house on the bridge amidships. The chief and second engineers are berthed in a large house placed on the after end of the bridge, the crew, fireman, and petty officers being berthed in the topgallant forecastle. The chart and steering house is arranged on top of the saloon house. The steam-steering gear is placed at the after end of the engine casings, with the controlling gear to this steering house. The vessel has a cellular double bottom throughout for water ballast; the after peak is also arranged for water ballast; there is also a large deep tank placed forward; also one abaft of the boiler room arranged for carrying water ballast, or cargo. The deck machinery consists of eight powerful steam winches, supplied with steam by a large multitubular donkey boiler, working at 180 lbs. pressure, and the cargo will be handled by double derricks placed on each mast; a patent steam windlass is fitted on the forecastle head, and a powerful screw gear aft. The vessel is rigged as a two masted fore and aft schooner, and is complete in every respect as a high class modern cargo carrier. The engines and boilers have been constructed by Messrs. Blair & Co., Limited, of Stockton-on-Tees, the sizes of the cylinders being:—25 in., 43 in., 73 in., by 48 in. stroke, supplied with steam by three large multitubular boilers working at 200 lbs. pressure. The vessel has been constructed under the personal supervision of Captain Thomas H. Gore, the owners representative in this country. The launch, which was most successful, was affected by means of hydraulic power, and was gracefully christened by Mrs. T. H. Gore, of Bristol. There were also present Mrs. Robert Thompson, Madame Lechere, of Antwerp; Miss Andrew, Mrs. P. Phorson, Captain T. H. Gore, Captain J. Jenkins, Captain David Jenkins, Mr. Lund, of London; Mr. E. Pinkney, Mr. K. Pinkney, and the members of the builders' firm. After the launch the company adjourned to the firm's luncheon room, where the usual toasts were duly honoured.

Everingham.—On October 18th the Blyth Shipbuilding Co., Limited, launched from their shipbuilding and graving dock works at Blyth, a steel screw steamer of the following dimensions:—Length, 337 ft.; breadth, 47 ft.; depth, 24 ft. 10 in. This vessel has been built to the order of Messrs. Alex. Meek & Sons, of Goole, and will class 100 A1 at Lloyd's. She is of the three deck type, with single deck laid, having poop, bridge, and topgallant forecastle. The cabin accommodation for captain and officers is fitted in house on bridge, the engineers in sidehouses on bridge, and the crew in forecastle. Her equipment includes stockless anchors, five steam winches, large donkey boiler, steam windlass with detachable warping gear, steam-steering gear, and all the latest appliances for the speedy and safe working of the vessel. Triple expansion engines of good power will be supplied and fitted by Messrs. Blair & Co., Limited, of Stockton. As the vessel left the ways she was named *Everingham*, by Miss Rosa Meek. The vessel and machinery have been constructed under the inspection of Messrs. J. Jamieson & Co., of Hull.

Runo.—On October 19th there was launched by Sir James Laing at Sunderland a spar-decked steamer named the *Runo*, which has been built to the order of the Neptune Steam Navigation Co. Her dimensions are:—Length over all, 400 ft.; breadth, 46 ft. 6 in.; depth, 29 ft. 6 in. She has a carrying capacity of 6,000 tons, and will be engined by Messrs. Richardson, of Hartlepool, with engines of 2,500 H.P., guaranteed to give a speed of $11\frac{1}{2}$ knots. This vessel, which is the seventeenth, representing 44,000 tons, that has been built by Sir James Laing for the Neptune Line, will run between Baltimore and Rotterdam.

Etruria.—On October 19th Messrs. Craig, Taylor & Co. launched from their Thornaby Shipbuilding Yard, Thornaby-on-Tees, a very fine steel screw steamer of the following dimensions, viz., 274 ft. by 35 ft. by 23 ft. 8 in., moulded, to the spardeck type, with poop, long bridge, and topgallant forecastle, water ballast in double bottom fore and aft and in peaks. She is built on the deep-frame principle to Lloyd's highest class, under special survey, and also to the German law requirements. Her equipment consists of patent direct steam windlass, patent steam-steering gear, four large double-powered steam winches, large donkey boiler, stockless anchors, and all the latest improvements. The propelling machinery has been constructed by Messrs. T. Richardson & Sons, Limited, Hartlepool, the cylinders being 22 in., 35 in., 59 in., by 39 in. stroke, with two large boilers working at 160 lbs. pressure. This vessel has been built to the order of Messrs. A. C. de Freitas & Co., Hamburg, under the superintendence of Mr. Heinrich Wiengreen and Mr. M. Rother. The ceremony of christening the vessel *Etruria* was gracefully performed by Mrs. W. Ford, of Ingleside, Stockton. This is the fifth vessel that Messrs. Craig, Taylor & Co. have built for Messrs. A. C de Freitas & Co., and they have a sister vessel constructing for the same owners.

Gadsby.—On October 19th Messrs. Ropner & Son, of Stockton-on-Tees, launched a steel screw steamer of the following dimensions, viz.:—Length between perpendiculars, 325 ft.; breadth, extreme, 48 ft.; depth, moulded, 24 ft. 3 in. The vessel will take the highest class at Lloyd's, and is built on the three-decked rule, having poop, very long bridge, and topgallant forecastle. She has been built to the order of Messrs. Ropner & Co., West Hartlepool. The accommodation for captain and officers will be fitted up in the poop, and for engineers and apprentices in iron houses on the bridge deck, the crew being berthed in the forecastle as usual. The vessel has double bottom on the cellular principle for water ballast, also in fore and after peaks. She will carry a deadweight cargo of about 5,280 tons, and is fitted with all the most recent appliances for the expeditious loading and unloading of cargoes, has direct steam windlass, steam steering gear amidships, with powerful screw gear aft, and is also supplied with six large steam winches driven by two donkey boilers. The vessel will be fitted with a set of triple-expansion engines by Messrs. Blair & Co., Limited, of about 1,100 I.H.P. The christening ceremony was gracefully performed by Miss Elsa Ropner, of Preston Hall, who gave the vessel the name of *Gadsby*.

Sandsend.—On Thursday, October 19th, Messrs. William Gray & Co., Limited, launched the large steel screw steamer *Sandsend*, built to the order of the Pyman Steamship Co., Limited, of West Hartlepool. The vessel takes Lloyd's highest class under special survey, and her dimensions are:—Length over all, 385 ft.; breadth 49 ft. 6 in., and depth 28 ft. 3 in. The deck erections consist of a full poop, long bridge, and topgallant forecastle. The saloon, and captain's and officers' rooms are located in the poop, and the engineers' rooms are in houses on the bridge deck. The hull is built with deep frames, and cellular double bottom and aft peak for water ballast, powerful steam winches, steam-steering gear amidships and hand-screw gear aft, patent direct steam windlass, two large donkey boilers, grain divisions, stockless anchors, and a complete outfit will be fitted for a first-class cargo steamer. Three cylinder triple-expansion engines are being supplied by the Central Marine Engine Works, of Messrs. William Gray & Co., Limited; they will develop over 1,400 H.P. The cylinders are $25\frac{1}{2}$ in., $46\frac{1}{4}$ in., and 67 in. diameter, with a piston stroke of 45 in., and large steel boilers constructed for a working pressure of 180 lbs. per square inch. The hull and machinery have been built under the superintendence of Mr. Cromar on behalf of the owners.

Sebriana.—On October 20th Messrs. Short Brothers launched from their works at Pallion a handsomely-modelled steel screw steamer, built to the order of the British Maritime Trust, Limited, of London, of which Sir E. T. Gourley, M.P. for Sunderland, is a director. Her principal dimensions are:—Length, 372 ft.; breadth, 48 ft.; and depth, moulded, 30 ft. 10 in. The vessel is built of steel to the highest class in Lloyd's register under special survey. The framing being on the improved deep-frame principle leaves the holds clear of obstructions. The vessel is fitted with a cargo poop, long bridge amidships, on which is fitted up houses for the accommodation of the captain and officers, with saloon, messrooms, &c. A commodious topgallant forecastle is fitted up for the accommodation of the crew. The holds are four in number, with eight powerful steam winches; steam-steering gear is fitted at the after end of the engine platform, with controlling rods from flying bridge. The bottom is of cellular construction, divided into six compartments for water ballast, the after peak being also fitted as a trimming tank. Every attention has been given in the arrangements of the vessel for the quick loading and discharging of cargoes, and the appliances are of the latest pattern. On leaving the ways the vessel was named *Sebriana* by Mrs. A. H. Walker, of West Hartlepool. The vessel is to be fitted with triple-expansion engines by Messrs. W. Allan & Co., Limited, of Sunderland, having cylinders 25 in., 41 in., 69 in. diameter, with a stroke of 48 in., steam being supplied by three large steel boilers working at 180 lbs. pressure.

Heemskerk.—On October 21st this vessel building to the order of Messrs. Van Vliet & Co., of Ymuiden, by Messrs. Cochrane & Cooper, Limited, was launched from their yard at Selby. She has been specially constructed for trawling and all the necessary auxiliary appliances for her trade will be fitted. The principal dimensions are:—Length, 115 ft. 4 in.; breadth, 21 ft. 6 in.; moulded depth, 11 ft. 6 in. The vessel will be fitted with triple-expansion engines by Messrs. Sir Christopher Furness, Westgarth & Co., Limited, of Middlesbrough, having cylinders 13 in., 21 in., and 34 in., with a 24 in. stroke, and will take steam from a large single-ended boiler at a working pressure of 180 lbs. The vessel throughout has been constructed to Lloyd's and the Dutch Government requirements, under the immediate supervision of Messrs. Flannery, Baggallay & Johnson, of London and Liverpool.

Oro.—On October 21st Messrs. Sir Raylton Dixon & Co., Limited, launched from their Cleveland Dockyards, Middlesbrough, a fine steel screw steamer. built to the order of Messrs. Gellatly, Hankey & Co., of London. She is built to Lloyd's highest class spar deck rule, her principal dimensions being length 352 ft. 4 in., breadth 47 ft., depth moulded 25 ft. 9 in., and has a deadweight carrying capacity of about 5,300 tons on a light draught of water. The spar and main decks are of steel and iron, and poop, bridge, and forecastle deck, of pitch pine. Triple expansion engines will be fitted by Messrs. Sir C. Furness, Westgarth & Co., Limited, of Middlesbrough, having cylinders 25 in. 40 in., 66 in. by 45 in. stroke, with two large single ended boilers working at 180 lbs. pressure and fitted with Howden's system of forced draught. The vessel and machinery have been built under the supervision of Captain John, superintendent for the owners. On leaving the ways she was gracefully named *Oro*, by Miss Jean Kennedy, the young daughter of Mr. Walter Kennedy, agent for Messrs Gellatly, Hankey & Co. in Middlesbrough.

Shamrock.—On October 21st Messrs. Cochrane & Cooper, Limited, launched from their Grovehill shipyard, Beverley, a new steam-trawler of the following dimensions:—100 ft. by 21 ft. by 11 ft. depth of hold, built to the order of Messrs. E. & R. Osborne, Grimsby. Messrs. C. D. Holmes & Co., of Hull, are supplying engines of the triple expansion type. The vessel will be completed ready for sea and will be replete with the most modern appliances for trawling. Mrs. R. Osborne, of Grimsby, named the vessel *Shamrock*, and among the company were Mr. and Mrs. C. A. Osborne, Miss J. Osborne, Mr. and Miss Southern, Mr. and Miss Fearn, and Mrs. Shaw. After the ceremony the company adjourned to the Beverly Arms, for breakfast,

Hornby Castle.—Lately Messrs. William Pickersgill & Sons, Southwick, Sunderland, launched from their yard, a finely modelled steel screw steamer built to the order of Messrs. J. Chambers & Co,, Liverpool, Her dimensions are as follows:—Length 361 ft. by 46 ft. 3 in. by 28 ft. 2 in. She has been built under special survey to take Lloyd's highest class as a spar decked steamer. The hull is built on the deep frame principle, and fitted with cellular double bottom throughout for water ballast, the after peak being also used for this purpose, the scantlings have been so much increased to enable her to claim what is practically a three-decked freeboard, which will allow of her carrying a good deadweight cargo on a moderate draught. A large steel deck-house on bridge affords accommodation for saloon captain and officers' berths, the saloon will be tastefully fitted up in oak. The engineers' berths are fitted up in steel houses on bridge deck, the petty officers and crew are berthed under topgallant forecastle. The vessel will be rigged as a two-masted fore and aft schooner, having steel lowermasts and wood telescopic topmasts, she is to be fitted with seven steam winches by Messrs. Clarke, Chapman & Co., Gateshead, steam-steering gear by Messrs. J. Lynn & Co., Limited, Sunderland, which is fitted in a house abaft engine casing, steam windlass by Messrs. Emerson, Walker & Thompson Brothers, and a large multitubular donkey boiler by Messrs. Riley Bros. She has been specially designed with a view to rapid loading and discharging of cargo, and is provided with five large hatchways worked by extra strong derricks and derrick gear, in addition to two derrick posts amidships for working aft end of main hold. She will be equipped in a thoroughly efficient manner, with all the latest appliances necessary for a first-class modern cargo steamer. The machinery and boilers are being supplied by Messrs. George Clark, Limited, of Southwick, Sunderland, the engines are of the triple expansion type, with cylinders 23½ in., 40 in. and 67 in. diameter, by 45 in. stroke and two large steel boilers with a working pressure of 180 lbs. fitted with Howden's forced draught. During construction the vessel and engines have been under the personal superintendence of Mr. E. H. Bushell, consulting engineer of Liverpool, she is now being completed under the supervision of Captain Jackman, who will take command on completion. After the launch, the *Hornby Castle* proceeded to the engineers to receive her machinery.

LAUNCHES—Scotch.

Leven, **Mersey**, and **Nidd.**—On September 4th Messrs. Mackie & Thomson launched at Govan three screw fleeters which they have built for Messrs. James Leyman & Co., Hull. The dimensions of each are:—Length, 105 ft.; breadth, 21 ft.; depth, moulded, 11 ft. 7 in.; tonnage, 180 gross. Triple-expansion engines of 250 I.H.P. will be supplied by Messrs Muir & Houston, Kinning Park. The vessels were named the *Leven*, by Mrs. Somerville Letten, Grimsby; the *Mersey*, by Mrs. George Watson, London; and the *Nidd*, by Mrs. R. B. Macouat, Arden, Jordanhill.

Dale.—On September 19th there was launched at Aberdeen, for the Dee Line Steam Fishing Co., Grimsby, an iron steam ketch of about 180 tons gross named the *Dale*.

Adato.—On September 26th Messrs. William Hamilton & Co. launched from their Newark Yard, Port-Glasgow, a steel screw steamer for Messrs. Andrew Weir & Co., 102, Hope Street, Glasgow, for their Eastern and general trade. The dimensions of the vessel are as follow:—Length between perpendiculars, 330 ft.; breadth, 45 ft. 6 in.; depth, moulded, 26 ft. 6 in.; with poop, long bridge amidships, and topgallant forecastle for crew, and the vessel is classed in Lloyd's 100 A1 spar deck. She is designed to carry a weight of 5,400 tons on a light draught of water, with a net register tonnage of about 2,100 tons. The propelling machinery, which is being supplied by Messrs. Dunsmuir & Jackson, of Glasgow, consists of one set of triple-expansion engines, having cylinders 24 in., 40 in., and 65 in. diameter respectively, by 42 in. stroke, steam being supplied by two large boilers constructed for a pressure of 180 lbs. The steamer was named the *Adato* by Mrs. M'Intyre, the wife of the captain. The owners were represented at the launch by Captain M'Intyre, who is to command the vessel. Immediately after the launch, which was most successful, the vessel proceeded to the Prince's Dock, Glasgow, to receive her machinery.

The Duchess.—On September 26th the Ailsa Shipbuilding Co. launched from their yard at Troon a steel screw steamer, classed 100 A1 at Lloyd's, for Messrs. J. Hay & Sons, Glasgow. The steamer is intended for the coasting and Continental trade, and is of the following dimensions:—Length, 184 ft.; breadth, 27 ft.; and depth, moulded, 13 ft. 5 in. Compound surface-condensing engines, with cylinders 21 in. and 44 in. diameter by 30 in stroke, will be fitted by Messrs. Muir & Houston, Limited, Glasgow, The ceremony of naming the vessel *The Duchess* was performed by Mrs. Hay, 44, Windsor Terrace, St. George's Road, Glasgow.

Sardinero.—On September 27th the Campbeltown Shipbuilding Co. successfully launched a steel screw steamer of 3 400 tons deadweight, single-deck type, built to the highest class at Lloyd's, for Spanish owners. The vessel is intended for general trading. On leaving the ways she was named *Sardinero* by Miss Waite, Springbank, Campbeltown. The engines will be supplied by Messrs. Hutson & Son, Kelvinhaugh Works, Glasgow.

Advice.—On October 2nd the London and Glasgow Engineering and Shipbuilding Co., Limited, Govan, launched the first of two paddle tugs which they are constructing for the British Admiralty. The vessel is fitted with all the latest and strongest appliances for towage purposes, and she has been constructed so that she may be of great service in shallow water. Her principal dimensions are:—Length, 144 ft.; breadth, 27 ft. 3 in.; and 700 tons displacement. The engines and boilers, which are also supplied by the builders, are to develop 1,250 I.H.P. The vessel was named *Advice.*

Hyson.—On October 4th there was launched from the yard of Messrs. David & William Henderson & Co., Partick, a large handsomely modelled steel screw steamer, which they have built to the order of the China Mutual Steam Navigation Co., Limited, London. The dimensions of the vessel are 465 ft. by 53 ft. by 34 ft., with a gross tonnage of about 6,500 tons. The vessel has a large carrying capacity, and has been specially designed to suit the extensive Eastern trade of the owners, has been built under special survey to class 100 A1 at Lloyd's, and in addition will have a Board of Trade passenger certificate. Sixteen powerful steam winches have been fitted, with large derricks, and all the latest improvements for the rapid handling of her cargo. The vessel is constructed with poop, long bridge and forecastle, the saloon and captain's accommodation being on the bridge deck. The accommodation for engineers and officers is of a superior style, and is also fitted on the bridge deck, alongside the engine casing. A complete installation of electric light has been fitted throughout the vessel by Messrs. W. C. Martin & Co., Glasgow; steam-steering gear by Messrs. Davis & Co., London, and a powerful capstan windlass on the forecastle head by Messrs. Emerson, Walker & Co. She will be rigged as a fore and aft schooner, with two telescopic pole masts to suit the Manchester Canal. Water ballast is carried all fore and aft, including the fore and after peaks, with a large deep tank for trimming purposes. The engines, which are of the triple-expansion type, have been constructed by the builders, and consist of three cylinders 28½ in., 47 in. and 78 in. by 60 in. stroke, with two double-ended boilers with Howden's forced draught and built for a working pressure of 180 lbs. Throughout the construction of the vessel, the hull and machinery have been under the personal supervision of the owners' representatives, Captain John S. Hogg for the hull and Mr. H. Seal for the engine department. This latest addition to the extensive fleet of the China Mutual Co. was gracefully named *Hyson*, as she left the ways, by Miss McLean, daughter of David McLean, Esq., Kensington Court, London.

Clonallon.—On October 6th Messrs. John Fullerton & Co. launched at Paisley a steel screw steamer, about 350 tons, which has been built to the order of Messrs. Joseph Fisher & Sons, Newry, for their extensive coasting carrying trade. The steamer is largely in excess of Lloyd's requirements, and has the most modern outfit for working both ship and cargo. Compound engines of 450 I.H.P. are being supplied by Messrs. Hall-Brown, Buttery & Co., Govan. The steamer was named *Clonallon* by Mrs. James Fullerton, Abbotsburn, Paisley. This is the eleventh steamer built by Messrs John Fullerton & Co. for the same owners, and has been superintended during construction by Mr. Edward Connolly, engineer, Newry.

Stirling Castle.—On October 7th there was launched from the shipbuilding and engineering works of Messrs. John Scott & Co., Kinghorn, a beautifully modelled paddle steamer to the order of the Galloway Saloon Steam Packet Co., Leith. The vessel is 170 ft. long between perpendiculars, 24 ft. broad, and 7 ft. 9 in. deep, moulded to main deck, and has been built under the superintendence of Mr. Harris, to highest class of Board of Trade. The steamer has been built for the Stirling passenger service of the company, and has a handsomely furnished saloon at the after end fitted up in solid oak, and upholstered in Utrecht velvet; dining and bar accommodation has also been provided for both first and second class passengers, and a smoking room all beautifully finished and lighted with electric light by Messrs. M'Ewan Clarke & Co., Edinburgh. The vessel is propelled by compound diagonal disconnecting engines, and steam is provided by one large single-ended marine boiler under forced draught. As the steamer left the ways she was gracefully named the *Stirling Castle* by Miss Galloway, daughter of M. P. Galloway, Esq., of the Galloway Saloon Steam Packet Co. The engines during construction have been superintended by Mr. Richard Young, of the London and Edinburgh Steamship Co. After the launch, the builders entertained a large company to cake and wine, when the usual toasts, &c., were duly proposed and honoured. Meanwhile the *Stirling Castle*, having been launched with steam up, had got under way and after having her compasses adjusted, proceeded to Burntisland.

Assaye.—On October 7th Messrs. Caird & Co., Limited, launched at Greenock a large steamer to the order of the Peninsular and Oriental Company. The ship's gross tonnage is about 7,300 tons, and, in addition to taking 2,000 tons of coal in her bunkers and reserves, she has large cargo capacity, whilst her displacement will not be less than 12,600 tons. Her total length is 450 ft., with a breadth of 54 ft., and the I.H.P. is such as to result in a sea speed of 16 knots. A special feature in the ship is that she has three promenade decks in addition to the navigating bridge, giving something like 50,000 superficial feet of promenade space; whilst to provide for bad weather the passage arrangements will allow travellers to pass under cover from one end of the ship to the other. There is accommodation for 114 first and 57 second saloon passengers, all provided in roomy cabins on the upper and hurricane decks. The dining saloon is on the upper deck, whilst the drawing and smoking rooms are on the hurricane deck. This ship, which was named the *Assaye*, is intended, along with her sister-ship the *Sobraon*, for the company's mail and passenger lines, and they will take their place in the company's programme, the former leaving London towards the end of the present year. The *Assaye* has twin screws, whilst altogether 22 boats will be carried, notwithstanding the exceptional subdivision of the vessel by watertight bulkheads into watertight compartments. She will be rigged with two pole masts. Messrs. Caird & Co. will themselves supply the engines which will be on the triple-expansion principle. Mrs. Alexander Tweedie, of London, the well-known authoress, performed the naming ceremony in a graceful manner. The *Assaye* was afterwards towed round to the Victoria Harbour.

Kaffir.—On October 10th there was launched from Messrs. William Jacks & Co.'s Broomhill Boat Slip, Port Dundas, a steel screw lighter of 100 tons deadweight capacity. The lighter is intended chiefly for carrying the builders' iron on the Forth and Clyde Canal. The engines are being supplied by Messrs. Shanks, Anderson & Co., Polmadie, and the boiler by Messrs. John Wallace & Co., Barrhead. As the boat left the ways she was named the *Kaffir* by Mrs. John Dick, Grangemouth.

Glynn.—On October 10th there was launched from the yard of the Ailsa Shipbuilding Co., Troon, a finely modelled steel screw steamer, built to the highest class at Lloyd's for Irish owners, and of about 1,000 tons register. The engines, which are of the triple-expansion type, are being supplied by Messrs. Muir & Houston, Limited, Glasgow. The vessel has three steam winches, steam windlass, steam and hand steering gear, steam capstan, and all the latest appliances for the loading and discharging of cargo, and for the safe navigation of the vessel. As the vessel left the ways she was gracefully named *Glynn*, by Miss Wilson, Kelburne, Fairlie.

Hibernia.—On October 10th the twin-screw steamer *Hibernia* was launched from the Leven Shipyard of Messrs. William Denny & Brothers, Dumbarton. The launching ceremony was performed by Lady Houldsworth, wife of Sir W. H. Houldsworth, Bart., M.P., who is a director of the company. Immediately after the launch, which was most successful, the party adjourned to the Model Hall, where lunch was partaken of. The success of the vessel and her owners, the London and North-Western Railway Co., was cordially pledged, and thereafter the health and long life of the lady who so gracefully performed the ceremony, was proposed by Mr. Peter Denny.

replied to by Sir William Houldsworth. The *Hibernia* is virtually a sister ship of the *Cambria*, built by the same builders, and delivered to the company in December, 1897. This vessel was fully described in our September, 1897, and January, 1898, issues, so we need only remind our readers of the leading particulars. In brief, then, the *Hibernia* is a twin-screw steamer having a length of about 340 ft., beam 39 ft., and a depth of 24 ft. to the awning deck. She is practically a passenger steamer, carrying only parcels and passengers luggage, and is intended to take her place along with the *Cambria* and her sister ship the *Anglia* (which is still on the builders' stocks, and will be launched in the course of a month), on the company's Holyhead and Dublin service. The first-class passengers are accommodated on the upper main and lower decks amidships, and forward of the machinery in handsome staterooms and open saloons, special provision being made for separate ladies' staterooms and retiring-rooms. The saloon is on the main deck, is handsomely finished in oak, and can accommodate a large number of passengers. Berths are fitted for 214 first class passengers, and all the usual conveniences have been carefully attended to, ample ventilation and lighting having been made a speciality. The steerage passengers are accommodated aft in a long poop and on the lower deck. Here again the ladies' wants are carefully attended to, a separate saloon being fitted for them, with lavatories attached. The whole of the awning deck forms a handsome promenade at the after end for the steerage, amidships and forward for the first-class passengers. This vessel will no doubt be as speedy as the *Cambria*, which on trial attained a maximum speed of 22 knots on the measured mile, and 21·35 on the 100-knot course. The *Cambria* is quite famous for the regularity of passages, and has become a favourite ship. This is the fifth vessel built by Messrs. William Denny and Brothers, who have been entrusted with the contract of practically renewing the company's fleet of mail steamers, the *Rostrevor*, *Connemara*, and *Galtee More* being employed on the Holyhead and Greenore line, whilst the *Cambria*, *Hibernia*, and *Anglia* are, or will be, employed upon the Holyhead and Dublin line.

Cuzco.—On October 10th there was launched from the yard of Messrs. Napier & Miller, Limited, Yoker, a steel screw steamer, built for Messrs. W. R. Grace & Co., of London and New York. Her dimensions are:—Length, 375 ft.; breadth, 50 ft.; and depth 28 ft. 8 in., moulded, with a gross tonnage of about 4,500 tons. The vessel is designed to carry a deadweight of fully 7,000 tons, with large hatches and eight powerful steam winches; also double derricks at each hatch stepped on strong derrick tables, thus making an efficient arrangement for the rapid handling of cargo. She has been constructed to Lloyd's 100 A1 three-deck rule with poop, bridge, forecastle, and with large capacity for water ballast in double bottom and in after peak, all accommodation being placed in houses on top of bridge deck, and the crew as usual being berthed in topgallant forecastle. A complete installation of electric light is fitted, also steam windlass and steam-steering gear. The engines have been constructed by Messrs. D. & W. Henderson & Co., and consist of three cylinders, 52 in., 41 in., and 67 in. in diameter respectively, with a piston stroke of 48 in. The two boilers are single-ended, with a working pressure of 200 lbs. to the square inch, and with Howden's system of forced draught. Both hull and machinery have been constructed under the supervision of Mr. Thomas Todd, consulting engineer, of Fenchurch Street, London. On leaving the ways the vessel was named *Cuzco* by Mrs. Henry Napier, Milton House. Bowling.

Pena Castillo.—On October 11th Messrs. Archibald McMillan & Son, Limited, Dumbarton, launched the steel screw steamer *Pena Castillo*, which they have built for the Compania Santanderina de Navegacion, of Santander. Her dimensions are 270 ft. by 37 ft. by 20 ft. 6 in. Her tonnage is 1,610 tons, and her carrying capacity 2,700 tons.

Seagull.—On October 19th Messrs. Mackie & Thomson, Govan, launched a steel screw steamer which they have built for Messrs. Leach & Co.. London. Dimensions:—Length, 225 ft.; breadth, 33 ft.; depth, 16 ft. 6½ in.; tonnage, 1,100 gross. Triple-expansion engines of 1,000 I.H.P., with two large steel boilers, will be supplied by the North-Eastern Marine Engineering Co., Limited, Sunderland. The vessel, which was built under the superintendence of Captain Lumley on behalf of the owners, was named the *Seagull* by Mrs. R. H. B. Thomson, Blawartlea, Scotstounhill.

Kokine.—On October 20th there was launched by the Grangemouth Dockyard Co., from their shipbuilding yard at Grangemouth, the second of two oil-tank steamers for the carriage of petroleum in bulk, built to the order of Messrs. Jacobs & Barringer, of London, for clients in the East. The dimensions are 355 ft. by 32 ft. 6 in. by 24 ft. moulded, and she has been built to the highest class at Lloyd's spar-deck rule, and is provided with all the most modern appliances for a vessel of this type, including two powerful pumps, capable of discharging 180 tons each per hour; air fan for exhausting inflammable vapour from the holds, apparatus for steaming out the holds in case of fire, electric light, steam-steering gear of horizontal type, and quick-warping steam windlass. The vessel is subdivided into 18 compartments, of which 14 are oiltight for the carriage of oil cargo in bulk. These holds are also fitted for carrying general cargo if required, being provided with large composite hatches, steam winches, and derricks. Throughout she is designed for service in tropical waters, having teak decks, double awnings, and a complete system of ventilation. Triple-expansion engines for a high rate of speed will be fitted aft, the boilers being arranged for coal or oil fuel, the latter of which will be used for ordinary service. The ceremony of naming the vessel *Kokine* was gracefully performed by Miss Vary Finlay, daughter of Mr. Finlay, London.

LAUNCH—Irish.

Rathlin Head.—On October 17th there was successfully launched from the North Yard of Messrs. Workman, Clark & Co , Limited, Belfast, a fine steel twin-screw steamer, named the *Rathlin Head*, built to the order of the Ulster Steamship Co., Limited, Belfast, Messrs. G. Heyn & Sons, managers. The dimensions of the vessel are:—Length between perpendiculars, 470 ft; breadth, 53 ft.; depth, 35 ft. 6½ in.; about 6,740 tons gross, and 4,440 net register, and carrying capacity of about 9,650 tons deadweight. The steamer will be classed 100 A1 at Lloyd's, under special survey, with machinery certificate. The vessel is built under the three-decked rule, considerably in excess of Lloyd's requirements; has long forecastle, long bridge house amidships, extending from side to side of the vessel, forming a complete protection for engine and boiler casings, &c., a long poop aft, and a permanent fore and aft centre bulkhead have been fitted in the lower holds, ensuring safety against cargo shifting. There are six cargo holds, all of about equal capacity, and seven hatchways, each with double derricks. Ten powerful steam winches by Messrs. John H. Wilson & Co., of Liverpool, fitted with the company's specialities, are provided for the rapid and careful handling of their general cargoes; Wilson's latest and improved make of steam windlass is placed in forecastle, with independent gear to work two powerful warping capstans on forecastle deck; and Pirrie & Wilson's patent spring tiller, and direct steam-steering gear, by the Harrison Steering Engine Co., is fitted aft with controlling rods from bridge. The *Rathlin Head* is built on the cellular double-bottom principle, having capacity for about 1,650 tons water ballast, to enable the vessel to make winter passages light across the Atlantic, with large trimming tank aft, fitted for cargo; is fore and aft rigged, with two steel masts (telescopic topmasts) and four derrick posts (fitted as ventilators); has two complete heavy steel decks, and bridge deck of steel, covered with pine. Saloon and accommodation for captain and a few passengers are arranged in large house on forward end of bridge deck, with charthouse and wheelhouse above on flying bridge. Engineers' and officers' rooms are on after end of the bridge deck; petty officers are accommodated in the forecastle, and the crew in poop. The steamer will be fitted throughout with a very complete installation of electric light, including powerful arc lamps for working cargo, &c., by Messrs. J. H. Holmes & Co., Newcastle-on-Tyne. The engines and boilers, which have also been constructed by Messrs. Workman, Clark & Co., consist of two sets of three-crank triple-expansion type with latest improvements, to indicate about 3,200 H.P., with 200 lbs. working pressure, steel shafting and two Atlas bronze propellers. Steam is supplied from four single-ended boilers, with Howden's patent system of forced draught. The *Rathlin Head* is a fine specimen of the most modern type of cargo steamer. The vessel and her machinery have been constructed under the supervision of Mr. Hugh Wisnom, the company's superintendent engineer. She will be commanded by Captain Thomas McCalmont, commodore of the Head Line, who has been connected with the company since its formation. This is the fifth vessel built by Messrs. Workman, Clark & Co. for the Ulster Steamship Co,, who now own a fleet of 13 high-class cargo steamers, 11 of which have been built in Belfast. The *Rathlin Head* is intended to leave next month for New Orleans to load on the company's line for Belfast and Dublin.

LAUNCH—German.

Korea.—On Thursday, October 12th, a fine steel screw passenger and cargo steamer, built by the Flensburg Shipbuilding Co., to the order of the Ostasiaske Kompagnie, of Copenhagen, was safely launched. Her principal dimensions are:—428 ft. by 49ft. 8 in. by 30 ft. 6 in. moulded, having a deadweight carrying capacity of about 7,000 tons. She is classed to Lloyd's 100 A1 "spar-deck rule," having long poop and forecastle. Amidships are placed two large deckhouses for first-class passengers. The saloon is built to accommodate 30 persons, and is handsomely fitted up in oakwood framing, having oil paintings from different Danish painters. The passengers' cabins will have all the latest improvements, and smoking-room will be fitted in oakwood, with panels of Dutch plates. The captain's rooms and charthouse will be situated in the upper deck house, whilst the officers and engineers will be accommodated in house abaft engine casing—petty officers' accommodation being in house on poop aft. Croom & Arthur's patent direct steam-steering gear will be fitted with controlling shaft from pilot bridge amidships, and the vessel will be fitted throughout with electric light and telephone communication, and one of Messrs. Hall's large refrigerating machines. Triple-expansion engines, having cylinders 28½ in., 47½ in., and 78 in. by 54 in. stroke, with four large boilers capable of giving the necessary steam, will be supplied by the Engineering Department of this firm. As the vessel left the ways she was christened *Korea* by Frau Berentzen, the wife of the captain. The vessel is at present under the Danish, but when completed will be transferred to the Russian flag. The launch was effected by the use of Mr. Phorson's patent launching trigger, which was used by the firm for the first time on this occasion, and was found to act excellently, assuring as it does the safe launching of vessels. Mr. Phorson, the patentee (Messrs. J. L. Thompson & Sons, Limited), Mr. J. A. Thompson, and Mr. L. Marr paid a visit to the yard, and after the lunch the chairman of the company, Mr. Andresen, and Mr. Bredsdorff, the managing director, in a toast to Mr. Phorson, paid a special tribute to that gentleman with regard to the value of his invention.

LAUNCH—Norwegian.

Alma.—Lately a steel cargo screw steamer was launched by the Laxevaags Engineering and Shipbuilding Co., Bergen, Norway. The vessel is of the following dimensions:—Length over all, 235 ft.; breadth, 32 ft.; depth, 15 ft. 8 in. The vessel has been built to the order of Mr. D. W. Ellerhusen, Bergen, Norway, and to Norwegian Veritas highest class. The *Alma* has cellular double bottom for water ballast and afterpeak ballast tank, and will be provided with three steam winches, Emerson-Walker patent steam anchor windlass, Fisher's patent steam-steering gear, Bower's patent rapid-closing apparatus for stop valve (worked from bridge as well as engine-room), Bower's patent protection box for propeller shaft and donkey boiler; triple engines by the Laxevaags Engineering and Shipbuilding Co.—cylinders 15¾ in., 25½ in., 42 in., and stroke 30 in.; the boiler 13 ft. 6 in. diameter, 10 ft. 6 in. long for a working pressure of 160 lbs.

TRIAL TRIPS.

Newton Hall.—On September 20th the s.s. *Newton Hall* left the Wear for her official trial trip, the machinery working most satisfactorily in every way. She has been built to the order of Messrs. C. G. Dunn & Co., of Liverpool, by Messrs. J. L. Thompson & Sons, North Sands, Sunderland, and engined by the North-Eastern Marine Engineering Co., Limited, at their Northumberland Engine Works, Wallsend-on-Tyne (of which we gave particulars in our August issue, page 235). There was a large company present at the trial trip, including Mr. Dunn, representing the owners; Mr. Armstrong, representing the shipbuilders; Mr. Daglish, representing the engine-builders; Mr. Atkinson, of Messrs. Irwin, Atkinson & Young, Liverpool, under whose superintendence the machinery has been constructed; and Captain Kilvert, the owners' marine superintendent, who has personally supervised it. After the trial trip the vessel sailed for Galveston, U.S.A.

Manchester Corporation.—On September 26th the large steel screw cattle and cargo steamer *Manchester Corporation* proceeded on her trial trip. The vessel has been built to the order of the Manchester Liners, Limited, by Messrs. Furness, Withy & Co., West Hartlepool (of which we gave full particulars in our July issue, page 172). The trial trip was most satisfactory. The owners were represented by Mr R. B. Stoker and Mr. Greenip, the shipbuilders by Mr. H. Withy and Mr. G. W. Sivewright, and the engine-builders by Mr. T. Westgarth. After the trial trip the vessel proceeded to the Tyne for bunkers.

Rokeby.—On September 26th the new steamer *Rokeby* built by Messrs. Ropner and Son, of Stockton-on-Tees, to the order of Messrs. George Pyman & Co., of West Hartlepool (for further particulars see September issue, page 284), made her official trial trip in the Tees Bay, which proved satisfactory in every respect, and, after the adjustment of the compasses, the vessel proceeded on her voyage to the United States. The vessel has been built under the inspection of Mr. Cromer, the owners' superintendent surveyor, who was present at the trial trip, together with Mr. Smyth, representing the owners, whilst the builders were represented by Mr. L. Ropner

Shieldrake.—On Wednesday, September 27th, the s.s. *Shieldrake*, which has been constructed by Messrs. Wigham-Richardson & Co., Limited, for the Cork Steamship Co., Limited (for further particulars see October issue, page 326), went for a very successful trial trip off the Coast, the engines giving the greatest satisfaction. Immediately after the trial trip the vessel sailed for Antwerp under the command of Captain Dunn. The owners were represented on the trial trip by Captain Hore, of Liverpool, their marine superintendent, and by Mr. J. A. Flockhart, of Liverpool, their superintendent engineer.

Empress.—On September 29th the stern-wheel steamer *Empress*, built by Messrs. Ritchie, Graham & Milne, Whiteinch, for the African Lakes Corporation, Limited, had her trial trip. The vessel proceeded from Paisley (where she was engined by Messrs. Campbell & Calderwood) to Bowling, when she was tried on the measured mile, and afterwards to Prince's Dock, Glasgow, where her machinery will be landed, and the floatable sections taken apart and shipped by the corporation's specially chartered steamer engaged for the transport direct to East Africa. The results of the trial were very satisfactory. The vessel is fitted with the latest improvements in her type. Her dimensions are 105 ft. by 24 ft. beam, and she is provided with very comfortable accommodation for about 20 passengers. A similer steamer—the *Duchess*—but of smaller dimensions, is, at present being completed by Messrs. Ritchie Graham & Milne for the same owners. Both steamers are for navigation on the rivers Zambesi and Shiré, East Africa, and will bring up to seven the number of similar vessels on that section of the corporation's service to the lakes district of Central Africa.

Finanzminister Witte.-On September 29th the steamer *Finanz minister Witte*, built by Messrs. Robert Duncan & Co., Limited, Port-Glasgow (of which we gave particulars in our September issue, page 285), went down the Clyde on her official trial trip. The vessel was fully loaded and ready for sea, and none but the representatives of the builders, engineers, and owners were on board. The results of the trials of speed and coal consumption were satisfactory, and exceeded the guarantees given by the builders. After a series of trials had been run, the vessel left for Libau, Russia, where she is owned by the Rossija Steamship Co., and may be said to be the pioneer of steam shipping in that rising Russian port on the Baltic, as this is the first steamship registered and owned in Libau, and has been named after the present Minister of Finance to the Imperial Russian Government.

Olanda.—On September 30th the handsome steel screw steamer *Olanda*, built by Messrs. W. Gray & Co., Limited, for the Scheepvaart & Steenkolen Maatschappij, of Rotterdam (for further particulars see September issue, page 284), was taken for her trial trip. The vessel averaged nine knots, under very unfavourable weather conditions, the performance of ship and machinery being quite satisfactory. She afterwards proceeded to the Tyne to load.

Itzehoe.—On October 2nd the s.s. *Itzehoe*, built by the Flensburg Shipbuilding Co. to the order of the Deutsch Australische Dampfschiffs Gesellschaft (of which we gave particulars in our October issue, page 332), put out to sea for her official trial trip, during which the vessel averaged a speed of 13 knots, the owners having expressed themselves as perfectly satisfied both with the ship and the machinery. After the trial the vessel proceeded to Hamburg.

Glenroy.—On October 3rd the fine steel screw steamer *Glenroy*, built by Messrs. W. Gray & Co., Limited, to the order of Messrs. Livingston, Conner & Co., of West Hartlepool (for further particulars see September issue, page 282), had her trial trip. The vessel carried a full cargo of coals, and averaged a speed of 10½ knots.

Hero.—On October 3rd the large new screw steamer *Hero*, built by Messrs. Osbourne, Graham & Co., Hylton, and owned by Messrs. Brusgaard, Kjosterud & Co., of Drammen, Norway (of which we gave particulars in our September issue, page 283), left the Wear for her trial trip, which was in every way satisfactory, a mean speed of 11¾ knots being easily obtained.

Darleydale.—On October 7th the s.s. *Darleydale*, a fine large steel screw steamer, built by Messrs. W. Gray & Co., Limited, for the Dale Steamship Co., Limited (Messrs. Lucas & Co., of Bristol, managers) (for further particulars see September issue, page 283), had her maiden voyage to the Tyne, where she takes in her first cargo. Everything in the engine-room gave the utmost satisfaction, and the vessel averaged a speed of 11 knots.

Kelvingrove.—On October 7th the steamer *Kelvingrove*, which has been built by Messrs. Archibald McMillan & Son, Limited, Dumbarton, for the Glasgow Steam Shipping Co., Limited, had a very successful trial of her machinery. The *Kelvingrove*, which has been built to Lloyd's highest class, has a carrying capacity of 5,000 tons. She has been specially designed for the River Plate trade, and has a complete shade deck from end to end, above which is placed accommodation for the captain, officers, and engineers, which is of a more extensive and comfortable description than is usual in steamers of this class; the crew are berthed under the poop, and the cattlemen forward. The vessel is fitted in the most modern style for carrying cattle, and has electric light throughout and every convenience for the expeditious and safe working of ship and cargo. The engines have been constructed by Messrs. David Rowan & Co., and are of large power, so as to ensure a high speed for a vessel of this class. They are of the triple-expansion type, and the boilers, which are of large capacity, are fitted with Howden's forced draught. As the vessel is to be employed largely in the cattle trade, a very complete condensing plant has been fitted, capable of producing 40 tons of fresh water per day. The evaporators are of Morrison type, and the fresh water condensers are by Kircaldy & Co. Mechanical ventilation is provided in all ventilators by electric fans. The whole arrangements have been under the guidance and control of Mr. George McFarlane, of Glasgow. The steamer will be commanded by Captain E. H. O'Neal, the senior captain in the company's service. At the trial trip there was a large company of the friends of builders and owners, and, as it was a lovely day, the sail on the firth was much enjoyed. At the luncheon Mr. McMillan proposed success to the new steamer, which was enthusiastically pledged and responded to by Mr. J. Albert Black, of Messrs. John Black & Co., the managing owners. Immediately after the trial the vessel proceeded to Liverpool to load, under charter for Messrs. R. P. Houston & Co.

Stirling Castle.—On October 10th the Galloway Saloon Steam Packet Co.'s new steamer, *Stirling Castle*, launched on October 7th from the shipbuilding and engineering works of Messrs. John Scott & Co., Kinghorn, went on her official trial trip, when everything worked most satisfactorily, and the guaranteed speed of 15 knots was easily maintained. There, after turning trials were undergone with engines disconnected and one engine full speed ahead, and the other full speed astern, when it was found that the vessel could turn in her own length. There was a large company on board, including Mr. M. P. Galloway, of the Galloway Steam Packet Co.; Mr. S. Crawford, of John Scott & Co., the builders; Messrs. J. B. & R. S. Crawford, of John Scott & Co.; Mr. Harris, B.O.T.; Mr. Young, of the London and Edinburgh Steamship Co.; Mr. Welsh, superintendent engineer for the Furness Railway Co.; Mr. Weir, engineer manager to John Scott & Co., and others.

Nedenes.—On October 10th the steamer *Nedenes* (of which we gave full particulars in our Launch columns, October issue, page 327) left the shipbuilding yard of Messrs. Short Brothers for her trial trip, which proved in every way satisfactory. After adjusting compasses a series of runs was made over the measured mile, when a mean speed of 11 knots was attained. After the trial the vessel proceeded to Antwerp under the command of Captain Svenningsen.

Duke of Rothesay.—On October 11th the trial trip of the *Duke of Rothesay*, the latest addition to the Duke Line of steamers plying between Glasgow and Dublin, took place on the Clyde, between the Cloch and the Cumbraes Lights, a distance of 13½ miles, which was traversed three times. The trial was in every way satisfactory. The *Duke of Rothesay*, built by the Caledon Shipbuiding and Engineering Co., Dundee, is much longer and more commodious than any of the other steamers of this line. Her dimensions are:—Length over all, 276 ft. b.p., 265 ft.; breadth, 35 ft.; depth, 23 ft. 9 in., with a gross tonnage of 1,250. Accommodation is provided for 110 first-class passengers, 900 steerage, and 27 of a crew. The engines are of the triple-expansion type, having cylinders of 75 in., 47 in. and 28 in., with 45-in. stroke, and there are two double-ended boilers 13 and 10 ft. diameter by 20 ft. long, with a working pressure of 180 lb. per square inch.

Urlana.—On October 11th the steamer *Urlana*, built by Messrs A. & J. Inglis for the British India Steam Navigation Co., underwent her official trial over the measured mile at Skelmorlie. The *Urlana*, which has been constructed for the company's Eastern cargo trade, is 410 ft. between perpendiculars, 50 ft. 6 in beam, and 32 ft. deep, with a cargo capacity of about 8,000 tons. The machinery, constructed by the builders, is of the triple-expansion type, having cylinders 26¼ in., 42 in., and 66½ in. diameter, and 4 ft. 3 in. stroke, and is fitted with Howden's system of forced draught. The trial passed off most successfully and to the entire satisfaction of Captain Hodgkinson and Messrs. Clark and Dobbie, the representatives of the company.

Tagus.—On October 14th the new steam-ship *Tagus*, built by Messrs. R. Napier & Sons, Limited, Govan, for the Royal Mail Steam Packet Co., London (of which we gave particulars in our August issue, page 236), had a very successful trial trip. The machinery consists of a set of triple-expansion engines having cylinders 37 in., 58 in., and 97 in. diameter, by 5 ft. 6 in. stroke, and capable of indicating 7,000 H.P., with six single-ended boilers for a working pressure of 180 lb., and furnished with the most recent improvements for efficiency and economy, including Howden's system of forced draught, Gwynne's centrifugal pumps, &c. The *Tagus* has a very symmetrical appearance, and is altogether a splendid specimen of naval architecture. A marked feature of the trial was the absence of any vibration.

Portugal.—On October 14th the fine steel screw mail and passenger steamer *Portugal*, built by Sir Raylton Dixon & Co., Limited, Cleveland Dockyards, Middlesbrough, for the Empreza Nacional de Navegaçao a Vapor, of Lisbon, was taken out to sea for her official trials under the command of Captain Cura. She is built to Lloyd's highest class, spar deck rule, her principal dimensions being: 377 ft. by 45 ft. 6 in. by 29 ft. 9 in., and has a deadweight carrying capacity of over 5,000 tons. The upper decks are of steel sheathed with teak. She is fitted with very first-class accommodation for passenger trade between Lisbon and the West Coast of Africa, having large saloon on the upper deck aft to accommodate 80 passengers, the walls of which are covered with decorated marble panels and elegant cabinet work in walnut, and upholstered in green Morocco leather; having piano at one end and sideboard at the other, the floor being laid in polished parquet of elegant design. The entrance lobby is of the same description and abaft of this is an elegant saloon for the accommodation of ladies, in light coloured, polished woodwork and tapestry panels. The sleeping accommodation for first-class passengers is provided in the 'tween decks under the saloon in large staterooms, having two berths and a good sofa only, all the joiner work of these cabins being in polished hardwood of very elegant description. Handsome bathrooms are provided having marble baths with hot and cold water service. The floors are laid in encaustic tiles and the lavatory accommodation is very complete and of the latest style. Large mail and baggage rooms are situated in the middle part of the ship, the cabins being kept to the outside for light and air. Ventilation is also provided for by air-channels from every one of the rooms leading to an electric exhaust fan in the engine room. Electric light is also distributed throughout the ship, and there are extensive refrigeration-chambers for the preservation of provisions. Above the saloon aft there is also a large airy smoking-saloon decorated in coloured marble, and with a highly ornamental dome glazed with decorated glass, the principal feature of which are the emblazoned arms of the Empreza

Nacional Co. Accommodation for 40 second-class passengers, with saloon from side to side of the ship, is in the 'tween decks amidships, and the 'tween decks forward are fitted for the accommodation of 250 emigrants or third-class passengers, having separate cabins to be used as a hospital in case of need. A very complete galley, with steam cooking apparatus with ovens, is provided amidships; and also for native passengers a galley with three large steam boilers in the forecastle. The arrangements on deck are very complete for working cargo by means of eight steam winches, and a powerful derrick for lifting 20 tons weight. Numerous ventilators to the holds and 'tween decks are also a prominent feature on deck, and on top of the bridge amidships are steel lifeboats, and a large-sized steam launch is carried in the davits. The engines, by Messrs. Thomas Richardson & Sons, Limited, of Hartlepool, are of about 3,000 I.H.P., and will give a speed of over 12 knots at sea. The engines are of the latest design, and fitted with Weir's feed-pumps, centrifugal circulating pumps, pulsators, feed-heater and evaporator; also bronze blades for the propeller, and all their latest improvements. A large party of friends were on board during the trial trip, and the vessel made her runs over the measured mile, quickly obtaining a speed of about 14 knots. The vessel has been under the supervision of Mr. T. C. Laws, of Liverpool, representative of the Empreza Nacional of Lisbon in this country. The engines have been surveyed by Mr. Edwards. It has been arranged by her owners and builders to admit the public on Sunday to inspect this fine vessel at a small charge, for the benefit of the North Riding Infirmary. After taking in necessary coal she will proceed to Lisbon on her way to the West Coast of Africa.

Saxoline.—On October 19th this vessel, built to the order of Messrs. Lane & Macandrew, of London, on behalf of Messrs. Desmarais, Freres of Paris (of which we gave particulars in our October issue, page 327), was taken for trial from the builders' yard, Messrs. Sir W. G. Armstrong, Whitworth & Co., Newcastle. On the trial the speed was calculated at almost 11 knots. After the trial the vessel returned to the Tyne to bunker before proceeding on her maiden voyage.

Bylands.—On October 21st the new steamer *Bylands*, built by Messrs. Ropner & Son, of Stockton-on-Tees, to the order of Messrs. Joseph F. Wilson & Co., of West Hartlepool (of which we gave particulars in our October issue, page 328), made her official trial trip in the Tees Bay, which proved satisfactory in every respect, and she sustained an average of 11 knots. After the adjustment of compasses, the vessel proceeded on her way to Cardiff, to load for Bombay. The vessel has been built under the inspection of Mr. Maddison, the owners' superintendent surveyor. He was present at the trial trip, and expressed great satisfaction with the vessel.

Sheppy Allison.—On October 21st this vessel had her maiden voyage, proceeding to Sunderland, where she loads for Marseilles. She is a fine steel screw steamer, built by Messrs. William Gray & Co., Limited, to the order of Messrs. J. S. Allison & Co., of West Hartlepool (of which we gave particulars in our October issue, page 328). Amongst those who went round with the ship were Mr. Sydney Hogg, managing owner; Captain T. Morris, who has inspected the vessel during construction; Mr. James C. Clarke, consulting engineer, who has superintended the building of the engines; Captain Murrell and Mr. McGlashan, from the shipyard; and Mr. W. C. Borrowman, manager of the engine works. The trial was a very satisfactory one, an average speed of 11 knots being recorded.

Eclipse.—On October 23rd the trial trip of the steam trawler *Eclipse* took place, and proved highly satisfactory, a speed of 10½ knots being attained. The vessel was recently launched by the Irvine Shipbuilding and Engineering Co., Limited, for the Peterhead Trawling Co., Limited, Peterhead, and is fitted with all the latest appliances for fishing in the North Sea. The dimensions of the vessel are: 117 ft. between perpendiculars by 21 ft. by 11 ft. 9 in. moulded, and the engines, supplied by W. V. V. Lidgerwood, Coatbridge, are triple-expansion, having cylinders 12 in., 19½ in., and 32 in. by 22 in. stroke. The builders have three other similar vessels on hand for the same firm.

Atlantian.—Lately the large steel twin-screw steamer *Atlantian*, built to the order of the West Indiaand Pacific Steamship Co., Limited, of Liverpool, by Messrs. Sir W. G. Armstrong, Whitworth & Co. (of which we gave particulars in our August issue, page 233) left the Tyne for a trial trip. The vessel and machinery, which worked with the greatest regularity and smoothness, gave entire satisfaction to all those on board. After the compasses had been adjusted a trial of some hours' duration was made, and a mean speed of over 13 knots was obtained.

Trevessa.—Lately the new steamship *Trevessa*, a steel screw steamer, built by Messrs. John Readhead & Sons, South Shields (of which we gave particulars in our October issue, page 326), went on her trial trip off the Tyne. The vessel having had her compasses adjusted, made a series of successful runs to sea, averaging a speed of 11 knots. The behaviour of the *Trevessa* was all that could be desired, her performances giving every satisfaction to those concerned. This steamer is the thirty-fifth built by Messrs. Readhead for the firm of Messrs. E. Hain & Son, St. Ives.

Nicolai Pallibin.—Lately the *Nicolai Pallibin*, a powerful self-propelling bucket-ladder dredger, recently built by Messrs. Fleming & Ferguson, Limited, Paisley, completed a series of dredging and speed trials. This dredger has been built to the order of the Imperial Russian Government, and is intended for carrying out deepening operations at the port of Kertsh, in the sea of Azof. The dimensions of the vessel are 157 ft. by 33 ft. by 12 ft. It is constructed with single ladder and chain of buckets working through centre of hull. Each bucket has a capacity of 22 cubic feet, and the dredger is capable of raising 1,000 tons of material per hour from a depth of 33 ft. The trials were superintended on behalf of the Russian Government, by Colonel Petroff, Chief Commissioner, and were in all respects entirely satisfactory, and the dredger thereafter started under her own steam.

Reviews.

The Arithmetic of Electrical Measurements. By W. R. P. Hobs. London: Thomas Murby & Co.

The author of the present volume (which is one of Murby's Science Series), from his position as headmaster of the Naval Torpedo School at Portsmouth, brings the best possible qualifications to his task. It is intended to be a clear and a concise application of Ohm's law such as young students can appreciate and grasp. How far he has fulfilled his aim is shown by the appreciation with which his book has been received. Already six editions have been absorbed, and this fact is in itself enough. The treatment of the subject is thorough and mathematically exact. The student is taught to deal with something more than tendencies. He learns how to appreciate the force and extent of the movements and currents whose nature he is considering. In each chapter of the work, certain brief and lucidly expressed rules are laid down, then examples illustrative of their working are set out, and finally a large number of problems based upon these examples are afforded for practice and further illustration. To these the answers are disclosed, so that the student is enabled to ascertain whether or not he has correctly grasped the theory, and properly worked out the mechanical part of the task. The little book is a most useful addition to the student's library.

How to enter the Royal Navy. By Ernest J. Felix. London: Simpkin, Marshall, Hamilton, Kent & Co. No date. Price 1s.

The subject of the little book is a very good one, and it aims at filling a niche which ought to have long ago been filled. The naval service is one which suits the temperament of young Englishmen. It is a profession of the highest honour, yet one to which the sons of relatively poor people may aspire. Parents who send their sons to serve their country at sea may know that they secure to their offspring healthy conditions of life and a certain means of livelihood. At the same time they are fulfilling a patriotic duty of the most important character. It is constantly brought to one's notice that if the way to get boys into the various branches of the Navy were better understood there would be no possibility of difficulty in obtaining all the officers (and men, too) that could conceivably be required.

The little book before us gives details of the cost of sending boys into the various branches, including the supply and accounting departments, and affords information as to the requirements exacted from candidates and as to the prospects which lie before them if successful in their examinations.

Details as to the various examinations are naturally dwelt upon. This is only to be expected when we remember that the author is intimately connected with a tutorial establishment. Copies of recent examination papers are given, and solutions to these, worked out by various officials of the establishment in question, are furnished in the appendix. It is thus possible, without much trouble, to ascertain the kind of instruction which intending candidates for the Royal Navy will need, and a standard is, at the same time, set up whereby the probabilities of success can be gauged.

Special attention is rightly directed to a memorandum which sets out some of the physical defects which will for ever debar a boy from thinking of entering the Queen's service afloat. Careful study of this is properly insisted upon, because it may save parents and boys from waste both of time and money and the following bitter disappointment

---

Feilden's Magazine for September and October, 1899, issues. London: The Feilden Magazine Co.

It is a poor compliment to British industrial art in general that everyone who has picked up the copy of this magazine, which has been lying for a couple of days on the reviewer's table, should have remarked, "So there's another new American magazine out," and not been convinced that it was "quite English, you know," till they opened its pages. The get-up both in illustration and paper is quite up to the best American standard, though the printing might with advantage be somewhat improved. For example, on page 218, September issue, eight and nine lines from the bottom there are two instances of broken type, and at the beginning of the fourth line on page 207 an "f" has fallen out. These things are trifling indeed. We only mention them to show that our criticism is discerning, and that, when we speak of other parts of the work as really excellent, we mean that they are as near perfection as can be reached in the present year of grace and under ordinary commercial conditions.

There are many articles in the September issue which deal with subjects rather foreign to our readers. But they will find them none the less instructive and interesting on that account. Amongst these we may notice a profusely illustrated article on the Great Central Railway. This runs through from the initial issue of the magazine. There is a description of the Colt Automatic Machine Gun, which it seems should be read by all intelligent students, for the gun in question seems likely to play a great part in future operations. Under the title "An Innovation in the Glass Industry" we read of a mechanical device for blowing glass. Professor Vivian B. Lewis continues his account of "Acetylene Gas Generators" up to date. Mr. P. R. Bjorling discusses piston and ram pumps. Sir William Roberts Austen speaks of the fractures which are made in projectiles in armour plates, and Mr. Scott-King writes on the "Construction and equipment of an up-to-date Engineering Works." This last article should be read by engineers and boilermakers with great care. It will certainly repay perusal. The same may be said of Mr. Tom Mann's contribution on engineering in Britain and America. Manufacturers who read may form their own opinion of the weight of his criticism of their methods in dealing with their workpeople. We will content ourselves with disputing his proposition that "neither Britain nor any other country can have or ought to have a monopoly of the world's trade." Without construing the word "monoply" in its most absolute sense, we are content to say that Britain did have as near a monopoly as was attainable a quarter of a century ago. She worked for it and she got it, There was no sign then that this was unfair to other nations. They had their agricultural and their other industries. Britain laid herself out entirely for commercial supremacy. She adopted free trade. She put her land out of cultivation. Surely there must be something wrong if after all this other nations, without making such sacrifices as we have made, are cutting seriously and deeply into our most cherished industries! Workpeople say the masters are to blame, masters blame the men. Strikes and lock-outs have had much to do with the falling off, no doubt. But the truth probably is that there are faults on both sides, and that too much prosperity has been bad for every one. If that be so, the re-action now coming will soon correct them—if the lesson come not too late.

The October issue contains, amongst other articles: "Governors: or, Control and Steadiness in Machinery," by Professor Robert H. Smith; "Modern Telephony," by A. R. Bennett, M.I.C.E.; "Machine Tools," by Ewart C. Amos, M.I.M.E.; and "A New System for Gas and Oil Engines."

The Shipowners' Technical Code Book. By Walter Phillips. London: Whitehead, Morris & Co., 1899.

The design of this work is to supply a code word, as far as possible, for every portion of the ship, be she steamer or sailing vessel, and for every part of her machinery, giving, where the parts for the different sides of the ship are different, alternative words which distinguish that required for the port side from that which goes to starboard. There are code words for dates, numbers, and latitude and longitude, and for a large number of matters and sentences connected with electricity. These latter, owing to the growing importance of electrical installations aboard ship, should be very useful. Special attention is also devoted to the section which comprises miscellaneous sentences. The code is designed in short, for communications between the shipmaster and the owner, though it is also likely to be largely availed of by underwriters, surveyors, and salvage people. The author seems to have made an exhaustive list of the things which are likely to need cabling, and we do not doubt that the book will prove very useful to the classes for whose benefit it has been compiled.

Recent applications for Patents connected with Marine Engineering, Ship Construction and Mechanical Appliances for use in Ships, from June 8th to October 12th, 1899.

20458 A. Walbrecker. Shaft bearings.

OBITUARY.

CHARLES SHENTON DU SAUTOY.

THE death took place in Southampton, on the 8th ult., of Mr. C. S. Du Sautoy, who was for many years superintendent engineer of the Union Steamship Co. of South Africa. Fully two months ago he was suddenly seized with illness when engaged with his favourite pastime of bowls, and never recovered; his end was not altogether unexpected. He was 49 years of age, and was the son of Mr. H. Du Sautoy, who was for many years chief in the service of the Royal Mail Co., and later was superintendent of the company's works at Southampton Docks. Mr. Du Sautoy was an officer of the Royal Naval Reserve, being one of the very few men holding the rank of honorary chief engineer in Her Majesty's Navy, a distinction of which he was very proud. He was president of the local branch of the Institute of Marine Engineers, as well as a member of the central executive, and a prominent Freemason.

Notice of Removal.—Mr. Arthur Hamburger (representing Guilbert-Martin) has removed his London depôt from 1 and 2, Falcon Street, to larger and more commodious premises situated at 9, Edmund's Place, Aldersgate, E.C., where, owing to an increased stock, especially of gauge glasses, cylinder tubing, rod, and enamels, he will be in a position to execute orders more promptly.

Palermo.—We understand that a new shipyard, fitted out with the best and newest machinery, is being laid out at Palermo.

Marine Engneers' Examination.—At the quarterly examination of extra first-class engineers, held in October, Liverpool takes the lead this time again, and Messrs. Robert A. McMillan and Charles P. Parry were successful. The two candidates passed the first attempt, and were prepared at Pritchard's Marine Engineering Academy, 8, Walton Road, Liverpool, this making 10 successful candidates this year.

"**Arechondo**"—On October 24th, the steel screw steamer *Arechondo*, built by Messrs. Craig, Taylor & Co., of Thornaby-on-Tees, to the order of Mr. Antonio Uribe, of Bilbao of which we gave particulars in our October issue, page 328), proceeded to sea for her trial trip in the Tees Bay, The engines gave every satisfaction, a speed of 10½ knots being maintained on the run from the Tees to the Tyne, in the face of a heavy wind and strong tide. The owner was represented by Captain Jose R. Bollar, and Mr. F. Lawrance, of Messrs. W. Dickinson & Co., Newcastle.

BOARD OF TRADE EXAMINATIONS.

EXTRA FIRST CLASS.

October 21st, 1899.	Coe, Alfred E. ..	Ex. 1C	London

The Marine Engineer.

LONDON, DECEMBER 1, 1899.

THE Americans have decided, as far as their expert inspectors and reporters go, that submarine torpedo-boats shall be adopted for the defence of their ports. Some months ago we gave a description of the *Holland* submarine torpedo-boat as far as its details were known, which was then being developed and perfected by its proprietors. It would appear that an official test has been made with one of the boats of the proprietary company, which is one of two laid down in 1897. It is 50 ft. long, with a beam of 11 ft. and a displacement of 138 tons, and is thus smaller even than a second-class British torpedo-boat. It has only an I.H.P., as far as is known, of 50. It does not attempt to develop a speed of more than eight knots. As its power of submergence is its means of safety, it is obvious that no high speed is required, and, as its attacks are to be made by stealth, eight knots would be ample for the boat to stealthily approach its object with its fell purpose. The U.S. Naval Strategy Board stipulated that the boat should carry three torpedoes in place, and be prepared to discharge them whilst going at full speed, both when submerged and unsubmerged. The course decided was a two-mile trial off Sandy Hook, the boat to start submerged, to come to the surface at the end of a mile and discharge her torpedoes at a boat anchored near the buoy marking the end of the run. She was then to sink again and return to the starting-buoy under water. This programme was carried out, and it is stated in addition that a torpedo was fired at a target 800 yards distant, but we are not informed with what success, which latter we should consider doubtful. The Board say the test has demonstrated the boat to be equal to the requirements of the Naval Strategy Board, and Chief Engineer Lowe states that the boat is capable of making a *bona-fide* attack without being seen or otherwise detected. It is an engine of warfare of terrible potency. It would thus appear that the American engineers have succeeded, after great patience and perseverance, in perfecting a submarine torpedo-boat, which has so long been amongst the possibilities. It is, of course, reported that the French also have a submarine boat, which is said to be a practicable success and of which some are now being built. Sorry as we may all be to see marine warfare carried out by such stealthy and submerged weapons of offence or defence, we must not shut our eyes to the fact that such submarine engines of destruction appear now to be within the bounds of practical politics, and we must not be behind our friends and enemies in experimenting upon the possibilities of even such noxious insects as submarine torpedo-boats.

THE Reverend Edward Lyon Berthon, who has just died at the ripe old age of eighty-six, deserves an obituary notice at our hands. Mr. Berthon was a descendant of an old French Huguenot family of the old noblesse, his great-great-grandfather being one who survived the great massacre following the revocation of the Edict of Nantes, and escaped and settled in Lisbon, the next generation emigrating to England. The Rev. E. L. Berthon was a man of great versatility of talent, being an artist and an accomplished astronomer and archæologist; but it is as a great and successful mechanician that he is best known to the engineering world. The Berthon collapsible boat is now in use in every navy, both mercantile and fighting, of the world, and the demand for these boats gave employment to a large factory and an immense number of hands, and upon their supervision and organisation Mr. Berthon devoted much time and energy, having given up for some years his post as vicar of Romsey. The Berthon collapsible boat is no doubt well known to our readers in its present simple and perfected form, but few would imagine the difficulties presented in the task, and the persistent ingenuity required from the inventor, for the perfection of the boat in its apparently simple present form. It was first tried to make the longitudinal ribs of solid wood, steamed and moulded to form, but this was not found to answer, and eventually they were built up of a number of thin pieces, all bent on a mould bench and riveted together. When so formed they have no tendency to straighten themselves from the form in which they have been built and moulded. The flexible covering also gave much trouble. Indiarubber-coated canvas was first tried, but was not satisfactory: the rubber covering rapidly perished, and it was too dear. Eventually a paint was found which would not crack nor become sticky in any climate, and which would retain its nature for many years. Mr. Berthon's mechanical inventions were not limited to his boat. He invented many ingenious mountings for his telescopes. He dabbled also in the screw propeller, and invented a very successful perpetual log based on the principle of the difference of the level of the water in two tubes passing through the ship's bottom and terminating in nozzles of diverse directions, determining the differential height of the water and indicating the speed by inspection at any moment. In all departments of mechanical or artistic skill Mr. Berthon showed his extraordinary talent and fertility of resource, by which he would no doubt have achieved a much higher and recognised position amongst the engineering luminaries of his day, had he commenced his career by more directly adopting the profession in which he was so eminently calculated to shine.

THE Hon. Charles A. Parsons has, in his presidential address to the Institution of Junior Engineer, given many interesting details of the *Turbinia*, and forecasts as to the probable adaptability of the turbine system to vessels of a larger size. The problem of proportioning an engine of so novel a class to the screw propellers, and to the vessel to be driven, has been the subject of costly experiments extending over several years. The *Turbinia* was commenced in 1894, and after many alterations and preliminary trials was only satisfactorily completed in the spring of 1897. A satisfactory solution has been found, giving very economical results in regard to pounds of steam consumed in the engines per effective H.P., which are equal, or superior, to those so far obtained with triple-expansion engines of ordinary type in torpedo-boats or destroyers, and with almost a total absence of vibration at the extraordinary speeds realised. The arrangement adopted is that, instead of placing, as usual, one engine to drive one shaft, the turbine engine is divided: two, three, or sometimes more separate turbines each driving a separate screw shaft, the steam passing successively through these turbines as a high-pressure, intermediate, and low-pressure engine successively. As to the propellers, they approach closely to the usual form, but it has been found best to place two propellers of approximately the same pitch on each shaft at some considerable distance apart, so that the after one is out of the wash of that in front. Cavitation behind the blades of the propellers also gave much trouble at the high speeds of rotation required, such cavitation commencing when the mean thrust pressure on the projected area of the blades exceeded 11¼ lbs. per square inch. On each of the three shafts of the *Turbinia* are three propellers, making nine in all. The water-tube boiler with which she is fitted has 1,100 ft. of total heating surface and 42 square feet of grate area. The turbine motor is now being applied to two torpedo-boat destroyers—one, the *Viper* for our own Government; and the other, a similar vessel for Sir W. G. Armstrong, Whitworth & Co. The boilers are 12 per cent. larger than in such a destroyer, and it is estimated that 10,000 H.P. will be realised from them. The estimated speed for going ahead is 35 knots for these vessels, and upwards of 32 knots has already been reached in the preliminary trials of one of these boats, and at the time of going to press it is reported that 37 knots has been attained. The conditions appear to be favourable to Mr. Parsons for the application of motor turbines to cross-channel boats, fast passenger vessels, cruisers, and liners, the absence of vibration, with enormous speed and lighter draught of water, being obvious advantages. Mr. Parsons considers it possible to build a light unarmoured cruiser of, say, 2,800 tons displacement, to travel for about eight hours at 44 knots.

THE American naval constructing yards are now seriously competing with the British yards in carrying out orders for foreign navies. The construction of the Russian battleship *Retvizan* is progressing in Cramp's yard at Philadelphia. The plates are being provided from Messrs. Carnegie's works under the Krupp process, and some 5-in. plates for the quick-firing battery have proved most successful in their resisting power. The plates showed no sign of perforation with 5-in. shells, and consequently no reliable figures are available as to its ultimate resisting power. At any rate, such Krupp process plates are at least more than equal to a wrought-iron plate of 2½ times its thickness. It is only in the British Navy at present that the quick-firing batteries will be found to be protected by anything like resisting armour to this extent; and, should foreign navies now adopt armour of this degree of resistance, heavier quick-firers, such as 7·5-in. or 8-in. guns, will be required to do any execution. The battle, therefore, between armour and guns is still being waged in as lively a manner as ever, the application of the Harvey and Krupp's process to steel plates having now more than doubled the defensive value of the armour weight for weight as was the case with simply wrought-iron plates.

PATENT DROP RUDDER.

THE advantages of a rudder forward, as well as one at the stern, have been recognised for many years, particularly in vessels plying in waters where the navigation is rendered difficult by the presence of a large amount of shipping, or the available passages are narrow, or the currents are strong. For example, some of the excursion steamers on the Thames are, we believe, provided with fore and aft rudders. The difficulty, no doubt, has hitherto been to arrange the rudder in an effective position, and house it snugly and securely when not required.

We have now the pleasure of describing and illustrating an arrangement of forward rudder, which, as far as our knowledge goes, has considerable novelty. In the adjoining diagram Fig. 1 is a side view of the rudder projecting downward from its tube or housing. Fig. 2 is a vertical section on the line *A B* in Fig. 1. Fig. 3 is a transverse section on the line *C D* in Fig. 1. Fig. 4 is an outside longitudinal elevation of a boat fitted with this rudder.

The main feature of the device is that it is a drop rudder, and, therefore, can be drawn up within the body of the hull when not required, thus not forming an obstruction to the progress of the vessel in its inoperative position. It will be seen from the illustration that the rudder is mounted within a narrow elongated tube, or housing, formed in the hull of the vessel with an opening through the keel into the water below. The rudder, which is of the balanced type, is attached to a stiff rudder-post, which latter is journalled at its lower end in a bearing held in vertical guides carried by the tube, so that it can slide up and down therein. When the rudder is drawn up into its tube the bearing is carried up with it.

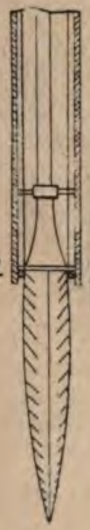

FIG. 2

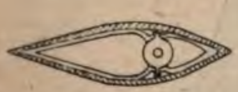

FIG. 3

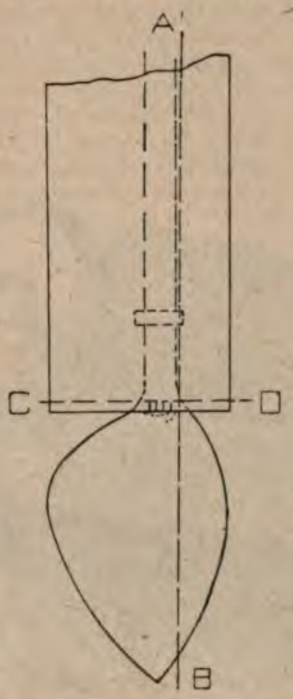

FIG. 1

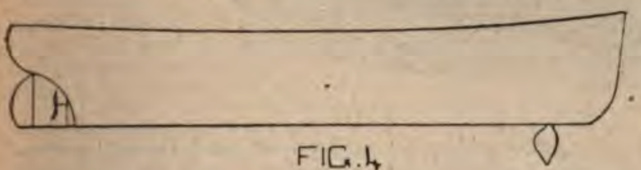

FIG. 4

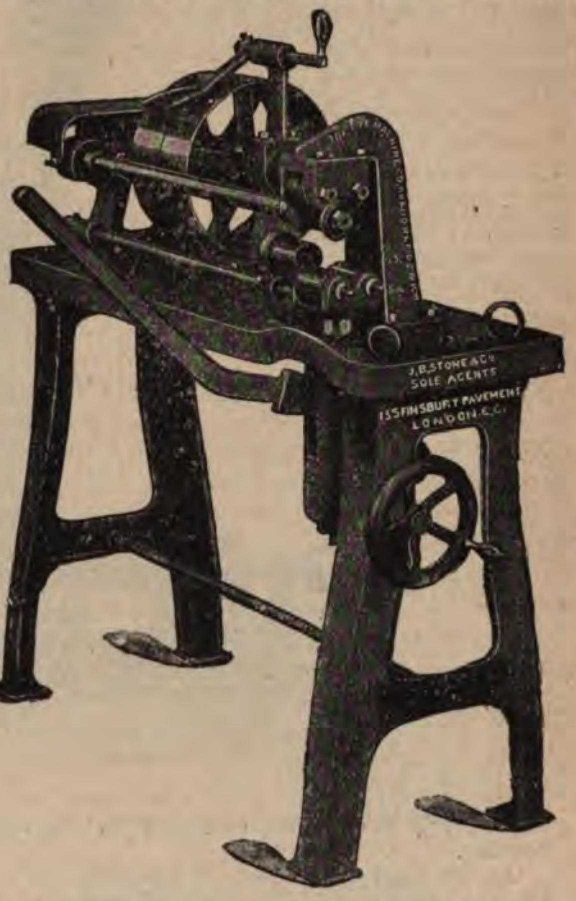
It is a matter of common knowledge that with the ordinary stern rudder the angular displacement of the ship is mainly effected at the after end, whereas with a rudder at either end it can be displaced angularly at both ends, or the ship can be displaced laterally in a diagonal direction, maintaining the axis of the ship parallel to the direction it had at the commencement of the steering operation.

Further, if required to check the vessel's progress, it can be turned through 90 deg. to a position normal to the direction of motion. It forms a reserve rudder in case of damage to the stern rudder, and when a vessel is hove to will keep it in the eye of the wind. It is claimed that in stormy weather it steers better than the ordinary arrangement, as the force of the wind has a greater disturbing force forward than aft. In a cross sea it makes the steering easier owing to its being balanced, and in the case of sailing yachts it is stated that it holds them better to windward, is more effective, and not so detrimental to speed as the old-fashioned arrangement. The device is being put upon the market by Mr. W. O. A. Lowe, of 86, Leadenhall Street, London, E.C., and c11, Queen Insurance Buildings, Liverpool.

THE FOX TUBE OR PIPE CUTTING MACHINE

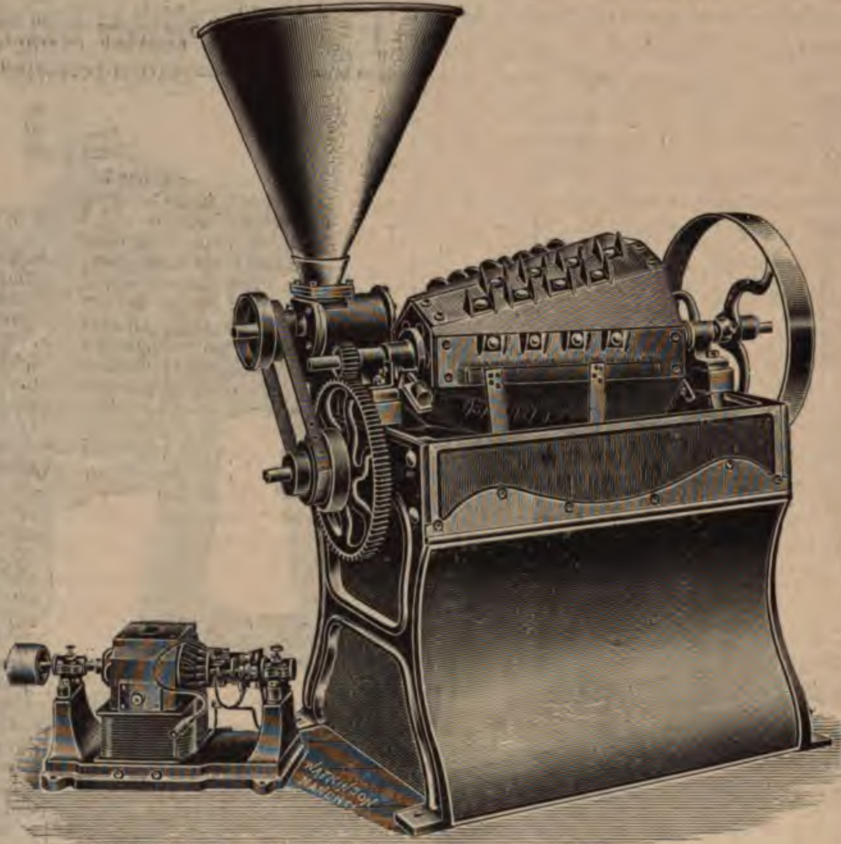
THE machine which we illustrate in the adjoining diagram is another example of the ingenuity and ability for adaptation possessed by American toolmakers. It has been specially designed to cut heavy tubing, such as boiler tubes, steam and gas pipes to length, quickly and accurately.



It will be seen from the illustration that the machine is constructed on the same general principles which obtain in ordinary tube cutters, with the exception that it is specially designed to withstand very heavy pressures.

The driving shaft is heavily geared to the shaft carrying the cutting disk, the latter making one revolution to three of the counter shaft. All the gearing is cut and the pinions are of steel. The bearing rolls are of hardened steel and large in diameter. The lower rolls are carried in an adjustable bearing block, which is elevated and lowered by the hand wheel shown on the end of the machine, the motion being transmitted by means of bevel gears. In this manner these rolls may be almost instantaneously adjusted to cut pipes and tubing from ⅜ in. to 2½ in. outside diameter.

The proper adjustment is that which brings the pipe just clear of the cutting disk when pressure on the hand lever forces the pipe up against the rotary cutter, quickly separating the tubing. The hand lever terminates in a cam directly under the plunger which carries the lower bearing rolls, and will elevate them ⅜ in., the handle returning to its original position.



On the shaft at the back of the cutting disk is a hardened steel sleeve, which in turn bears against the two anti-friction rolls at the top, thus distributing the upward pressure of the cut over a large surface. An adjustable stop is provided to take material up to 6ft., so that duplicate pieces may be rapidly and accurately cut.

It is interesting to note that upon actual test an ordinary piece of steam pipe 1 in. in diameter was cut in 10 seconds, and a piece 2½ in. diameter in 30 seconds. The fast and loose pulleys are 12 in. diameter, and 3 in. face, and run 450 revolutions per minute. This machine is put on the market by Messrs. J. B. Stone & Co., 135, Finsbury Pavement, London, E.C.

PATENT ELECTRO-MAGNETIC SEPARATOR.

THE accompanying illustration shows an improved patent apparatus for separating iron and steel particles from brass and other cuttings, and which is already in successful use in several important engineering works and brass foundries. This machine is being introduced by Mr. J. F. Butterworth, 28, Queen Street, London, E.C., has been named the patent "electro-magnetic" separator, and the following description of its leading features will be of interest to our readers. The apparatus consists of a rotating conically-shaped drum, in connection with a trough, and carrying on its periphery a number of electro-magnets arranged in rows. These rows of magnets are connected by wires to each other, and also to a segmental brass rings fixed in insulated segments concentrically to each end of the drum, each segment receiving the wire of one row of magnets. On each side of the segmental rings is arranged in contact an annuler brass ring, which always exposes about a third of the segmental ring, and these annuler rings are connected to a suitable electric source. They are stationary in relation to the segmental rings, and set up against their sides by means of springs. The trough underneath the drum runs parallel to the periphery of the latter, and extends a short distance below its centre, its upper end being formed with a hopper furnished with a feed-worm, and its lower end with an outlet. The metal cuttings to be separated are placed in the hopper and conveyed by a worm to the trough. When the drum is rotated the rows of magnets passing under the annuler ring are magnetised, and, in going through the cuttings, pick up the iron or steel filings; whilst as each row of magnets leaves the ring it instantly becomes demagnetised, and the iron or steel cuttings fall by gravitation into a receiver underneath. The conical form of the drum causes the filings as they are separated from the iron or steel particles to be gradually carried forward and discharged into a receiver. As will be seen, the special feature of this separator is the introduction of electro-magnets instead of permanent magnets, which enables them to be controlled, and secures a constant magnetic, force which is not obtainable with the permanent magnets hitherto mainly in use. Another feature is the patent automatic knock-off motion already described, whereby the magnets are demagnetised for a small portion of each revolution, allowing the iron collected to drop into the receiver, and leaving the magnets free for a new collection. It is claimed that this separator will give a largely-increased output as compared with that obtainable from other machines, averaging 2 to 2½ tons per day, and no skilled labour or attention is required. It is supplied either separately or with its own dynamo, and requires about 1 H.P. to drive the combined arrangement. Where electric current is available the separator can be adapted to suit the voltage of supply.

THE FLEETS OF THE MAIL LINES.

(*From our own Correspondent.*)

Details of the Remarkable Voyage

of the steamship *Waikato* are now to hand. The vessel in question has achieved the distinction of reaching the port of Fremantle in no less than 157 days after sailing from London. She started on her usual trip to New Zealand ports on the 4th May of the present year, and in due course passed Teneriffe and the Cape. The latter was sighted at 7 p.m. on the 3rd June, and almost immediately the ship's troubles began. The first things to go wrong were the air-pump guards, which caused three stoppages of the machinery in the next two days. But the real trouble occurred at 2 p.m. on the 5th of June, when the tail-shaft broke in the tube. Owing to the position of the fracture repairs of any kind were out of the question. The vessel would not steer and had to be allowed to drift. Attempts were continually made to make her navigable, both by the setting of additional canvas, made from the vessel's awnings and such like, and by the laying out of sea-anchors. But till the 28th July—a period of 55 days—nothing was sighted. Then the Liverpool barque *Tacora* came along and tried to take the big unwieldy steamer in tow. Her attempts extended over a period of three days, but the weather was unfavourable, and she was in slight collision with the tow on no less than three occasions. At last she bore away, taking with her the first news that the *Waikato* was still afloat. In consequence of her report H.M.S. *Melpomene* was sent out from Mauritius to look for the helpless vessel, but she managed, after 17 days' cruise, not to find her, keeping, as the event proved, too far to the northward all the time. Three days after the departure of the *Tacora* the Danish barque *Aarlborg* was spoken, and took away some letters. Another 30 days passed before the next craft—the *Banca*, of Glasgow—was seen and then the weather did not warrant the sending away of a boat. On the 8th of September, only six days after the previous sighting of a vessel, the *Alice*, of New York, came up. She provided the *Waikato* with some provisions, and also with sails to replace those which had been lost. Five days later another sailer was sighted, and at last on the 15th September the sight of a steamer's smoke told the prisoners that the *Asloun*, the vessel which was to prove their deliverer, was at hand. They had then been drifting for 102 days in an absolutely aimless manner, going in every direction over a comparatively small stretch of the Indian Ocean at the mercy of wind and current. The *Waikato* is reckoned to have traversed in that time a distance of 4,552 miles. The average movement was thus about forty-five miles a day. The master of the *Asloun* promised to tow the *Waikato* into Fremantle, the port to which his own ship was bound, the distance being no less than 2,521 miles. He mentioned, however, that he had only 17 days' coal in his bunkers. But that fact was not allowed to interfere with the result, for the two ships proceeded to Amsterdam Island, a tiny rock, which lent them some little shelter whilst under its lee, and there in the ships' boats a hundred tons of coal from the bunkers of the *Waikato* were transferred to those of the *Asloun*. This operation was accomplished on the 20th and 21st September, all the boats of the *Waikato* being employed. It was not got through without difficulty and some risk, for the vessels drifted away from the land, and had to steam back into position, with the boats astern. The voyage was resumed on the 21st, but the *Waikato's* dangers were not over. In very heavy weather on the 28th September the hawsers broke and the vessels lost sight of one another. So heavy was the weather on this occasion that the *Asloun* actually started her funnel with her rolling. Next day, however, the towage was recommenced, and continued till Fremantle was reached without further incident on the 8th of October. The experience of those on board the *Waikato* must have been a very trying one. A diet of tinned sardines in the first place must have been horribly monotonous, when it extended over so many months, but the strain of watching for help, which was at first so disappointing, and in effect so long delayed, at all events in effectual form, must have been far worse. It says much for the officers and men in both the navigating and engineering departments that there was no trouble on board, and that when the coaling was suggested all hands turned to with a will on what seemed so unpromising and dangerous an operation.

The settlement of the award for the *Asloun's* services will be awaited with some interest.

La Compagnie Generale Transatlantique

seems bent on renewing and modernising its fleet. The old steamer *Washington*, built as a paddler on the Clyde as long ago as the year 1863, has been disposed of, and two new steamers have been purchased for the new cargo line to New York. This service, as will be remembered, was opened a few months ago with the Lund Line *Wooloomooloo* and the French steamer *Chateau Lafitte*. The new departure seems to have been justified, for now these two large vessels are being purchased. They are both modern steel vessels belonging to well known British lines. Both were constructed in the year 1891. One which will in future be known as the *Bordeaux*, is the Johnston liner *Sedgemore* of 4,332 tons gross, and of a length of 406 ft., built at Liverpool by the Messrs. Royden. She was fitted with triple-expansion engines by Messrs. J. Jones & Co., of the same city. The other vessel was the Wilson liner *Francisco*, now to be called the *Pauillac*. This vessel has about three hundred tons greater gross tonnage than the *Sedgemore*, though she is about thirty feet shorter. She was built and fitted with a set of triples by the well known firm of Messrs. Robert Stephenson & Company, of Newcastle. These purchases following that of *L'Acquitaine*, and the commencement of the new mail boats, looks as though the company intended to keep itself well to the front in the future.

The Condition of the River Thames.

In last month's Notes I mentioned the deplorable condition of the River Thames, whereby the Atlantic Transport Company's *Marquette*, inward bound from New York, lost 12 hours in getting into Gravesend. It appears that this delay, irritating and expensive as it is to the owners, will—unless very vigorous measures be taken by those using the waterway—only be the beginning of their trouble. The owners of the *Marquette* are building two steamships, at least, of the size which Liverpool shipowners find most profitable, namely large carriers which can be loaded down to a 30-foot draught. No attempt is being made by the Conservancy to deal with the work which is coming to it. It says it has no means to pay for the necessary dredging, and that the work which provision for such large vessels would entail would cost it a couple of millions. It further says that in view of the small number of ocean steamers frequentin “ port, and the large number—*number* and not *tonnage* remark—of small craft entering the navigation, it is unnecessary to provide for big vessels, which will only be subjected to a "little" detention and "slight" inconvenience if things remain as they are. This thing is nonsense, as the experience of all other ports worthy of the name either in Great Britain, Germany, the Netherlands, Canada, or the United States—if they would engage in the Atlantic passenger or cargo trade—has shown. It now becomes a question whether Londoners are so enamoured of the Thames Conservancy that they will keep it and its mediæval ways of thought and of action in preference to their supply of grain and of meat. If they keep the former, and retain a museum of men with fossilised ideas, they will assuredly lose their big cargo trade, and will also have to pay railway charges as well as freight on the vast majority of the food-stuffs that supply their tables.

The Transports.

A good deal of nonsense has been talked in the daily press about the mismanagement of the Admiralty in regard to the transport of the Army Corps to the Cape. It has been asked why such vessels as the unfortunate "Z's" were taken, and steamers of the class of the *Lucania* and the *Oceanic* were left. The answer to that is easy enough. The engagements of vessels like the *Oceanic* and the *Lucania* are constant and pressing, and are made long beforehand. Anyone who looks into the Admiralty Court when a case of salvage by towage is being tried, and who hears something of the engagements, both in prospect of herself and of her line, which attend the working of even an Atlantic cattle boat, will understand this. Had the Government been in a position to go round a few weeks before the war was sprung upon us by the Boers, and ask the shipowners to reserve them tonnage, they could—at a price reasonable enough considering its value and its engagements—have secured the finest ships that fly the blue ensign. But when war came it was sprung on the Government. The vessels of the highest class were either at sea or about to sail. The Admiralty merely asked tonnage of the class it usually takes. It got it, and got it to the extent of the whole steam tonnage of nearly any mercantile marine save our own. It got it, too, at very fair average rates, and without in any way dislocating the trade of the empire. True, it has stiffened rates of freight a bit, and—in conjunction with other factors—sent up the price of coal; but our mail lines are still carrying on their business, and our cargo boats still bring in our daily bread and meat. Naturally, at the first call, the spare boats of the mail lines were offered—so, too, in the case of the mixed passenger and cargo lines. These were the best ships available, save perhaps the new steamers preparing for sea which were in a position to be hurried forward and completed for troopships, perhaps sooner than their passenger fittings could be put into them. Where the Admiralty went wrong was in taking vessels that were out of a job. That it only did in a couple of cases, and those errors which it made early in the business could have been avoided if its officials had had five minutes' conversation with an intelligent chartering clerk in the city of London. What is much more to the purpose is the consideration of three things. First, how it was that the proper loading of the transports was neglected, and that some of them were sent to sea too light, when they might have taken out coal for the home trip and so saved the country very large sums of money. Secondly, why the temporary fittings, alike for horses and men, were so long being put aboard, and why they were of the character which was chosen, which, in many cases, is not that which the best experience of those engaged in the trade of horse-shifting and man-carrying recommends. Lastly, why bad food for men and horses was accepted from rascally contractors. These things will have to be gone into thoroughly when the war is over. At present I merely note them. But the conduct of Mr. R. P. Houston, M.P., alike in regard to his *employes*, to the Government, and to faulty stores, should not go without a word of recognition.

Amid the nonsense that has been talked I notice one statement that should have a specific contradiction. The *Arawa*, now of Messrs. Elder, Dempster & Company's fleet, is in no sense a sister ship, as has been so repeatedly stated, to the *Zibenghla* and the *Zayathla*. She is younger, larger, and comes from a different yard. She even belonged to a different fleet. The only characteristic she has in common with the vessels in question was the fact that at one time she was engaged in the same trade with them. The delays which she suffered were in no way due to her propelling machinery, and she made an excellent passage as far as the Canary Islands.

The "Tainui,"

which is really a sister to the *Arawa*, in the most exact sense of the word, has just changed hands. Since her departure from the New Zealand trade she has been variously employed, most recently in the Allan Mail Line between Liverpool and the St. Lawrence. It is now announced that she has been acquired by the Anchor Line, and she left Liverpool for Glasgow on the 20th November.

Further Transports.

As the time goes on and the needs of the Admiralty are more appreciated by shipowners, the class of vessel available has much improved, in speed, at least, though in other regards the great majority of the vessels taken are quite as good as need be. Amongst the latest charterings are the new steamer *Sicilian*, of the Allan Line, which has not yet made a voyage; the *Canning*, of Messrs. Lamport & Holt; the *British Princess*, of the British Shipowners Company; and two famous Atlantic passenger boats, the *Majestic*, of the White Star Line, and the *Canada*, of the Dominion Company. The Admiralty has undoubtedly got speed in these vessels if it can use it. Yet I cannot but think that the general public will be highly disappointed with the passage of a 20-knot Transatlantic liner if the authorities treat her as they have treated their previous chartered ships. A vessel to do herself justice must be loaded according to certain ascertained principles well within the knowledge of everyone connected with the mercantile marine. She must have hold of the water, but she must not be laden too deeply, and the adjustment of weights with regard to the diminution of coal supply and provisions during the trip must not be lost sight of. The ship must be stable and yet not too stiff. Yet in their treatment of the ships the Admiralty has hitherto despatched, all these elementary propositions seem to have been quite ignored, and, crowded as they were with all manner of stores, it is not surprising that slow runs were made. If the ships had not been staunch indeed there might have been worse disasters than the breaking of the thrust shaft of the *Persia*, which up to now is the only real breakdown to be chronicled. The steam-tug *Blazer*, of Liverpool, which has done so much good service in the past, was opportunely at St. Vincent when the *Persia* broke down, being there to tow home a disabled Italian steamer, and she quickly brought the transport into safety.

The "Kaiser Wilhelm der Grosse"

is steadily cutting away at her own record and making the task more and more difficult for any who should be bold enough to desire to take it from her. Leaving Southampton on the evening of the 22nd October, she reached New York at 11 a.m. on the 28th, having steamed 3,047 nautical miles in five days 17 hours, and 48 minutes. This shows an average speed of 22 knots. She was turned round very rapidly at both sides of the Atlantic, and sailed again from Southampton on the 15th November. This time she again achieved a diminution of her time from Cherbourg, but I have not yet obtained details of her performance.

The Hamburg-American Line

has sustained a serious loss in the burning of their fine steamship *Patria* in the German Ocean. This vessel was a twin screw four-masted steamship of about 6,600 tons gross, built at Stettin by the Vulcan Company. She was but five years old. Homeward bound from New York to Hamburg with 150 passengers, 120 crew, the mails, 16 valuable racehorses, and a large and valuable general cargo, she passed Dover, apparently all well. on the morning of the 15th November. Some four hours later at 11 o'clock, an alarm of fire was raised. With incredible speed it seemed to spread, and though every effort was made to combat it, it was found necessary to put the passengers into the boats. This difficult work was safely accomplished; a Russian steamship, the *Ceres*, soon picked them up and landed them at Dover by means of a tug. Of the passengers it may be said that all was well, save that the shock was too much for one of them, who succumbed shortly after landing. The crew stuck to their ship manfully. But though help was forthcoming from the company's steamship *Alesia*, an attempt to tow the burning vessel into Hamburg proved impossible. Captain Frohlich had at last to remove his men, and the vessel was abandoned. Attempts were made by various ships to take her into some port but without avail. At last the Hamburg Line's *Hansa* (to which Captain Frohlich himself and another experienced commander of the line had been transferred) got hold and made for the English coast; the German tug *Simson* came to assist and a British cargo boat got a line out aft to give the tow steerage way. But off Deal the ill-fated vessel's sides burst open, and she went down in about seven fathoms of water aft. Her bows just showed. She is, however, a total loss, being completely gutted. So fierce was the heat, fed on such combustibles as linseed, wax, oats, and bran in the cargo, that the steel decks melted. Nothing seems to have been saved except human life. The mails, racehorses, psssengers' and crew's effects, all were lost. It is a merciful thing indeed that the disaster occurred in perhaps the most crowded waters of the world and in calm weather. Had it taken place in darkness and storm at sea the results might have been dreadful to contemplate.

The "Oceanic"

has seen some real Atlantic weather on her third outward trip, which she made with a full complement of passengers against heavy wind and seas from the westward. She has by her behaviour confirmed the reputation her first performances won for her, being very easy in her movements, and quite free from vibration. Her passage on this occasion was about six days eight hours, though she was never pressed, and, at times, was reduced to less than two-thirds of her power. The weather on the worst day was noted as having increased to a hurricane. Yet against that she did 377 nautical miles, and did it without inconveniencing those aboard of her. The time of her eastward passage was spoiled by a detention at New York, on account of fog, which kept her inside of Sandy Hook till fifteen hours after her usual sailing hour.

The Manchester Liners, Limited,

which was registered last year, started its business with two steamers, the first of which was called, after it took her over, the *Manchester Enterprise.* This vessel is now reported as having foundered in the North Atlantic on the 15th November, whilst on a voyage from Manchester to the St. Lawrence. The steamer in question was originally named the *Queensmore.* and was built in 1890 for the Johnston Line by Messrs, Gourlay Brothers, of Dundee. Her length was 360 ft., and her gross tonnage under 3,800 tons. The Manchester Liners, Limited, has since it acquired its first ships ordered seven further vessels, six of which are already in the water. They have all been constructed on the East Coast. Their size is much more ambitious than that of the vessel now lost—running in the case of the *Manchester Corporation*, built at Hartlepool by Messrs. Furness, Withy & Co., up to 5,367 tons gross register.

Shipbuilding Companies.

Messrs. Vickers, Son & Maxim find the expansion of their business—which, of course, includes that of the old Naval Construction and Armaments Company of Barrow—so great that they seek to raise a further three quarters of a million sterling. This it is proposed to obtain by the issue of a quarter of a million £1 shares, at a premium of 200 per cent. So prosperous are they that it is thought that the existing shareholders will feel it a favour to be allowed to take up this allotment, premium and all, in proportion to their present holdings. Messrs. John Brown & Company, who recently purchased the Clydebank yard, offered 500,000 new ordinary shares at a 50 per cent. premium in August, to aid them in paying for their new acquisition, which was valued at something over a million sterling. They now propose to make an issue of 48,000 preference shares of £10 at a 20 per cent premium, whereby a sum of £480,000 more should be realised. The money is required to complete the purchase of Clydebank. From the prospectus some interesting information is obtainable. The shipyard was taken over on the 2nd of September last. The establishment has acquired new machinery within the last four years to the extent in cost price of over a quarter of a million. It has unexecuted contracts on hand whose aggregate value is over three millions. These include the construction of five large Atlantic liners, a battleship for Japan, and three first-class cruisers for the Royal Navy.

Bristol.

In last month's Notes I expressed a doubt as to whether or not it were worth while discussing the Bristol City Council's latest proposals for improving the facilities of the port. Whilst the notes were being printed, the whole scheme was withdrawn by its author, Alderman Proctor Baker, who found, just as he was going to the meeting which was to confirm the direction to go to Parliament for powers, that the suggested new service had fallen through. Thus he felt bound to give the matter up. The time for entering new schemes is now past, and Parliament cannot therefore be asked to sanction any proposals for improvements in the Avon for another year. Meanwhile, by order of the Postmaster-General, Messrs. Elder, Dempster & Company have been obliged to remove their weekly mail line of Canadian steamers from Bristol to Liverpool, and so Bristol is already worse off than she was before. In this connection—though it no longer concerns Bristol directly—it is well to notice that the *Lake Erie*, the first of the twin screw vessels specially designed for this mail service, was launched on the 18th November. She is the first of a fleet which next year will tend to make the St Lawrence competition even keener than it has been of late. The trade will, however, it is said be relieved next season of one competitor, for it announced that Messrs. Frederick Leyland & Company intend to put their vessels now running to the St. Lawrence into the New York trade as an opposition to the White Star and Cunard Lines.

THE BABCOCK & WILCOX MARINE BOILER.

THE resurrection and revival of the water-tube boiler, and its successful employment for naval purposes, has naturally raised the question as to whether such boilers cannot be used with general advantage in the mercantile marine; and, as might have been expected, the opinions expressed by engineers have wide points of difference, varying between the extreme opinions that there is nothing to hinder their immediate adoption, and that such boilers are not, and never will be, fit for mercantile steamships.

It is but fair to state that the controversy, both in political and professional circles, has practically revolved round one particular form of water-tube boiler, so that the general merits of the case have been, no doubt, confused, and in many instances entirely lost sight of.

We propose in this article to give our readers some small idea as to what is being, and has been, done by Messrs. Babcock & Wilcox, Limited, in the matter of water-tube boilers afloat.

We will first direct our readers' attention to the adjoining illustrations, of which Fig. 1 shows a cross section and front elevation of a boiler as fitted in passenger and cargo steamers. This boiler has about 2,750 square feet of heating surface, 58 square feet of grate surface, and a working pressure of 225 lbs. per square inch, and with natural draught will develop about 8,200 H.P. Turning now to Fig. 2, we see a perspective view of one of the four boilers which have been fitted in H.M.S. *Sheldrake*, whilst Figs. 3 and 4 show respectively a longitudinal sectional section and front elevation of the same boiler.

It will no doubt be remembered that the *Sheldrake* is a torpedo gunboat of the *Salamander* class, with twin-screw triple-expansion engines of 3,500 H.P. collectively. The total heating surface in each boiler is 2,356 square feet, and the grate surface 63 square feet The boiler pressure is 200 lbs. per square inch, reduced at the engines to 150 lbs., the steam on its way passing through separators.

There are 19 sections of tubes in each boiler. The tubes throughout are of solid-drawn steel, galvanised on the outside. The diameter of the tubes connecting the headers and iron boxes is 1 13-16ths diameter, and their length about 7 ft. 6 in. The uptake headers are connected to the steam and water drum by 4-in.

tubes, the down tubes being the same diameter. The level of the water is regulated by Thornycroft's feed-water regulators. In the trials these boilers were found to be capable of burning 42·2 lbs. of coal per square feet of fire-grate, and of evaporating 337 lbs. of water per square feet of fire-grate.

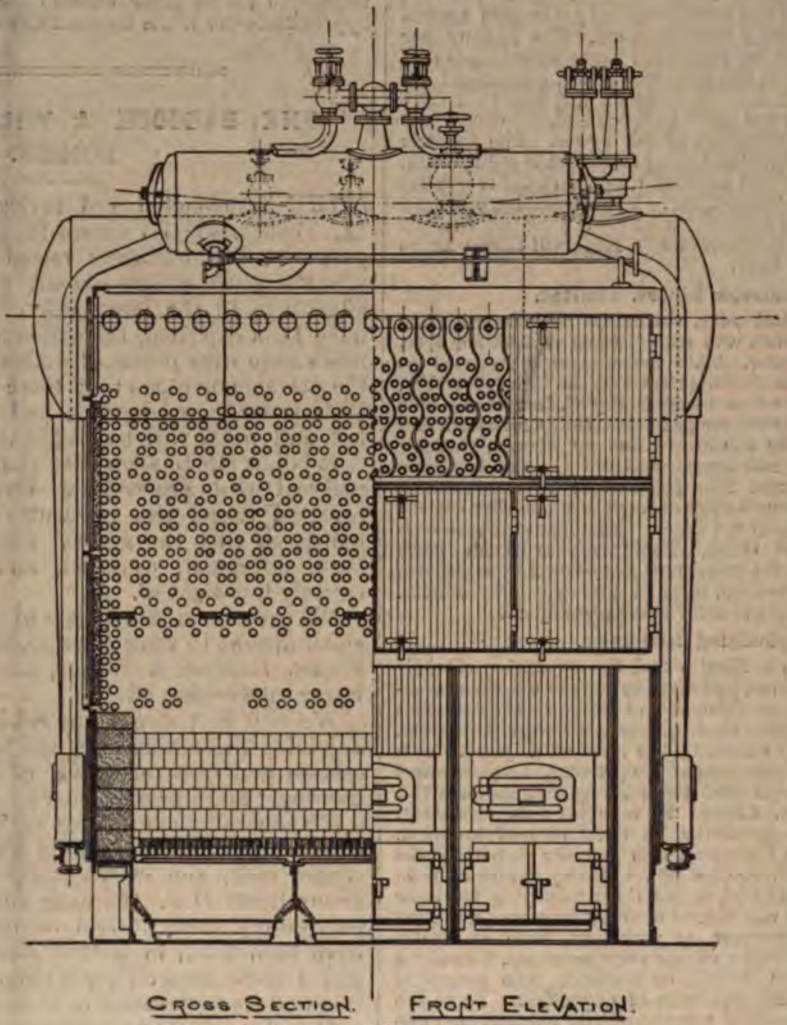


Fig. 1.—The Babcock & Wilcox Marine Boiler.

Fig. 5 shows a view in the boiler-room of the cruiser *Chicago*, of the United States Navy. This illustration gives a very good general idea of a stokehold of a vessel having water-tube boilers. This cruiser is the one that was appointed for service in South African waters. During her first commission this vessel made very long voyages to different parts of the world, and it will be remembered she visited the Mediterranean last year.

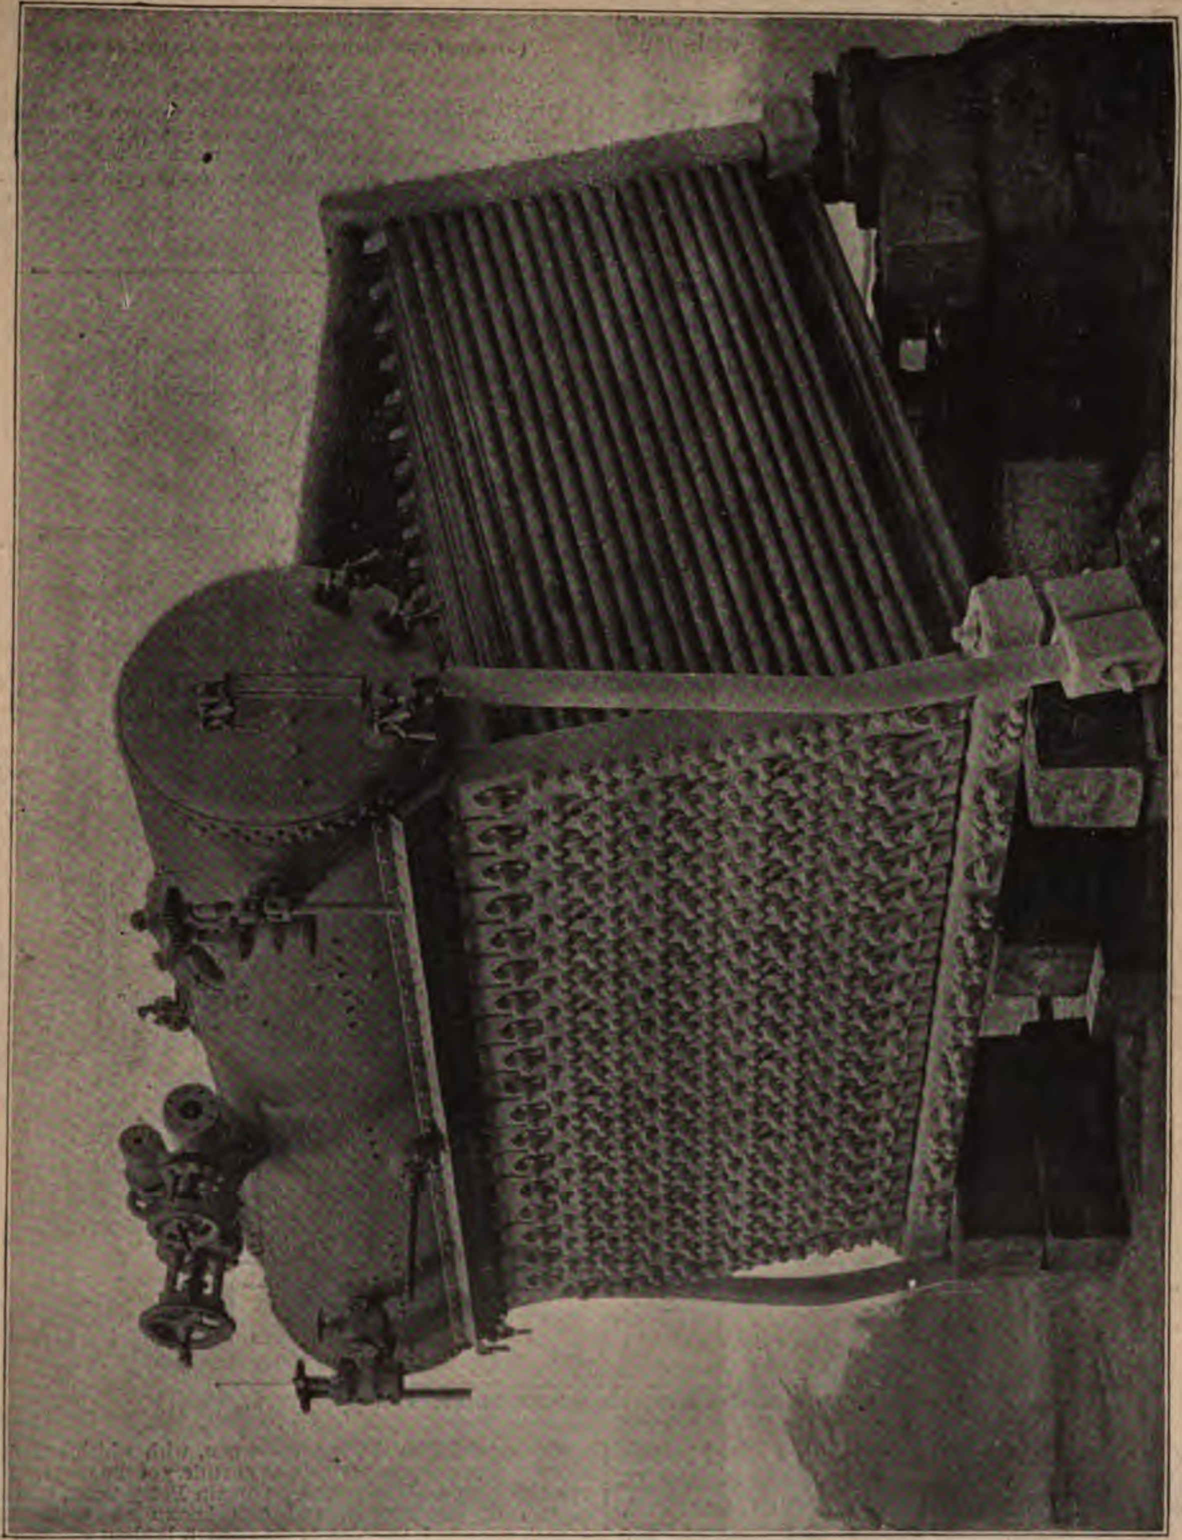
The boilers have, we understand, worked very well, and, as tending to bear out this fact, it may be mentioned that the United States naval authorities have since fitted their cruiser *Atlanta*, the monitors *Canonicus*, *Manhattan*, and *Maliopac*, their cruisers *Alert* and *Wyoming*, and one of their latest large cruisers, the *Cincinnati*, with eight boilers of an aggregate of 5,000 I.H.P.

With regard to the mercantile marine, it may be mentioned that Messrs. Wilson, of Hull, have these boilers fitted in eight of their vessels, and we would make special reference to the s.s. *Tasso*, which is fitted with two water-tube boilers. The vessel was fitted at the commencement of this year, and has made a number of voyages with good results.

This vessel was originally equipped in 1893 with ordinary shell boilers, and the results of the first six voyages with water-tube boilers, together with details of corresponding voyages when the vessel was fitted with ordinary boilers, are given by Messrs. Wilson as follow :—

	Ordinary boilers.	Water-tube boilers.
Total distance..	9,472 ..	.. 9,200.
Total consumption of coal ..	1,072 tons	.. 981 tons.
Average speed..	11·45 knots	.. 12·5 knots.
Average coal per voyage ..	178½ tons	.. 163½ tons.

This shows in favour of the water-tube boilers to the extent of a saving of 90 tons of coal burnt and a gain of ·6 knots in speed, a result calculated to be equal to 130 tons of coal saved per voyage assuming the speed to be the same with both boilers. In this ship there were only two men on each watch, one stoking and



The Babcock & Wilcox Marine Boiler. Fig. 2.

the other trimming, getting out the ashes and assisting to clean the fires.

It was found by actual experience on the trial that the feed-water to the boilers only required regulation about three times per hour, and when it is considered that the firemen on board were entirely new to the ship, and had not had any previous experience with water-tube boilers, the results may be set down as highly satisfactory.

Messrs. Babcock & Wilcox, Limited, have recently booked an order to fit one of Messrs. Wilson's large passenger boats, the s.s. *Martello*, employed on their Hull to New York and Boston service, with four of their marine type water-tube boilers.

This contract is excellent evidence of the opinion of Messrs. Wilson in regard to these boilers, as they have been gradually adopting this type of boiler for seven years past. The firm have also received an order from the British Government for a set of boilers for H.M.S. *Espiegle*. Further, they are making 15 boilers for sand-pumping dredgers for the Queensland, New South Wales, and Indian Governments, the dredgers being built by Messrs. Sir W. G. Armstrong, Mitchell, Whitworth & Co., Limited, of Newcastle.

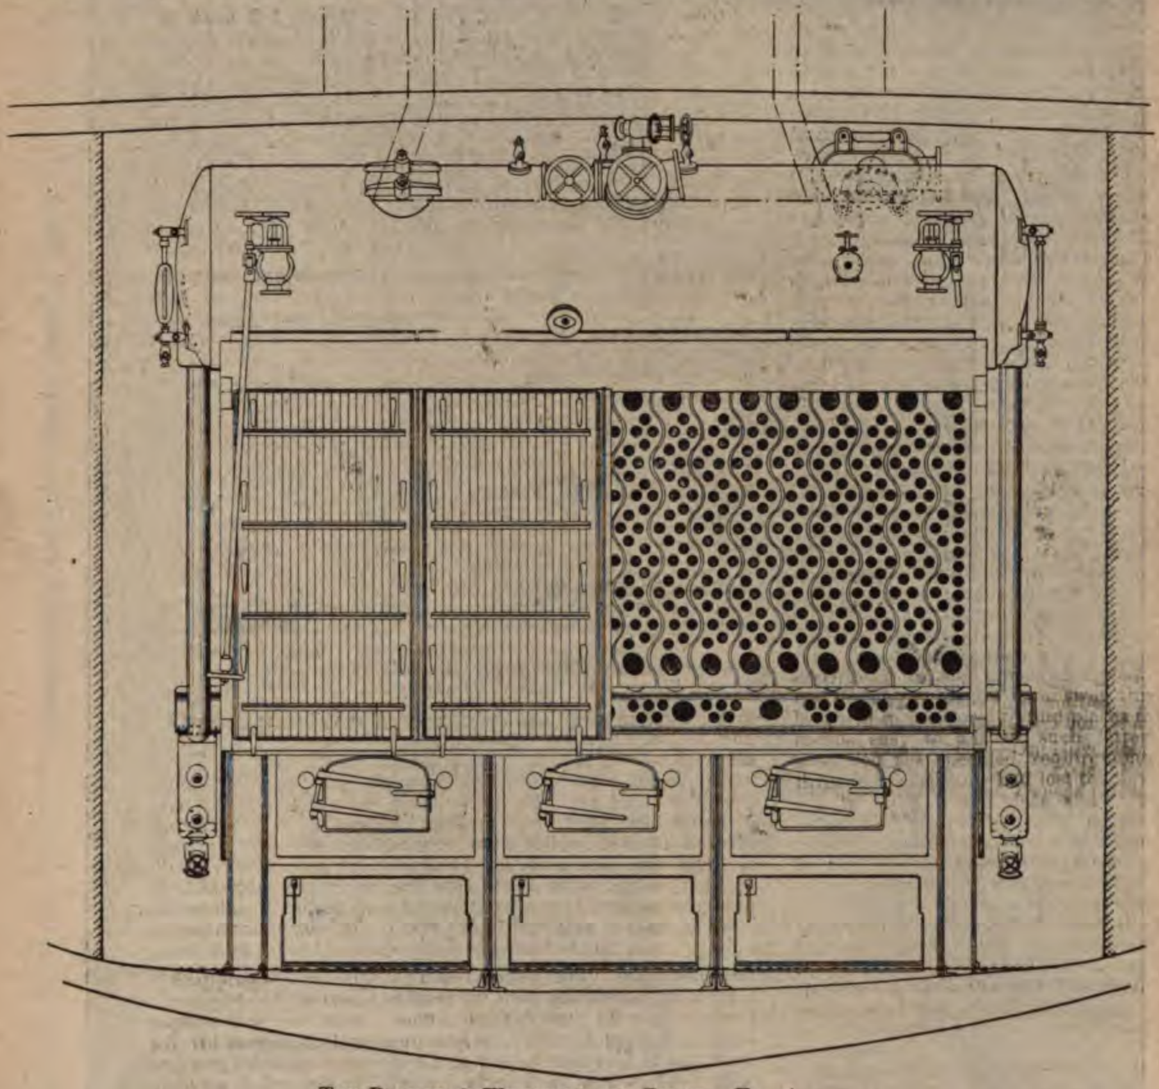
NAVAL MATTERS—PAST AND PROSPECTIVE.

(From our own Correspondents at home and abroad.)

The Navy and the War.

THE Navy has once more come to the assistance of the Army in time of trouble, and the manner in which the "handy man" manœuvred his guns at Ladysmith is the subject of praise from all. It appears that we could produce nothing more powerful than the 15-pounder gun, with which our field artillery is armed, against the heavy artillery of the Boers. But the Navy came to the rescue. Captain Percy Scott, now the captain of the *Terrible*, and well known as a gunnery expert, conceived the idea of building a landing carriage on which some of his guns, as a matter of fact never intended for land service, could be made use of to assist our artillery at Ladysmith. He called together his senior assistant engineer and a couple of engine-room artificers, and between them a carriage was designed, the parts made, put together, and the first gun mounted on it, in a couple of days. The 12-pounder gun which



THE BABCOCK & WILCOX MARINE BOILER. FIG. 4.

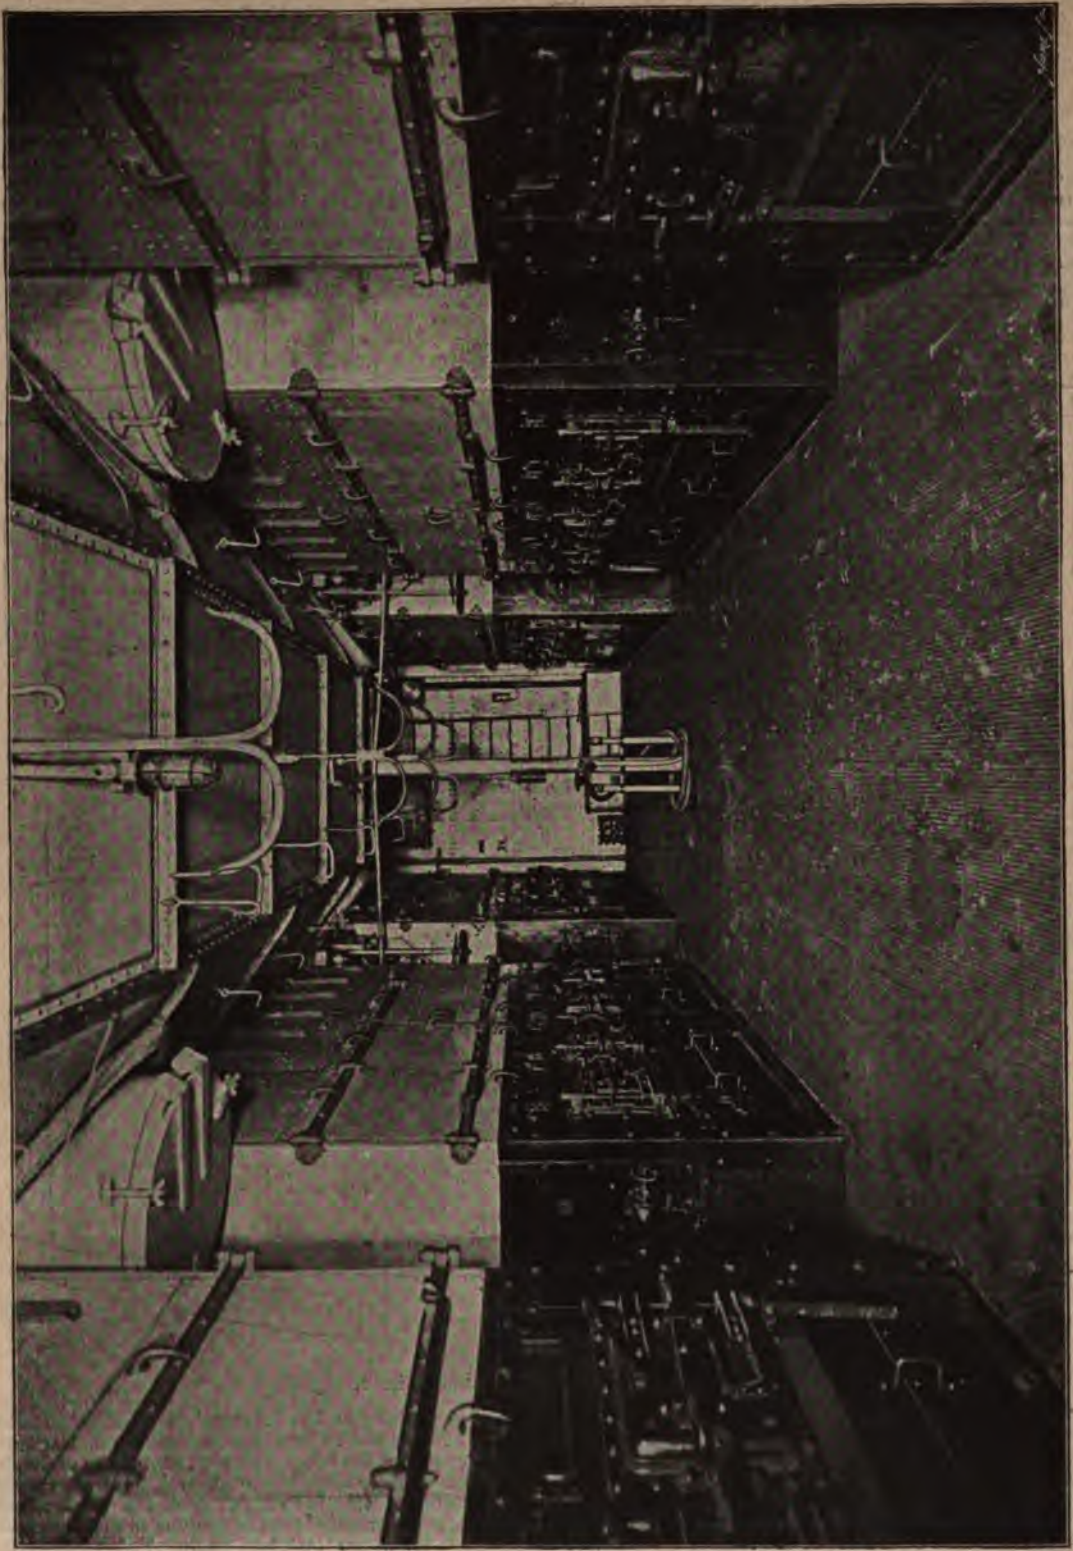
Captain Scott has transformed into a field piece has a muzzle velocity of 2,200 foot-seconds, a muzzle energy of 423 foot-tons, and can perforate over 8 in. of iron. Captain Scott also designed a mounting for the 4·7-in. naval gun by simply bolting a ship's mounting down on to four pieces of pile. At an extreme elevation the lyddite shell fired went 12,000 yards against 9,000 yards of the 12-pounder. The experiment has been a complete success. Four properly equipped Naval Brigades have been landed, and the seamen have proved their worth on many occasions since they have left their ships. Unfortunately, they have not been able to carry out their work without some loss: in addition to several men being wounded and killed, Commander Egerton received injuries at Ladysmith which first of all necessitated both his legs being amputated, and subsequently caused his death. Had he survived he would have been entitled, as he had been promoted to the rank of commander, to a special pension of £500 a year in addition to the ordinary service pension. Universal regret has been felt at his death, which is a serious loss to the Navy.

Executive and Engineer.

Admiral Melville, in his annual report on the working of the Steam Engineering Bureau of the United States Navy, makes some remarks which lead one to believe that the amalgamation of the executive and engineering branches has not proved as successful as was expected. He had hoped, as indeed had many others, that the whole trend of detail would be towards the complete amalgamation of executive and engineering interests in the Navy, with a favourable outlook for the protection of the rapidly advancing engineering science. There is still a hope, however, and a well founded one, that the comprehensive union of the executive and engineering vocations will before long be brought about. Briefly, he says, the fate of the reconstruction of the *personnel* hinges upon the provisions made for future and continuous supply of efficient engineers in the Navy. The duties of the executive branch were believed to be perfectly compatible with a professional excellence in engineering matters. A not unwarranted expectation was that preference for the mechanical part of these combined duties would be shown by a great number owing to the intense interest attaching itself to this field of work and to its almost universal application to the progressive arts of the age. Although something of disappointment seems to have affected the admiral, he considers that the only plausible scheme is to insist upon the present executive officer adapting himself as soon as possible to the new conditions and increasing, where lacking, his knowledge of mechanical engineering.

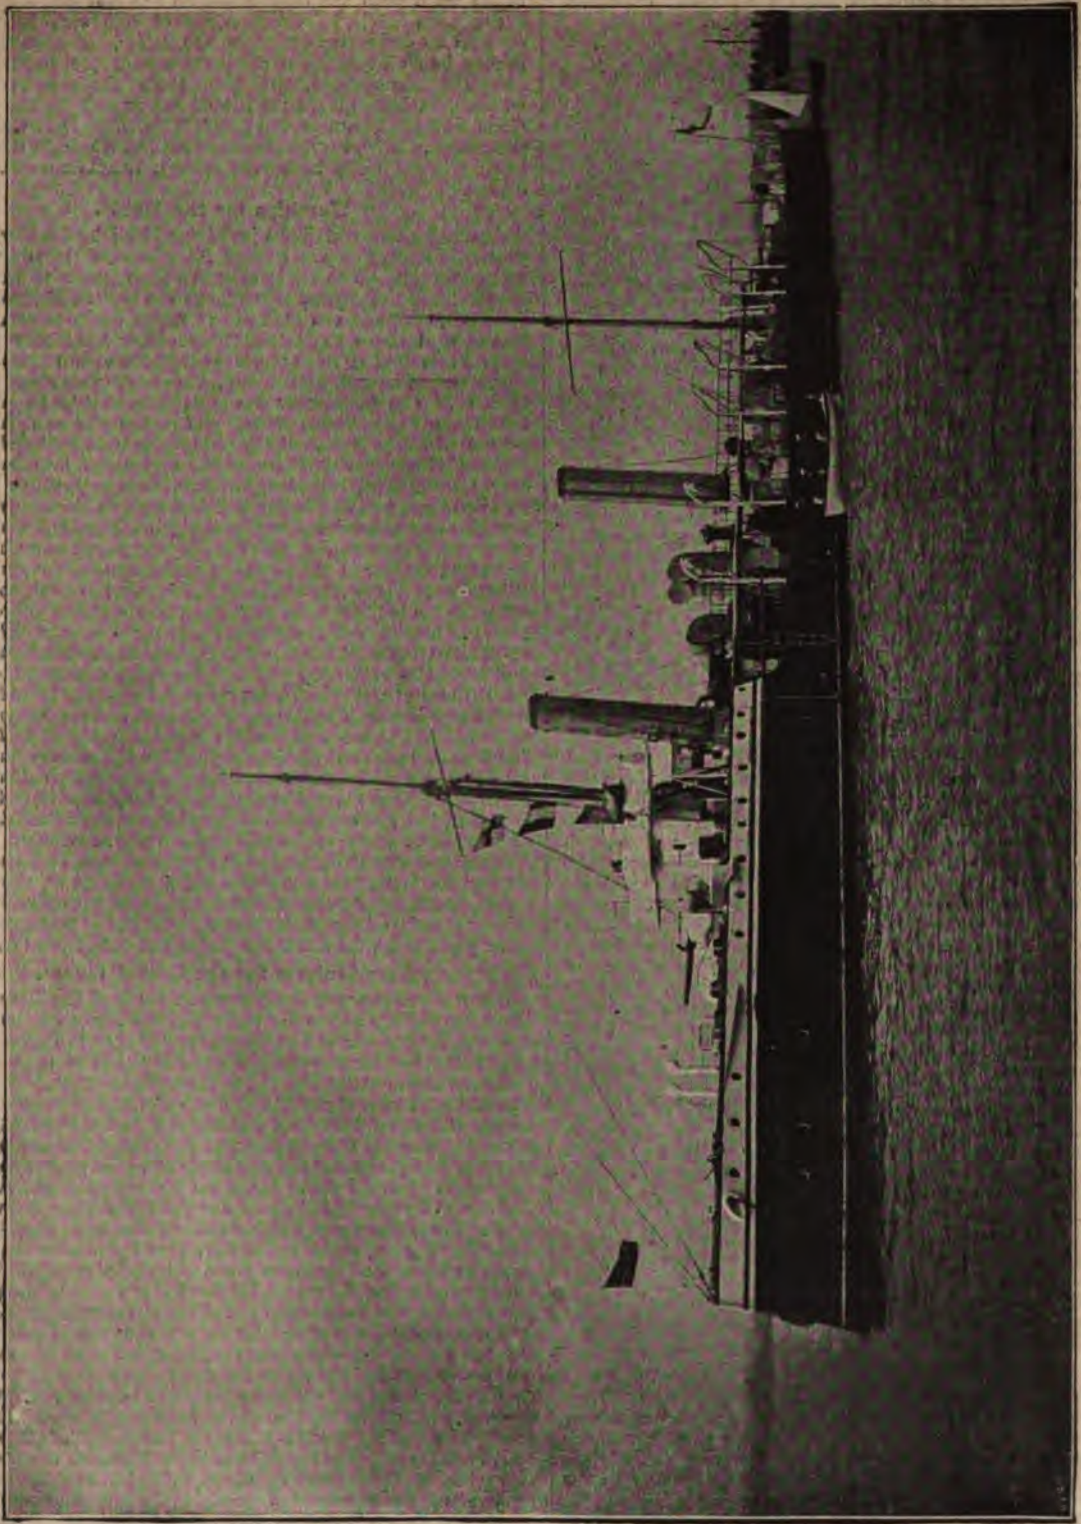
Portsmouth Dockyard.

A great many vessels are expected to leave this yard in the course of the next week or so, either to supersede ships on foreign stations or to convey crews to vessels recommissioning. The *Bellona* was to take up the work of the *Blonde* in the Iceland fisheries, but has been ordered to proceed to Gibraltar, and



BOILER-ROOM IN THE U.S. CRUISER "CHICAGO." FIG. 5.

there to await further orders. The *Tyne* is to take out new crews for the *Polyphemus*, the *Imogene*, and the destroyers *Ardent*, *Boxer*, *Bruiser*, and *Dragon* in the Mediterranean, and the *Latona* is to take out a relief crew for the *Indefatigable* on the North America and West Indies Station. On the 5th of this month the *Canopus* commissions for service in the Mediterranean, provided her services are not required elsewhere, and the *Scout* relieves the *Nymph* on the same station. The *Glory* is to arrive at this yard on the 5th inst., and is to be completed for sea before April. It is a curious fact that the galley and pinnace of the *Glory* are to be painted royal blue. Altogether some very special instructions have been given in



H.M.S. "SHELDRAKE," FITTED WITH FOUR BABCOCK & WILCOX BOILERS, 3,500 I.H.P.

connection with the preparation of the vessel for the pennant. The inference is that the Duke of York will hoist his flag as Rear-Admiral on her. The only signs given of the floating out of the *Pandora* is that the Admiralty inquired about a week ago whether her cost would be materially increased by her completion being postponed from March to July. As so much has been made of the fact that some of the 4·7-in. guns of the *Terrible* have been moved from Durban to Ladysmith, it is interesting to note that, as soon as it was known that this had been accomplished, designs were prepared, and men kept at work all day and through the night in building suitable carriages for sending such guns across country. A number of these improvised carriages were dispatched last month. The dispatch of transports from this dockyard has been considered a most creditable performance. The *Arawa*, for instance, was prepared for sea in five days, and on the sixth day embarked the Shropshire Light Infantry at Southampton.

The New Navy and the Old.

The old Training Squadron with its picturesque but practically useless masts and sails, has at last given way to a squadron composed of steel ships propelled entirely by machinery—another victory for steel and steam over canvas and hemp. For many years past our seamen have learnt the mystery of spar and sail drill in the old vessels, but after all quickness of eye and limb, steadiness of nerve, resourcefulness, self-reliance, and calmness in sudden emergencies can be learnt equally as well by a spell of service in torpedo-boats; and the experience thus gained will be found more useful to the men in after years than the knowledge of how to handle sails. From the point of view of the picturesque and artistic, the change is to be regretted, but then it must be borne in mind that our ships are not ornaments, but hard, matter-of-fact fighting machines. One can easily sympathise with Lord Graham, who, in his letter to the *Times*, defends the now defunct Training Squadron. Probably the masted warships would have been able to hold their own with similar vessels belonging to other nations, but then one cannot always pick and choose the class of vessel with which to grapple. Lord Graham suggests the continuance of the use of the vessels now dispensed with, and thinks that boys might be drafted straight from the receiving ships into the Training Squadron, instead of into a modern man-of-war, thus doing away with the necessity of teaching men the use of old guns after they have grown accustomed to modern ones. As regards the development of the chest and other parts of the body, there is no doubt that our seamen felt the benefit of their stay in the old Training Squadron, and it is quite true that none were ever the worse for a turn under canvas; but sails must in course of time give way entirely to steam, and therefore it is better that our seamen should learn their profession in modern cruisers.

The Conduct of the Navy.

The report issued dealing with the conduct of the Navy for last year is a most interesting one. When reading it, however, the size of the British Navy should be taken into account, also the fact that seamen are by nature more reckless and regardless of consequences than either soldier or civilian. The report shows that 149 cases of striking or attempting to strike a superior officer were dealt with by court-martial, including 25 outbreaks on the part of marines; 46 cases of wilful disobedience were also dealt with, and other serious breaches of discipline, including desertion, improperly leaving a place of duty, drunkenness, and using threatening language. Happily there are only 57 criminal offences against the common law, comprising 44 cases of theft and embezzlement, seven forgeries, and six cases of disgraceful conduct. Out of the 187 courts-martial held upon seamen of the Royal Navy, 199 persons were accused and punishments inflicted in 191 instances; 103 men were sentenced to imprisonment and dismissal, with or without disgrace, and 78 to imprisonment with hard labour. The only serious increase is in the number of offences against superior authority, but even in this case it must be remembered that the *personnel* of the Navy has been augmented by nearly 30,000 men since 1888. In that year there were 140 offences against discipline tried by courts-martial, but in 1892 this number had been reduced to 105 cases, to be increased in 1898 to 253 cases. Altogether there cannot be said to be anything very startling in these figures, for the misdeeds of a few hundred bad men must not be taken as a proof that 100,000 good men are going "to the dogs."

Devonport Dockyard.

The part of this yard devoted to shipbuilding will before long present as busy an appearance as ever. Early next month the first-class battleship *Montagu* will be laid down, and a good deal of the material to be used in her construction is now in readiness. She is to be built on slip No. 2, and contrary to custom no attempt is being made to commence her before the keel is officially laid. However, as soon as a start is made, she will be advanced as rapidly as the *Bulwark*, or any other of her predecessors that have been built at this yard. The *Blonde*, after all, is to have a new set of boilers, this time on the water-tube principle. The job will probably cost about £20,000, and, as the Keyham Factory is at present choked up with work, she will probably be attended to at a private yard. The decision to supersede the obsolete cruisers of the Training Squadron by modern vessels raises the question as to what is to be done with the *Calypso*, which has just had over £10,000 spent upon her. In consequence of this step it has been decided to discontinue work on the *Active*, but a good deal of money has already been spent upon her. Yet another signal book has disappeared, this time from the gunboat *Magpie*, which left here in the middle of last month for the Cape of Good Hope. There is not much hope, now that the *Magpie* has sailed, of discovering the offender, but if caught his punishment will certainly be severe enough to act as a deterrent to others.

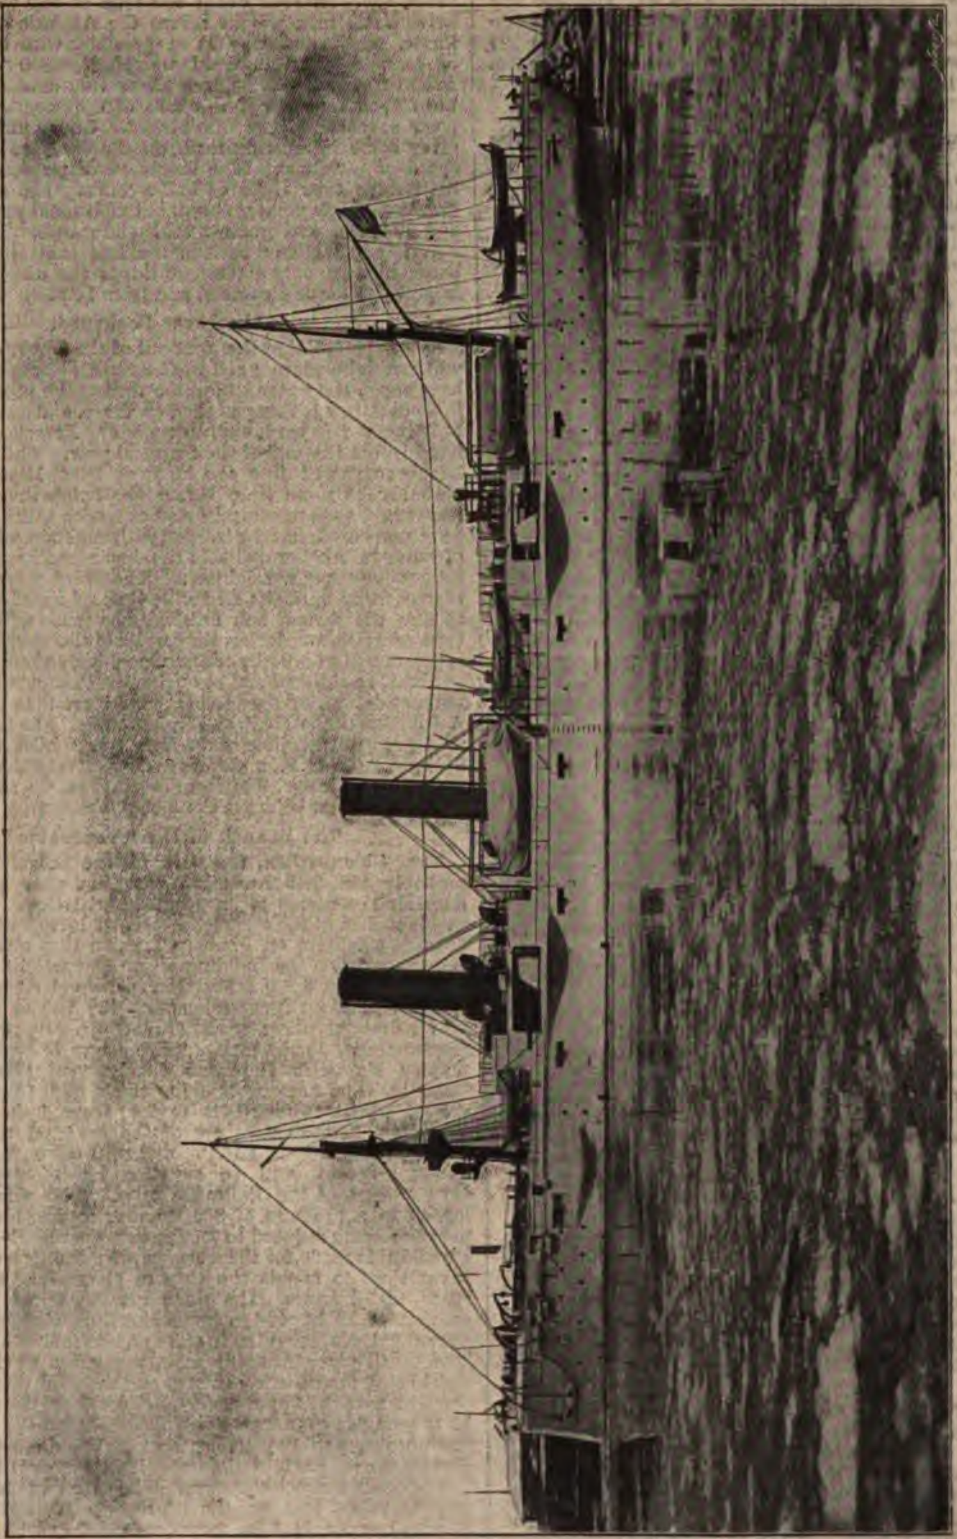
Warships for the World.

According to a statement just issued by Lloyd's, there are at present building in the United Kingdom 52 British warships and 30 foreign. The paper affords a comprehensive view of the shipbuilding in progress throughout the United Kingdom. The vessels mentioned are said to be "under construction," which means that those mentioned may either have only just had their keels laid or are not quite ready for steam trials. Warships are, of course, incomplete, even when this stage has been reached, for in most cases the guns have still to be placed on board and the vessel fitted out before she can hoist the pennant, but she is nevertheless out of the builders' hands. From the list it appears that there are 14 warships building at the Royal dockyards, including two first-class battleships building at Chatham, two at Devonport, and two at Portsmouth; one first-class armoured cruiser building at Pembroke, one first-class protected cruiser, and the Royal yacht; one third-class protected cruiser building at Chatham, and four sloops at Sheerness. Altogether the displacement of these vessels amounts to 125,920 tons. At the private yards there are 38 vessel at present under construction, with a total displacement of 205,430 tons. At Barrow there are three vessels building; one first-class battleship and two first-class armoured cruisers. At Birkenhead there are six vessels building, including two first-class battleships, two sloops, and two torpedo-boat destroyers. Three first-class battleships are building at Blackwall, and one at Jarrow. Two first-class armoured cruiser are building at Clydebank, one at Glasgow, and three at Govan. One second-class protected cruiser is building at Glasgow, two gunboats at Liverpool, one torpedo-boat destroyer at Chiswick, three at Clydebank, two at Govan, four at Hebburn, one at Hull, four at Jarrow, and one at Sunderland. As regards foreign vessels there are 68 building at the private yards, including seven armoured vessels, one protected cruiser, nine torpedo-boat destroyers, 11 torpedo boats, and two river gunboats, with a total displacement of 287,060 tons.

New Cruisers for the United States.

Some interesting particulars are to hand of the Denver class of cruisers which are to be built for the Navy of the United States. Altogether six of these cruisers are to be laid down, and their speed when completed is calculated to be 16½ knots. Length of load water line, 292 ft.; length, extreme, 308 ft. 2 in.; breadth, extreme, about 43 ft.; mean draught at trial displacement, with two-thirds coal, ammunition, and stores, 15 ft. 6 in.; extreme draught, fully loaded, 16 ft. 8 in.; trial displacement, about 3,100 tons; full load displacement, about 3,400 tons; coal carried on trial, 470 tons; total bunker capacity, not less than 700 tons. The engines are of the four-crank triple-expansion type. The armament will consist of ten 5-in. breechloading rapid-firing guns, eight 6-pounder, two 1-pounder rapid-firing guns, and four Colt machine guns. The 5-in. guns will be more effective than the old type. Eight of them will be mounted on the main deck in recessed ports. The two remaining 5-in. guns will be mounted behind shields on the spar deck, one forward and one aft. Four 6-pounders will be mounted on the main deck, two forward and two amidships, and four more on the spar deck. The two 1-pounder guns will be mounted aft on the main deck, and the Colt machine guns on the top of the hammock berthing amidships. The coal capacity of these ships with bunkers full (700 tons) is sufficient to give them a radius of action at full speed of about 2,600 miles. At the most economical rate of steaming, probably in the neighbourhood of 10 knots, they should be able to steam about 9,800 miles without recoaling, or more than sufficient to take them from San Francisco to Manilla. The ammunition supply will be large. For each of the 5-in. guns they will carry 260 rounds, and for each of the 6-pounders 500 rounds.

The wood material used in the construction of the hulls will be reduced to a minimum. All the bulkheads on the gun and berth decks will be of metal, and they will each be fitted with



U.S. Cruiser "Chicago." *(See page 388.)*

a pilot house on the spar deck built entirely of non-magnetic metal. The main engines, of which there are two sets, each driving a propeller, are of the vertical inverted cylinder direct-acting triple-expansion type, having cylinders:—High-pressure 18 in. diameter, intermediate-pressure 29 in., and two low pressure 53½ in. diameter, 30 in. stroke. The I.H.P. of the combined engines is to be 4,500 when the engines are making 172 revolutions per minute, with a boiler pressure of 275 lbs. reduced to 250 lbs. at the high-pressure cylinder.

Chatham Dockyard.

The defects which were discovered in the machinery of the *Goliath* during her steam trials in October have now been set right, and her official trials have been resumed. At her eight hours' run on the measured mile her engines will be expected to develop 13,500 H.P. and a speed of 18 knots. All her guns are now on board, with a staff from the Portsmouth School of Gunnery, who are to superintend her gun trials. On the completion of her trials she is to take the place of the *Centurion* as flagship on the China Station. The damage which the torpedo boat *Cheerful* recently sustained has now been attended to, and she is to resume her trials almost at once. The launch of the *Venerable* was, as might have been expected, a brilliant success. On the slip she has vacated a new battleship of the *Duncan* class is to be commenced. She will displace 14,000 tons and will have triple expansion engines capable of developing 18,000 H.P. More than £100,000 will be spent upon her during the current financial year. The *Irresistible* and *Pioneer* are being completed as rapidly as possible, and a great deal of work has been put into them despite the hurry necessary for the preparation of the transports *Idaho* and *Algeria* for the conveyance of the Royal Field Artillery to the Cape. On the 7th of this month the *Dryad* leaves for the Mediterranean Station. The *Terpsichore* is also expected to be sent to the China Station before long, and the *Argonaut* will probably leave for foreign waters shortly. The *Arethusa* is now on her way to the Pacific to relieve the *Amphion*. The *Ariadne*, first-class cruiser, and the *Coquette*, torpedo-boat destroyer, have been passed into the Fleet Reserve, and are to be kept ready for use. The refit of the *Blenheim* is also practically finished, and the *Archer* has now been passed out of dockyard hands and formally handed over to the Reserve.

The German Navy.

The new shipbuilding scheme which the German Emperor seems desirous of carrying out has not met with much favour outside the columns of the official publications. The scheme has not yet been officially announced. According to the Navy Bill passed last year no further expenditure was to be asked for for six years. Within the first three years it was proposed to lay down seven battleships, one of which was the *Kaiser Karl der Grosse*, recently launched, and two armoured cruisers of the *Fürst Bismarck* class. Five battleships were to be laid down in the course of the second three years to take the place of the *Bayern*, *König Wilhelm*, *Kaiser*, *Baden*, and *Deutschland*. However, the increased cost of materials, and the delays caused by advances in constructive principles, may render it impossible to commence more than three ships during that period with the means provided. According to the new semi-official scheme, however, it is proposed to lay down three ships yearly during the sexennate. The scheme as set forth by the *North German Gazette* involves the increase of the non-recurrent expenditure under the head of naval construction from £3,000,000 to £4,350,000, and an increase of the other non-recurrent outlay from £450,000 to £600,000, with the addition of £250,000 to the current expenditure. But it is doubtful if even this additional money would be sufficient to pay for the ships it is proposed to lay down. The present shipbuilding programme extends to 1904, but between this date and 1911 the Emperor would like to see the building commenced on ten battleships, and between 1911 and 1917 eight more, in addition to cruisers and torpedo-boats.

The Progress of Steam Navigation.

In last month's *Cassier's Magazine* is published a most interesting and instructive article on the progress of steam navigation during the last 60 years. It is contributed by Sir William White, the Director of Naval Construction, and from it one gathers that during the period mentioned the speed of warships has been increased from 8½ to 22½ knots; ships have more than trebled in length, about doubled in breadth, and increased tenfold in displacement. The engine power has been made 40 times as great, and the ratio of H.P. to the weight driven has been increased fourfold, chiefly owing to the institution of fast steaming torpedo-boat destroyers. The rate of coal consumption measured per H.P. per hour has, however, decreased, as it is now only about one-third of what it was 60 years ago. In 1840 about 550 tons of coal were necessary to drive 2,000 tons weight across the Atlantic at a speed of 8½ knots, whereas to-day it is possible, with only 3,000 tons of coal, to drive a vessel weighing 20,000 tons across the Atlantic at 22 knots. Three times this amount of coal would have been required if the rate of coal consumption had not been so considerably diminished. Sir William White also gives some interesting facts on the increase in the size and speed of warships. The increased displacement of modern battleships over those of half-a-century ago does not merely give the vessels greater speed, but additional powers of offence and defence, and greater coal endurance. The Director of Naval Construction mentions the fact that the largest of our battleships are only about two-thirds the displacement of the largest passenger steamers, and from 200 to 300 feet shorter.

Sheerness Dockyard.

It is expected that the float-out of the *Shearwater* and *Vestal* will not take place until next month although they were to have taken the water some time during the present month. A little overtime is being worked on these, and on the other sloops building at this yard, as the *Condor* and *Rosario* should be out of hand before the end of the financial year. The gunboat *Speedy* has been passed into the Medway Fleet Reserve, but it will probably be some time before she hoists the pennant. The *Sheldrake* has been commisioned as tender to the *Rodney*. It will be remembered that she is fitted with the Babcock & Wilcox type of water-tube boiler and that she has recently undergone some interesting experimental tests. The third vessel is the *Sharpshooter*, fitted with the Belleville type of water-tube boiler. As soon as the *Seagull* has finished her trials with the Niclausse type of water-tube boiler, the results of the working of the three types of boilers will be collected and published. The *Skipjack* gunboat, re-boilered and re-engined at Palmer's, is to be finished without delay, and the vessel to once more take her place in the A Division of the Medway Fleet Reserve. She has been refitted with water-tube boilers of the Reed type, whilst her new engines indicate 6,000 H.P., an increase of 2,500 over that developed by the late machinery. The *Perseus* and *Prometheus* should be ready for the pennant before the end of this month.

The Launch of the "Venerable."

Mrs. Chamberlain, the wife of the Colonial Secretary, is probably the first American who has ever performed the launching ceremony to an English battleship. The *Venerable* was launched at the commencement of last month and was laid down at Chatham on January 2nd, so that she has been just eight months on the building slip. Her weight when she took the water was 5,200 tons. Her principal dimensions are:—Length, between perpendiculars, 400 ft.; extreme breadth, 75 ft; draught of water, forward, 25 ft. 2 in.; aft, 22 ft. 3 in.; displacement, 15,000 tons. The bottom is coated with Hartmann's Rahtjen's Improved Composition (The Red Hand Brand). The armour is 9 in. thick and 15 ft. deep amidships, whilst forward it varies from 3 in. to 7 in. in thickness. The engines are of the inverted triple-expansion type, having 15,302 I.H.P., and will give a speed of 18 knots. Steam will be supplied by 20 separate water-tube boilers of the Belleville type. The safety valves are loaded to a pressure of 300 lbs. per square inch, the steam pressure being reduced to 250 lbs. per square inch at the engines. Provision is made for the stowage of 2,040 tons of coal, which is sufficient to enable the ship to steam for thirty days at a speed of 10 knots. The main armament of the *Venerable* consists of 12 in. 46-ton breech-loading wire guns of the improved pattern, mounted in pairs on turntables in the barbettes. The auxiliary armament mainly consists of 12 6-in. guns, eight being placed in casemates on the main deck, and four in casemates on the upper deck. Besides these the ship will carry 16 12-pounder guns, equally divided between the upper and the main decks, two 12-pounder boat and field guns, and eight ·45 Maxim guns. Each of the two military tops will be fitted with three-pounder Hotchkiss guns. The vessel has four submerged torpedo tubes, two on the broadsides forward and two aft. She will carry 14 8-in. torpedoes, and five 14-in., the latter being fitted with dropping gear from the ship's steamboats.

Cheating the Government.

The severe remarks of Mr. Justice Grantham, when summing up the case brought by the Admiralty against a contractor named Bligh, were more than justified. This person was sued for damages in respect of the defective manner in which he had performed a contract, in the neighbourhood of Sheerness and below Chatham, of a defensive work for the prevention of torpedo-boat attacks up the Medway. He undertook to construct a boom made up of steel hawsers supported by piers, but these piers were so badly secured that the whole erection was rendered practically useless thereby. The work done showed that the defendant must have deliberately made up his mind to commit a fraud. An examination of the bolts used showed that a number of them were mere spikes given the appearance of bolts, and the concrete at the bottom of the piers had been deliberately omitted, as the mud had not been cleared to form the foundation. The contractor denied that he had been guilty of any fraudulent collusion with the Admiralty assistant engineer. Mr. Justice Grantham said he considered that when a person broke a contract in which the safety of the country was concerned, he ought to be dealt with as a criminal. If it was not a criminal offence, it ought to be made one. The jury returned a verdict for the full amount claimed. Another unsatisfactory business which calls for attention is the delivery of rotten hay as food for the horses which are being transported to South Africa, and the fact has also been made public that stinking meat was placed on board another vessel as food for the troops. Whoever is responsible for such iniquitous proceedings should be made to pay the penalty for such crimes.

Pembroke Dockyard.

The new Royal yacht is to leave this yard on the 6th inst. It is supposed that her ultimate trials will include a trip to Madeira and back for the purpose of proving her stability. During the passage observations will be made of her rolling. She is, as might be expected, the subject of a great deal of criticism. It is asserted in some quarters that her great freeboard will considerably take away from her handsome appearance when she is afloat. Good progress is being made on the *Drake*, considering the small number of hands employed upon her. The *Spartiate* does not make very great progress, as so many of her hands have lately been transferred to the Royal yacht. However, when that vessel is out of the way, the energy of the whole of the workmen in the yard will be concentrated on the *Drake*, *Essex*, and *Spartiate*. In the ensuing financial year no new vessels will be assigned to this yard, but No. 5 building slip is to be extended, and the new electric shop completed

The Transport Department.

The attacks which have been made upon the Transport Department recently on account of the various vessels engaged being late in arriving at their destination, or meeting with mishaps before or after they had left English waters, has brought forth in the *Times* and elsewhere several articles in defence of the Admiralty's selection of steamers for the conveyance of troops. In the *Times* a writer asserts that "for military, not for Admiralty, reasons it was considered undesirable to hurry out troops to ports from which they could not be moved under a considerable time. Consequently steamers of moderate but good speed would carry them out quite fast enough; and, as the utilisation of these would be incomparably cheaper than that of the very fast vessels, it would have been an unpardonable waste of public money not to engage the former! If this is the case, then a good deal of the blame which has been given to the Transport Department should be shifted to the War Office. A letter also appears in the same paper in which it is attempted to prove that the *Zibenghla* and *Zayathla* were only a day or so longer in reaching the Cape than other transports, but the statement the writer appends to his letter showing the passages of transports from the United Kingdom to Capetown only gives the time these two vessels took from the date of their finally leaving British waters. Of course, the real times are from when the *Zayathla* left the Mersey on September 27th, and arrived at Capetown on October 26th, and from when the *Zibenghla* started on October 2nd. It is true that when the two vessels in question were chartered we were not at war with the Transvaal Republic, but it must have been well known that there was certain to be fighting, and therefore somebody will have to explain why fast, reliable steamers were not chartered. That the artillery which the *Zibenghla* and *Zayathla* carried was badly needed at the front has been proved by the fact that it was found necessary to make use of warships' guns for land service.

IMPROVED SHIPS' LAMPS.

THE increased average speed of steamships in all weathers the last few years necessitates the utmost care being exercised in the navigation of vessels.

This requires not only that the ship be skilfully manœuvred by its captain and officers, but also that passing ships receive timely warning, especially during night-time, of the approach of others, and be able to distinguish, without any doubt or hesitation, approximately on what course they are steering.

It will be unnecessary to go into details of the various regulations, except to mention that a green and a red light are placed on the starboard and port sides respectively, of every steamer when under way, besides a masthead light which is of clear glass.

Further, various distinguishing lights are used to indicate whether a ship is disabled, laying cables, at anchor, &c., which it would be beyond the limits of this article to describe.

Granting the necessity of being able to distinguish the lights at as great a distance as possible, it becomes necessary to see in what direction this result can be obtained.

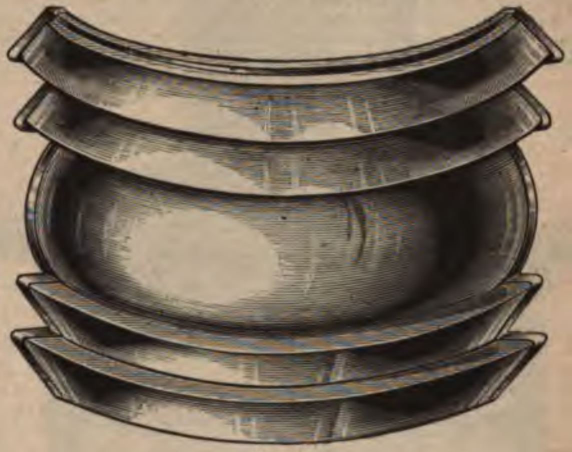


Fig. 1.

Up to the present time most care has been bestowed upon the lamps; this, however, is not nearly so important to-day, as practically every important steamer is fitted with electric light, and its various lights are connected to the mains, and only oil-lamps used as a stand-by.

The other only method of improving the light is by using the most perfect lenses. Here there is room for vast improvement.

The following statement about lenses is made by the Board of Trade in its instructions as to the survey of lights and fog-signals :—

"The lenses should be made of crown glass, highly polished, and free from air-bubbles or other visible defects."

This very clearly points out that the Board of Trade recognise the necessity for the highest class of lenses.

In spite of this request, practically all the lenses used are made of moulded glass in one piece, and can, therefore, only be approximately accurate. Such lenses waste a great amount of light, and also diffuse a large percentage of the light in the wrong direction so that, for example, the screens of the side lights cut off more than is desirable.

To meet a want in this direction, Messrs. Estler Brothers, 27, Leadenhall Street, E.C., are introducing built-up dioptric lenses, in which each portion or lens is accurately ground from an optical point of view, and highly polished.

The various parts have each the correct prismatic shape to diverge the light to the required angle, and, at the same time, absorb an irreducible minimum.

These lenses are naturally more expensive than the inferior moulded article, but when one considers the small proportion of the cost of a set, or even two sets, of lamps in comparison to the remaining outfit of a ship, and when, during the night-time, especially in hazy weather, the safety of a valuable ship depends, to a great extent, on its lights, it must be obvious that none but the very best should be used.

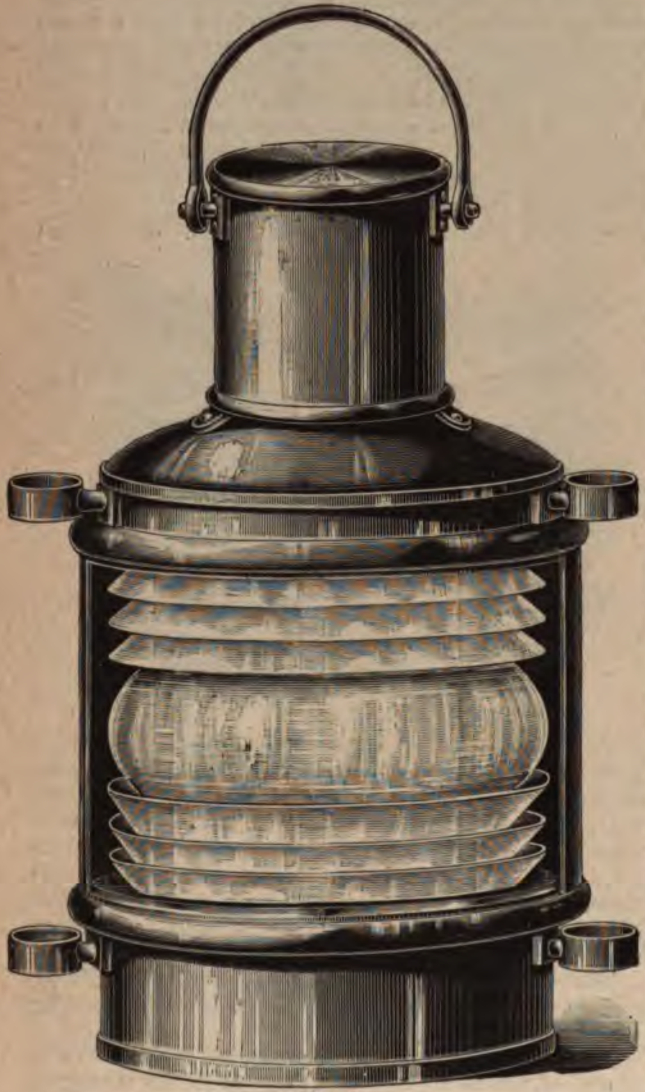

Fig. 2.

The illustrations show the general features. Fig. 1 shows a side-light lens. It will be noticed that it is built up of five parts—the centre-curved lens and the prismatic strips, two above and two below. The various lenses are cemented into a neatly finished brass frame, so that there is no possibility of displacement between the various parts. Fig. 2 shows a masthead light complete as arranged for oil. The lanterns are, as usual in the best class of work, made of copper, and can be fitted for either electric light or oil. Fig. 3 illustrates the various lenses in section with three, five, and six elements. They are made in various other sizes to meet every possible requirement.

In conclusion, we may remark there is very little doubt but that important steamship companies will recognise the necessity of adopting the best quality of glass and accurate lenses for their signal lights.

MARINE ENGINEERS' NOTES.

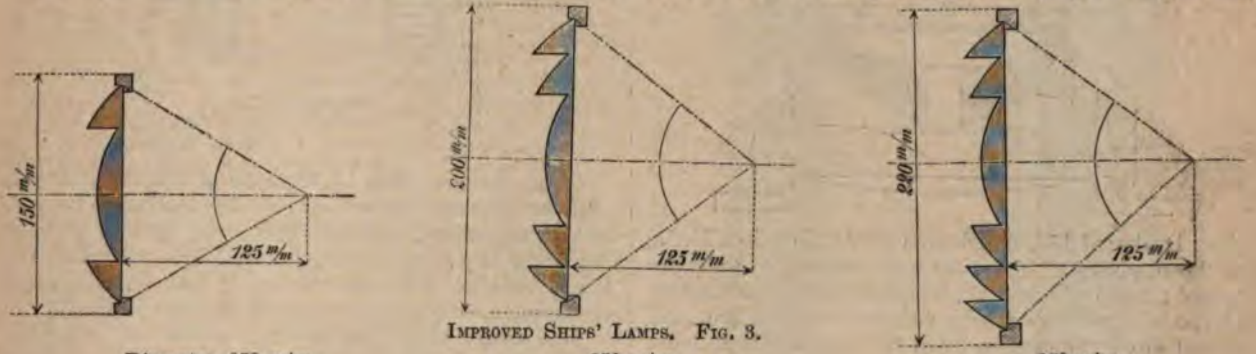
(From our own Correspondent.)

A MEETING of members of the Institute of Marine Engineers took place at their premises, 58, Romford Road, Stratford, Mr. W. Lawrie in the chair. The paper under discussion was that of Mr. Houfe on "Objectionable matter which tends to enter steam boilers and its prevention from so doing." Mr. Lawrie thought the title of the paper would include incrustaton as well as boiler deposits, but this the author had not included as objectionable matter, and so it would be best to confine their attention to the exclusion from the boiler of grease and dirt. One user of filters had already said that they were a failure. Mr. Railton, a maker, gave his experience in writing. He had made them for six years, and he thought the ready method of cleansing the filters had proved very valuable. He found that it was better to place the filter on the discharge side than on the suction side of the pumps—as it is free then from pulsation, which is very bad for the filter. It is the large area on the discharge side of the pump which gives it an advantage. The *Oceanic* and *Deutschland* have been fitted with filters on the discharge side. The former have a filtering area of 30,000 square inches, whilst the area of the latter is 32,000 square inches. Mr. Girvin thought the filters intercepted a great deal of foreign matter. The chairman said Mr. Houfe advocated a separating tank. When he was at sea they had on one of their steamers a condenser for supplying water to cattle, and had to run it from 15 to 20 hours a day. In the evening they filled all the barrels with feed-water for the cattle, and there was neither oil on the top nor deposit in the barrels. Mr. Houfe put his filter on the suction side of the pump, but the maker said ten times as many media were required on that side of the pump. He thought carbonic acid an active force in the corrosion of boilers. Mr. James Adamson said some had adopted the plan of running up the density of the water when they found grease in the boiler.

The dinner of the institute took place at the Holborn Restaurant on the 15th ult. The president, Sir James Lyle Mackay, occupied the chair, and he was supported by Sir Thomas Sutherland, Mr. Duncan Mackinnon, Sir Marcus Samuel, Sir Fortescue Flannery, Sir Walter Pearce, Dr. John Inglis, and others. About 230 were present. Sir Thomas Sutherland proposed "The Navy, Army, and Reserve Forces." He said never since the days of the Crimean War have our Army, our Navy, and our Volunteer forces been engaged in a struggle with a European foe—a foe as brave and determined as we ourselves. Great Britain has entered into this great struggle inspired by the determination that in South Africa there shall be liberty and equality for Englishmen and for all white races alike, under the supremacy of the British Government, which supremacy is essential to the maintenance of our empire. The regiments engaged in Africa, or many of them, bear upon their colours the names of victories achieved in the Peninsular War, in the Crimea, and on the plains and hills of India, but before this struggle is over they will also bear upon those colours the names of victories as great as any of those which have gone before—victories won in contest with men as gallant as they are themselves. For those who have fallen surely no better requiem can be said of them than in the words we know so well—

> "Not once, or twice, in our fair island-story,
> The path of duty was the way to glory."

Admiral Rolfe responded for the Navy, and said it had been the consternation of the Continent to see how a large army corps could be transported to the scene of operations, whilst the generosity of the shipowners and the manner in which they had worked with the Government were marvellous. The ladies of the United States had furnished a vessel for use as a hospital ship, and there was an important American merchant company, the Atlantic Transport Line Co., the chairman of which, Mr. Bernard Baker, had actually given us free a magnificent vessel, most suitable for the purpose of carrying our wounded and taking care of our sick. Messrs. Fletcher & Co. had docked and painted this ship free of expense. Forty years ago Captain Peel took the Naval Brigade with its heavy guns out of the *Shannon* into Central India during the Mutiny. The men of the Navy were doing like good work in the Transvaal to-day. Captain Scott took the guns out of his ship, and arranged the whole thing so satisfactorily that these heavy guns were in Ladysmith, a distance of 200 miles, without anybody in this country being aware of it until they were in action. Lieutenant-Colonel Pritchard responded for the Army, and said our innings in South Africa had not yet commenced, but soon would. The batting on the side of the Boers had been very weak, and he thought that when our men went to the wicket they would surprise the enemy. Colonel Denny responded for the Reserve Forces. He replied also for those volunteers who were now fighting side by side with the regular soldiers and bringing no shame on the name. He was replying for the men from Canada, from Australia, and elsewhere. He was replying for the lion's cubs, who were coming to help the lion.



IMPROVED SHIPS' LAMPS. FIG. 3.

Diameter, 250 m/m.
Height, 150 m/m.

250 m/m.
200 m/m.

250 m/m.
220 m/m.

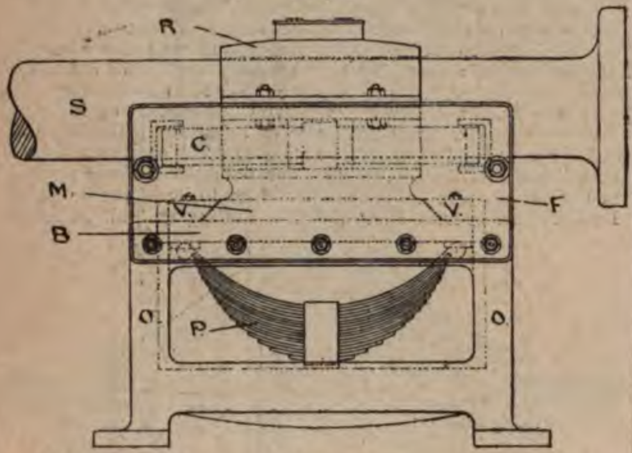
The speech of the evening was that of the President, who proposed "Success to the Institute of Marine Engineers." He said: It would ill become him to attempt to deliver an address to the present audience on abstruse technical subjects. He was a believer in the adage, "the cobbler to his last," and he was sure they would not thank him for making an effort to explain to them how they could obtain an increase of H.P. from a certain engine by reducing the pitch of the propeller or by making an alteration in the throttle valve. He would not give his views on the relative merits of compound, triple and quadruple expansion engines, or instruct them how to repair a slide valve, join together a propeller shaft in event of either giving way at sea, or how to ascertain the density of the water in their boilers in the case of the salinometer becoming disabled. The Institute of Marine Engineers had had a marvellous record of success. Started ten years ago with some 50 members, it had now a list of fully 1,000. Its income last year was £981, and expenditure £914, a state of affairs financially which would have gladdened the heart of Mr. Micawber. The main objects of the association of marine engineers are to promote the science and practice of marine engineering, to facilitate the exchange of ideas respecting improvements in machinery, and to afford facilities for education and self-culture amongst marine engineers with the view to improving their status and that of their profession. The institute had secured a great measure of success, as was shown by its annual records, and that it had the sympathy of scientific, practical, and business men was demonstrated by the list of its past presidents. In a few months' time the nation would be offering a welcome to the returning victors and heaping upon them honours, decorations, and rewards, which they had so well earned. They would have done their duty. The lot of the marine engineer did not involve them in fighting the enemies of their country, but they had daily and nightly battles to fight, going not only down to the sea in ships but down into the engine-rooms, the stokeholds, and the tunnels of these ships. The vessel might be running into danger of which the sharp, unexpected ring of the telegraph in the middle of the watch was to be the first announcement, but their place was on the starting platform in ignorance of what was taking place on deck, and there they remained till summoned from above or driven from below. Deeds of unrecorded heroism occur in British ships every week of the year: danger and death are calmly faced, and full share of these falls to those whose duty lies in the engine-room. A society such as theirs could not but have an influence for good upon its members, and if he might with all humility venture to make a suggestion it would be that they should take steps to record and recognise in some way amongst themselves conspicuous instances of bravery and resource on the part of marine engineers. Sir Fortescue Flannery proposed "Kindred Societies." When the institution was founded 10 years ago there was no feeling of rivalry towards other then existing institutions having similar objects. It was felt that there was a sphere of scientific usefulness hitherto unoccupied by any institution, and that good service could be rendered by such an institution to a class of men who hitherto had not banded themselves together for purposes of scientific research and good fellowship. The institution had prospered with the fullest sympathy and the assistance of kindred institutions. Dr. Inglis responded on behalf of the Institution of Engineers and Shipbuilders in Scotland, which was founded by Professor Rankine—that great mathematician whose power, had he lived, would have enabled him to wrest the whole of Nature's secrets from her. Subjects dealing with all branches of engineering were discussed, and these discussions seldom lacked animation. They did not entertain a feeling of jealousy, and the proceedings of the Institute of Marine Engineers were followed with keen interest. Mr. J. T. Milton responded for the Institution of Civil Engineers and the Naval Architects. The latter body, he said, always welcomed amongst its members marine engineers. Mr. Boyle proposed "The Visitors." Commander Colwell, of the United States Navy, who responded, said that in the inception of marine engineering, and in its progress the Anglo-Saxon had taken the lead. The first steam-engine applied practically to marine propulsion was made by a Scotchman on the Clyde in 1802. The first steam man-of-war was built in New York in 1814. She was made to fight the British. Eventually she blew up. She was a remarkable ship and contained submarine guns to fire 100-lb. shells. It was in the recollection of most present when a marine engine weighed 5 cwt. per I.H.P., and burnt in rectangular boilers 5 lbs. of coal per hour per I.H.P. They could now put 8,000 to 10,000 H.P. engines into a destroyer of 400 tons, which used less than 1½ lb. of coal per I.H.P. per hour. In the naval service of his country they were all trained as engineers. As gunnery instructor, he had under his control more engines and more H.P. than the chief engineer of the ship. He had control of all the engines with the exception of the propelling engines. By the laws of the United States every naval officer must also be a marine engineer. We had heard a good deal during the last few days of what a handy man could do, and the sailor could do it all, but he could not be "an absent-minded beggar." The open door must be maintained by Great Britain and America for all trades.

Alderman Sir Marcus Samuel proposed the heal[illegible] president.

DRAKE'S BEARINGS FOR PROPELLER SHAFTING.

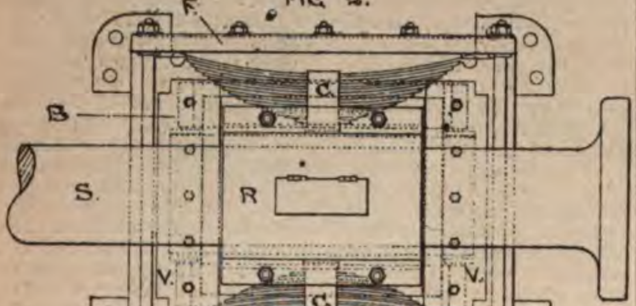
THE difficulties with the propeller shafting of steamships—arising from the bearings being more or less out of line, or the shafting being bent; also from the strains set up by differences of temperature, or from dry docking by placing the vessel on uneven blocks; or from the uneven loading of the cargo causing the vessel to hogg and sagg heavily when exposed to rough weather and heavy seas—are too well known to those interested to need any extensive description from us in the present instance.

Fig. 1



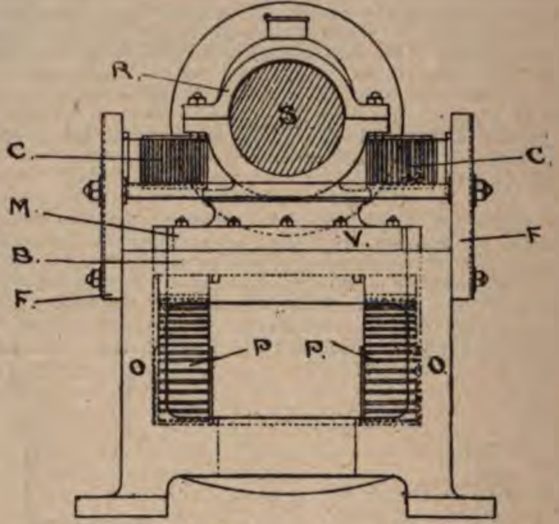
Mr. Drake, of 157, Fenchurch Street, London, E.C., has been giving the matter some attention, and has devised means which shall, within certain limits, allow the shaft to revolve freely, reduce the vibration, and prevent any undue strain upon the engines, couplings, and shafting. The device essentially consists of the employment of bearings supported by springs to replace the rigid bearings now in use, and is illustrated in the adjoining diagrams, of which Fig. 1 is a side elevation, Fig. 2 is a plan, and Fig. 3 is an end elevation. The vertically movable table B is fitted between the columns D, so as to slide, and is supported by the two springs P, the table being left sufficiently clear to allow it to move in an upward and downward direction.

Fig. 2.



The shaft S is supported in a plummer block R, carried by the horizontal thwart-ship sliding table M, and the latter is engaged in grooves V on the vertical table B. Springs C are arranged between the sides of the plummer block R and the frame or columns F, sufficient room being left at the ends of the springs to allow the table M to move athwartships should the vessel be straining in that direction, or in the event of the shaft being bent.

Fig. 3.



It is obvious that by supporting the shaft in this manner its bearings will adjust themselves to its particular alignment, and will follow its motion without throwing any great strain thereon, thus obviating the heavy strains that are set up in the shafting, and removing a very potent cause of fracture in shafts.

We await with interest the result of practical application of this principle of bearing, as it appears to possess very considerable claims to merit for effectively solving a difficult problem, viz., overcoming the serious objections and usual results when the shaft has to support the ship in maintaining its proper form and shape.

ELECTRICAL NOTE.

(From our own Correspondent.)

Electric Motors in the United States Navy.—Rear-Admiral Melville, engineer-in-chief of the United States Navy, has issued his annual report, in which he deals with the electrically driven auxiliary machinery on board ships. The bureau has for a long time been carefully investigating their adaptability to the driving of the numerous auxiliary engines on board ships, and in view of the conclusion that the electric drive of the auxiliaries would not under existing conditions be so satisfactory and economical on the whole as the steam drive, believes it would be of interest to state the reasons for the conclusion. It is commonly believed that, because electric motors are successful on shore, they must be equally successful on board ship. The bureau has planned to use electric motors exclusively in its new plant at the Brooklyn Navy Yard, and it will be readily appreciated, therefore, that their non-use on board ships is for very good reasons. The advantages claimed for electric motors instead of small steam-engines on board ship may be classed as greater ease of operation, avoidance of heat, and much greater economy. Against those, however, are to be put the much greater weight of the necessary electric outfit, the greater delicacy of the type of electric motors ordinarily used, the lack of ready adaptability to the various conditions of the service, a general denial of the claims for economy as ordinarily presented, and the increase in the amount of space required below the protecting deck for the installation of the necessary dynamo-rooms, this space being necessarily taken from the coal bunkers. On board ship, where excess of weight is so carefully guarded against, it would be certainly unwise to adopt a change of motive power, involving a great increase in weight, unless the advantages gained are very material. It must always be remembered that, speaking generally, on board ship the use of an electric motor involves a total weight for the motive power at least three times that of the motor itself, because there are always the generator and its driving engine, besides the motors supplied by them ; that is, the electric drive of an auxiliary will weigh at least three times as much as the steam drive, assuming the motor to weigh no more than the engine it displaces, although usually it does weigh more. It may be objected, however, that the auxiliaries are not all in use at one time, and that, therefore, the generator capacity required is considerably less than the total motor capacity. This is another case where a statement, which may be true elsewhere, is not true on board ship. Naval machinery has to be designed so that in time of action, everything can be ready for use, and, as a matter of fact, a very little study of the question will show that it not only may, but almost certainly would, happen that every auxiliary on the ship, except the capstan engine and some of the boat winches, would be used simultaneously. What has led to the wide use of electric motors on shore are not only the absence of heat, cleanliness, and ease of installation and operation, but above all the simplicity of the transmission of power from a central station to a distance. Now, the great majority of the auxiliaries on board ship are so near the boilers that less piping is involved in a steam drive than in an electric drive from dynamos necessarily at some distance from the boilers. The distance of capstan and steering gear makes electrical drive for them feasible. but it is objected that electricity is not sufficiently reliable for them. A system involving four parts, each liable to break down, is more delicate than one only involving two of these parts. With a steam drive there are the boilers and engines driving the auxiliaries. In the electric drive there are the boilers, the steam engines, also the electric generators and motors. If motors are considered sufficiently reliable to drive feed-pumps and air-pumps on shipboard, for which they are not well adatped, they would be reliable for these other two cases noted which they fit so well otherwise. The absurdity of an electric drive of auxiliary machinery on board ship situated closer to the main engines than the engines driving the dynamos becomes all the more apparent when contrasted with the steam drive for auxiliaries situated in the very extreme ends of the ship. Rear-Admiral Melville takes the case of the *Alabama*. In this the space required for electric motors where used is approximately the same as that required for steam engines to do the same work. The space required for the wiring, etc., is less than that necessary for steam piping had that been used. The space required for the generating sets is 10,140 cubic feet. The capacity of these generating sets is 256 kilowatts, total. If all the auxiliary machinery on board this ship was operated by electricity, and if the space required for the electric generators were increased in the ratio of the increase of necessary capacity in the generating room, the space that would be required would be 50,700 cubic feet for a capacity of 1,200 kilowatts. Consequent upon the extension of the use of electricity would be an increase in the total weight of the machinery equal to from 150 to 250 tons as a minimum. The loss in weight is as much as the gain following the use of water-tube boilers. The increased space occupied by the larger generating room would accommodate 900 tons of coal, or 3,000 H.P. could be added to the power of the propelling engines, giving the ship in the first instance 45 per cent. greater coal endurance, or in the second instance 1·5 knot increase in speed.

The Rankine Patent Feed-water Filter Co., Limited, have taken into partnership Mr. Samuel Cockayne, who was 25 years with the late firm of Siddeley & Co., Liverpool, and for the past seven years partner in the firm of Messrs. E. H. Williamson & Co., engineers, etc., of Liverpool, and have commenced business under the style of Rankine, Cockayne & Co., Limited, as engineers, brassfounders, coppersmiths, etc., at Regent Brass Foundry, 10, Bentinck Street, Liverpool.

THE THERMOSCOPIC LOOP STEAM-TRAP.

IN the adjoining illustration we show two views of the Admiralty pattern of the thermoscopic loop steam-trap. Fig. 1 is a front elevation, and Fig. 2 a side sectional elevation. It will be seen that the construction is of the simplest form. The bottom casting carries internally a tube adapted with a valve at its lower extremity. Around this inner tube an outer tube is arranged, and rigidly supported in the bottom casting. The upper part of the outer tube is provided with a cover carrying two arms, which pivotally support two levers, the free ends of which engage with a groove upon the adjustable screw collar of the upper valve spindle. The levers are pivoted at their central portions to tie rods attached to the bottom casting. The upper valve is adapted to seat upon the upper end of the inner tube. The adjustable screw collar is locked in position when adjusted by the lock nut situated above it on the valve spindle.

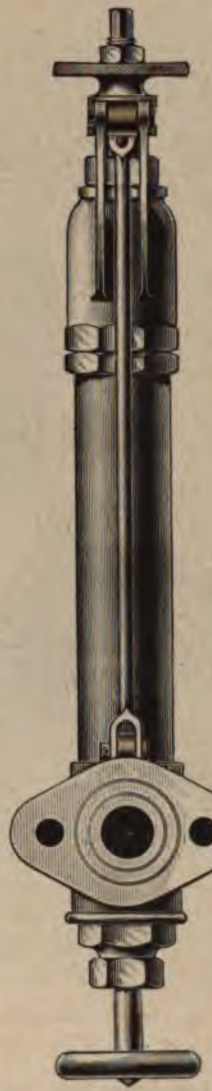


FIG. 1

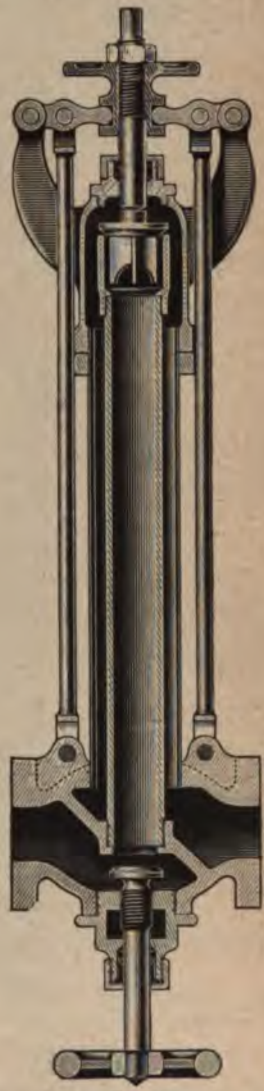

FIG. 2.

Assuming that the trap is properly set, its working s as follows:—As the water collects at the inlet, and the temperature of the inner and outer tubes is reduced, they contract in length and open the valve at the upper end, allowing the water to pass. When the water is nearly all drained away and the temperature is raised the tubes gradually lengthen, and the valve is gradually closed more or less, according to the rate of reduction of temperature. It will be noticed that the inner tube gets hot first, and if the valve does not close quick enough, and allows the hot water or steam to pass the valve, the outer tube is heated and expands, and quickly closes the valve.

To adjust the valve, the valve spindle is held fast by means of a wrench, and the lock nut is slackened back. If the valve is closed it is gradually opened by turning the adjusting screw collar on the spindle until steam appears, when the check nut can be tightened down upon the screw collar, and the trap will then continue to work automatically. This arrangement not only acts as a lock, but prevents the trap being thrown out of adjustment by accident or design, as when locked, the wheel and spindle rotate together.

This device is manufactured and put on the market by F. Lamplough, Rosebery Avenue, London, E.C.

OBITUARY.

MR. THOMAS H. ISMAY.

By the death on the 23rd November of Mr. Thomas H. Ismay after a long and painful illness, which he had combated for upwards of two months, not Liverpool alone, with which part of course he was peculiarly identified, but the whole shipping world loses one of its most prominent and respected representatives. Born in the year at which her Majesty came to the throne, Mr. Ismay had by no means reached old age, and his vigorous presence and cheery voice did not afford his friends any indication of the premature close which was to come to so useful a career. Born and bred in shipping, Mr. Ismay from his Cumberland home found his way to Liverpool, and as a mere boy entered the office of Messrs. Imrie & Tomlinson. On completing his indentures he went for a trip to South America, and on his return entered business on his own account, in conjunction with a son of one of the partners whom he had served. Of the work he has done for the travelling public, and of the mark his career has made on the history of the British mercantile marine, it were too soon to judge. When he, as a man of but 30, took over the famous White Star house flag, it was then borne by sailing ships alone, and was solely known in the Australian trade. Now it may be seen in the Australian trade again, but meanwhile in the North Atlantic, to New Zealand, and across the Pacific, it has extended and consolidated its reputation. Almost immediately upon his acquiring a business of his own he began to lay his plans for extending his operations into the highly competitive New York trade, where steamships of the highest class have always been in keenest rivalry. Some

(From a Photo taken by Alfred Ellis & Walery, 51, Baker Street, London, W.)

The late T. H. ISMAY, Esq., D L., J.P., Founder and Chairman of the White Star Line.

dealings had taken place between the firm of Ismay, Imrie & Co., and Messrs. Harland & Wolff, of Belfast, who had constructed sailing vessels for them. To them therefore Mr. Ismay turned for his pioneer steamship the *Oceanic*, and with them, as we heard the other day when the freedom of the City of Belfast was conferred upon Mr. Ismay, more than seven millions sterling has been expended on building and equipping steamships. All was done without contracts and without friction. That so unique an arrangement should have been practicable says much for both parties to the bargain. The advent of the *Oceanic* introduced comfort and safety to an unprecedented degree into Atlantic travel, and the popularity of the line quickly grew. Eleven steamships in all have been constructed for the mail line, culminating in the gigantic *Oceanic* No. 2, which Mr. Ismay saw launched indeed, but which it was not granted to him to see under steam. Not content with his share of the Atlantic trade, a departure was soon made into Trans-Pacific conveyance, where at present three fine steamers are now on the station. About the year 1881 it was seen that steam was now ready to affect commercial results in the New Zealand trade, and the companies interested then began discarding sailers in favour of steamers. When this point was reached, vessels of the White Star Line were brought in, and the *Arabic* and the *Coptic* were soon joined by the *Ionic* and the *Doric*. The type now affected for this trade is well represented by the twin-screw steamers *Delphic* and *Gothic*. Then vessels were built for the purely cargo trade on the Atlantic. Cotton—always a dangerous thing to carry—was relegated to these boats, and the reassuring announcement made that "cotton is not now carried by the passenger steamers." Beginning with the 4,400 tons *Runic* and her sister (both of the single-screw type) an advance to the twin-screw was made in the next pair. Size was increased in every new steamer, and every possible convenience for the safety and comfort of cattle brought into the fleet. The tiny percentage of losses of cattle by these vessels is the measure of the success which the care bestowed in their outfit and management brought. At the same time safety was studied, and large appliances introduced which might facilitate rapid handling of cargo. At last in the most recent vessel of this class the advisability of introducing a limited number of saloon passengers has been considered, and the experiment has been attended with conspicuous success. Mr. Ismay's last move with regard to his fleet was the inception of the Australian line, for which 60,000 tons of shipping in five splendid twin-screw steamers is being provided. Thus the line can offer a monthly sailing in exactly similar boats to shippers and passengers of the class catered for.

But shipping was not his only interest. The London and North Western Railway has had him for many years on the directorate, and he had the distinction of refusing its chairmanship, as he did the proferred peerage. The substitution of twin-screw passenger steamers for the old-fashioned paddlers in the fleets of the North Western Railway at Holyhead, and in that of the Lancashire and Yorkshire at Fleetwood, was largely due to his influence. To that is also due the immense advantage which Liverpool gained—and that none too soon—from the opening of the Riverside station. He was also on the board of the Royal Insurance Co.

He had much influence, of course, with the Mersey Docks and Harbour Board, of whose audit committee he was chairman. Liverpool and Belfast both had reason to regard him as a benefactor. To Liverpool, where he employed seamen, he gave—and gave handsomely—to the Aged Mariners' Home at Egremont. To Belfast, where he indirectly employed workmen, he gave liberally to the local hospital. To his own people he was generous, too, and much thought was expended for their benefit. Using for them his experience in the assurance world, he was enabled to produce for them a scheme of life assurance whereby the firm assists the officers to provide for themselves. In his more public work his unique position enabled him to do much to keep the North Atlantic Conference together, and it was his influence that caused the important mail lines to adopt the Lane Routes, which had only previously been adhered to by one or two. This has done much for the safety at sea which he considered so much more than mere speed. Various Royal Commissions, &c,.owed much to his services. Amongst these may be instanced the Bulkheads Committee, the Side Lights Committee, the Royal Commission on Labour, Lord Ravensworth's Admiralty Committee on the systems of building vessels for the Royal Navy. He acted as chairman of the Board of Trade Life Saving Appliances Committee, and was on Lord Hartington's (now the Duke of Devonshire) Royal Commission on Army and Navy Administration. At the time of his death he was serving, on the nomination of H.R.H. the Prince of Wales, on the Royal British Commission of the Paris Exhibition, 1900. Everything he touched he worked hard upon, and everywhere he served his tact and weight of character helped to soften asperities and to remove difficulties. His two sons, Mr. J. Bruce Ismay and Mr. James H. Ismay, have been for some years partners in their father's old firm. They are carrying on the policy which he inaugurated, and managing the business he built up with ability and success. The line which Mr. Ismay founded will doubtless continue to prosper, but the disappearance of so stalwart and representative an Englishman of the highest commercial class leaves a blank which will not easily be filled. Of the severity of the loss sustained by his family and friends this is not the place to speak.

MR. EDWARD MACKAY, GREENOCK.

The painfully sudden death occurred on the morning of the 24th ult. of Mr. Edward Mackay, manager of Messrs. Scott & Co.'s foundry, Greenock Mr. Mackay was in his usual health when he left the house, but whilst proceeding along Nelson Street, and when opposite the Eye Infirmary, he suddenly dropped down, and was immediately carried into the institution. Dr. Douglas was sent for, but life was extinct. Death was due to failure of the heart's action.

Deceased, who was a native of Largs, served his apprenticeship with Messrs. Scott & Co., starting in 1854. In 1860 he was sent by that firm to the South of England to look after some work on which they were engaged there. After serving for a time in the drawing office he entered the Glasgow University, where he was one of Professor Rankin's most promising pupils. He was engaged for a time as head draughtsman with Messrs. A. & J. Inglis, Glasgow, which firm he left to go to Sunderland to take up the position of head draughtsman and assistant manager of the North-Eastern Marine Engineering Co. He returned to Messrs. Scott in 1871, and was appointed manager, which position he held till his melancholy death. Mr. Mackay was held in great esteem by his employers, whose entire confidence he retained throughout. He was not much in public life, but gave valuable service in connection with the science classes of the School Board, and was an active member of George Square Congregational Church.

MR. DIXON KEMP.

Mr. Dixon Kemp, an eminent authority on yachts and yachting, passed away on Wednesday morning, November 22nd. In him there was the rare combination of editor and yacht builder. He was born in 1839 at Ryde, and was therefore 60 years of age at the time of his death. For three years—1859-62—he was editor of the *Isle of Wight Observer*, and from that time forward he was yachting editor of the *Field*. He published a number of books relating to yachts and shipping, many of which are now classical, and largely helped to found, and was for many years secretary of, the Yacht Racing Association. He also was largely instrumental in establishing "Lloyd's Yacht Register." He was a member of the Institution of Naval Architects, and was responsible for the design of many of our finest steam and sailing yachts.

HULBURD'S SEAMLESS COPPER JOINTINGS.

ONE of the questions which the modern engineer has often to consider is that of efficiently and readily making joints either of pipes or other connections, and for covers.

The increase in steam pressures of late years has made the necessity of a reliable jointing peculiarly obvious, and considerable attention has been directed to the subject, resulting in new methods being devised and old systems being improved. The Hulburd Engineering Co., of 150, Leadenhall Street, London, have devised and put on the market a system of jointing which, we understand, has been found from actual use to be most reliable and lasting for steam-pipes, cylinder, condenser and boiler-covers, valve-boxes, and domes.

The system of using a copper wire-ring is very old, and has been in common use for 25 years; and, although it made an excellent joint as a general rule, it had two defects, viz.:—Firstly, it offered so small a bearing surface that it did not cover blow-holes of any size, and its thinness of section naturally afforded little life or resilience under the pressure; and, secondly, it had the more important defect that the copper wire had to be soldered at its joint. This created not only a point of weakness, but gave unequal compressibility, which prevented the flanges being made absolutely steamtight, and increased the risk of bending the flanges by the use of excessive pressure.

In the adjoining illustrations we show sections of pipe-joints having Hulburd's seamless copper rings. These jointings are made of specially prepared copper, which allows a series of corrugations with sharp knife-edges to be formed on both sides, so that a very slight pressure upon the surfaces to be jointed makes the joint perfectly tight, and precludes any risk of strain; whilst in the case of very light glands or flanges, specially designed jointings, arranged both outside and inside the bolts, meets the same danger. Fig. 1 shows the ring arranged within a recess on one flange into which a spigot on the other flange enters, thus ensuring the concentricity of the ring with the pipe. Fig. 2 shows an arrangement to avoid unnecessarily increasing the width and weight of the rings in cases where any difficulty is likely to arise in centreing them, by providing a thin white metal disk to their outer edge, fitting exactly against the bolts, in order to ensure concentricity with the pipe.

The advantages which a practically indestructible jointing has over asbestos and similar materials consists not only in the fact that the former will neither char nor blow out, but also in that it can be removed and replaced without the use of tools, for it neither adheres to the flanges nor requires any red lead or other filling. In cases where speedy examination and reconnection has to be provided for, such a jointing appears to be most valuable. That this is so, and that the first cost is amply repaid in the saving of subsequent renewals, and the labour such renewals entail, is reasonably deducible from the fact that the Admiralty and chief naval contractors and railways—as well as private firms, who have even perhaps more than large corporations to compare immediate disbursements with future profits—have, we understand, adopted this system of jointing. The jointings are made in a variety of sections, sizes, and thicknesses, and are turned out with an exactitude which in itself shows how high a value is now put upon the question of jointing, as compared with the time when a rough washer of deleterious material was cut out by rule of thumb, and casually inserted between joints, upon which the very efficiency of an engine must more or less depend. For our part, we agree with those who hold that the best designed machinery may give bad results for want of attention to essential details.

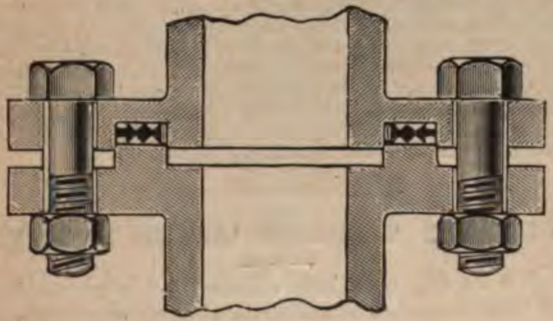

Fig. 1.

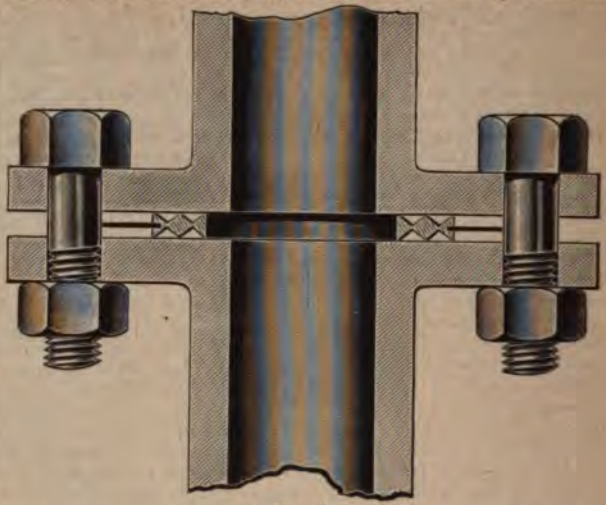

Fig. 2.

The Deighton's Patent Flue and Tube Co., Limited.—We have received a very handsome book from the Deighton's Patent Flue and Tube Co., Limited, which gives not only a description and illustrations of their Vulcan Works, Pepper Road, Hunslet, Leeds, but contains some extremely interesting information with reference to their particular form of patent furnace. Tabulated statements are given as to dimensions, thickness of plate, depth and pitch of corrugations necessary under various pressures. Illustrations and particulars are also given relative to six furnaces which were tested to destruction by the Board of Trade during 1898, which show the various results with various thicknesses of plates and other conditions. The book, although issued as a catalogue, is quite above the average style issued by manufacturers, and does the firm much credit.

Catalogue.—We have just received a very bulky and extensively illustrated catalogue of engineers' and joiners' tools and machinery manufactured and sold by Messrs. C. Nurse & Co., of 182, Walworth Road, S.E.; 144, Bishopsgate Street Without; and 100, Fleet Street, London, E.C. When we mention that it numbers over 300 pages, some idea can be obtained of the immense variety of tools and appliances set out therein. Not only are there some hundreds of illustrations, but the explanatory letter-press adjoining each illustration leaves nothing to be desired by those consulting the catalogue to select tools therefrom. Taking it as a whole, it is one of the most complete catalogues of tools we have ever come across.

The Buoyant Clothing Syndicate, Limited, of 21, Royal Hill, Greenwich, have supplied the American Ladies' Hospital Ship *Maine* with 300 specially made jackets. These jackets are now worn by over 21,000 soldiers and sailors, yachtsmen, ladies, and children, and no single life has been lost, although many wearers have been shipwrecked, and some three times in the same jacket. They are under Imperial, Royal, and most distinguished patronage, including the Royal Humane Society, Marine Engineers' Union, Limited, per Mr. Marshall, secretary, who signed a petition to the Board of Trade two years ago in favour of its adoption in the Merchant Navy—along with 15 M.P.'s, 50 largest shipowners, and 250 captains and officers in active marine service in the Castle Line and Atlantic, and other ocean services. Rear-Admiral Lord Charles Beresford, C.B., M.P., writes through his secretary, Mr. Robin Grey, and says: "I well remember your life jackets, and have no doubt of their excellence." The firm have also been awarded six gold medals, 11 diplomas of honour.

NAVAL ENGINEER APPOINTMENTS.

The following appointments have been made at the Admiralty, from October 26th to November 25th, 1899:—

Abbott, H., engineer, has been promoted to the rank of chief engineer in her Majesty's fleet.
Abbott, H., chief engineer to the *Victory*, for the *Crane*, to date October 9th.
Alexander, J. W. (probationary), assistant engineer to the *Sans Pareil*, to complete complement, to date November 11th.
Allden, F. A., engineer, has been promoted to the rank of chief engineer, with seniority of October 1st.
Allden, F. A., chief engineer to the *Tauranga*, reappointed on promotion, to date October 1st.
Allen, A. E. (probationary), assistant engineer to the *Revenge*, to date November 23rd.
Archard, E. A., assistant engineer (temporary) to the *Vulcan*, to date November 23rd.
Attwood, F. M. (probationary), assistant engineer to the *Juno*, to date October 31st.
Barker, H. C. D., assistant engineer to the *Sans Pareil*, to complete complement, to date November 11th.
Barry, G. W., fleet engineer to the *Revenge*, additional, and for recommissioning, to date November 23rd.
Bath, G. C., chief engineer to the *Cambrian*, to date October 31st.
Black, W. J., staff engineer to the *St. George*, to date October 31st.
Brown, H. A. (probationary), assistant engineer to the *Arrogant*, to date November 11th.
Burner, W. H., fleet engineer to the *Duke of Wellington*, for the *Raleigh*, to date October 31st.
Chope, W. D., engineer, has been promoted to the rank of chief engineer in her Majesty's fleet.
Chope, W. D., chief engineer to the *Barracouta*, to date November 2nd.
Codrington, C. A. (probationary), assistant engineer to the *St. George*, to date October 31st.
Cook, L. J., assistant engineer to the *Wildfire*, for the *Edinburgh*, to date November 1st.
Dalrymple, J. H., chief engineer to the *Vivid*, for the *Blonde*, on paying off, to date the day after paying off.
Dathan, W. A., engineer to the *Victoria and Albert*, to date November 9th.
Davis, F. C., engineer to the *Duke of Wellington*, for the *Brazen*, to date October 25th.
Downer, J. M., staff engineer, to be lent for transport duties in the Thames district, to date November 1st.
Everett, A. E., engineer to the *St. George*, to date October 31st.
Ferguson, S. P., engineer to the *Juno*, to date October 31st.
Garde, R. B., engineer to the *Pembroke*, for the *Angler*, to date November 7th.
Gay, G. M., assistant engineer (temporary) to the *St. George*, to date October 31st.
Goldsmith, H. C., fleet engineer to the *Excellent*, for the *Hero*, and for supervision of machinery of gunboat tenders to the *Excellent*, to date November 16th.
Goodwin, G. G., staff engineer, has been promoted to the rank of fleet engineer, with seniority of October 25th.
Goodwin, G. G., staff engineer, has been advanced to the rank of fleet engineer in her Majesty's fleet.
Gregg, C. J., engineer to the *Minerva*, to date October 31st.
Groves, E. (probationary), assistant engineer to the *Minerva*, to date October 31st.
Gurnell, T. (probationary), assistant engineer to the *Canopus*, to date December 5th.
Hall, W. B., acting engineer to the *Pembroke*, for the *Shearwater*, to date October 31st.
Hamilton, G. J. K., assistant engineer (temporary) to the *Vulcan*, to date November 23rd.
Hardcastle, S. U., assistant engineer to the *Collingwood* (temporary), to date November 1st.
Hawkins, H., fleet engineer to the *Canopus*, to date December 5th.
Hender, W. J., chief engineer to the *Bellona*, on commissioning, undated.
Heyes, H. W., engineer to the *Pembroke*, for the *Coquette*, in lieu of a chief engineer, to date November 1st.
Hicks, J. A. H., staff engineer to the *Wildfire*, for the *Edinburgh*, on commissioning, to date November 1st.
Hudson, G. W., staff engineer to the *Rupert*, to date November 23rd.
Hughes, T. E. (probationary), assistant engineer to the *Cambrian*, to date October 31st.
Hunter, R. A., engineer to the *Revenge*, undated.
Ireland, J. H. H., engineer to the *Victoria and Albert*, to date November 9th.
Jeffery, R. G., assistant engineer to the *Trafalgar*, to complete complement, to date November 11th.
Lilburn, T. E. F., assistant engineer (probationary) to the *Revenge*, to date November 23rd.
Maltby, P. D., engineer to the *Canopus*, to date December 5th.
Mathew, G. W. (probationary), assistant engineer to the *Trafalgar*, to complete complement, to date November 11th.
Miller, M. R., fleet engineer to the *Duke of Wellington*, for the *Iris*, to date November 23rd.
Minhinnick, P. C., assistant engineer to the *Canopus*, to date December 5th.
Moffett, E. G. P., staff engineer to the *Pembroke*, for the *Champion*, to date October 31st.
Moore, A. J. C., assistant engineer (probationary) to the *Revenge*, to date November 23rd.
Morgan, T. J., acting engineer, has been confirmed as engineer in her Majesty's fleet.
Morison, R. B., engineer to the *Europa*, to date November 23rd.
Morley, H. S., assistant engineer (temporary) to the *Revenge*, to date November 23rd.
Moysey, A. H., engineer to the *Pembroke*, for the *Swordfish*, to date November 7th.
O'Dogherty, F. B., assistant engineer to the *Howe*, to complete complement, to date November 11th.
Pill, J. H., staff engineer to the *Minerva*, to date October 31st.
Purkis, J. T., fleet engineer to the *Europa*, when commissioned, to date November 23rd.
Radford, H. G., assistant engineer (temporary), to the *Canopus*, to date December 5th.
Risch, C. L. J. (probationary), assistant engineer to the *Canopus*, to date December 5th.
Ross, G. J., fleet engineer, has been placed on the Retired List at his own request.
Rundle, M., engineer to the *Victoria and Albert*, to date November 9th.
Russell, H. F. (probationary), assistant engineer to the *Vivid*, for the *Albion*, to date November 11th.
Ryan, J., staff engineer to the *Vivid*, for the *Forth*, to date November 23rd.
Ryan, W., engineer, has been promoted to the rank of chief engineer in her Majesty's fleet.
Ryan, W., chief engineer to the *Beagle*, to date November 1st.
Salter, A. G. V., engineer to the *Vivid*, for the *Albion*, to date November 11th.
Sanders, W. C., engineer to the *Renown*, for the *Ardent*, in lieu of a chief engineer, to date November 1st.
Shattock, T., engineer to the *Cambrian*, to date October 31st.
Short, E. A., chief engineer to the *Sharpshooter*, to date October 31st.
Start, S. P. (probationary), assistant engineer to the *Howe*, to complete complement, to date November 11th.
Underhill, C., fleet engineer to the *Vivid*, for the *Volage*, to date October 31st.
Underhill, C., fleet engineer to the *Boscawen*, for the *Agincourt*, to date November 23rd.
Vinning, C. E., assistant engineer (temporary), to the *Rodney*, to date November 23rd.
Weeks, C. M. (probationary), assistant engineer to the *Australia*, to complete complement, to date November 11th.
Whebby, T., fleet engineer to the *Vivid*, for the *Cleopatra*, to date October 31st.
White, G., fleet engineer to the *Alexandra*, to date November 16th
White, W. W., fleet engineer to the *Juno*, to date October 31st.
Wormald, G., acting engineer, to be lent to the Admiralty for temporary duty, to date October 26th.
Wormald, G., acting engineer, has been confirmed as engineer in her Majesty's fleet.

The Russian Ministry of Ways of Communications is now building a dry dock at the port of Archangel, and has consented to allow it to be made use of by cargo steamers.

INDUSTRIAL AND TRADE NOTES.

THE CLYDE AND SCOTLAND.

(*From our own Correspondent.*)

CLYDE shipyard and engine-shop operations during November—or as much of it as is past at date of writing, 24th ult.—have been carried on with accustomed briskness, and a further considerable contribution has been made to the aggregate of the years' output, which, when fully told, will form by far the greatest figure on record.

The Governmental chartering of so many of our best mercantile steamers to take troops and munitions of war to South Africa is having its effect, not only in creating a demand for the tonnage that is available, but in making shipowners spur on the completion of vessels on the stocks. In this way shipbuilders are found in the several districts advertising and beating-up for additional "hands"—particularly riveters. A Leith firm, for example, by no means amongst the largest of the shipbuilding concerns in Scotland, are advertising for—and offering every encouragement in the way of constant employment—as many as 12 squads of "steady ship riveters." From the monthly report of the Boilermakers' and Iron and Steel Shipbuilders' Society, indeed, it is gathered that no fewer than 150 full squads of riveters are urgently wanted for shipyards in the various districts.

This great demand emphasises what has long been felt by shipbuilding employers, that the agreement as to limitation of apprentices, which has obtained for a considerable period, has operated most effectually in depleting the ranks of the riveters, and rendering such labour very scarce indeed. The agreement, however, has now run its course, and the employers are not likely to renew it. It is believed, on the contrary, that they will take the opportunity thus afforded them to raise the whole question of the "control of the workshops," as was done in the case of the engineers. With the unsteadiness and flagrant loss of time on the part of too many of their workmen, the employers are quite in a temper at the moment to see such a policy through to a finish.

The new contracts booked during November have not been very numerous, but several rather substantial orders are included, references to which will be made in the course of these notes. There are further inquiries in the market for steamers, and the demand for steel is very strong. Steel plates and angles are higher in price than they have been for many years, and makers can practically dictate their own terms, as they have well-filled order books which will keep them busily employed for a very long time. The result of high-priced materials and continued briskness in the yards and shops is, of course, dear ships and engines, and the orders which have been placed, it may be taken as assured, are for vessels very much required.

Apart from the Press Agency cables from "the other side" conveying the momentous announcement, nothing whatever has been heard on the Clyde of the two great steamships which a shipbuilding firm there is reported to have been instructed to build by the Great Northern Railway of America through its president, Mr. J. J. Hill. The vessels, which are said to be intended for plying regularly between Seattle and Japan, are both to be larger than the *Oceanic*, and each to have a capacity of 20,000 tons. "They are to be completed," says the cable, "by the year 1901." Meantime, it would appear the Clyde firm referred to are keeping these rivals of the big *Oceanic* up their sleeve!

Messrs. Charles Connell & Co., of Scotstoun, have been commissioned to build two large steamers of from 5,000 to 6,000 tons—one, if not both, being for the City Line of steamers, managed by Messrs. George Smith & Sons, the senior partner of which firm died on the 2nd ult. The engines for these vessels will be supplied by Messrs. Dunsmuir & Jackson, Govan, whose shops are, and have for some considerable time been, very fully taxed with work.

Messrs. John Shearer & Son, of Kelvinhaugh Shipyard, who have during the past six weeks or so been exceptionally well-occupied effecting the necessary alterations on the internal arrangements of steamers chartered by the Government as transports, are about to lay down the keels of two vessels of moderate size for coasting purposes, to the order of a Glasgow firm.

The latest addition to the Navy from Clyde shipyards is the new cruiser *Hyacinth*, which has now completed her official trials. This vessel has been built and engined by the London and Glasgow Shipbuilding and Engineering Co., Limited, and is the third sent from their works this year for the British Navy. Indeed, this firm, since Mr. J. W. Shepherd became the managing director, has taken quite a prominent place amongst naval shipbuilders, for the *Hyacinth* is the eighth vessel delivered to the Navy by the company. The displacement of these aggregated 70,000 tons, whilst the machinery represents 59,000 I.H.P., and all of this machinery has been designed and successfully passed through trial by Mr. William Morison, the engineering manager. The *Hyacinth* is a vessel of 5,600 tons, and resembles the *Hermes* and *Highflyer* constructed at Fairfield. The former has already gone off to South Africa to add to our naval strength there in view of the war.

Messrs. John Brown & Co., Limited, of Sheffield, launched on Saturday, the 18th, from their recently acquired establishment at Clydebank her Majesty's ship *Sutlej*, the first to be floated of the four armoured cruisers of the *Cressy* class, the orders for which were placed on the Clyde. The *Bacchante*, which is on the stocks at Clydebank, the *Cressy*, and the *Aboukir* at Fairfield, and the *Hogue* and the *Euryalus* at Barrow are sister ships. The vessels are 12,000 tons displacement, and their speed is to be 21 knots with the engines indicating 21,000 H.P., while steam will be supplied in each case by 30 Belleville boilers fitted with economisers. All the berths in Messrs. John Brown and Co.'s yard are full, as the British warship *Leviathan* is to be laid down in the place vacated on Saturday by the *Sutlej* The Japanese battleship *Asahi*—which will be ready about April—is in the dock with the *Sutlej*. On the stocks are the armoured cruiser *Bacchante*, three destroyers, four American liners, the Cunarder *Saxonia*, and two fast steamers for the London and South-Western Railway Co. The *Saxonia*, which is in essential respects a sister ship to the *Invernia*, launched from the shipyard of Messrs. Swan & Hunter on the Tyne in September last, will be launched before the close of the year, thus swelling the year's output of the Clydebank establishment by 14,000 tons. Like the *Invernia* the Clyde-built vessel is 580 ft. long (over all, 600 ft.), 64 ft. 6 in. beam, and 41 ft. 6 in. deep to upper deck. The wet dock adjoining the shipyard is now occupied, as above stated, by the *Sutlej* and by the Japanese battleship *Asahi*, 15,200 tons displacement. The latter is not expected to be ready for her steam trials before April next year. A statement which has been going the rounds to the effect that work on this vessel has been accelerated at the request of the Japanese Government is inaccurate. There has been no communication on the subject, and the completion of the vessel at Clydebank is proceeding as usual. The torpedo-boat destroyer *Electra* left the wet dock of the Clydebank Co. on the 15th of the month for Portsmouth to undergo her final trials preparatory to being taken over by the Government. Two other Clydebank-built destroyers will be leaving shortly for the same purpose.

From the 20th to the 22nd of the month, the subscription list was open for an issue of preference shares in Messrs. John Brown & Co., Limited, for the purpose of providing the remainder of the additional capital required for the purchase of the works and business of the Clydebank Engineering and Shipbuilding Co., Limited. The business has been carried on since the 31st March last on behalf of John Brown & Co., and a considerable part of the purchase-money has since been paid. The company took possession of the shipyard and other properties on the 2nd September last, since which date the business has been carried on by them. The Clydebank Works, the prospectus states, consist of the shipyard, engine works, boiler shops, and auxiliary departments, all of modern construction, fitted throughout with the latest appliances for efficiently turning out battleships and other war vessels, mail steamers, and cargo boats of the highest class. Over £280,000 have been spent on new machinery and other important extensions during the past four years. There are uncompleted contracts on the books for over £3,000,000, including three first-class cruisers for the Admiralty, the Japanese battleship *Asahi*, and five large Atlantic liners, which are progressing satisfactorily, and are considered sufficient to keep the works fully occupied at profitable prices for about two years.

Mr. J. G. Dunlop, who has for many years been actively connected with the management of the Clydebank business, has been appointed manager of the shipyard for a term of five years from April 1st, 1899; and on the 26th September, at a general meeting of the shareholders, he was elected a director of the Company.

Messrs. Bow, McLachlan & Co., Thistle Works, Paisley, who continue extremely busy with orders for their patent steering gears, hoists, and other specialities—many of which are for naval ships now being built in the dockyards and private establishments—have also on hand in the yard of Messrs. McArthur & Co., which they themselves carry on, three powerful tug steamers for the Admiralty. The vessels are 170 ft. in length, and are to be propelled by twin screws.

Messrs. William Simons & Co., Limited, Renfrew, launched from their yard on the 23rd ult., what is believed to be the most powerful barge-loading dredger ever built. This vessel, named the *Devolant*, has been constructed to the order of the Russian Government, and is intended to work at one of the ports on the Black Sea. The vessel is 182 ft. in length, 36 ft. broad, and 13 ft. deep. The buckets are exceptionally large, having each a capacity of 35 cubic feet. Dredging can be done to a depth of 36 ft. below water-level, and the lifting capacity of the vessel is 1,890 tons per hour. For propulsion the vessel has a set of compound surface-condensing engines, supplied from two cylindrical boilers of 120 lbs. working pressure. For regulating the cut of the dredger, powerful winches are fitted at the bow and stern. The dredger was launched with engines, boilers, dredging gear (including buckets), &c., fitted complete on board and ready for work, and will in a few days, after trials, proceed to the Black Sea.

Messrs. Simons & Co. have at present under construction, to the order of the Suez Canal Co., for the dredging of the Port Said roads, the largest stern-well bucket hopper dredger in the world, having a hopper capacity of over 2,100 tons of dredgings. The vessel is 266 ft. long between perpendiculars, 47 ft. breadth, moulded, and 19 ft. deep. She will dredge to a depth of 39 ft. 4 in., and will have a lifting capacity of 1,800 tons per hour, the buckets each having a capacity of 30 cubic feet. For propelling the vessel there will be two pairs of triple-expansion engines—either set of engines being capable of driving the dredging gear—supplied from two steel multitubular boilers of 160 lbs. working pressure. The hopper of this immense dredger will be one large apartment, placed amidships, and the hopper doors will be worked entirely from one position by one man.

Messrs. Fleming & Ferguson, Limited, Paisley, launched, on the 23rd ult., into the River Cart the new vehicular four-screw ferry steamer, with elevating platform, which they have for some time had under construction for the Clyde Trustees. The new vessel, which is in all essential respects similar to the vehicular ferry *Finnieston*, built in 1890 by Messrs. William Simons & Co., Renfrew, from designs patented by them a number of years previously, will eventually occupy the station at present—and since 1890—served by the *Finnieston*; and the latter vessel will be transferred to a new cross-river station further down the harbour, and be renamed. The large deep-water recesses on each side of the river—Whiteinch on the north and Linthouse on the south—for the reception of the vessel at the end of each passage are now almost entirely constructed, and the two steamers, old and new, ought to be on their respective stations and contributing materially to the cross-river facilities before the New Year.

Messrs. Russell & Co., of Port-Glasgow, have been busily employed for some considerable time past executing orders received from French shipbuilders for masts, spars, and other equipment destined to form part of sailing ships in course of construction in French yards; and now it is intimated that not only the masts and spars but the actual hulls of sailing vessels are to be prepared and shipped in pieces for reconstruction and completion on French soil. According to reports an order for six sailing vessels has been entrusted to Messrs. Russell, the hulls to be prepared and built on the Clyde, and afterwards taken to pieces, shipped to France, and there re-erected. We are enabled to state that these reports are in part well founded. The structural material for at least three vessels has been ordered and prepared on the Clyde, according to plans, and despatched to France for erection and completion.

Messrs. Blackwood & Gordon, Port-Glasgow, have been commissioned by the Mersey Dock and Harbour Board to build and engine the hull of a floating crane for harbour and river service. The hull will be about 160 ft. long, and will have engines for its propulsion, as well as for operating a jib-crane of 50 tons capacity and considerable outreach. The crane itself is to be supplied by Messrs. Russell & Co., Motherwell, several of whose appliances are now in use at Liverpool and giving satisfaction, notably the hydraulic travelling jib crane alongside the New Canada Graving Dock. The Mersey Harbour and Dock Board, it may be of interest to add, have within the last few years spent enormously in connection with the improvement of the Mersey and the port and docks of Liverpool, their bill for dredgers and such-like craft and apparatus to one Clyde firm alone, including the contracts presently on hand, amounting to over £150,000.

Early in the month an interesting trial trip took place on the Firth of Forth, this being the oil fuel trial of the tank steamer *Syrian*, built by the Grangemouth Dockyard Co., engined by Messrs. Hutson & Sons, Kelvinhaugh, Glasgow, for the carriage of petroleum in bulk for Eastern trade. In the previous week the coal trials were very successful, the speed obtained being nearly a knot in excess of the guarantee. The result obtained from the oil fuel was still more satisfactory. The oil used was that technically called astatki. On running the measured distance the speed was 11½ knots, or nearly a knot more than was the case with the Scotch coal. The number of revolutions was seven to eight more per minute and the H.P. 200 more than at the coal trial, whilst the steam pressure of 180 lbs. was obtained with ease, notwithstanding that all the auxiliary machinery was running the whole time. The consumption of oil at the trial was found to be 25 per cent. less per H.P. than the consumption of the coal. A number of experts, besides representatives of the owners, were present, and expressed themselves as highly satisfied with the successful results obtained, and predicted a bright future for this fuel for marine purposes. It is intended in the case of the sister ship now fitting out by the same builders to ship sufficient oil fuel to take her to her destination in the East. When on their regular services both vessels will use oil fuel exclusively.

Messrs. Hutson & Sons, of Kelvinhaugh Engine Works, Glasgow, have, in addition to the engines and boilers for the second of the two oil-burning vessels above referred to, a great amount of work on hand, chiefly for such shipbuilding firms as the Grangemouth Dockyard Co., the Campbeltown Shipbuilding Co., Messrs. McKnight & Co., Ayr, etc. In their boiler works at present some very interesting contracts are on hand in the way of "haystack" type of boilers for river and channel passenger steamers. This form of boiler, though not so much in use as it once was for river steamers, is still preferred by many engineers and shipowners, as affording high efficiency with small weight—especially in the case of the boilers now being made for high pressure. Messrs. A. & J. Inglis, of Partick, adopted the haystack type of boiler in the North British Steam Packet Co.'s new crack steamer *Waverley*, illustrated in our September issue. With the exception of Messrs. Inglis, there is scarcely another firm—apart from Messrs. Hutson & Sons—at all conversant with the building of this type of boiler, and the arrangement and preparation of parts are such as to preclude the ordinary run of boiler-makers from undertaking work of the kind. The amount of flanging, curvature, and smithing of parts is very great, and is of such a character as to necessitate hand work entirely. Messrs. Hutson & Sons have within the past few years turned out some six or seven such boilers to stand a high working pressure, which are now on board paddle steamers plying chiefly in South of England waters. They have at present in hand four boilers of the type, some of them to be worked at 110 lbs. pressure, and to furnish steam for engines of 2,600 I.H.P. The weight of a boiler of this capacity is only about 50 tons, the amount of heating surface being 4,500 square feet. One of these boilers at present in hand is for the renowned river steamer *Columba*, to replace one of the same type installed a good many years ago. Another is for a high-speed paddle steamer for the South of England, the order for which the firm obtained last month. The hull of this vessel, which is to attain a speed of 20 knots, is being laid down in the yard of Messrs. S. McKnight & Co., Ayr.

The Troon shipyard of the Ailsa Shipbuilding Co., was visited by an outbreak of fire early on the morning of the 10th inst. The two-storey building at the north end of the shipyard, used as joiners' and polishers' shops and boatbuilding shed was destroyed. A large quantity of the finer class of woodwork—which was being got ready for four vessels in course of construction—six ship's boats, and most of the carpenters', joiners', and other workmen's tools were destroyed. The damage to building plant and stock is estimated at about £1,500, which is covered by insurance.

The Ailsa Co. have most of their building berths well occupied, and they have lately received from the Glasgow and Londonderry Steam Packet Co. an order to build a screw steamer for the cross-channel trade. The work of construction is to be gone on with at once, so as to have the steamer ready for next season's trade. The engines for the vessel will be supplied by Messrs. Dunsmuir & Jackson, Govan.

Messrs. William Christie & Co., agents for the Crawford patent bulkhead door, illustrated and described in our October issue, inform me that a number of orders for various sizes of these doors have been received since the publication of the notice, and that inquiries are numerous. Altogether, before many days are over, the firm expect to be engaged on one dozen doors of various sizes. They are being manufactured meantime by a Sunderland firm, and the larger number of the orders, so far, have come from north-east coast firms. Messrs. Christie & Co. are now introducing a very special kind of metallic packing for high-pressure glands, about which something more definite will be said in the January issue.

Messrs. Andrew Lamberton & Co., Sunnyside Engine Works, Coatbridge, have leased a piece of ground in Burnbank Road, Coatbridge, owned by the Coatbridge Gas Co., for the erection of a large iron factory. Messrs. Lamberton intend making large castings for engines, &c. This will give employment to a large number of workmen.

Mr. Robert Tennent, Whifflet Foundry, intends making large additions to his work. The additions are necessary, owing to the increased output of chilled rolls for the manufacture of armour plate.

The Metallic Art Co., 53, Waterloo Street, Glasgow, have secured the Admiralty contract for the supply of name and number plates, in either aluminium or brass, for the next three years.

The new dock projects on the Clyde are now to be entered upon practically. At the monthly meeting of the Clyde Trustees, held early in the month, it was intimated that the plans and specifications and all that is necessary to enable the works committee to begin operations at the projected wet dock at Clydebank, are being prepared, and after their being submitted, along with a report, to the consideration of the committee, the work of dock formation will at once be started. The trustees have also decided to ask Parliament, during the coming session, for powers as before to construct a dock at Shieldhall, on the opposite side of the river, and about three miles nearer the city than Clydebank. It is proposed that the dock should be rather smaller than the one which was considered by the Parliamentary committee last session, the plans for which were considered to be rather complicated. The Trust have appointed a sub-committee to meet with the directors of the Caledonian Railway, and with the Glasgow and South-Western Railway, with the view of making arrangements for direct railway communication to the proposed dock. The Trusts' projects will involve the diversion of the main thoroughfare to Renfrew, so that there will be a sufficient amount of land for quay and shed accommodation between the dock and the Clyde.

Arrangements are also now being entered into for the actual start to the Renfrew Dock by the authorities at Renfrew. At a special meeting of the Town Council, held on the 15th of the month, Mr. Ralph Dundas reported that, as instructed by the council at their meeting on September 14th last, he had arranged with Sir John Wolfe Barry. Mr. Forman, and Mr. Colledge regarding the engineering of the works, and was taking steps regarding the raising of the capital for the authorised works. The meeting confirmed the appointment of Mr. Charles Forman and Mr. Francis S. Colledge as joint engineers for the construction of the works, and Sir John Wolfe Barry as consulting engineer, and instructed them to get the working plans completed early. Mr. Dundas further reported that he had arranged a meeting between the engineers of the town council and the engineers of the railway companies to consider as to the railway connection with the harbour.

The Caledon Shipbuilding and Engineering Co., Limited, Dundee, have secured the contract for building and engining a screw steamer for traffic on the Canadian lakes. She will be 255 ft. in length, 42 ft. beam, and 23 ft. 8 in. depth, moulded.

By the serious fire which broke out in the premises of the Dundee Shipbuilding Co. early in the month, some considerable inconvenience and delay were caused, but arrangements were not long in being made whereby the work of the yard was again in full swing. Three steamers are at present on hand, and although seriously handicapped by high prices and poor delivery of material, as well as with irregularity of workmen and loss of working time, the year's working has led to a clear profit of over £200.

Dundee, as well as Leith shipbuilding firms, are being asked by Messrs. James Currie & Co., of the Leith, Hull and Hamburg Steam Packet Co., to tender for two new screw steamers to be added to the large fleet already owned by that company trading between Leith and the Continent.

From the large new engineering and shipbuilding works established at Annan, Dumfriesshire, by Messrs. Cochran & Co., Limited, who have for many years been established at Birkenhead, there was launched during the month the small steamer *Ethelinda*, built to the order of the Embreza Nacional Co., Lisbon. This is the first occasion on which a vessel has been launched on the Scottish side of the Solway. In the days of wooden vessels the villages which dot the shores of Galloway were busy centres of industry, but this was changed with the advent of iron shipbuilding. Messrs. Cochran & Co., Limited, Annan, have contracted with the Admiralty to supply a number of boilers for service at the Cape. The new works are being put on day and night shifts, and the firm have been advertising for applicants for vacancies in all departments of their works.

At Aberdeen the new pontoon dock belonging to the Harbour Commissioners, while being used for the first time, sank in Albert Basin on the 15th inst. The steamer *Carnie* had been placed on the dock with the view of undergoing repairs, and the pumping gear was put in operation. The dock did not rise sufficiently, however, to bear the weight of the vessel, and the *Carnie* having been moved off the structure, it gradually subsided and sank. An inspection by divers revealed the fact that there was a leak in one of the corners of the dock, and that some of the manholes had been displaced, thus allowing the water to rush in. The work of raising the pontoon was commenced in the course of the afternoon. The dock cost £8,000, and was built by Messrs. Clark & Stanfield, London.

Considering that the International Exhibition to be held in Glasgow in 1901 would undoubtedly attract a large number of engineers and shipbuilders, not only from England and the colonies, but also from the Continent and America, the Council have decided to organise an International Engineering Congress to meet in the autumn of that year. A committee has been appointed to study the whole question, and to make the necessary preliminary arrangements. Some progress has already been made, and negotiations are proceeding with a view to obtaining the assistance and co-operation of the great scientific and technical societies in this country. The financial support already promised by members of the institution is such that the committee have no doubt of being able to organise a congress well worthy of the occasion. Lord Kelvin has consented to act as president of the congress, and application will be made to the University authorities for permission to hold the meetings of the congress in the University buildings. There will be a number of sections corresponding to the principal divisions in engineering practice, each section having a chairman and a distinct set of officials. Papers will be read in each of the sections, and doubtless apt illustrations of much that will form subjects of discussion will be found in the exhibition buildings close to the University. Should the promoters and organisers of the 1901 exhibition be successful in the efforts they are understood to be putting forth to make the engineering and shipbuilding exhibits a specially prominent feature, the congress will be held under almost ideal conditions as to date, site, and surroundings.

The Institution of Engineers and Shipbuilders in Scotland held their second general meeting of the present session in the hall of the Institution, Bath Street, Glasgow, on the 21st ult., Mr. Robert Caird, president, in the chair. The discussion on the paper on "Lighthouse engineering at home and abroad," by Dr. J. A. Purves, was concluded. Papers were read by Mr. W. J. Luke—late of the Admiralty and now on the staff of Messrs. John Brown & Co., Limited, Clydebank—on "The means adopted for moderating the rolling of ships," and Mr. John Barr on "Flow of water over bell-mouthed pipes."

At a largely attended meeting of the Scientific Society of the Glasgow Technical College, held on the 18th ult., an elaborate and interesting paper was read by Mr. David Pollock, M.I.N.A., Glasgow, on the subject of "The introduction and development of machine rivetting in shipbuilding." Examples of various machine tools on the pneumatic and other systems and specimens of rivetted work were shown, and an interesting discussion followed, being taken part in by well known local shipbuilders and others.

THE TYNE.

From our own Correspondent.)

Shipbuilding.—During the past few weeks the shipbuilding firms on the Tyne have had a busy time in estimating for new contracts—mostly on terms of deferred delivery—and there is not the least reason to doubt that the total work on hand has been largely augmented. The general impression now is, that at least two more years of full activity in shipbuilding is assured and unless wages difficulties should arise to check the flow of prosperity, the first years of the new century are full of promise for both employers and employed. The wages rates of all classes of shipyard operatives, are now at the highest point ever reached, and it is therefore improbable that any further demands will be made. The management of the Boilermakers' Society, however, will undergo an important change at the end of the year, the present general secretary Mr. Knight, giving place to the newly elected Mr. Cummings, and it is possible that under the new regime, more aggressive tactics may be resorted to than have hitherto characterised the action of that society. There are vague rumours already afloat, of an impending demand for an advance on behalf of the "black squad," but whether concrete form is given to them or not, is a matter which remains to be seen. In reference to this class there is one statement to be made which cannot be denied, and that is, the more wages they receive, the less they are inclined to work. That undeniable fact will furnish the employers with a strong argument against granting any claim for a further advance, should such be made; and in view of the circumstances that little better than two-thirds of the available time has been worked during the present year, the officials of the Boilermakers' Society will have a hard task before them, if they try to persuade the masters that a higher rate of remuneration is needed.

It will not surprise our readers to learn that Messrs. Swan & Hunter are among the firms that have added to their prospective work engagements lately, the orders booked by this firm being, we believe, of an exceptionally important class. The work on the stocks at the moment, comprises one or two cargo-passenger boats of superior type, and several vessels of a less costly kind; while, in the water, a couple of vessels are being fitted out. The firm have added some new machines of an interesting and effective kind to their already extensive plant, and it is understood that the covered building berths in the east yard - which form such a unique spectacle on Tyneside, and which are over 600 ft. long—are to be further lengthened, with a view to the accommodation of vessels up to 700 feet. The firm are making a bold bid for pre-eminence in the shipbuilding world, and there is no reason to doubt that the enterprise of this and other firms on the Tyne and Wear, has had a stimulating effect upon the industry.

Messrs. Wigham, Richardson & Co. have secured some additional orders, and have the two big boats in the east yard (a piece of ground added lately) well advanced in construction. These vessels which are each over five-hundred feet long, have, we understand, been ordered by the North German Lloyd, and the Pacific Steam Navigation Co., respectively, and they will both be finished and equipped in a very superior style, to fit them for the services intended. The addition of a further considerable area to the yard has involved the erection of new shops, and the putting down of additional machinery, and the productive capacity of this ancient, but thoroughly up-to-date, establishment has thus been very largely increased. As has been indicated, the yard is one of the oldest on the Tyne, or in the country, and it is much to the credit of the gentlemen who for so many years have had the direction of its destinies, that it is to be numbered amongst the shipbuilding establishments of the kingdom that possess the best appliances and the largest resources for carrying on work.

Messrs. Armstrong, Whitworth & Co., have an abundance of work for both their Elswick, and Low Walker yards, the berths of the former establishment being fully taken up with war ships of various types; while, in the latter, several exceptionally large mercantile vessels are in course of construction. A vessel intended for the carrying of oil cargoes from the East, was launched a few days since, and a special interest attaches to it from the circumstance that it is the largest oil ship afloat, and that the fuel to be employed for purposes of propulsion, is liquid. Messrs. Rusden & Eccles' system of oil burners, which has proved so satisfactory on other vessels of the "Shell" line (the owners of which ordered the present vessel) is we understand to be fitted, and will doubtless give the satisfactory results anticipated. The very large extensions which have been in progress for some time, are now approaching completion, and additional machinery is being placed in position.

The Tyne Iron Shipbuilding Co., Limited, have received among other orders, one from a Newcastle firm for a steamer of large size, and their designing department is, at the moment, particularly busy. Within the past year or two the company have practically renewed the equipment of the yards in the matter of machinery, and one of the results which may be expected to arise from the improved arrangements will be an increased output this year, as compared with former years. Messrs. Wood, Skinner & Co. are understood to have received some orders lately for steamers of moderate size to be employed in the coal trade, and their building berths are fully occupied. Messrs. Dobson & Co. have also a good show of work in their yard, the keel for a large vessel having been recently laid. The firm have some foreign contracts in hand, and it is rumoured that negotiations have been opened in respect of others.

The Palmer Co.'s Yard, at Jarrow, continues to exhibit great briskness, and the construction of the Admiralty work in hand, is being pushed forward with all possible despatch. The plating of the cruiser is now well advanced, and other Government vessels are in very forward stages, considering the dates on which their construction was commenced. The company have several very large merchant ships on the stocks and in the water, and there is reason to believe that there are some good orders in reserve.

It may not be uninteresting to state that there is a cycle manufacturing department connected with the Palmer Co.'s works, and that an excellent reputation has been achieved by the company's products in this line. We now hear that they are bringing out a new design of cycle, which has elicited the unstinted praise of experts, and is likely to further enhance the reputation of the company in this line of business.

Messrs. Hawthorn, Leslie & Co., are understood to have orders sufficient to last for many months yet, and the contracts in hand are being energetically pushed on towards completion. The torpedo destroyer *Viper*, which was launched a few weeks ago, and has been fitted with Parsons' turbine engines, had some preliminary trials lately, and under very bad conditions of weather, made several excellent runs. The speed attained was much above the 31 knots guaranteed, and quite exceeded anything yet done by vessels of this class. It is quite on the cards that the turbine principle as applied to marine engines, will prove a great success, many people going so far as to predict the attainment of a speed equivalent to 50 miles per hour. The graving dock connected with Messrs. Hawthorn, Leslie & Co.'s yard, is kept pretty constantly occupied, and the pontoons and dock belonging to the Wallsend Pontoons Co., have also been in constant requisition for some time past. The other docks and slipways on the river, are pretty generally engaged with vessels undergoing painting or repairs, and in the smaller yards of the lower reaches a good business is being done in the building of trawlers and other small craft.

Engineering—We have reason to believe that several new contracts of importance have been secured recently by the leading engineering establishments, and in some cases a resort to night work will again be found necessary. Locomotive works are well supplied with orders, and will be further strengthened (it is expected) by a large order from the Midland Railway Co. Northern built engines, which have been supplied to that company, are said to have given great satisfaction, and we have it on good authority that an order for 50 engines, to be divided between two Newcastle firms, will shortly be forthcoming.

A new boiler feed pump of the compound direct-acting type has recently been supplied to the Blaydon Ironworks, and has given excellent results, maintaining the supply of water to a boiler that has a maximum working pressure of 300 lb. The pump, which has been patented by Mr. J. P. Hall, of Peterborough, differs from the ordinary type in one important particular, the effect of which is a saving of 50 per cent. in steam consumption per unit of power used. The economy cannot fail to attract very general attention to the type, which is admirably adapted for use on steamships, where fuel economisation is a matter of vital consequence. Works for the manufacture of these pumps have been established by Messrs. J. P. Hall & Sons, at Peterborough, and Mr. C. H. Tate, Side, Newcastle, is the firm's representative on the North-East Coast.

Mr. W. F. Snowdon is doing an excellent business on the Tyne and Wear in the sale of that well-known speciality, Morison's evaporator, for which he is agent. Evaporators have now become a necessity on steam ships, and among the many contrivances of this kind on the market there are few, if any, that have attained so widespread a popularity as Morison's. Such is the demand for this article indeed, that the department set apart for its manufacture at Messrs. Richardson's works, Hartlepool, has had to be extended, and is now, with its enlarged capacity for production, kept going night and day.

Mr. L. Rusden, Royal Insurance Buildings, Queen Street, Newcastle, has during the present year had very marked success in the sale of Deighton's patent furnaces for marine and land boilers, in respect of which he is the accredited representative for the Tyne and Wear and north east coast generally. Latterly he has secured very large orders in all parts of the district indicated, and there is every reason to expect that the sale of this speciality will be largely increased in the coming year. Mr. Rusden has just added to his other agencies the representation of the new "Durr" light throughout the northern counties. This light is eminently suitable for ship yards, engine works, graving docks, &c., being very portable, easily fixed or removed, and simple to manage. The apparatus is constructed on a different principle to other contrivances of a similar kind, working automatically and without the employment of compressed air. It possesses many other advantages peculiar to itself, and is certain to be largely adopted wherever the absence of electrical installations gives scope for the employment of mechanical contrivances for providing and maintaining a powerful light in the open air.

Messrs. Isdale & Farrow, of St. Nicholas' Buildings, Newcastle, who towards the close of last year were appointed agents on the North-East Coast, for the Clydeside Tube Co., Limited, have already succeeded in establishing an excellent business connection in the district, and have secured a large number of orders during the year. Quite lately they have obtained from leading engineering firms some exceptionally large orders, and have also negotiated a number of good contracts, involving the fulfilment (in each case) of requirements in the way of iron and steel tubes over the whole of next year.

Messrs. Thomas Proctor & Son, ironmongers and manufacturers, Side, Newcastle, and South Shore Road, Gateshead, have a large number of orders for ventilators, tanks, and other steamship accessories, and their extensive works at the latter place are kept exceedingly busy. The extensions which have been in progress for some time are practically completed, and when the machinery equipment is finished, the productive capabilities of the firm will, it is expected, be equal to all calls that are likely to be made upon them.

Electric Lighting—Messrs. J. H. Holmes & Co., Messrs. Clark, Chapman, & Co., and Messrs. Scott & Mountain, are all well supplied with orders, the two former in ship lighting and general work, and the latter in power and lighting installations for collieries, mills, &c. A new firm, under the style and title of Carrick & Stevenson, have commenced business as electrical engineers at No. 34, Side, and have succeeded in obtaining a large amount of work. The firm, we believe, intend going in for both ship and colliery work, in which branches the partners have special experience.

Suffolk.—On November 20th the large screw-steamer *Suffolk*, (of which we gave full particulars in our launch columns, September issue, page 264) built by the Sunderland Shipbuilding Co., Limited, to the order of Messrs. Birt, Potter & Hughes, Limited, of London, for their well known line of Australian steamers proceeded to sea on her trial trip. She had on board a large cargo of railway iron and coal and when run over the measured mile at Whitley gave a very satisfactory result.

Messrs. Gourlay Brothers & Co., Dundee, have secured an order for a paddle steamer to be employed in the Great Eastern Railway Company's service from Harwich.

The Nova Scotia Steel Co., New Glasgow, N.S., is building another smelting furnace. The large steel building will be extended some eighty feet to cover the new furnace and bring the steel travelling crane in connection with it. The furnace will produce 100 tons a day.

THE WEAR.

(*From our own Correspondent.*)

Shipbuilding.—In the distribution of new orders for ships, it may safely be presumed that Sunderland firms who are in a position to accept additional work, have not missed getting a fair share of what was going, and we believe, as a matter of fact, that several new orders have been lately placed. Among the Wear shipbuilding firms however, there are some who do not care to add to their responsibilities, especially while prices of material are so high, and still inclining upwards. Any firm, indeed, that is already well booked forward, is scarcely likely to be solicitous just now for further work, excepting on conditions of long terms, for building, and at a considerable advance upon recent prices. Shipowners who can succeed in placing orders just now, excepting at enhanced rates, must be looked upon as rather lucky; for, in all probability, prices will go much higher by the end of the year.

The launch on the 17th ult., by Messrs. Doxford of the s.s. *Skandia*, ordered by Dutch owners, made the firm's seventh launch for the year, the aggregate tonnage of the vessels put into the water, coming well up to 30,000 tons. The large vessel which the firm are building for the P. & O. Company, is well advanced, and may possibly be ready for launching by the end of the year. Should this happen, the firm's output for the year, will reach a figure not likely to be beaten by any firm working an equal number of berths. The firm, it may be stated, have five berths; but one of them is usually occupied with a government vessel, and it is well known that these do not count very materially, in the estimating of output.

Messrs. Pickersgill have now about completed the new shops with their machinery equipment, and will doubtless be able to turn out much more work next year than they have done in any year of the past. Messrs. Robert Thompson & Sons have a good supply of work for their Southwick yard, and at their graving dock works near Sunderland Bridge there is a lot of work in hand. The principal contract just now being dealt with is the overhauling of the s.s. *Remembrance*, belonging to Messrs. Frear & Dix, and built by Messrs. Short Brothers nearly twenty years ago. In her long career the vessel has not, we understand, required very much, beyond the ordinary surveys, in the way of repairs, and the state of preservation in which she now appears is a strong testimony to the soundness of her original construction.

At Sir James Laing's yard there are two repair contracts in hand, in addition to the new work, and all departments continue busy. The Sunderland Shipbuilding Co. are also full of work, and have been complimented by a Government official on the superior manner in which the s.s. *Wakool* built by them and chartered for the South African service, has been "found" and equipped. Messrs. Blumer & Co. have the largest ship ever built by them now on the stocks, and at the Strand Shipbuilding Co.'s yard there are two vessels in hand, besides repair work.

Messrs. J. L. Thompson & Sons are, as usual, extremely busy, their initiatory departments showing quite a pressure of work. A very fine vessel is being fitted out at the Manor's Quay Works, and there is also some repair work in hand.

Engineering.—At all the marine engine works full activity is maintained, and the smaller engineering works are also kept steadily going. The Sunderland Forge and Electrical Works continue to show a high state of briskness, and in both branches the outlook for next year is excellent. We understand that Mr. Crawford, who for several years past has held the position of manager (under Mr. Irwin) at the North-Eastern Marine Engine Works, Sunderland, is about to undertake similar duties at the works of Messrs. Fawcett & Preston, Liverpool. Mr. Weir, head draughtsman at the North-Eastern Works, Wallsend, will succeed Mr. Crawford at the Sunderland works, and will commence his duties on the resumption of work after the new year holidays.

We hear that a large order for triple-expansion engines has been placed with Messrs. George Clark, Limited, Southwick, and though we cannot actually vouch for the truth of the statement, we have reason to believe that it will be found correct.

Iron foundries are keeping busy, and the same may be said of brass and copper works, rivet works, anchor works, forges, and iron rolling mills. Other industries may be described as fairly prosperous.

The Hartlepools.—During the week ending November 18th, four vessels were launched at this centre, the aggregate tonnage of which amounted to 35,000 tons, two of them representing a carrying capacity of 12,900 and 10,666 tons respectively. This is an extraordinary achievement in a shipbuilding centre having only three firms, and it may be doubted if it has ever been surpassed at centres having three or four times the number of firms. The circumstance says much for the capacity and enterprise of the firms concerned. Engineering works continue fully employed, and at the docks, business, particularly in timber importation, is very brisk.

Stockton.—Shipbuilding and engineering—both marine and general—continue brisk at this centre, and there is rather an increase than otherwise, in the pressure of work at the steel and iron manufactories.

Middlesbrough.—The shipyards continue to show fully occupied berths, whilst engine works and boiler and bridge works are apparently busier than ever. Local bridgebuilders have been intrusted with large contracts for bridges, to be shipped to South Africa, and are doing their utmost to give earliest possible delivery. Steel works are pressed with orders, and prices still tend upwards.

Consett.—The activity at the Consett Co.'s Iron and Steel Works, shows no sign of slackening, and a very high average of weekly output is maintained. The company's resources are being extended wherever possible, with a view to cope with requirements.

THE MERSEY.

(From our own Correspondent.)

THROUGHOUT practically all the leading branches of engineering in this district, establishments continue actively engaged, with a prospect of full employment for a considerable time ahead. Heavy stationary engine builders are perhaps not quite so pressed as they have been and textile machinists report work running out faster than new orders are coming in, but in other departments exceptional briskness prevails. Machine tool makers continue especially busy, both for general and marine and ordnance requirements, and they are as a rule assured of being kept fully going at any rate over the ensuing year. Locomotive builders and boiler makers are in a similar satisfactory position, whilst hydraulic engineers are also exceedingly well engaged, and in electrical engineering the tendency is towards an even greater pressure of work than that which has recently been experienced.

The monthly returns of the leading engineering trade unions continue of a very satisfactory character. The Amalgamated Society of Engineers reports a further reduction in the number on unemployed benefit, which now represents about 2¼ per cent. of the total membership. Locally the position is even better, as there are now less than 2 per cent. on donation. This is largely due to the number of men that have been sent from the Manchester office to Barrow-in-Furness during the last few weeks, owing to the large demand in the last named town for men accustomed to engine, tool and gun work. The Steam Engine Makers' Society has about one per cent. of its total roll on benefit, and the officials report an almost daily demand for men for the Government Dockyards that they are unable to meet. Locally this organisation has still practically a clear book. The United Machine Workers' Association has about two per cent. of the total list on donation, whilst in the Lancashire district the general average is only about one per cent., a considerable number of the branches having no names at all on the trade donation list. As regards labour and wages questions, there is this month nothing of any exceptional moment to report.

In a paper read before the Manchester Association of Engineers on November 11th, Mr. J. E. Fletcher, of Sheffield, made some interesting remarks with respect to the difficulties attending the production of castings for engine boiler and pipe connections for marine requirements. Of late years, he said, boiler manholes, safety valve seatings, stop valve bodies, and similar details had been much used as steel castings, and their manufacture had been successful, except in cases where the desire to eliminate weight had led to contractional flaws and blow holes. Recognising the fact that high pressure steam was to be the rule of the future, steel founders had made every effort to produce the intricate pipe connections between boiler and engine now required. In the Navy the introduction of the Belleville boiler had led to the use of steel castings of most intricate form, some of which had been produced successfully, but in the case of others waster after waster had rewarded the founders' efforts. Some of the exceedingly light designs that had been attempted in castings for high pressure boiler work were dangerous, and the use of them must sooner or later lead to accident. The cost of such castings was very great, and delays due to foundry failures were frequent. He believed he was perfectly correct in saying that on several occasions the completion of warships had been delayed simply on account of the difficulty in obtaining delivery of steel boiler castings of the intricate order to which he had referred.

Messrs. Craven Brothers, Limited, of Manchester, have recently completed a number of exceptionally heavy machine tools, specially adapted for marine engineering and ordnance requirements, of which a few particulars will be interesting. One of these is a special gun tube and shaft boring machine, weighting 62 tons. This has two driving headstocks and may be used as one machine for boring up to its maximum capacity when operating from both ends at the same time, or as two separate machines when boring from one end only. The driving headstocks have revolving hollow mandrils, the face-plates on which are fitted with four gripping jaws with case-hardened removable fronts, to grip large and small diameters of forgings, so that any type of jaw may be affixed to suit the work. The face-plates and mandrils are each driven by a worm and worm wheel with three sets of changeable spur gearing and two speed cone pulleys, giving six different speeds.

Another new design is a double-ended ingot boring machine, weighing 46 tons, and capable of boring ingots from both ends at the same time or either end separately as required. The foundation bed, which is 44 ft. long, has its upper surface planed with slots the full length, to receive the two top beds carrying the boring headstocks and guide pedestals for supporting the out ends of the trepanning bars. The machine is driven by fast and loose pulleys, or electric motor as desired, with a clutch to stop or start each head to work them either together or separately.

The firm also make a special double spindle horizontal and vertical milling machine that will mill surfaces to right angles, and the spindles of which may be used separately for either vertical or horizontal milling, whilst the vertical spindle is arranged to work with a profile shaper. The bed is arranged to form a cistern for the lubricant. The spindle carriage is carried by a balanced cross slide, adjustable vertically on the face of the uprights by strap power to suit the work fixed on the table. The spindles run in adjustable conical gun metal bearings. The table has planed T slots with a dish round it to catch the cuttings and lubricant, which is conveyed back to the cistern in the bed. The table has an automatic stopping motion to arrest the traverse at any desired point. It may be added that the firm have also just completed an exceptionally large 42-in. centre planing machine, which is 47 ft. between the centres and 60 ft. long, and weighs 92 tons, whilst they have another machine of the same size on order.

Messrs. W. Muir & Co., Limited, of Strangeways, Manchester, have recently completed an improved double spindle profiling and general milling machine, specially designed for milling two connecting-rods at the same time from one former plate. The spindle slides have spindles 4 in. diameter, and provided with Alfred Muir's patent couplings for readily securing and releasing the mandrils, for cutters, and constructed to work either independently or simultaneously. Each carriage has a disengaging motion so that one or both can be worked or stopped from the one driving shaft, and arrangements are also provided for coupling both carriages together by means of an adjusting screw for profiling in unison along the sides of two sets of work from one former plate. The cross slide is balanced and raised or lowered by power. The machine is provided with practically two tables, the main one being a rectangular table with T slots, and provided with troughs all round the outer edge to drain away the lubricant back to the cistern in the bed of the machine, and is fitted with self-acting longitudinal reversing hand feed motions, and quick traverse in either direction by power. This table is 10 ft. long by 5 ft. wide, and the machine will admit 5 ft. 6 in. between the uprights, and 5 ft. in height between the cross slide and the table. The subsidiary table is circular and 3 ft. in diameter, arranged to fit on the rectangular table, from which it can be readily removed when not required. This smaller table is self-acting by worm and wheel. The cutter stays are arranged to take cutters 9 in. diameter by 13 in. long; all the slides are fitted with index rules, and a centrifugal pump is provided for lubricating the cutters. The machine weighs 25 tons.

During the past month there has been a continued upward move in prices, both for raw and manufactured iron. In pig-iron makers' quotations have advanced from 1s. and 1s. 6d. up to 3s. in some cases, and although buyers are following the rise rather cautiously, and there is underselling by merchants in some brands, makers, who are generally heavily sold for some time forward, are generally firm at their full rates. Local makers are now quoting 79s. 6d., less 2½ for foundry qualities. For Lincolnshire foundry makers have hardened up 2s. 6d. to 3s. per ton, and are now asking 76s. 6d. net, whilst Derbyshire, which has made a similar advance, is now nominally quoted 80s. to 82s. 6d. net, delivered in Manchester. Forge qualities are also about 3s. dearer, Lincolnshire makers asking 75s. 2d. net, with Lancashire about 77s., less 2½ delivered Warrington. Middlesborough iron is 1s. to 1s. 6d. higher, ordinary foundry brands averaging about 78s. 10d. to 79s. 4d., with some makers now quoting 80s. 4d. net, by rail, Manchester. In Scotch iron there has been an upward move of about 1s. 6d. per ton, Eglington and Glengarnock averaging about 80s. to 80s. 6d. net in the open market, with makers asking about 2s. more, delivered Manchester docks.

In the finished iron trade exceeding activity is reported, with makers, who are sold far into next year, in most cases having to decline a large weight of business that is offered. Quotations all round have been advanced 10s. per ton, local bar makers now asking £9 10s., with sheets £11, and list rates for hoops £9 17s. 6d. for random to £10 2s. 6d. for special cut lengths delivered in Manchester district, and 2s. 6d. less for shipment. Nut and bolt makers have put up their list rates 20s. per ton, and a further advance is not improbable.

Prices in the steel trade have also shown a strong upward move. Hematites are 2s. to 3s. dearer, the average quotations for No. 3 foundry qualities being 90s. 6d. to 93s., less 2½. Billets have risen about 5s. per ton, local makers quoting £7. For bars local makers' minimum for ordinary basic qualities is now £9. Plates range from £9 for tank qualities to £9 10s. and £9 12s. 6d for boiler plates. Hoops have been put up 10s. per ton, £10 being the new quotation.

The only alteration to record in the metal market is a reduction of ¼d. per lb. in list rates for condenser plates. Other descriptions of manufactured goods are firm with an active demand to meet boiler makers, locomotive builders' and general engineers' requirements. Delivered Manchester district, list rates are as under:—Solid drawn brass boiler tubes, 9d.; condenser tubes, 10½d.; copper tubes, 11½d.; brazed copper gas and steam tube, 11¼d.; brazed brass tubes, 10d.; common rolled brass, 8¾d.; common brass wire, 8½d.; copper wire, 8¼d. per lb.

In the coal trade an exceedingly strong tone is reported, and list prices have not been generally advanced with the commencement of the month. So far as house-fire coals are concerned business has been only moderate, but as the men have been working only indifferently at pits—evidently with a view of strengthening their position on the wages question—stocks are not being increased to any very appreciable extent. Steam and forge coals are in brisk request, the activity in the iron and engineering trades keeping up large requirements, and all the output is moving away; in fact in many cases it is short to meet the demand. In engine fuel the demand is fully sustained, collieries in fact reporting it largely in excess of their present production. The average rates are now 13s. 4d. to 13s. 10d. best Wigan Arley; 11s. 8d. to 12s. 6d. Pemberton four foot and seconds Arley; 10s. 6d. to 11s. common round coal; 7s. to 7s. 6d. common slack; 8s. to 8s. 6d. good medium sorts; and 8s. 6d. to 9s. 6d for the very best qualities.

Shipping enquiry is increasing with prices hardening, 12s. being now generally quoted for steam coal delivered Mersey ports.

Coke is in pressing demand, which is more than sufficient to take away all the output. Prices have shown a further stiffening, 28s. being now quoted for good foundry qualities, and 21s. to 22s. for ordinary furnace cokes at the ovens.

Scotch Steel Makers have advanced the price of steel boiler plates 5s. a ton, the quotation now being £9 10s., less 5 per cent. Steel bars have also been raised 5s. a ton to £9.

THAMES.

(From our own Correspondent.)

MESSRS. TOLCH & CO., of Fulham, are making arrangements for a large extension of their works. It is the intention of the firm to establish a new department outside of the launch and oil engines which will extend to a greater area than their present premises.

The two large launches which the firm built and engined for the Egyptain Coast-Guard service have now been delivered and are in use, the one at Alexandria the other at Port Said. They were to be fitted with a search-light. The speed got out of the two boats was an easy 7½ knots. Now when the Army Corps is in South Africa and about to operate across the Orange River one would have thought that a few flat gunboats or large launches would have been of considerable service cruising about on the border river. Such craft would have been very useful in patrolling in the vicinity of the bridges and preventing the enemy from placing mines about them for blowing them up. As there is plenty of petroleum oil about the country such fleet gunboats or large launches could have been simply fitted with oil engines, and not shown any smoke. On the Niger the firm have several of their launches at work, some also are at use in the pearl fishing of Madagascar, and others in Siberia.

Vauxhall Iron Works.—This firm is building some small tandem compound engines. They are of the tandem two-cylinder, two-stage expansion type. The cylinders are 7 in. and 12 in. diameter with one piston rod, the two pistons drive a single crank of 8 in. throw. The engine is non-condensing, and of 40 H.P., and is to be applied to drive a four-bladed screw 2 ft. 6 in. diameter fitted in a shallow draught steamer, building abroad for use on African lakes. The pressure of steam for which the engines have been designed is 180 lbs. to the square inch, and the number of revolutions will be 350 per minute. The slide valves of the engine are moved with the same valve rod, the high pressure cylinder is served with a piston valve, and the low pressure with a flat slide valve. As the engine has a high speed the bearings have been made exceptionally long. The frame and bed-plate are of toughened cast iron, and the columns, crank shaft, and piston rod are of forged steel. The thrust block consists of gun metal horse shoes. There is a single hand lever to reverse the engine. Steam will be supplied by a water-tube boiler.

BELFAST.

(From our own Correspondent.)

THE shipbuilding and engineering industries here continue to be in the same normal condition as chronicled last month, but it is reported on good authority that an amicable settlement between Messrs Harland and Wolff, Limited, and the Belfast Harbour Commissioners has been arrived at, although details have not yet reached us. If reports are true, this firm require ground for building an addition to their works in the shape of a large forge to enable them to make their own forgings, and this will give additional employment to a large number of men, so that, this matter being settled, we are likely to have this firm with us for many years to come, notwithstanding the "bids for their patronage" from all parts of the kingdom.

During the month the new steamer *Persic*, of the White Star Line, left this port for Liverpool. This is the third of five steamers which Messrs. Harland & Wolff have in hand for Messrs. Ismay, Imrie, & Co., to run on their new monthly service, *via* the Cape, from Liverpool to Australia. The dimensions of the *Persic* are:—Length 550 ft., breadth of beam 63 ft., depth 44 ft., and gross tonnage, about 12,000 tons. The vessels forming the fleet have been specially built for the particular trade, and the new service is of special interest to the port of Liverpool. inasmuch as large quantities of the products of the colonies will no doubt be landed there in future direct from Australia. Although the accommodation is for third-class passengers, yet that accommodation is of such an exceptionally luxurious character that really, saving the decorative element, it is practically equal to the provision made on many of the best modern passenger steamers for saloon passengers, and superior to that in many of the older lines. The fact that the upholstery work is not so obtrusive will, in fact, be an advantage when passing through tropical climes, and with plenty of air, which the ample dimensions of the ship will afford, the maximum of comfort on board will be obtained. The dining-room, which is amidships, is large and airy, and fitted with separate revolving seats, whilst the promenade available on the main deck, fore and aft, is also very wide and spacious. The *Persic* is commanded by Captain Inman Sealby. She is propelled by twin-screws, and her machinery has also been constructed in the builders' own works.

On the 18th inst. a large steel steamer was successfully launched from the north end of Messrs. Harland & Wolff's yard. That vessel is named the *Minneapolis*, and has been built for the London and New York service of the Atlantic Transport Line. She has a gross tonnage of about 13,700 tons, and her dimensions are:—Length 600 ft., breadth 65 ft., depth 44 ft. She will have twin-screw propellers, driven by separate sets of quadruple expansion engines, and, besides having accommodation for a large number of first-class passengers, will have a large cargo and dead meat capacity, and be fitted up to carry 676 head of cattle on the upper deck, as also with permanent stalls of the most improved kind for nearly 200 horses on the same deck.

Messrs. Workman, Clark & Co., Limited, launched on the 3rd November, a handsomely modelled steel screw steamer named the *Lord Downshire*, built to the order of the Irish Shipowners Co., Limited, Belfast.

The s.s. *Sicilian*, the new Allan liner built here by Messrs. Workman, Clark & Co., which as mentioned last month had been chartered by the Government to carry troops, &c., to the Cape, left this port on the 3rd inst. for London, whilst there she was inspected by several experts, who report her to be a model troop and store ship, her large size and beam, with the large spaces at command for fittings and accommodation giving ample fresh air and freedom to all on board. We understand she has since sailed for her destination.

The s.s. *Christiania*, of the Hamburg-American Line, has been in the Hamilton Graving Dock here for the past fortnight receiving extensive repairs and alterations to her hull, &c., which are being carried out by Messrs. Harland & Wolff, Limited, whilst the s.s. *China* is near completion and will soon be afloat again.

Messrs. McColl & Co., Limited, engineers, &c., have launched a new cross river ferry boat for the Belfast Harbour Commissioners, and are at present engaged making steam cranes for the same company.

Mr. Joseph Lewis, consulting engineer, has, we believe, placed orders on the Tyne, for at least two rather large steam vessels for the North of Ireland Steam Navigation Company. He has also several vessels under contract on the Clyde for local firms and also smaller craft being constructed at Larne. We hear that Mr. Lewis is adopting the Deighton Furnace in all these new steamers. This furnace we understand is being very freely adopted and is proving highly satisfactory.

NORTH-WEST OF ENGLAND.

(*From our own Correspondent.*)

Barrow.—The shipbuilding and marine engineering industry at Barrow remains in a very active state. Messrs. Vickers, Sons & Maxim, who have generally turned out about £500,000 or £600,000 work per year, have contracts in hand for the next two-and-a-half years representing £4,000,000, and all the orders are for pressing delivery. Under the circumstances, therefore, it is impossible for the firm to enter into any new contracts requiring early attention, and the company consequently are respectfully refusing to tender for many of the important contracts which are on offer in the market. A larger number of men are employed at the Barrow yard than was ever previously the fact, and many more would be employed if it were possible to get houses for them to live in. New property is being built on a large scale in various parts of the town, and it is probable that the spirit shown by builders will be very much increased with the turn of the year. Much progress has been made in the building of the first-class British cruiser *Hogue*, but the builders will not be able to launch her before Midsummer next year, owing to the deepening operations at the docks at Barrow, but this will mean when the cruiser is launched she will be well forward in her construction, as ships generally are launched at very heavy deadweight at Barrow, and the delay in her launch will not mean delay in the date of delivery to the Admiralty. Her engines and auxiliary machinery are very well forward, as also her Belleville boilers. The sister ship of the *Hogue*, the *Euryalus*, is gradually lifting her sides, and the larger cruiser *King Alfred* is beginning to display her great length and breadth. The Japanese battleship is gradually lifting its massive frames, and it is understood the Japanese Government are anxious to get her as soon as possible. Under the best conditions that will not be possible for two years, and in the meantime this will mean a very great deal of work to be done, but day by day the Barrow yard is getting more and more fit to tackle the work on hand and give it the best despatch. New machinery, new departments, extensions to the yard, and every modern facility which science and practice has suggested is being adopted. Several new foundries for iron, steel and brass are to be built, and the already large gun-mounting shop is to be doubled in size because of the large amount of business passing through it. During the past few weeks Messrs. Vickers, Sons & Maxim have been entrusted with the order to construct the gun mountings and the guns of four warships for Her Majesty's Government. This, in addition to the large orders already in hand in this department, will ensure activity in the gun-mounting branch of the Barrow works for two or three years.

The Ramsden Dock at Barrow has not yet been closed for the purpose of sinking the dock sill 6 ft., but it will be closed some time during December, so soon as the four deep water berths in the Ramsden Dock entrance basin have been completed. Then it is expected the work of lowering the sill will be accomplished by the end of May next. After that the largest and deepest draught ships can enter or leave Barrow docks at high water. This it will be readily understood will be of the greatest possible advantage to shipbuilders.

The workmen who live on the s.s *Alaska* at Barrow have not got on very well together under the arrangements made for their comfort and convenience on board the ship, but now the control of the ship in every respect is invested in a committee elected by the men themselves, and this committee is not only answerable for the order of the ship, but for the commissariat for the sanitary arrangements generally. It is believed the ship will become a more popular home under these conditions.

The engineering and boiler-making departments of Messrs. Vickers' works are very fully employed. Never at any time were the works so crowded with orders, and all the available machinery and all the available men are employed.

Mr. James Dunn.—Mr. James Dunn, the naval director of Messrs. Vickers, Sons & Maxim, had a narrow escape on the morning of November 20th of being suffocated by fire. He was staying at Furness Abbey Hotel and went to bed as usual about 11 o'clock. He was awoke about three o'clock by a fit of coughing, and then found his bedroom full of smoke. Although half suffocated he managed to make his way to the door along the Batchelors' Corridor to the bedroom of the manager, Mr. Trefenbock. On examination it was found that a fire had taken place under the hearth of Mr. Dunn's bedroom, and it soon began to spread. Grenades and buckets of water were used to extinguish it, but ultimately it was found necessary to telephone for the Barrow Fire Brigade which were on the scene about half an-hour afterwards. By this time the fire had got well hold of the south wing of the hotel, and before it could be extinguished, Mr. Dunn's bedroom together with several of the bedrooms on the same floor and also the bedrooms on the floor above were destroyed, the fire breaking through the roof in several places. The chef of the hotel had a narrow escape, and Mr. Dunn, although he helped in the effort to extinguish the fire, was very much shaken. A portion of his clothes were destroyed, and it was feared that several valuable papers belonging to Messrs. Vickers Sons & Maxim were burnt up, but fortunately the travelling bag in which these papers were deposited, although absolutely charred and destroyed, was found to have preserved its contents. Mr. Dunn lost a valuable dressing case, some jewellery, &c. He has since been the recipient of many congratulatory messages from gentlemen connected with the Admiralty and the shipping interest generally on his very narrow and fortunate escape from suffocation.

West Cumberland.—The shipbuilding trade in West Cumberland is remarkably brisk, and both at Maryport, and at Workington, orders are largely held for light tonnage craft. Business in Maryport is on steady and satisfactory lines. Messrs. R. Ritson & Co., launched from their Maryport yard on the 6th. November, a finely modelled screw steamer, which has been built to the order of Mr. H. Podens, of Wismar. The vessel was launched broadside on. She has a cellular double bottom, and has been built to pass 1st class at Germanischer

Lloyd's. Her dimensions are: Length, 190 ft.; breadth, 30 ft.; and depth over marking, 15 ft. 1 in.; and her deadweight capacity is 1,100 tons. She has been named *Thomas Leigh*, and she was launched by that gentleman. She will be fitted by Messrs. McKie & Baxter, Glasgow, with triple-expansion engines. Other new work is going down at the Maryport yard. At Workington, Messrs. Williamson & Sons have a full order sheet of small craft which represent profitable business. There is every prospect that at both the Maryport and the Workington yards, builders will have plenty to do for many years to come as a good string of regular business falls to their lot, indeed even in quiet times West Cumberland shipbuilders are invariably busy.

A Good Old Chestnut.—Every year when the municipal elections are on at Whitehaven, the good old town is promised a revival of its old shipbuilding industry, and this year has proved no exception to the rule. The Mayor of Whitehaven, Mr. Musgrave, hinted in his inaugural speech, and he anticipated during his year of office this industry would be renewed. It is a very worthy ambition though the worst has been trotted out so often that one begins to regard it as a chestnut, yet there is plenty of money, and plenty of enterprise in Whitehaven to remove this old yard, and if the needful is forthcoming, there is no reason why under capable management, shipbuilding in Whitehaven should not pay.

Shipbuilding Material.—A marked improvement has asserted itself in the shipbuilding material trade, and the improvement which has set in, is taken as evidence of the good demand at present felt for shipping tonnage generally. Steel ship plates are very brisk at the improved price of £7 per ton, and new business is not only of a very pressing character, but makers are already very fully sold forward. The greatest activity is maintained at both the heavy and the light mills which work regularly night and day, Sundays excepted. There is also a brisk demand for steel boiler plates, which are quoted at £9 per ton, and orders for which have been very largely placed. Prices are quoted at £9 5s. per ton. The heavy steel castings are in full request for engineering and shipbuilding purposes, and the foundries in the district are all very full of orders, and makers have really undertaken more work than they can get through comfortably. Good long prices are quoted for heavy castings, and are readily paid. Other branches of the shipbuilding material trade are very busy, and are likely to remain so as orders are not only numerous, but they seem to be on the increase, and certainly prospects for the future are very good.

The Hematite Trade.—A very brisk demand is maintained for hematite pig-iron, and business during the past month has been done on a large scale. The output of the district is in fact not enough to supply the demand, and prices have consequently been forced up. Makers are quoting 80s. per ton for mixed Bessemer Nos. net f.o.b., and are very fully sold forward. Warrant iron is at 78s. 7½d. net. cash sellers, 78s. 7d. buyers. Stocks have been substantially reduced, and now stand at 216,190 tons, but they are still 40,211 tons higher than at Christmas, therefore recent reductions are of interest as giving strength to the market. There are 47 furnaces in blast, as compared with 40 at the corresponding period of last year.

Shipping.—The shipping trade is very fully employed, and the exports of pig-iron and steel are well maintained. The total exports this year have reached 462,265 tons of pig-iron, and 431,648 tons of steel, as compared with 469,251 tons of pig-iron, and 468,761 tons of steel in the corresponding week of last year, showing a decrease of 6,986 tons of pig-iron, and 37,113 tons of steel, as compared with the corresponding week of last year. Coasting shippers are so busily employed that in many instances they are ordering new shipping tonnage, whilst in others new vessels are being built.

Wydale.—On November 21st the steamer *Wydale*, 1,870 tons, from Oran to Glasgow, with esparto grass, arrived in the harbour with her cargo on fire. A large staff of firemen were engaged all day endeavouring to extinguish the fire, but that work was only accomplished when the vessel sank. The damage to ship and cargo will probably amount to £6,000. A number of firemen were injured during the day.

GRIEVANCES OF YOUNG ENGINEERS.

PROFESSOR EWING voiced the grievances of many young engineers at a meeting held in the Senate House, at Cambridge, on Saturday afternoon, November 18th, under the presidency of the Vice-Chancellor, to form an Association for the employment of graduates of the University in the various professions and occupations for which they were fitted by their University training. He said they had an extraordinarily copious supply of men in the engineering department of the University. Year by year and term by term the stream of young men coming up to learn engineering continued to be increased. They endeavoured, with the very scanty resources at their disposal, to give these young men such a training as might be helpful to them in their professional life, and here, it might be said, that their responsibility ended. Still they could not see, without some sad anxiety, that little army, year by year swelling in numbers, going down after taking their degree, facing in its simplicity the entirely unknown world of practice. And, again, they could not help feeling that it would be well if the employers were aware what a large volume of excellent material was at their hands, only lacking a little practical experience to make it of first-rate utility. He thought an Appointments' Association would do much to foster both these ends. The young engineer when he left the University had to get some practical experience. He was sorry to say that generally he had to pay dearly for it; he had to pay for the privilege of giving his services gratuitously to his first employer often for three or four years. One thing the Association might very well set itself to do, and that was to endeavour to secure at the hands of engineers some better, some more reasonable terms, for the reception of young men into their works. He would like to see more in England of what they constantly saw in America—a graduate from the technical school being at once accepted as at least worth his bread and butter.

Then again, in the history of a young engineer, after this period of probation was passed, it often happened that he found himself entirely adrift. It was then, he hoped, he would again turn to the Association—he had probably kept his name on the books—and would look to it once more, as he would look to a qualified registry office, to put him in touch with an employer who wanted practical experience as well as scientific training. One often received letters of enquiry from employers, saying that they wanted a man with a scientific training and practical experience for such and such a post. Within the last week it had fallen to his lot to answer three such letters. With the best will in the world to find places for young men, it was by no means easy to answer such letters. The young man who answered the specified requirements had gone down two or three terms ago; one had lost touch with him; one did not know whether he wanted a place, and so it often happened that such letters had to go without any satisfactory response. All these were matters for this new Association. He thought employers would go to the Association, knowing that it would act the part of an honest broker, and that the men whom it recognised would at least have shown some guarantee of their qualities, some capacity for discharging the work that they were trained to do; and as regarded the engineer employers in particular, he thought they would turn their eyes more to the University than they had done in the past, they would do so to an increasing extent, and they would soon learn that men who came from the University with a sound scientific training made good engineers.

It was unanimously agreed, on the motion of Lord Rothschild, to form a University Appointment Association, and a strong board of management was appointed. Among those who wrote expressing sympathy with the objects of the movement were: Lord Loch, Sir John Lubbock, Mr. Hugh Bell, Messrs. Bell Bros., ironmongers, North of England, Mr. Yarrow, Sir Thomas Andrews, Mr. W. H. Allen, Queen's Engineering Works, Bedford, Mr. Noble, Britannia Works, Ilford, Mr. Kennie B. Murray, secretary of the London Chamber of Commerce, and many others.

The three ironclads just laid down by the Swedish Admiralty, and being constructed in Sweden, are to be provided with Yarrow boilers.

LAUNCHES AND TRIAL TRIPS.

LAUNCHES—English.

British Prince.—On October 21st a finely-modelled steel twin-screw steamer was launched by Palmer's Shipbuilding and Iron Co., Limited, at Jarrow-on-Tyne, of the following dimensions:—Length between perpendiculars, 470 ft.; breadth, extreme, 56 ft. 6 in.; depth, moulded, 35 ft. The vessel will be rigged as a four-masted fore-and-aft schooner, and has been built under special survey to take the highest class in Lloyd's registry. She is of the three-deck type, with two steel decks laid all fore and aft, and has a closed in shelter deck, specially strengthened for the Atlantic trade, extending over the whole length, and above this a shade deck covering the machinery openings. All the available space under the shelter and shade decks is left clear for carrying horses. The hull is divided into ten watertight compartments by means of nine watertight steel bulkheads. The vessel will be lighted throughout by electricity, and will be fitted with all the most modern appliances for the rapid loading and discharging of cargo, and for the general working of the ship. The vessel is designed to carry upwards of 10,000 tons deadweight on about 27 ft. mean draught. The vessel has been constructed for the British Shipowners' Company of Liverpool, of whom Messrs. Gracie, Beazley & Co., are the managers. The christening ceremony was performed by Miss Winifred Barbara Jackson, daughter of the chairman of the British Shipowners' Company, who named the vessel *British Prince*.

Brunswick.—On October 21st there was launched from the shipbuilding yard of Messrs. John Jones & Sons, on the Mersey, the steel screw tugboat *Brunswick*, which has been built to the order of the Alexandra Towing Company, of Liverpool. This is the third vessel of the same type launched this year by Messrs. Jones for the same owners. The machinery in each case has been constructed by the builders.

Hawkwood.—On October 21st there was launched by Messrs. John Blumer & Co., at Sunderland, a screw steamer, built to the order of Mr. H. Cecil Polly, of London. The vessel is intended for the coasting coal trade. Engines will be fitted by Messrs. John Dickinson & Sons. The vessel was christened *Hawkwood* by Miss Catherine Swan, of South Shields, daughter of Captain Swan, who will take command.

Hesperides.—On October 21st there was launched by Messrs. Bartram & Sons, at Sunderland, a large steel screw steamer for Messrs. R. P. Houston & Co., Liverpool. The vessel is of the following dimensions:—Length, 365 ft.; breadth, 47 ft.; depth, 27 ft. 6 in., and has been built under special survey to take the highest class in Lloyd's registry. She is intended for Messrs. Houston's River Plate line, and has been specially designed by the senior partner, Mr. R. P. Houston, M.P., for the various requirements of the Plate trade.

Mora.—On October 21st there was launched at South Shields a steel schooner-rigged steamer of about 2,870 tons gross, named the *Mora*.

Robinia.—On October 21st there was launched at Grimsby for the North-Eastern Steam Fishing Co., Limited, Grimsby, an iron steam yawl, of about 185 tons gross, named the *Robinia*.

Waterloo.—On October 21st there was launched at Liverpool for the Alexandra Towing Co., Liverpool, a steel steam tug, of about 149 tons gross, named the *Waterloo*.

Steel Screw Steamer.—On October 21st there was launched from the shipbuilding yard of Messrs. John Readhead & Sons, West Docks, South Shields, a steel screw steamer of the following dimensions:—Length, 335 ft. over all; breadth, 47 ft.; and depth, moulded, 25 ft. The vessel has a large deadweight capacity on a light draught. She has been built under special survey, and is classed 100 A1 at Lloyd's. Her engines, also built by Messrs. John Readhead & Sons, are of the triple-expansion type, having cylinders, 24 in., 40 in., and 64 in. by 45 in. stroke, steam being supplied by two large steel boilers working at a pressure of 160 lbs. per square inch.

St. George.—On October 25th there was launched at Hull for the Grimsby Victor Steam Fishing Co., Limited, Grimsby, a steel steam ketch, named the *St. George*.

Kilnsea.—On November 2nd Messrs. William Gray & Co., Limited, launched the large steel screw steamer *Kilnsea*, which they have built to the order of Messrs. William Brown, Atkinson & Co., Limited, of Hull, for the Sea Steamship Co., Limited. Her principal dimensions are:—Length, overall, 336 ft.; breadth, 47 ft.; and depth, 24 ft. 10 in., and she is built to Lloyd's highest class, with poop, bridge, and forecastle, and fore and aft schooner rig. Very tasteful cabin accommodation is provided in a large deck-house on the bridge. The engineers' rooms are also on the bridge, and the crew's berths forward. The hull is built with deep frames, and a cellular double bottom and after peak tank for water ballast. Steam windlass, steam-steering gear amidships, hand screw gear aft, six steam winches, and the whole of the outfit are of the most improved description. The engines are by the Central Marine Works of Messrs. William Gray & Co., Limited, on the triple-expansion system, with cylinders 24 in., 38 in., and 64 in. diameter, and 42 in. stroke, and three single-ended main boilers to work at 160 lbs. pressure per square inch. The ship and machinery have been built under the superintendence of J. Jamieson & Co. on behalf of the owners. The ceremony of naming the *Kilnsea* was gracefully performed by Mrs. Arthur Atkinson, of Elloughton. The following were also present at the launch, viz:—Mrs. Fenton, Mrs. S. Earle, Joseph Atkinson, J.P., Messrs. Arthur J. Atkinson and Edwin Fenton (Wm. Brown, Atkinson & Co., Limited), and Mr. Jenkins (principal of J. Jamieson & Co.), along with others.

Whakatane.—On November 3rd there was launched by Messrs. R. and W. Hawthorne, Leslie & Co., Limited, at Hebburn-on-Tyne, for the New Zealand Shipping Company, London, a large two-masted steel screw steamer. Her principal dimensions are:—Length over all, 435 ft.; breadth, 54 ft.; depth 40 ft. to shelter deck. She is the 17th of a series of nineteen vessels built and building by Messrs. Hawthorn, Leslie & Co., for the Australian and New Zealand frozen meat trade. The engines of the vessel have been built at the works of the firm and are of the triple-expansion surface-condensing type, with cylinders of 30 in., 48 in. and 78 in. diameter by 54 in. stroke. The vessel was named *Whakatane* by Mrs. Croucher, wife of Captain Croucher, who will command the vessel.

Southgate.—On November 4th there was launched by Messrs. T. Turnbull & Son, at Whitby, to the order of Messrs. Turnbull, Scott & Co., of London, a steel screw steamer of the following dimensions, viz.:—Length over all, 361 ft. 3 in.; length between perpendiculars, 350 ft.; breadth, extreme, 43 ft.; depth to top of ordinary floor, 28 ft. 6 in.; class 100 A1 spar-deck at Lloyd's, under special survey of hull and machinery; built of steel, with Web frames; water ballast tanks throughout holds, under engines, and in after peak. Messrs. Blair & Co. will supply direct-acting triple-expansion engines, having cylinders 24 in., 40 in., and 65 in., stroke 42 in. The vessel was named the *Southgate*, and will be commanded by Captain G. Thompson, late of the *Trongate*.

Thomas Leigh.—On November 4th there was launched at Maryport, for Mr. H. Podens, of Wismar, a steel schooner-rigged steamer, the *Thomas Leigh*, of about 791 tons gross.

Caucasian.—On November 4th this vessel, building to the order of Messrs. Lane & Macandrew, of London, by Messrs. Sir James Laing & Sons, Limited, Sunderland, was successfully launched. She is of the following dimensions:—Length, 365 ft.; breadth, 49 ft. 6 in.; moulded depth, 30 ft. 5 in., and will carry about 6,000 tons of petroleum in bulk, besides 800 tons of coal and the usual stores. The vessel is being constructed throughout to Lloyd's highest class and the Suez Canal regulations, under the personal supervision of Messrs. Flannery, Baggallay & Johnson, of London and Liverpool. The engines, by Messrs. George Clark, Limited, will be fitted amidships, having cylinders 25½ in., 42 in., and 69 in., with 45 in. stroke, and will take steam from three large single-ended boilers at a pressure of 180 lbs. per square inch. Electric light will be fitted throughout the ship, and an elaborate pumping arrangement will be fitted to enable the cargo to be quickly discharged. Detailed auxiliary machinery will be fitted, including large donkey boiler. steam heaters, steam and hand steering gear, steam windlass, steam winches, warping winch, &c. The vessel goes to the engine yard to take her machinery.

Dacia.—On November 4th there was launched from the West Shipbuilding Yard of C. S. Swan & Hunter, Limited, a steel screw steamer which has been built to the order of Messrs. A. C. De Freitas & Co., of Hamburg. The leading dimensions of the vessel are:—Length overall, 346 ft.; beam, 48 ft.; and depth moulded, 34 ft. 9½ in. to the shelter deck. A shelter deck has been fitted right fore and aft, which can be used for either cattle or light cargo; all the accommodation for the officers and engineers being in houses on top of this deck, while that for the crew and firemen, is under the shelter deck forward. The machinery has been constructed by T. Richardson & Sons, Limited, of Hartlepool, and consists of a set of triple-expansion engines having cylinders 24 in., 39 in., and 66 in. diameter by 45 in. stroke, steam being supplied by two large single-ended boilers working at a pressure of 180 lbs. On leaving the ways the vessel was gracefully named the *Dacia* by Miss Hunter, of Jesmond.

Begonia.—On November 4th there was launched from the yard of the Tyne Iron Shipbuilding Co., Limited, of Wellington Quay-on-Tyne, a steel screw steamer built to the order of the Stag Line, Limited, of North Shields, and of the following dimensions, viz.:—Length, 345 ft.; breadth, 46 ft.; depth, 27 ft. 2 in., moulded, and to class 100 A1 at Lloyd's on the spar deck rule. This vessel has water ballast fitted right fore and aft on the cellular system, and is also fitted with all modern improvements for the rapid loading and discharging of cargo, including five double cylindered steam winches, direct acting steam windlass, large donkey boiler, steam steering gear by Messrs. Clarke, Chapman & Co., Limited, and Hastie's screw gear aft. The engines, which are to be supplied by the North Eastern Marine Engineering Co., Limited, are of the triple-expansion type, having cylinders 23 in., 38½ in., and 64 in. by 42 in. stroke, and working at a pressure of 180 lbs. On leaving the ways the vessel was named the *Begonia* by Miss Mabel Williamson, of South Shields. It is interesting to note that the vessel is the 18th built by the Tyne Iron Shipbuilding Co., Limited, and the engines the 28th set built by the North Eastern Marine Engineering Co., Limited, for the above owners.

Brenda.—On November 6th there was launched at Sunderland, for Messrs. Fenwick, Stobart & Co., a steel schooner-rigged steamer of about 1,146 tons, named the *Brenda*.

Lindsey.—On November 7th Messrs. Cochrane & Cooper launched at Selby for the Lindsey Steam Fishing Co., Limited, Grimsby, the steam trawler, *Lindsey*.

John H. Barry.—On Tuesday afternoon, November 7th, this vessel was launched from the Shipbuilding Yard of Messrs. Joseph L. Thompson & Sons, Limited, North Sands, Sunderland, and has been built to the order of Messrs. John H. Barry & Co., of Whitby, and is the 12th ship built by this firm for these owners. Her principal dimensions are:—Length, between perpendiculars, 320 ft.: breadth, extreme, 47 ft. 5 in.; depth moulded, 24 ft. 9 in. She is built to Lloyd's 100 A1 class under their special survey on the three-deck rule, but having only one deck laid right fore and aft. She has a poop and bridge amidships arranged for the stowage of cargo, the topgallant forecastle being fitted for the accommodation of seamen, firemen, and petty officers. The accommodation for the captain, saloon, spare berths, steward, engineers, and officers, &c., being in houses on top of the bridge deck. The deck machinery is of a powerful description, and consists of six steam winches, supplied with steam by a large multitubular donkey boiler working at 160 lbs. pressure. The steam steering gear is placed at the after end of the engine casings, connected by controlling gear to the steering house placed on top of the saloon house, a large chart-room also adjoins this steering house. A powerful screw gear is placed on the poop deck aft, and a patent steam windlass is fitted on the forecastle head, having all the latest improvements. The vessel has a cellular double bottom constructed for water ballast, which will also be carried in the after peak. Shifting boards are fitted longitudinally throughout the ship and six transverse watertight bulkheads are also fitted, and in addition the usual wood division bulkheads. The vessel is rigged as a two masted fore and aft schooner with telescopic topmasts. Four boats are placed on top of the accommodation amidships, and the vessel is supplied with all the latest improvements for the rapid handling of cargo, and for the complete equipment of modern vessels. The engines and boilers have been constructed by Messrs. John Dickinson & Sons, Limited, of the Palmer's Hill Engineering Works, Sunderland. The cylinders are:—23 in., 38 in., 62 in., having a stroke of 42 in., supplied with steam by two multitubular boilers working at 160 lbs. pressure. The hull and machinery have been constructed under the personal supervision of Mr. H. O. Barry, of Whitby, the managing owner. There was a numerous company present at the launch, the christening and launching ceremony being gracefully performed by Mrs. H. O. Barry. Mr. Phorson's patent launching trigger was used at this launch, and is used at every launch at this yard. Among the company present were:—Mrs. J. H. Barry, Mr. and Mrs. H. O. Barry, Mr. and Mrs. G. E. Barry, Mr. and Mrs. Robert Thompson, Mr. and Mrs. J. B. Jackson. Mr. and Mrs. J. Jackson, Miss Maccoy, Mrs. Clark, Mr. Cooper, Captain and Mrs. Jefferson, Miss Smalls, Mr. J. Suggit, Mr. J. K. Hill, Captain C. Vasey, Superintendant Pinkney, Mr. R. Pinkey, Mr. and Mrs. T. Metcalf, Mr. J. Marr, Mr. and Mrs. P. Phorson, &c. After the launch, which was most successful, the company adjourned to the firm's luncheon room, where the usual toasts were duly honoured.

Hornsea.—On November 8th there was launched at Hull, for the Hull Steam Fishing & Ice Co., Hull, an iron and steel steam ketch, named the *Hornsea*.

Skandia.—On November 16th Messrs. W. Doxford & Sons launched from their Pallion Yard, Sunderland, the large turret steamer *Skandia*, built for Messrs. W. Muller & Co., of Rotterdam. The dimensions of this vessel—the 54th turret steamer afloat—are: 405 ft. by 50 ft., by 28 ft. 6 in., and her deadweight capacity is 7,500 tons, on the comparatively small draught of 22 ft. The vessel is classed with the Bureau Veritas, and has been specially designed on somewhat novel lines to meet the requirements of the iron ore trade, in which the greatly concentrated weight of the cargo and the rapid loading and discharging of ore were the difficulties to be met by the designer of the vessel. Ample strength had been secured in the turret type of structure, and the *Skandia* is fitted with ten masts, five on each side of the ship, thus enabling no less than 18 derricks to be operated at once, and these, together with other special fittings, will very greatly expedite the shipment or discharge of large ore cargoes. She has been fitted with three boilers and engines, 25 in., 43 in., and 70 in., stroke, 45 in., also built by the same firm.

St. Gothard.—On November 16th there was launched by Messrs. J. T. Eltringham & Co., at South Shields, a steel screw trawler, 100 ft. 6 in. in length, 20 ft. broad, and 10 ft. 6 in. in depth, to be fitted with engines by Messrs. Baird & Barnsley, of North Shields. She was christened the *St. Gothard*, and is built to the order of Mr. Robert Hastie, of North Shields.

Drachenfels.—On November 16th Messrs. Wigham-Richardson & Co., Limited, launched from their Neptune Shipyard, Newcastle-on-Tyne, a large steel screw steamer which they are building to the order of the Deutsche Dampfschifffaharts Gesellschaft "Hansa," of Bremen. The steamer is for the Indian trade, and will carry 10,000 tons dead weight on a light draft of water. She will be fitted with quadruple expansion engines on the Yarrow, Schlick & Tweedy system, working at 210 lbs. pressure, which, together with the boilers, are being constructed by Messrs. Wigham-Richardson & Co., Limited. As the vessel left the ways she was named the *Drachenfels*, the christening ceremony being gracefully performed by Mrs. Newberry, of Tynemouth.

Helsingborg.—On November 16th, Messrs. William Gray & Co., Limited, launched a fine steel screw steamer which they have built to the order of the Rederiaktiebolaget Helsingborg (Mr. N. C. Corfitzon, manager). She will take Lloyd's highest class, and is of the following dimensions, viz.:—Length overall, 312 ft.; breadth, 43 ft.; and depth, 22 ft. 3½ in.; with full poop, bridge, and top-gallant forecastle. The saloon and captain's rooms are under the poop, and the engineers' and officers' accommodation in houses on the bridge. The hull is built with deep bulb angle frames, cellular double-bottom, and aft peak tank for water ballast, six steam winches, steam-steering gear amidships, hand screw gear aft, patent quick warping steam windlass, patent donkey boiler, grain divisions, stockless anchors, and other improved appliances. Three cylinder triple-expansion engines of over 1,000 H.P., are being supplied by the Central Marine Engine Works, of Messrs. Wm. Gray & Co., Limited. The cylinders are—22 in., 35 in., and 59 in. diameter with a piston stroke of 39 in., and large steel boilers to work at a pressure of 160 lbs. per square inch. The ceremony of christening the steamer *Helsingborg*, was gracefully performed by Mrs. Wm. C. Borrowman, of West Hartlepool. The *Helsingborg* is the 600th ship launched by the builders.

Llanover.—On November 16th, Messrs. Richardson, Duck & Co., launched from their yard a steel screw steamer of the following dimensions, viz.;—Length overall, 351 ft. 9 in.; breadth, extreme, 48 ft.; depth, moulded, 28 ft. 4 in.; tonnage, gross, about 3,850 tons. This vessel which has been built to the order of Messrs. Evan Thomas, Radcliffe & Co., of Cardiff, will class 100 A1 in Lloyd's Register, and has been built under special survey. She is a "single deck" steamer built to three deck rule, having poop, bridge extending from mainmast to foremast, and top gallant forecastle. Accommodation for captain and officers is provided in poop; engineers being berthed in iron side-houses on bridge deck; and crew in top gallant forecastle, which has been specially fitted with patent galvanized iron berths, and a bath-room. A cellular double-bottom all fore and aft, and fore and aft peak tanks are fitted for water ballast, and equipment includes six steam winches by R. Roger & Co., an auxiliary main boiler by Messrs. Blair & Co., of 160 lbs. working pressure, steam windlass, stockless anchors, steam steering gear, and all latest appliances for the economical and safe working of the vessel. The engines by Messrs. Blair & Co., have cylinders 25 in., 42 in., and 68 in. by 45 in. stroke, steam being supplied by two single-ended boilers of 160 lbs. working pressure. As the vessel left the ways she was christened *Llanover*, by Mrs. C. W. Elliott, of Stockton-on-Tees.

Eduard Bary.—On November 17th Messrs. Ropner & Son, Stockton-on-Tees, launched a steel screw steamer of the following dimensions, viz.:—Length between perpendiculars, 325 ft.; breadth, extreme, 48 ft.; depth, moulded, 24 ft. 3 in. The steamer has been built to the order of Messrs. Furness, Withy & Co., Limited, West Hartlepool, for Mr. H. J. Pallisen, of St Petersburg. The vessel is built on the three deck rule, with one deck laid, having full poop, long bridge, and top gallant forecastle. The saloon and cabins for the captain and officers will be fitted up in the poop, the accommodation for engineers under the bridge deck, and the crew will be berthed in the forecastle as usual. She has double bottom on the cellular principle for water ballast fore and aft, and in large after peak tank. The vessel will carry about 5,200 tons dead weight, on Lloyd's freeboard: is fitted with direct steam windlass, stockless anchors, steam steering gear amidships, with powerful screw gear aft, 5 large steam winches, supplied with steam from a horizontal multitubular donkey boiler, &c. She will be fitted with a set of triple-expansion engines by Messrs. Blair & Co., Limited, of about 1,100 I.H.P., steam being supplied by two steel boilers 15 ft. 3 in. by 10 ft. 3 in., their pressure being 160 lbs. per square inch. The christening ceremony was gracefully performed by Miss Casper, of Middlesbrough, who gave the vessel the name of *Eduard Bary*.

Freiburg.—On November 17th Messrs. Furness, Withy & Co., Limited, launched from their Middleton Shipyard, Hartlepool, a large steel screw steamer built to the order of Messrs. The Norddeutscher Lloyd, of Bremen, Germany. She is over 400 ft. in length, and built throughout of Seimen's-Martin steel, with a measurement capacity of 12,900 tons. The vessel is of the three deck type, with long poop and forecastle, and takes Lloyd's highest class. The holds are fitted for wood shifting boards, and all decks, deck erections, skylights, bulwarks, bulkheads, etc., are constructed of steel and iron. The greater portion of the plates are in 24 ft. lengths. Ten steam winches, donkey boiler, patent steam steering gear with hand-screw gear fitted aft, direct steam patent windlass, twelve derricks, six large cargo hatches, and other modern appliances are fitted for the handy working of the ship. The vessel is fitted with cellular double bottom all fore and aft, and the fore and after peaks are also available for water ballast. An extra number of bulkheads are fitted, making the vessel practically unsinkable in the event of collision. A large hold is fitted aft of the engine room for the carriage of camphor. The vessel will be lighted throughout by electricity, and the saloon and cabin for the accommodation of the captain and officers of the ship are handsomely fitted. She will be rigged as a two-masted fore-and-aft schooner. Triple expansion engines will be fitted by Messrs. Sir Christopher Furness, Westgarth & Co., Limited, Middlesbrough, with cylinders 28 in., 44 in., 75 in., by 48 in. stroke; steam being supplied by two boilers 14 ft. long by 12 ft., and one 15 ft. 5 in. by 12 ft., working at a pressure of 180 lbs. Howden's forced draught will also be fitted. Messrs. Furness, Withy & Co., Limited, have a duplicate of this vessel now on the stocks, for the same owners. On leaving the ways the ceremony of christening the vessel *Freiburg* was gracefully performed by Miss E. Liessmann, of Bremen. Director Leist and other officials of the owners were present.

Daphne.—On November 18th there was successfully launched from the shipbuilding yard of Messrs. Wood, Skinner & Co., Limited, at Bill Quay, Newcastle-on-Tyne, a handsome steel screw steamer which has been built to the order of Mr. John. Bull, of Tonsberg, Norway. The vessel is of the long raised quarter-deck type, with short bridge and top gallant forecastle, and she will be rigged as a fore and aft schooner with telescopic topmasts. Her principal dimensions are as follows, viz.:—Length, 264 ft.; beam, 36 ft.; depth, moulded, 18 ft., and she is designed to carry about 2,300 tons dead weight on a light draught. The saloon, captain's accommodation, and spare berths are arranged in a large house on bridge deck amidships, with chart room on flying bridge above, the officers' accommodation being in houses on bridge deck on either side of vessel, whilst the crew are berthed in the top gallant forecastle. Water ballast is provided in the cellular double bottom, all fore and aft, and in the after peak. She will be fitted with the most modern description of deck machinery and other appliances for facilitating the rapid loading and discharging of cargo, and general working and navigating. The propelling machinery has been constructed and will be fitted by the North Eastern Marine Engineering Co., Limited, at their Northumberland Engine Works, Wallsend-on-Tyne, and will consist of a set of their triple-expansion engines of improved design, having cylinders 18½ in., 39 in., and 40 in. diameter respectively, with a stroke of 33 in., steam being supplied by a large steel multitubular boiler, working at a pressure of 160 lbs. per square inch. Both the ship and engines have been built to Norwegian Veritas highest class, and have been surveyed during construction by Mr. Lauritz M. Bodin, of Sunderland, the local representative, and by Captain Berg, of Christiania, who will take command. The christening ceremony was performed by Miss Dessen, daughter of Mr. Fred Dessen, of London, who named the vessel *Daphne*.

Cecil Rhodes.—On November 18th there was launched by Messrs. Forrestt & Sons, at Wyvenhoe, the steamship *Cecil Rhodes*, built for the Tanganyika Concessions, Limited. The new vessel, which will be the first iron steamer to ply on the waters of Lake Tanganyika, is to be employed primarily in laying the wires of the Cape to Cairo telegraph line along the shore of the lake. The hull and the engines have been so constructed that they can be taken to pieces and packed into small parcels of about 40 lbs. each for transport. The dimensions of the *Cecil Rhodes* are:—Length, 80 ft.; beam, 14 ft.; depth, 7 ft. She is built of galvanised Siemens-Martins steel, and will carry a load of 40 tons on light draught. The machinery, which has been supplied by Messrs. Mumford, of Colchester, is of the compound, surface condensing type, after the latest Admiralty pattern. The boilers are water-tube, and the vessel is driven by twin-screw propellers.

Eva.—On November 18th Messrs. Wm. Gray & Co., Limited, launched the large side ballast tank steamer *Eva*, which they have built to the order of Mr. M. Jebsen, of Hamburg. The *Eva* is similar to the *Mancunia*, *Claudius*, and *Wearside*, the first side tankers by the same builders. In all these vessels when in ballast the beneficial effects of the side tanks have been very considerable; the speed and behaviour of the ships have been highly satisfactory, the racing of the machinery much less than usual. By this system efficient ballasting under easy control is provided without the cost and inconvenience of having to ship rubbish ballast. The *Eva* is built to Lloyd's highest class. Her dimensions are:—Length over all, 350 ft.; breadth, 51 ft.; depth, 27 ft.; deadweight capacity, 6,200 tons, with large measurement capacity and deck area for cattle or timber, etc. The arrangements throughout the ship, including a special outfit of steam winches, derricks, etc., will enable cargo to be dealt with most expeditiously. A cellular double-bottom extends throughout, and after peak tank for water ballast, whilst the side tanks contain an additional 720 tons of water ballast. The side tanks (McGlashan's) extend through the main and after holds and engine-room for a length of 191 ft., in way of which the ship has double sides, adding greatly to her strength and also to her safety. These advantages are secured without extra material being required in the construction of the side tanks, lower decks and other parts used in strengthening ordinary ships, and which greatly impede stowage, being dispensed with so that the new type loses nothing as a cargo carrier. The machinery consists of a fine set of triple-expansion engines of over 1,400 H.P., having cylinders 25½ in., 40½ in., and 67 in. diameter, and 45 in. piston stroke, with three main boilers to work at a pressure of 170 lbs. per square inch, all by the Central Marine Engine Works of the builders. Mr. P. H. Bahnsen has superintended the building of the ship on behalf of the owners, and the ceremony of christening the *Eva* was gracefully performed by Miss Frieda Bahnsen of West Hartlepool.

Macedonia.—On November 18th, Messrs. Craig, Taylor & Co., launched from their Thornaby Shipbuilding Yard, Thornaby-on-Tees, the second of two very fine steel screw steamers which they have lately had under construction for Messrs. A. C. de Freita's & Co., Hamburg. The dimensions are 274 ft. by 35 ft. by 23 ft. 8 in. moulded. She is of the spar deck type, to Lloyd's highest class. She has been built on the deep frame principle, and has poop, bridge, and top gallant forecastle, the bows being specially strengthened for ice. She has water ballast in double bottom fore and aft, and in peaks, and is fitted with patent steam windlass, patent steam steering gear, four steam winches, extra large donkey boiler, screw gear aft, and all the latest improvements. Triple expansion engines by Messrs. Thomas Richardson & Son, Limited, Hartlepool, are being supplied, of the following dimensions, 22 in., 35 in., 59 in., by 39 in. stroke, two steel boilers working at 160 lbs. pressure. The ship and engines have been built under the superintendence of Mr. Heinr. Wiengreen and Mr. M. Rother. As the vessel left the ways, she was gracefully christened the *Macedonia*, by Mrs. M. B. Dodds, wife of the town clerk of Stockton. The lady, on performing the ceremony. was presented with a bouquet and holder by Master George Butt Craig, while Captain G. Cantieny, representing the owners, presented a handsome gold bracelet suitably inscribed.

Manchester Shipper.—On November 18th there was launched from the yard of Messrs. Irvine's Ship Building and Dry Docks Co., Limited, at West Hartlepool, a finely modelled steel screw cattle and cargo steamer named the *Manchester Shipper*, built to the order of the Manchester Liners Limited, of which Sir Christopher Furness is chairman. The vessel is being built expressly for the Manchester Liners' Service from the Manchester Ship Canal to Canada, and has a cargo capacity of 10,666 tons. She is of the following dimensions, viz:—Length, 382 ft.; breadth, 48 ft.; and depth, 36½ ft. She has two masts and is rigged fore-and-aft with telescopic topmasts to suit the Manchester Canal bridges, and has been built under special survey to take the highest class in Lloyd's Registry. She is built to the highest grade with one steel deck, and has an iron shelter deck specially strengthened considerably in excess of Lloyd's requirements for the Atlantic trade extending over the whole length and above this is a bridge deck 110 ft. long. All the available space under the shelter deck and along each side under the bridge deck is fitted throughout to pass the American and Canadian regulations, with the most approved and modern arrangements for carrying about 500 head of cattle. The accommodation for saloon, captain and spare state-rooms, &c., is arranged on the bridge-deck, in a large steel deckhouse, with separate houses for officers and engineers, while the seamen and firemen are berthed under the shelter-deck forward, the cattlemen's quarters being under the shelter-deck aft. A cellular double bottom is fitted all fore and aft for water ballast and also four separate tanks under engine and boiler space for fresh water for supplying cattle. Water ballast is also arranged to be carried in a deep cargo tank and in the after peak giving the vessel a total water ballast capacity of over 1,600 tons. The vessel is divided into six water-tight compartments by means of seven steel bulkheads, all of which extend to the upper deck. Each compartment is fitted with complete iron and wood grain divisions. A most complete system of ventilation has been arranged to ensure the safe carriage of cattle, grain or other cargoes. The vessel has six hatches, eight powerful steam winches, and twelve derricks provided for the rapid loading and discharging of cargoes. A powerful steam windlass is fitted forward for working the cables and a combined hand and steam steering gear, of special design, is fitted in a large steel wheelhouse on the after-end of the shelter-deck. Special steering telegraphs are fitted for navigating purposes whilst going up the canal. The vessel is lighted throughout by electricity, and is fitted as a first-class cargo steamer, including all the most modern improvements for the Atlantic trade. The engines are being constructed by Messrs. William Allan & Co., Limited, of Sunderland, and are of the inverted triple expansion type, having cylinders 25 in., 41 in. and 69 in. in diameter by 48 in. stroke, steam being supplied by three single ended boilers 14 ft. 3 in. in diameter by 11 ft. long with a working pressure of 180 lbs. All the shafting is very considerably in excess of Lloyd's requirements. The auxiliary machinery is of the most modern type. As the vessel left the ways the christening ceremony was gracefully performed by Mrs. Stephen W. Furness. She has been specially designed and built for the Manchester Canal trade, under the supervision of Mr. A. H. Walker, shipbuilding superintendent for Sir Christopher Furness, and also Mr. T. M. Greenip, Marine Superintendent for the Manchester Liners, Limited. There was a large company present to witness the launch, including Mr. and Mrs. S. W. Furness, Major D. G. and Mrs. Irvine, Mr. W. C. Gray, Mr. and Mrs. Chas. Cooper, Mr. and Mrs. Kinch, Miss Furness, Mr. Chalton, Miss Purdon and others.

Penrith Castle.—On November 18th Messrs. Wm. Pickersgill & Sons launched from their shipbuilding yard at Southwick a finely modelled steel screw steamer, built to the order of Messrs. The Lancashire Steamship Co., Limited, of Liverpool, of which Messrs. Jas. Chambers & Co. are the managers. This is the seventh steamer built for the same owners, and her dimensions are:—Length, 371 ft.; breadth, 46 ft. 3 in.; and depth, 28 ft. 2 in. She has been built under special survey to take Lloyd's highest class as a spar deck steamer. The vessel is built on the deep frame principle, and fitted with cellular double bottom throughout for water ballast, in addition to which the after and fore peaks are fitted as tanks, and a large deep chamber tank is also being constructed abaft engine room with a view of enabling the vessel to go on long voyages in ballast, if necessary, with increased safety. The scantlings of the vessel have been considerably increased above Lloyd's spar deck rules to enable her to claim what is practically a three-deck freeboard, which will allow of her carrying a large deadweight cargo on a moderate draught. She has also been fitted with an extra long bridge, extending over nearly 200 ft. amidships, and completely covering the two main hatches, which will materially increase her measurement capacity in the case of light cargoes, and her other erections consist of a poop and forecastle. The whole of the erections are made 8 ft. high, and the bridge is fitted throughout with sidelights. also four cattle doors are provided in bridge sides, and the ventilation of the erections has been considerably increased, so that, if occasion should require, the vessel may, in a very short space of time, be fitted up for the carrying of cattle. The vessel has been specially designed with a view to rapid and efficient loading and discharging of cargo, and for this purpose she is provided with six large cargo hatchways, each of which is fitted with double derricks capable of raising heavy weights, large derrick posts being fitted for this purpose where necessary, and the ventilation of all cargo holds has been specially attended to, four large ventilators being fitted to each hold. She will be finished and equipped in a thoroughly efficient manner with all the latest appliances necessary to the outfit of a first-class modern cargo steamer. The vessel will be rigged as a two-masted fore and aft schooner, with steel lower masts and wood telescopic topmasts, and her eight steam winches will be supplied by Messrs. Clarke, Chapman & Co., while a special quick warping windlass will be fitted by Messrs. Emerson, Walker & Thompson Bros., and a large steam steering gear, by Messrs Lynn & Co., is fitted in house amidships abaft engine room, and controlled from bridge by means of rods and bevelled wheels. The donkey boiler for supplying steam to deck range will be made by Messrs. Riley Bros. A large steel deckhouse is fitted on bridge deck for the accommodation of the officers, with a large messroom tastefully fitted out in oak, while the captain is berthed in a steel house above, alongside the chartroom. The engineers accommodation is built in steel houses alongside engine casing on bridge deck, where rooms are also provided for apprentices. The seamen and firemen are berthed in topgallant forecastle, where there are also berths and messroom for the petty officers. The machinery and boilers are being supplied and fitted by Messrs. George Clark, Limited, of Southwick, the engines being of the triple-expansion type, having cylinders 24 in., 40 in., and 67 in. diameter, and a stroke of 45 in., and two large steel boilers with a working pressure of 180 lbs., fitted with "Howden's" forced draught. The ballast donkey arrangements have also been considerably increased to enable the large quantity of water ballast to be efficiently dealt with. During construction the vessel and engines have been under the personal supervision of Mr. E. H. Bushell and Mr. G. Kennaugh, of Liverpool, and she will be completed under the superintendence of Captain Lewis, who will take command. The vessel was named *Penrith Castle* on leaving the ways, and she immediately proceeded to Clark's engine works to receive her machinery.

Strombus.—On November 18th this vessel, which has been built to the order of Messrs. M. Samuel & Co., of London, by Messrs. Sir W. G. Armstrong, Whitworth & Co., Limited, of Newcastle-on Tyne, was successfully launched from the builders' yard at Walker. The vessel is intended for the Eastern oil trade, and special attention has been given to this fact in the preparation of specifications and during construction. The principal dimensions are:—Length between perpendiculars, 410 ft.; beam, 52 ft.; depth moulded, 33 ft. 9 in., for total deadweight capacity of 8,450 tons. She has been constructed throughout to Lloyd's highest class, and to comply with the Suez Canal regulations for bulk oil carrying and general cargo steamers, under the immediate supervision of Messrs. Flannery, Baggallay & Johnson, of London and Liverpool. There is a powerful pumping installation for the rapid discharge of the liquid cargoes, and extensive arrangements have been made to facilitate prompt loading and discharging of general cargoes, including the fitting of powerful steam winches and derrick gear of the latest type. The whole of the forward part of the vessel is reserved for cargo space, the engine accommodation for the engineer officers being aft, that of the captain and deck officers in the bridge, the crew being housed in spacious forecastle forward. The main engines are being built by Messrs. The North-Eastern Marine Engineering Co., of Wallsend, and have cylinders 28 in., 44 in., and 77 in. diameter, with a 48-in. stroke, taking steam at a working pressure of 180 lbs. per square inch from three large single-ended boilers. The auxiliary machinery includes, besides that mentioned above, steam steering gear, steam windlass and capstan, steam heaters, evaporators and feed filters, steam ash hoist and powerful marine type donkey boiler. Like many of the vessels belonging to Messrs. M. Samuel & Co., this steamer will be fitted for the burning of liquid fuel, and every arrangement for this has been provided. As the vessel left the ways she was gracefully named *Strombus* by Lady Samuel.

Brough.—On November 20th Messrs. Cochrane & Cooper, Limited, launched from their Grovehill Shipyard, Beverley, a new steam trawler of the following dimensions: 117 ft. 4 in. by 21 ft. 6 in. by 11 ft. 3 in. depth of hold, built to the order of Mr. J. H. Collinson, of Hull. Messrs. C. D. Holmes & Co., Hull, are fitting engines of the triple expansion type, all the most modern appliances for trawling will be fitted, and the vessel completed ready for sea. In the presence of a large number of visitors from Hull and district Mrs. T. B. Hodgson, of Beverley, named the vessel s.s. *Brough*. After the ceremony the company adjourned to the offices of the builders, where luncheon was provided.

LAUNCHES—Scotch.

Ravenscraig.—On October 18th there was launched at Dundee, for Mr. W. H. H. Hutchinson, Kirkcaldy, a steel schooner-rigged steamer, of about 830 tons gross, named the *Ravenscraig*.

Adriatico.—On October 20th there was launched at Port-Glasgow, for Eredi C. Cav. Gerolimich & Co., Lussinpiccolo, a steel schooner-rigged steamer, of about 3,618 tons gross, named the *Adriatico*.

Heros.—On October 21st there was launched by Messrs. A. Rodger & Co., at Port-Glasgow, a steel screw steamer to the order of Messrs. G. W. Snellman & Co., Kristinestad, Finland. Dimensions:—Length, 314 ft.; breadth, 44 ft.; depth, 23 ft. 3 in., moulded. The steamer registers 2,560 tons gross, and will carry 4,350 tons deadweight. The machinery will be supplied by Messrs. Hall-Brown, Buttery & Co., Glasgow. The ceremony of naming the steamer *Heros* was performed by Miss Rodger, Glenpark, Port-Glasgow. The steamer was superintended during construction by Captain Snellman, who will command.

Humber.—On October 21st there was launched at Ardrossan, for Mr. E. P. Hutchinson, of Hull, a steel schooner-rigged steamer of about 280 tons gross, named the *Humber*.

Donside.—On October 23rd there was launched at Aberdeen, for Mr. G. Fyfe, Aberdeen, a steel steam ketch of about 182 tons gross, named the *Donside*.

Puffin.—On October 23rd there was launched at Rutherglen, for the Manchester and Liverpool Transport Co., Limited, Manchester, a steel steam cutter of about 241 tons gross, named the *Puffin*.

Twin Screw Steamer.—On November 1st there was launched from the yard of Messrs. Ramage & Ferguson, Limited, Leith, a twin screw steamer for the African Boating Co., Limited, of Durban, Natal, contracted for by Messrs. Donald Currie & Co., London. The vessel will be ready to leave Leith about the first week in December. The launching ceremony was performed by Mrs. Ramage, The Hawthorns, Leith, and the owners were represented by Messrs. Munn, Ritchie & Tait.

Speedwell.—On November 3rd Messrs. Hawthorns & Co., Limited, launched at Leith the second of two beautifully-modelled steel screw steamer carriers of the following dimensions:—Length between perpendiculars, 140 ft.; breadth, moulded, 22 ft. 3 in.; depth, moulded, 11 ft. 8 in. She will be fitted out by the builders with triple-expansion engines, having cylinders 13 in., 22 in., and 37 in. diameter by 27 in. stroke, working at a boiler pressure of 200 lbs. per square inch. The hull and machinery have been constructed to the highest class at Lloyd's, and as the vessel left the ways she was named *Speedwell* by Miss M. Leyman, daughter of the chairman of the Great Northern Steamship Fishing Co., Limited, Hull, for whom the vessel has been built.

Gresham.—On November 6th Messrs. Taylor & Mitchell launched at Greenock a steel screw steamer for London owners, of the following dimensions:—Length, 185 ft.; breadth, 29 ft.; depth, 14 ft., moulded. The vessel will be furnished by Messrs. M'Kie & Baxter, Govan, with triple-expansion engines, the diameter of the cylinders being 15 in., 25 in., and 40 in., with a piston stroke of 27 in. The steamer, which is built to Lloyd's highest class, was named *Gresham* by Mrs. George Proven, whose husband superintended the construction of the vessel.

Steel Screw Steamer.—On November 6th Messrs. Robert Duncan & Co., Limited, launched at Port-Glasgow a single-deck steel screw steamer (a repeat of the steamship *Spartan Chief*), built to the order of Mr. T. B. Stott, Liverpool. Dimensions:—Length, 235 ft.; breadth, 34 ft. 6in.; depth, 18 ft. 9 in., moulded. The steamer will carry 2,000 tons deadweight. The engines are to be supplied by Messrs. Hall Brown, Buttery & Co., Govan; cylinders, 18½ in., 30 in., and 49 in., by 33 in. stroke. The steamer is designed and arranged for the Baltic and timber trades, and her construction was superintended by Mr. George S. Horne, Glasgow.

Croham.—On November 9th Messrs. William Hamilton & Co. launched from their Glen Yard, Port-Glasgow, a steel screw-steamer for Messrs. Houlder, Middleton & Co., London. The vessel has been specially built for their Eastern trade. The following are the principal dimensions:—Length between perpendiculars, 330 ft.; breadth, 45 ft. 6 in.; depth, moulded, 26 ft. 6 in., with poop, long bridge amidships, and topgallant forecastle, and is classed at Lloyd's 100 A1. She is designed to carry over 5,400 tons deadweight on a light draught, with a net register tonnage of about 2,100 tons. A feature in this vessel's construction is the joggling of the shell, deck, and tank top plating, thus bringing all the strakes of plating close to the frames and beams without the use of filling slips. The propelling machinery, which is being supplied by Messrs. David Rowan & Co., of Glasgow, consists of one set of triple-expansion engines, having cylinders 24 in., 40 in., and 65 in. diameter, respectively by 42 in. stroke; steam is supplied by two large boilers constructed for a pressure of 180 lbs. As the vessel left the ways she was named the *Croham* by Miss May Harvey, of Benclutha, Port-Glasgow. The owners were represented by Mr. Satchell, who has superintended the construction of the vessel. Immediately after the launch the vessel proceeded to Glasgow to receive her machinery.

Ethelinda.—On November 9th Messrs. Cochran & Co., Birkenhead and Annan, launched the first steamboat ever built at Annan, when they placed in the water a steam launch which they have built to the order of the Empreza Nacional Co., Lisbon, for one of their Royal Mail Line of steamers to the South African possessions of Portugal. A select company was present at the ceremony, and as the vessel glided down the way she was named the *Ethelinda* by Miss Ethel Forrest, niece of Mr. John T. Cochran, senior partner.

Jurua.—On November 10th there was launched from the yard of Messrs. Murdoch & Murray, Port-Glasgow, a steel twin screw steamer built for passenger and cargo service on the river Amazon. On leaving the ways the vessel was named *Jurua*. Messrs. Jno. G. Kincaid & Co., Greenock, will supply the machinery.

Von Podbielski.—On November 10th, Messrs. David J. Dunlop & Co., engineers and shipbuilders, Inch Works, Port-Glasgow, launched a steel twin-screw cable steamer built by them to the order of the Norddeutsche Sukabelwerke Co., of Cologne. This new steamer has been specially designed for cable laying and repairing purposes, and all the details of her arrangements and construction have received the most careful consideration at the hands of the owners and builders, with a view to fulfilling satisfactorily all the requirements of the service in which she is to be more particularly employed. The following is a description of the steamer and her arrangements. Principal dimensions: Length, between perpendiculars, 255 ft.; Breadth, moulded, 35 ft.; depth moulded to underside of main deck, 16 ft.; depth moulded to under side of spar deck, 23 ft. 6 in. Classification, &c. The vessel has been constructed under the rules of Germanischer Lloyd to obtain their highest class (100 A 4) in steel as a spar deck steamer, and when fully equipped for sea has a deadweight carrying capacity of about 1,300 tons on 16 ft. 6 in. draught of water. The speed of the steamer when laden with 500 tons deadweight will be 13 knots per hour on the trial trip. The *Von Podbielski* has a cutwater stem and elliptical stern, the paying out and picking up gear fitted on stem and stern being so arranged as to reduce as far as possible the rubbing of the cable on the hull when it is handled. The upper deck is flush all fore and-aft, giving an unobstructed lead from the different cable tanks to the picking up and paying out machines at the bow and stern. The rig of the steamer is that of a two masted fore-and-aft schooner, the masts being of steel, and at each mast is provided a suitable steam winch, with all appliances for working, the derrick when handling buoys, grapnels, &c. The spar deck is of teakwood, and main deck is of pitch pine. The tween-decks accommodate all the necessary hands for working the steamer efficiently, and the after portion is fitted for the cable officers, and includes a well-apportioned and handsome saloon in hardwood, french polished, and spacious staterooms. The entrance to the cable officers apartments is approached from a large steel deckhouse having a double-way stair. A teak ornamental skylight gives light and ventilation to the saloon, and an electric driven fan is provided for specially ventilating these quarters. The alleyways alongside the engine and boiler space are suitably arranged for the accommodation of the navigating officers and marine engineers, with all the necessary conveniences and sanitary appliance. Forward of the boiler room bulkhead in tween decks, for a distance of 64 ft., accommodation is provided for all the cable hands, with a large testing room for electrician, workshops, staterooms, &c. The quarters for seamen and firemen are placed abaft the collision bulkhead, and are suitably fitted up with a view to ensure the utmost comfort. The cable machinery which has been supplied by Messrs. Johnson & Phillips, of Old Charlton, London, is of the most modern description, and the main forward portion comprising engines and picking up gear occupies the space between the crew's quarters and the rooms for cable hands on main deck. On the spar deck forward of boiler casing, a large house is fitted up, the after part containing a steam steering gear by Messrs. Alley & McLellan, and the fore part a large room for the chief navigating officers. Overhead is built the flying bridge, in which is placed the chart and wheelhouse. The cable tanks are three in number, first and second being arranged forward, and third one aft, each having cones in centre 6 ft. diameter at bottom, and 3 ft. 6 in. at top. The capacity of the tanks being about 20,500 cubic feet. Deep water ballast trimming tanks are fitted on the McIntyre principle, the tops of which form the bottoms of cable tanks, in the forward and after holds, having a capacity of about 300 tons. The pumping arrangements for all the several compartments being of the most approved and efficient description. The outfit of the steamer includes a patent direct steam capstan windlass by Emerson, Walker, & Thomson, six boats complete to Seeberufsgenossenschaft requirements; hawsers, anchors, and chains, to the requirements of Germanischer Lloyd. Complete installation of electric light by Messrs. Wm. Harvie & Co., together with an Admiralty type, 20 in. projector, and all the customary modern appliances for a steamer of this description. A large ice house is fitted up aft complete. The nautical instruments include a Lord Kelvin's Standard Compass, and steering and engine room telegraphs. The propelling machinery consists of two sets of triple expansion surface-condensing engines, having cylinders 17 in., 28½ in., and 47 in. diameter, by 33 in. length of stroke, each engine being fitted with Edwards air pump, and separate centrifugal pump for circulating water through condensers. The feed pumps and feed heaters are by Messrs. G. & J. Weir, with all the latest improvements. Davie's patent feed filter and evaporator. The propellers are loose blades, having cast iron bosses, with four bronze blades bolted on, steam is supplied by two large single ended boilers, 15 ft. 9 in. diameter, by 10 ft. 9 in. long, each having three furnaces of Deighton's patent, all proportioned for a working pressure of 180 lbs. per square inch, separate funnel to each boiler. A large donkey boiler, Cochrane's Patent, is fitted to work auxiliary machinery when vessel is in port. The machinery as well as the hull, has been erected under Germanischer Lloyd survey, to obtain the highest certificate. The ceremony of christening the steamer *Von Podbielski*, was gracefully performed by Miss Forde, sister of the submarine cable superintendent for the Company. A large number of guests assembled in the model room, when the various toasts were proposed and responded to. The owners were represented by Mr. Diederick and Mr. Guillaume.

Strathmore and **Strathbraan.**—On November 16th Messrs. Hall, Russell, & Co. Limited, launched at Aberdeen two steam trawlers named respectively *Strathmore* and *Strathbraan*. They have been built to the order of the Aberdeen Steam Trawling and Fishing Co. Limited, of which Bailie Brown is manager. The dimensions are:—Length, 109 ft.; breadth, 21 ft. 6 in.; depth 12 ft.; gross tonnage, 160 tons. The vessels are constructed of steel and classed 100 A1 at Lloyds, and will be fitted with steel boilers and triple-expansion engines of 320 I.H.P.

Drumblair.—On November 18th there was launched by Messrs. J. Duthie & Co., at Aberdeen, a steam trawler named the *Drumblair*, being the first of two screw vessels for the Aberdeen and North of Scotland Steam Fishing Co., Limited. The *Drumblair* is 124 ft. long over all, having a beam of 21 ft. 6 in., and a moulded depth of 12 ft. She will be furnished with triple-expansion engines by Messrs. Morton, of Leith.

Lune.—On November 18th, Messrs. J. Duthie & Co., launched at Aberdeen, the trawler *Lune*, one of four vessels ordered by the Palatine Steam Fishing Co., Grimsby. The *Lune* is 120 ft. long over all; 20 ft. 6 in. breadth; and 11 ft. 6 in. deep. She will be engined by Messrs. Tindal, of Hull.

Quarnero.—On November 20th, Messrs. Russell & Co., launched at Port Glasgow, a large steamer of the spar-deck type for Messrs. Eredi C. Cav. Gerolimich & Co., Lussinpiccolo (Dalmatia). The dimensions are:—Length, 331 ft.; breadth, 48 ft.; depth, 26 ft.; to carry 5,500 tons on Board of Trade summer free-board. Messrs. Kincaird & Co., Greenock, will supply engines, the cylinders being 24 in., 40 in., and 65 in. by 42 in. stroke. The steamer was named *Quarnero*.

Edith.—On November 21st, Messrs. Scott & Sons, launched from their Shipbuilding yard at Bowling, a screw steamer of the following dimensions, viz.:—100 ft. by 23 ft. by 11 ft. 4 in., moulded, which they have built to the order of Messrs. Joseph Monks & Co., Limited, Warrington. Compound surface-condensing engines are to be fitted on board by Messrs. Fisher & Co., Paisley. On moving down the ways the vessel was named *Edith* by Mrs. Alfred Howard, of Warrington.

Lake Erie.—On November 21st Messrs. Barclay, Curle & Co., Limited, launched from their shipbuilding yard at Whiteinch, on the Clyde, a steel twin-screw steamer, built to the order of Messrs. Elder, Dempster & Co., of Liverpool, for mail and general service between the United Kingdom and Canada, being commissioned by the Dominion of Canada for the carriage of the Canadian mails. The vessel's dimensions are—465 ft. by 53 ft. by 30 ft. 7 in. to shelter deck, with a gross tonnage of 6,500 and a deadweight of nearly 8,000 tons. She has been built to class 100 A1 at Lloyd's on the three-deck rule, with additional stiffening over rules to meet the requirements of the North Atlantic trade. She has three complete steel decks and a shade deck amidships. Water ballast is carried in a double bottom all fore and aft and in after peak. In addition there is a large hold water-ballast tank abaft engine-room, having a capacity of 1,000 tons, for trimming purposes when the vessel is running light. The passenger accommodation is fitted amidships, under shade deck, ample provision being made for about 100 first-class passengers, who will be berthed in large and handsomely furnished staterooms. The public rooms are commodious, and upholstered in excellent taste, and include dining-saloon, smokeroom, ladies' boudoir, lounge, &c. There is also accommodation for about 80 second-class passengers, who are provided with large and airy staterooms, separate dining-saloon, smokeroom, &c., complete. Accommodation is also provided for about 500 emigrants on main deck forward; the quarters are large, well lighted and ventilated, and the fittings of the newest style. A large recreation room, about 150 ft. long, is specially reserved for emigrants' use, and is a special feature in this vessel. The vessel is lighted throughout by electricity. The lower 'tween decks aft are insulated, and a powerful refrigerator is fitted up by the Linde British Refrigeration Co., Limited, London. Steam fire-extinguishers are supplied to each hold, and every precaution has been taken to ensure the safety of the passengers. The vessel is specially adapted for the carrying of troops and munitions of war; and, if necessary, horses and cattle can be carried all fore and aft, special portable fittings having been arranged for that purpose, The ventilation of the ship is exceptionally treated for the special purpose of the trade. The vessel is rigged as a fore and aft schooner, with four masts, and will present a very smart and handsome appearance when completed. The arrangements for the rapid loading and discharging of cargo are of the most complete and up-to-date kind, and include 12 powerful steam winches, steam windlass, steam-steering gear, fitted directly over the rudder-head. On leaving the ways the vessel was named *Lake Erie* by Mrs. W. R. Ferguson, Kelvinside, Glasgow. After the launch, the vessel was towed to the harbour to be fitted with her machinery, which is being supplied by the builders, and consists of two sets of triple-expansion twin-screw engines of 2,000 I.H.P. The diameter of the cylinders is 22 in., 37½ in., and 60 in., with a stroke of 4 ft., the steam being supplied by three large double-ended boilers of ample steaming power, working at a pressure of 180 lbs. per square inch. The engines are strong and substantially made. In addition to the main engines there are two electric light engines, refrigerator engines for cold meat chambers, two of Gwynne's centrifugal circulating pumps, Weir's pumps, evaporators, and heaters, Carruthers's donkey engines and ballast pump, three of Quiggin's distilling condensers, capable of making large quantities of fresh water for passengers and cattle, and the feed-water before going into the boilers is purified by one of Railton & Campbell's feed filters.

Finnieston.—On November 22nd Messrs. Fleming & Fergusson launched from their yard at Paisley the new cross ferry steamer to be used on the Clyde at Finnieston. The vessel, which has been fitted with elevating decks, is suitable for carrying both vehicular and passenger traffic. The elvated decks are so constructed that, by means of steam power, they will be adjustable to the rise and fall of the tide, and will therefore be at all times on a level with the quay walls. The vessel was named the *Finnieston* by Lady Richmond.

Itaura.—On November 22nd Messrs. W. Denny & Brothers, Dumbarton, launched a steel screw-steamer of the following dimensions:—410 ft. by 50 ft. 6 in. by 32 ft., and of 5,300 tons gross register. The vessel is to the highest class at Lloyd's, and has been built to the order of the British India Steam Navigation Co., Limited. On leaving the ways it was named the *Itaura*, the launching ceremony being performed by Mrs. Whitehead, wife of the captain of the ship.

Devolant.—On November 22nd Messrs. Wm. Simons & Co., Limited, Renfrew, launched successfully from their yard the dredger *Devolant*, which is believed to be the most powerful barge-loading dredger afloat. This vessel has been constructed to the order of the Russian Government, and is intended to work at one of the ports on the Black Sea. The dredger was launched with engines, boilers, dredging gear, including buckets, &c., fitted complete on board and ready for work. One pair of powerful compound surface-condensing engines of sufficient power to dredge about 2,000 tons per hour. The buckets each have a capacity of fully 35 cubic ft., or almost equal to two tons, and are the largest yet constructed by Wm. Simons & Co.. Limited. The main engines are also arranged to propel the dredger at a speed of seven knots. Besides the main boilers, an auxiliary boiler is fitted to drive the auxiliary machinery when under repairs. A machine room and repairing shop is fitted on board with lathes, drilling and planing machines, &c. The vessel is fitted with electric light throughout, and on deck large lamps are placed to enable dredging operations to be carried out day and night. The winches at both ends of the vessel are of very strong construction, and are worked by independent engines. The bucket ladder, which, with its chains of buckets weighs over 100 tons, excluding dredgings, is also controlled by a powerful set of independent engines. This dredger will, in a few days after trials, proceed to the Black Sea.

Hope and **Rapid.**—On November 25th there were launched at Irvine, by the Irvine Shipbuilding and Engineering Co, Limited, two steel screw steam trawlers to the order of the Peterhead Trawling Co., Limited, Peterhead. The vessels are built to Lloyd's highest class, under special survey, and are fitted with all the latest appliances for trawl fishing. They are of the following dimensions:—117 ft., between perpendiculars, by 21 ft., by 11 ft. 9 in. moulded, and are being supplied by W. V. V, Lidgerwood, Coatbridge, with triple-expansion engines of about 400 I.H.P., having cylinders, 12 in., 19½ in., and 32 in. by 22 in. stroke, steam being supplied from a large steel boiler working at 180 lbs. pressure. The one vessel was named *Hope* by Mrs. Leask, wife of Provost Leask, Peterhead; and the other *Rapid* by Mrs. Mitchell, wife of Ex-Bailie Mitchell, Peterhead.

Caledonia I.—Lately there was launched at Aberdeen, for Messrs. Young & Jameson, of Aberdeen, a steel steam ketch, of about 190 tons gross, named the *Caledonia I.*

LAUNCHES—Irish.

Galeka.—On October 21st. there was launched at Belfast, by Messrs. Harland & Wolff, to the order of the Union Steamship Co., the steamship *Galeka*, which is similar in design to the other vessels known as the "G's" already running in the Union Line, but somewhat larger than the first "G's," being a sister ship to the *German*. The new vessel will be propelled by twin-screws driven by two sets of triple-expansion engines, and while providing a very large carrying capacity for cargo the *Galeka* will have unusually complete accommodation for first, second, and third class passengers. She will be specially fitted with every convenience, including electric light and refrigerator and cold chambers for the conveyance of fruit. The *Galeka* is expected to sail for the Cape early in the new year.

Lord Downshire.—On November 2nd there was successfully launched from the South Yard of Messrs. Workman, Clark & Co., Limited, Belfast, a handsomely-modelled steel screw steamer, named the *Lord Downshire*, built to the order of the Irish Shipowners' Co., Limited, of which Messrs. Thomas Dixon & Sons, Belfast, are the managers. The dimensions of the vessel are:—Length between perpendiculars, 405 ft.; breadth, 48 ft. 6 in.; depth moulded, 32 ft. 3 in., with a deadweight carrying capacity of about 7,500 tons. She has been constructed under special survey to class 100 A1 in Lloyd's Register of Shipping, and is considerably in excess of the requirements of their society. There are two complete steel decks and a poop, long bridge-house amidships, affording protection to the engine and boiler casings; also a topgallant forecastle deck. The holds are divided into five watertight compartments, the lower portion being fitted with a permanent longitudinal bulkhead, to ensure safety against the cargo shifting. For the rapid handling of general cargoes, 10 powerful steam winches have been placed at the hatches, and where the masts are not available for working the derricks, crane posts have been introduced. The deck machinery is arranged for working the vessel with a minimum amount of trouble, and embraces the winches, steam steering gear, hand screw steering gear and steam windlass. The *Lord Downshire* is built on the cellular double-bottom principle, which provides for the carriage of water ballast required, when a vessel is in light condition; the peaks at extreme ends and a portion of No. 5 hold are also arranged as ballast tanks for trimming purposes. The saloon and accommodation for captain, officers, and engineers will be arranged in houses on top of bridge deck. Petty officers are berthed in the forecastle and the crew and firemen in the poop. The rig will be that of a two-masted fore and aft schooner. Machinery, consisting of triple-expansion engines and three steel boilers, has been constructed at Messrs. Workman & Clark's Engine Works, and will be placed on board without delay.

LAUNCH—German.

Aero. - On November 14th the Flensburg Shipbuilding Co. launched from their yard at Flensburg a small steel screw passenger and mail steamer of the following dimensions:—87 ft. 6 in. by 17 ft. 8 in. by 7 ft. 11 in. She is built to the order of the Dampskibselskabet Aero, who have been subsidised by the Danish Government to run this vessel between Aero and Fyn carrying mails and passengers to and fro. She will be fitted with compound engines having cylinders 14 in. and 26 in. by 16 in. On leaving the ways the vessel was christened Aero by Miss Else Bauer.

Smart Passage of Clyde Built Dredgers.—The dredgers *Fervid* and *Vtoroi* constructed by Wm. Simons & Co., Limited, of Renfrew. to the order of the Chinese Eastern Railway Co., arrived at Shanghai on 18th and 30th September respectively, after the remarkably quick passage, for dredgers, of 66 steaming days from Clyde.

TRIAL TRIPS.

Katso.—On October 20th the new steamship *Katso*, built by Messrs Edwards Brothers, North Shields, for the White Star Steam Fishing Co., Limited, Grimsby, had a successful trial trip on the Clyde. The engines, which were supplied by Messrs. Shanks, Anderson & Co., Glasgow, are of the triple-expansion type, of 480 H.P., boiler 180 lbs. working power to Lloyd's survey, worked with smoothness, and gave satisfaction to all on board.

Bloomfield.—On October 21st the screw steamer *Bloomfield*, which has been built to the order of Messrs. Hunting & Son, Newcastle, by the Tyne Iron Shipbuilding Co., and engined by the North-Eastern Engineering Co. (of which we gave particulars in our Launch columns, October issue, page 328), was taken on her trial trip. The vessel, built for the oil trade, has a carrying capacity of 6,000 tons of oil. The *Bloomfield*, with most of her tanks filled, was taken over the measured mile, attaining a speed of 11½ knots.

Norham Castle.—On October 24th the steam trawler *Norham Castle* was taken out from the Tyne upon her trial trip. This vessel is an addition to the fleet of the Castle Fishing Co., of which Mr. Richard Irvin, jun., is the manager. The hull is of wood, built by Mr. James Miller, St. Monance, Fifeshire. The engines, boiler, winch, &c., were supplied by Messrs. Baird & Barnsley, North Shields. During the run at sea the machinery gave every satisfaction to owner and builders.

Insizwa.—On October 24th this steamer, the 11th built for Messrs. John T. Rennie, Son & Co., of London, Aberdeen, and Natal, was taken to sea for her final trial, from the yard of Messrs. Hall, Russell & Co., builders, of Aberdeen. She is 342 ft. long, 41 ft. beam, 28 ft. deep, and is fitted out for 70 first and second class passengers, the first-class saloon and staterooms being placed amidships, and the second class aft. She has been designed for the direct Natal service, and the owners' long experience has provided a most comfortable and well-arranged system for all weathers. The ship is lighted throughout with electricity, and has cold chambers for provisions and fruit. Her machinery is of the triple-expansion type with cylinders 25½in., 42½in., and 69 in. diameter by 45 in. stroke, driven by powerful double-ended boilers. Many and various pumps are fitted with feed-heater, filter, freezing, and other machinery. The power developed on trial was fully 2,500 H.P., and drove the ship, which is fine lined, at about 14 knots speed. Mr. George Hall Rennie, senior partner of the owners' firm, accompanied by a party of friends, and Mr. Johnson, of Flannery, Baggallay & Johnson, of London and Liverpool, his consulting engineers, left Aberdeen for the south in the steamer after trial, and she will sail for Natal early next month.

Bali.—On October 25th the new steel screw steamer *Bali*, built for the Stoomvaart Maatschappij Nederland, and engined by Messrs. Bow, M'Lachlan & Co , Paisley (of which we gave particulars in our Launch columns, August issue, page 236), went down the firth on her trials. On leaving the dock the *Bali* proceeded to the measured mile and engaged in a series of exhaustive trials. These were in every respect satisfactory, and despite the unfavourable weather—the trial being conducted in a gale of wind—an average speed of 10·8 knots was maintained on the mean of four runs, the engines developing 1,650 I.H.P. The trials went off without a hitch, everything working smoothly, and the performance of machinery gave highest satisfaction to all concerned, so much so that, although in terms of the contract the trials were to extend over two days, the owners accepted the steamer on the merits of the first day's trials. At the trials the owners were represented by Messrs. Burgher and Meyers, the engineers by Mr. Bow, and the Bureau Veritas by Mr. Lucas. After trial and adjustment of compasses the *Bali* sailed for Amsterdam, where she will be engaged on the company's service between Java and Amsterdam.

Active.—On October 26th the trial trip of the steam trawler *Active* (of which we gave particulars in our October issue, page 331) took place, and proved highly satisfactory, a speed of 10½ knots being attained on the measured mile. The vessel is the second of two recently launched by the Irvine Shipbuilding and Engineering Co., Limited, for the Peterhead Trawling Co., Limited, and is equipped with all the latest appliances for trawl fishing.

Alma.—On October 26th the steel cargo steamer *Alma*, built by the Laxevaags Engineering and Shipbuilding Co., Bergen, Norway, went on her trial trip. She has been built to the order of D. W. Ellerhusen, Esq., Bergen, and to Norwegian Veritas highest class. The vessel is of the following dimensions:—Length, extreme, 235 ft.; breadth, 32 ft.; depth, 15 ft. 8 in. She is 1,032 brutto register tons. The engines are of the triple-expansion type, about 580 I.H.P., and a speed of 10½ knots was attained. The ship has a steel deck, double bottom for ballast, peak tank abaft, and is specially built for the timber trade. She is well fitted out in every way, having Emerson-Walker's patent steam anchor windlass, Fisher's patent steam-steering gear, Bower's patent rapid closing apparatus for stop valve—worked from bridge as well as from engine room, Bower's patent protection box for propeller shaft, three steam winches, and large donkey boiler by Messrs. Clarke, Chapman & Co. The vessel and her machinery have been built under the superintendence of Mr. Fred. T. Hansen, Bergen. There were present on her trial trip the managing owner, Mr. D. W. Ellerhusen, and a large company of ladies and gentlemen. The trial was in every way a complete success.

Hirundo.—On October 26th the handsome new screw steamer *Hirundo*, built by Messrs. Wood. Skinner & Co., Limited, at Bill Quay-on-Tyne, and engined by the North-Eastern Marine Engineering Co., Limited, of Wallsend-on-Tyne, to the order of Mr. Conrad Blumer Hofgaard, of Tonsberg, Norway (of which we gave full particulars in our Launch columns, November issue, page 367), left the Tyne for her official trial trip, which was in every way most successful, a mean speed of 10½ knots being obtained on the measured mile. There was a large number of ladies and gentlemen present, including Mr. Hofgaard, the owner of the vessel, Mr. Skinner and Mr. John Wood representing the shipbuilders, Mr. R. Philipson the engine builders, Mr. Goddard, Grimsby, and Captain Jacobsen. After the trial the vessel sailed for Pensacola, under the command of Captain Olsen.

Sardinero.—On October 30th the Campbeltown Shipbuilding Co.'s steamer *Sardinero* ran her speed trial at Wemyss Bay with highly satisfactory results. The *Sardinero* is a vessel of the single-deck type, of about 3,500 tons deadweight, and is intended for the same trade as the sister ships *Gorbea* and *Enero*, previously built by this firm for the same owners.

Clumberhall.—On October 31st the s.s. *Clumberhall*, built by Messrs. Irvine's Shipbuilding and Dry Docks Co., Limited, for the West Hartlepool Steam Navigation Co , Eimited, (of which we gave full particulars in our Launch columns, October issue, page 328), proceeded on her trial trip. After the compasses had been adjusted, the vessel went at full speed, and on completion of the trial it was ascertained a mean speed of 12 knots had been attained, which was considered very satisfactory, the engines working smoothly. The vessel afterwards proceeded to Cardiff to load a cargo for the East. The hull and engines have been constructed under the supervision of Mr. Robert Craig, marine superintendent, who represented the owners; Mr. A. S. Purdon, the shipbuilders; and Mr. Urquhart, the engine builders.

Hillglen.—On October 31st the new steamer *Hillglen*, a spar-deck steamer, built by the Northumberland Shipbuilding Co., Limited, of Howdon-on-Tyne, for Messrs. Hugh Evans & Co., of Liverpool (of which we gave particulars in our Launch columns, October issue, page 327), was taken to sea for her trial trip. The propelling machinery has been supplied by the Wallsend Slipway and Engineering Co., Limited, and consists of a set of triple-expansion engines, with large steel boilers working at 180 lb. pressure, the power developed during the trial trip being 2,000 I.H.P. On leaving the Tyne the *Hillglen* was loaded with about 2,000 tons ballast and bunkers, and, after adjusting compasses, proceeded on the measured mile, where a speed of 13 knots was attained.

Wearside.—On November 2nd the large side ballast tank steamer *Wearside*, built by Messrs. W. Grav & Co., Limited for Messrs. J. & E. Kish, Sunderland (of which we gave full particulars in our Launch columns, October issue, page 329), had her trial trip, which was a very successful one, the average speed being 10½ knots. The vessel proceeded to Cardiff, where she takes in a cargo of coal for the Cape.

Barendiz.—On November 6th this steamer, which has been built to the order of Messrs. Van Vliet & Co., of Ymuiden, Holland, by Messrs. Cochrane & Cooper, Limited, Selby (of which we gave particulars in our Launch columns, November issue, page 368), was taken to sea for trial, when an average speed of 10½ knots was obtained, everything working well and smoothly. A thoroughly exhaustive trial of the machinery was made, and everything worked satisfactorily.

Southwood.—On November 8th the new steel screw steamer *Southwood*, which has been built by Messrs. William Dobson & Co., Low Walker, to the order of Messrs. William Cory & Son, Limited, of London, proceeded to sea for her loaded trial trip, the result of which was in every way successful. The machinery, which has been built by the North-Eastern Marine Engineering Co., Limited, Wallsend, consists of a set of triple-expansion engines.

Hylas.—On November 11th the new steamer *Hylas*, which has been built by Messrs. Archibald McMillan & Son, Limited, Dumbarton, for Messrs. R. P. Houston & Co., Liverpool, had a very successful trial of her machinery. The *Hylas*, which is of dimensions 390 ft. by 48 ft. by 29 ft. to main deck, has been built to Lloyd's highest class. She has a complete shade deck from end to end, above which is placed accommodation for the captain, officers, and engineers, the crew being berthed forward. The vessel is fitted with every convenience for the safe and expeditious working of ship and cargo. The machinery has been constructed by Messrs. Rankin & Blackmore, the engines being of the triple-expansion type, and the boilers being fitted with Howden's forced-draught arrangement. The *Hy'as* is one of Messrs. R. P. Houston & Co.'s Government chartered steamers, and immediately after the trial trip she proceeded to Liverpool to load for South Africa. This is the third steamer delivered this year by Messrs. McMillan for Messrs. Houston, and they have still two others on hand for the same owners.

Harriet.—On November 15th the s.s. *Harriet* was taken to sea for her trial trip. She is a fine steel screw steamer, and has been built by Messrs. William Gray & Co., Limited, West Hartlepool, to the order of Mr. Martin Carl, of Copenhagen (of which we gave full particulars in our Launch columns, November issue, page 367). After adjustment of compasses by Mr. Berry, the vessel was headed for the Tyne, where she loads for a Mediterranean port. A very satisfactory run was made, the average speed being 10½ knots.

Denbighshire.—On November 16th the new screw steamer *Denbighshire*, being the fourth vessel built to the order of Messrs. Jenkins & Co., Limited, of London, for their Shire Line of steamers by the Sunderland Shipbuilding Co., Limited (of which we gave full particulars in our Launch columns, November issue, page 367) was taken to sea for her official trial trip, and was in every way most satisfactory, after which the vessel left for Middlesbrough, where she takes in the first portion of her cargo for Japan.

Spero.—On November 16th the *Spero*, built by Messrs. S. P. Austin & Son, Limited, at Sunderland, to the order of Messrs. R. S. Gardiner & Joseph Reay, of the Pelton Steamship Co., Limited, Newcastle-on-Tyne (of which we gave full particulars in our Launch columns, November issue, page 368), ran a loaded trial trip off the Tyne. Notwithstanding the fog prevailing at the time of the trial, the vessel steamed at an average of 9½ knots, the engines working smoothly and satisfactorily. The machinery was supplied by Messrs. George Clark, Limited. The company on board included Captain Harland, representing the owners; Mr. Robson, representing the builders; and Mr. Esdon, representing the engine builders.

Ravenscraig.—On November 18th the steamer *Ravenscraig* had a successful trial trip on the Tay. The vessel has been built by the Dundee Shipbuilders Co. for the Kirkcaldy Steamship Co., and is intended for general trade between Kirkcaldy and Hull. Over the measured mile the steamer attained a speed of about 11 knots. The gentlemen representing the company expressed themselves as highly pleased with the vessel.

Etruria.—On November 23rd the handsomely modelled steel screw steamer *Etruria* left the yard of her builders, Messrs. Craig, Taylor, & Co., Thornaby-on-Tees (of which we gave particulars in our Launch columns, November issue, page 369), for her trial trip in Tees Bay, which proved highly satisfactory. During the whole of the trip the engines worked without the slightest hitch, a speed of 12½ knots being maintained against a strong wind and tide. The owners, Messrs. A. C. de Freitas & Co., Hamburg, were represented by Captain G. Cantieny, who expressed himself as being highly pleased with both the ship and engines. The vessel afterwards left for Cardiff, under the command of Captain Lorenz.

Syrian.—Lately, the steel screw tank steamer *Fyrian*, built by the Grangemouth Dockyard Co., to the order of Messrs. Jacobs & Barringer, of London, acting on behalf of clients in the East (of which we gave particulars in our Launch columns, October issue, page 330) went down the Firth of Forth on her official steam trial with coal fuel. Previous to the steaming trials the oil compartments were filled up with water by the powerful installation of pumps designed for dealing with oil cargo or water ballast, the whole of the compartments being run up in five hours. Thereafter two runs were made between Inchkeith and Oxcar lights, when the mean speed was found to be nearly 10¾ knots, or fully three-quarters of a knot in excess of the contract speed. The engines, supplied by Messrs. Hutson & Son, Limited, Kelvinhaugh, Glasgow, are triple-expansion, with cylinders 19 in., 31 in., and 51 in. respectively, and 36 in. stroke, and are supplied with steam at 180 lb. pressure by two large single-ended boilers. During the trial these worked most satisfactorily. For the working of the winches, fans, and oil pumps a large multitubular horizontal type boiler for 120 lb. pressure has been provided. The owners, who were represented at the trial by Mr. Barringer, London, expressed themselves as entirely satisfied with both hull and machinery. On November 2nd, the oil fuel trial of the tank steamer *Syrian*, took place in the Firth of Forth. The result obtained was still more satisfactory. The oil used was that technically known as astatki. On running the measured distance the speed was 11½ knots, or nearly a knot more than was the case with the Scotch coal. The number of revolutions was seven to eight more per minute, and the horse-power 200 more than at the coal trial, whilst the steam pressure of 180 lb. was obtained with ease, notwithstanding that all the auxiliary machinery was running the whole time. The consumption of oil at the trial was found to be 25 per cent. less per horse-power than the consumption of the coal. A number of experts, besides representatives of the owners, were present, and expressed themselves as highly satisfied with the successful results obtained, and predicted a bright future for this fuel for marine purposes. We understand it is the intention in the case of the sister ship now fitting out by the same builders to ship sufficient oil fuel to take her to her destination in the East. When on their regular services both vessels will use oil fuel exclusively.

Ino.—Lately the steamer *Ino*, built by the Campbeltown Shipbuilding Co. to the order of the Bristol Steam Navigation Co., Limited, ran her loaded speed trial at Stokes Bay, when an average speed of 10 knots was obtained. The *Ino* is intended to carry general cargo between the Continent and Bristol and Gloucester, and is the third vessel which the Campbeltown Shipbuilding Co. have built for the same owners for this trade.

The Marine Engineer.

LONDON, JANUARY 1, 1900.

AGAIN we have to claim recognition for the services of the engineering branch of the Royal Navy as compared with the readiness of public praise to the executive branch. We have all heard of splendid services rendered by the Navy in the public service in South African waters in the designing and making of the special carriages for the 4·7-in. naval guns that have proved such a terror to the Boers and of such magnificent service to the defence of Ladysmith and in other portions of the campaign; but the public has never heard any mention of the chief and assistant engineers who perfected the designs and who carried out the work. Nor has the following fact, which has come to our ears from a private and authoritative source, ever to our knowledge been made public—viz., that amongst the naval party selected from Durban to accompany the naval guns to Ladysmith were engineers selected from the engine-room staff to mount those guns on their carriages upon their arrival at Ladysmith. We all heard of the marvellous celerity and workmanlike manner in which those guns were mounted and brought so promptly into action; but we have not publicly heard of the presence of selected naval engineers in the naval contingent told off for that duty, and that there are members of our profession actively engaged at the front and responsible for the perfect carrying out of engineering work in the face of the enemy. It is not for these men to blazon forth their patriotic devotion to duty, and if it lay with them the world might never hear of it; but it shall not be our fault if public attention is not drawn to another example of the essential value and importance of the services of marine engineers, whether in peace or war. Every day the development of guns and gunnery, and of the intricate mechanical appliances necessary for the working of such guns, renders greater the importance of the services of the naval engineer and the necessity of according to him a due recognition of his importance.

IT is a strange fact that seagoing engineers, whether of the commercial marine or of the Navy, are so reticent of their experiences and of their troubles frequently overcome with magnificent persistence and ingenuity at sea. If it depended only upon the engineers themselves to give the benefit to their fellow-workers, and indirectly to engineering designers, manufacturers, and inventors of their experience as to failures and breakdowns, little would ever be heard of such matters. And yet what is more valuable to all those connected with the production of machinery, or to the shipowners or Admiralty as the users of such machinery, than to have full particulars of breakdowns or failures at sea. Such particulars, to be in a form most useful to all interested in seagoing machinery, need not necessarily be invidious either to individual manufacturers, to ships, or to those in charge, as facts only (without identification), methods of repair, or consequences following unexpected failure in apparently trifling or auxiliary machinery would carry lessons of enormous importance to all, without reference to specific vessels, if properly substantiated as between recipient and communicant. Such a journal as ours is essentially the organ for such communications, and we regret that our repeated invitations on the matter to seagoing engineers has met with such little response. We published some months back a detailed account of a disaster to the machinery of a trading steamer, and some slight account of the repair effected; but we are sorry to say we were indebted to the second executive officer for the account instead of to one of the engineers. It is obvious that information from the latter quarter would probably have much exceeded the interest of the account from the former quarter, as it could have dealt much better and in more detail with the engineering difficulties and the devices eventually adopted for repair. It is curious, too, how little is ever heard of failures of machinery on board our warships after the machinery has left the contractors' hands. It is probably assumed by the Admiralty that it is not their business to instruct marine engine-constructors at large, and the dearth of information in no way implies to our mind that there are not many interesting examples of failure from which much might be learnt. We believe it is not the practice of the Admiralty to go out of their way to collect or distribute information to the many makers of special machinery, of which there is so much now on every war-vessel, of the troubles or failures that may have been found in their specialities, once they have been passed and taken over by the Navy. Probably the result is merely a cessation of orders for the future. But would it not much better advance engineering improvement if the makers' attention were specifically directed by precise information to any weak spots in design or construction that might be found in seagoing practice. If this cannot be obtained officially from the Admiralty or from shipowners, much might be done for the benefit of the marine engineering profession by the practice of seagoing naval or commercial marine engineers giving particulars of such cases as might have come under their own observation. Nothing teaches like failure. Our columns are always eagerly open to such information, however crude and bare may be its form; and we trust our sea-going readers will be found public-spirited enough to take the small amount of trouble necessary to record such experiences with us.

THE Cambridge University journal is voicing some of the troubles of the graduates of that University who go there to learn the scientific bases of their professions, particularly that of engineering. It was held that the requirements of engineering employers, that such young men had still to learn the practical rudiments of their profession, and that a further three or four years' pupilage in works was generally enforced before they were considered worth their bread and butter, was quite an unreasonable demand. We fear this expression of opinion is made by those who, however cultured they may be in the scientific part of the engineering, have little grasp of the familiar acquaintance with practice that is necessary to make an engineer worth his salt. Engineering is as much a training of eye and hand as it is a matter of abstruse calculation. Young men in their preliminary posts as engineers must be competent to oversee and direct the actual workmanship of artisans, if not to lend a hand in the actual performance, and the necessary self-confidence for such a position and the power to obtain the obedience of the men under them always must result from a practical personal experience amongst the men and in the particular class of work they are carrying out. This can only be attained by some considerable apprenticeship or pupilage to the practical work. It is as if a doctor was considered qualified to practise after having passed scholastic examinations without having passed through the practical ordeal of the hospitals. If doctors can simultaneously qualify themselves whilst walking the hospitals for their necessary scholastic examinations, why cannot young engineers equally train themselves in the scientific part of their profession whilst passing through their practical course in workshops or on works being carried out? There is no doubt that a great majority do this now, and if a young man must commence his acquirement of engineering by a University training, he must be content, we are afraid, to recommence his practical education after he has completed his University career. He may make the better engineer in the long run, though many of our foremost engineers of the last generation were what would now be considered almost illiterate at the commencement of their career. Sometimes a too erudite education for an engineer but makes him a pedant in his profession, splitting straws upon slight variations of theoretical calculations; whilst the man with practical experience and intuition would know that the allowance for safety—required for possibly faulty material or for almost uncalculable stresses, which, however, he knows to be there, will more than cover any discrepancies between various hair-splitting theories, which he can thus entirely ignore and is often better without. A University career prior to introduction to the profession of engineering can only be considered a luxury, carrying with it serious delay in the completion of the necessary practical curriculum.

TRIPLE-SCREW propulsion of which one screw is located in the fore-part of the hull is now being adopted in many directions with great advantage in some respects to the vessels so fitted. Curiously enough, however, the subject appears to have been thoroughly tested, experimented, and reported upon as far back as 1879 and 1880. In these years during the building of the *Livadia* a series of exhaustive trials, under the instructions of the late Sir William Pearce and the late Mr. A. D. Bryce Douglas, were carried out at Fairfield upon the different behaviour for propulsion of one screw, two screws, and three screws, and in different positions fore and aft. Afterwards in 1887 a series of steam trials on the Black Sea were made by Russian officers on the same subject and were analysed and compared with the original model trials by Dr. Kirk. The reports are now, we believe, to be made public, and will be very interesting reading. Dr. Kirk, it is believed, found that the propulsive efficiency up to 15 knots was the same whether the total power was divided between two or three screws, but that for higher speeds the distribution over three screws would be probably advantageous and that the steering was improved by employing the third screw, and that at very low cruising speeds the third engine was a desirable feature.

A CONTINUOUS MEAN-PRESSURE INDICATOR FOR STEAM ENGINES.[*]

By PROFESSOR WILLIAM RIPPER,
Member, of Sheffield.

THE instrument described in the present paper was devised in the first instance for the purpose of measuring the mean effective pressure on the piston of engines running at high rotational speeds. For this purpose an arrangement was adopted to separate the driving or impulse pressures from the resistance or back pressures, and to divert these two separate effects into two separate pressure-gauges, so that one gauge might give a continuous reading of the mean effect of the driving pressures only, and the other the mean effect of the back pressures only, the difference between the two gauge readings being the net mean effect. It was afterwards found

---

[*] Read at a meeting of the Institution of Mechanical Engineers on Friday evening, December 8th, 1899.

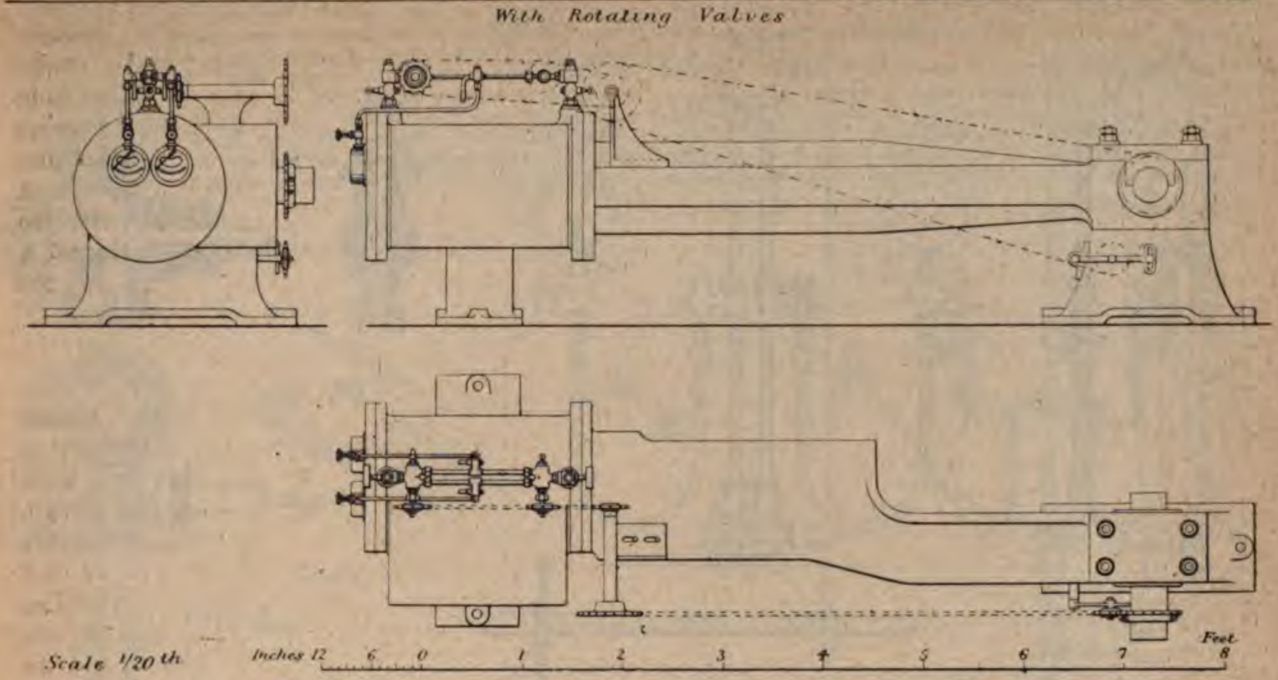

FIG. A.

possible to use the same instrument for engines running at any speed, high or low.

Description of the Instrument; Short-stroke Type.—In the proceedings of this institution (1897, page 347) in connection with the discussion on Mr. Morcom's paper on High-Speed Engines, a description of the earliest type of this instrument was given, but since that date it has been somewhat modified, valves with either an oscillating or rotating motion (see Fig. A) having been substituted for a reciprocating motion of the spindle of the valve.

Figs. 1, 2, and 3 illustrate to one-third full size the simplest type of the instrument. Figs. 6 and 7 show the same instrument attached to the cylinder of an engine. Fig. 2 shows the valve A in mid-position. The piston of the engine is then supposed to be at the top or bottom of its stroke. Fig. 4 shows the position of the valve, when the engine piston is at or about mid-position, and passing from the top to the bottom of the stroke, the steam from the top side of the piston passing into the driving-pressure gauge, and the steam from the bottom side of the piston passing to the exhaust gauge. Fig. 5 shows the valve reversed, when the piston is travelling in the opposite direction. The driving steam again passes to the driving-pressure gauge, and the exhaust steam to the exhaust-pressure gauge, as before. The valve has no lap on either the steam or exhaust edges, and the respective ports are open to both gauges for the full length of the stroke. The valve is moving at its maximum speed at the points of opening and closing—that is, at the beginning and end of the engine stroke.

Long-stroke Type.—In order to prevent loss of pressure through excessive length of the pipes which attach the instrument to the cylinder in long-stroke engines, separate valve-boxes C and D, Figs 8 and 9, are substituted for the single instrument, Figs. 1, 2, and 3. These valve-boxes are placed as near as possible to each end of the cylinder, so that they may take the steam at once, without loss of pressure due to passing through pipes. The valve-boxes are connected by pipes E and F, as shown, and the valves are so constructed as to turn the driving steam into one gauge G, and the back-pressure into the other gauge H. The arrangement of the valves A and B is shown in the sectional view, Fig. 13. The engine piston is supposed to be at the top of the stroke. The valves A and B are moving in the direction of the arrows. The top valve is opening communication between the top of the piston and the driving-pressure gauge, through the centre of the valve, and down the pipe E to the gauge G, Fig. 9; whilst at the same moment the lower valve B has closed the steam communication between the lower end of the cylinder and the driving-pressure gauge. At the same

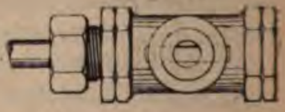

Fig. 12

Scale 1/3rd

time the top valve is just closing, whilst the bottom valve is just opening communication with the exhaust side of the piston and the exhaust-pressure gauge H. There is a partition in the valve separating the steam and exhaust sides of the valve.

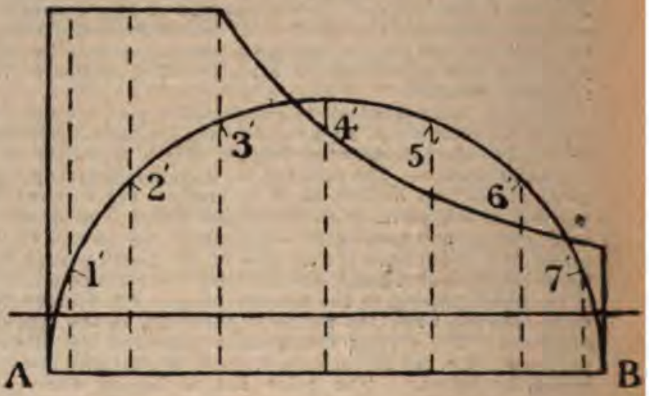
Fig. 14 shows an isometric view of the valves with the ports cut therein, and Fig. 15 shows that, when the faces of both valves are moving together in the direction of the arrows, the steam port of the valve A is opening to steam whilst the steam port of the valve B is closing; also that the exhaust port of valve A is closing while the exhaust port of valve B is opening. The valves oscillate about their axes, and are driven by an eccentric fixed on a counter shaft, the counter shaft itself being driven by a chain gear from the main engine shaft.

Figs. 10, 11, and 12 show the arrangement of the instrument with a rotating valve for high speeds. With this instrument no eccentric is required, the valve being driven by a chain wheel. The valve is hollow and has two openings or ports, which are on opposite sides and at opposite ends of the valve. The ports are respectively open during a half revolution to steam and during the other half revolution to exhaust. The steam is admitted to the gauge by entering the port at one end of the valve, passing through the centre of the valve, and entering the gauge pipe through the port at the other side and end of the valve. Figs. 17, 18, and 19 show the attachment of the long-stroke type to a horizontal cylinder.

Time-Pressure Diagrams.—The first point to be observed is that the mean pressure obtained by this instrument is the mean pressure on a time base, and not the mean pressure on a distance base, as is given by the ordinary indicator diagram. If the piston of an engine moved at a uniform speed throughout the piston stroke, then the mean pressure on a time base would be the same as the mean pressure on a distance base; but since the speed of the piston is not uniform, the mean pressure per stroke on a distance base, and the mean pressure per stroke on a time base, are not necessarily the same.

The two kinds of diagrams are illustrated by the two methods of indicating shown in Fig. 16, where the indicator A is one of the ordinary type, whose drum is connected by a string to a moving part of the engine giving it a motion to and fro, which is an exact copy to a reduced scale of the motion of the piston; and the diagram thus obtained is a pressure diagram on a distance base. Indicator B, on the other hand, differs from indicator A in having its drum connected to the engine by an endless cord, by means of which the drum is made to rotate uniformly and independently of the irregular motion of the piston. The diagram thus drawn on the uniformly rotating drum is a pressure diagram on a time base, because it gives

(*a*) Distance-Pressure Diagram.



(*b*) Time-Pressure Diagram.

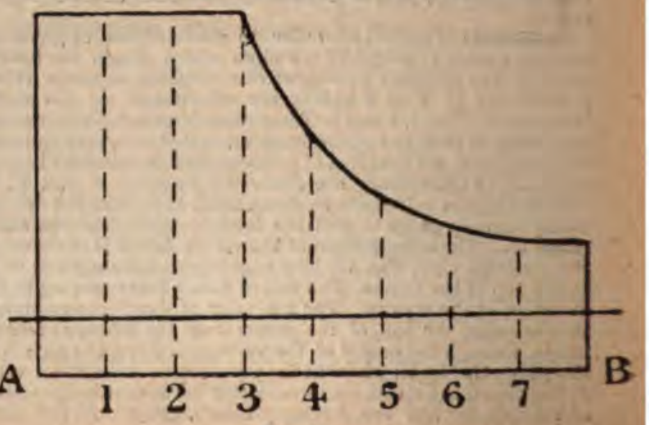


Fig. 25.

the pressure during successive intervals of time, without regard to the space moved through by the piston in those intervals. But since work is measured by pressure X distance only, it is important, if the mean time-pressure reading given by the gauges is to be of practical value, that it should be very nearly the same as the mean distance-pressure, or otherwise that there should be a definite and known ratio between them, which may be used for converting the one into the other. In practice the actual difference is small, as will be shown below, but whatever the difference may be, provided the ratio between the two kinds of mean pressure is definitely known, it is easy to convert the one into the other directly by the use of a factor expressing the known ratio.

A difficulty here suggests itself that the conditions may be very variable in the same engine, and that different points of cut-off and compression would require different factors; but it is possible in practice to use an average factor, which may be applied through all ranges of power, in the same engine, to convert the mean time-pressure into the mean distance-pressure within very narrow limits of error. This may also be done

without any calculation by an adjustment of the scale of the pressure gauge, as shown in Fig. 20.

By the arrangement shown in Fig. 16, the diagram drawn on the drum of indicator B is shown in Fig. 22, and includes the forward pressure and the back pressure in one continuous line.

If an ordinary indicator be attached to the mean pressure instrument in the manner shown in Fig. 21, then it is possible by coupling the indicator to the driving-pressure nozzle to obtain, on one card, the forward or driving-pressure lines taken together on one continuous roll, Fig. 23, or, again, by coupling the indicator to the back-pressure nozzle it is possible to obtain the backward or resisting pressure lines taken together on another continuous roll, Fig. 24. If a dotted line be drawn through the mean height of the variable pressure line, as in Figs. 23 and 24, this dotted line will represent the mean effect of the series of variable pressures, Fig. 23 for the driving strokes and Fig. 24 for the back pressure strokes. This mean effect is the reading given by the pressure gauges, which are respectively attached to the driving and back pressure sides of the instrument. The movement of the pointers of the gauges is reduced to a minimum by throttling. The higher the speed of the engine the more steady is the movement of the finger, other things being equal.

Relation between Time-Pressure and Distance-Pressure Diagrams.—The method of converting a distance-pressure diagram *a*, such as is taken with an ordinary indicator, into a time-pressure diagram *b* may here be explained. A semicircle is described on the base AB of the distance-pressure diagram, Fig. 25 *a*, and the semi-circumference is divided into any number of equal parts, 1 ft., 2 ft., 3 ft., etc. Also the base AB for the time-pressure diagram *b* is divided into the same number of equal parts. Draw at positions 1, 2, 3, etc., on *b* perpendiculars from the base line AB, in height equal to the height of the distance-pressure diagram *a* at positions 1 ft., 2 ft., 3 ft., etc., of the crank pin, and join the tops of these lines by a curve. Then this curve will give the forward pressure line of the time-pressure diagram. A similar method is used for the back-pressure line. The same construction applies to the converse case of converting a time-pressure into a distance-pressure diagram.

(1) Taking first examples of simple theoretical diagrams, and considering the forward or driving pressures only, it will be clear that if the steam is carried through the whole length of the stroke without expansion, then the two kinds of diagrams will in each case be a rectangle and their mean pressures will be the same. Figs. 26 to 33 are the upper lines of theoretical indicator diagrams for various points of cut off. The expansions are assumed hyperbolic, with a clearance space of 7 per cent. The full line diagram is the true or distance-pressure diagram. The dotted line shows where the time pressure departs from the distance pressure. The shaded area represents the difference between the two. The following table shows a summary of the differences between the two diagrams for a series of cut-off points between 0·2 and the end of the stroke:

TABLE 1.

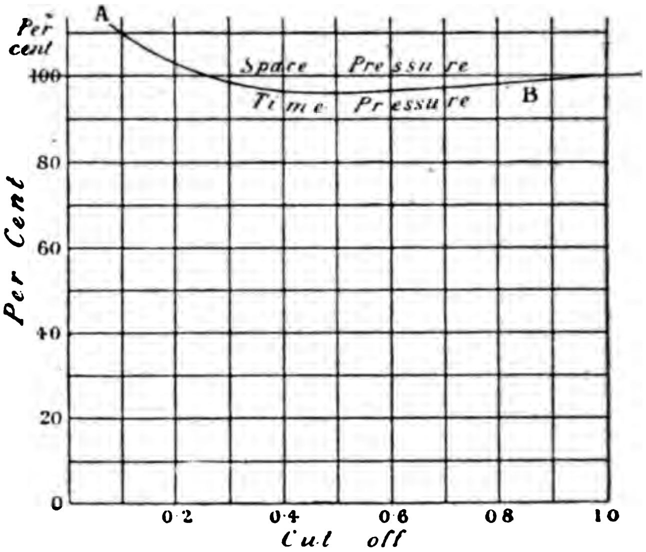
Point of Cut-off.	Percentage difference reckoned on the mean absolute forward pressure.
0·2	+ 2·9 per cent.
0·3	— 1·4 „ „
0·4	— 3·5 „ „
0·5	— 3·9 „ „
0·6	— 3·4 „ „
0·7	— 2·6 „ „
0·8	— 2·1 „ „
0·9	— 1·1 „ „

Average percentage difference throughout the range from 0·2 to end of stroke = — 1 88 per cent.

Fig. 34 shows the same facts by means of the curve AB. The difference intercepted by the vertical between the 100 per cent. line and the curve AB through any point of cut-off on the base line represents the difference per cent. at that cut-off, between the two kinds of mean pressure for the forward or driving stroke of the piston. Fig. 35, 36, and 37 show further results under various conditions.

Fig. 38 shows that if the top line of the indicator diagram slopes uniformly from admission to release—which is the tendency, more or less, in high-speed engines—then the positive area which increases the time-pressure diagram in the first half of the stroke is neutralised by the negative area in the latter half of the stroke, and the two means are in this case equal to one another.

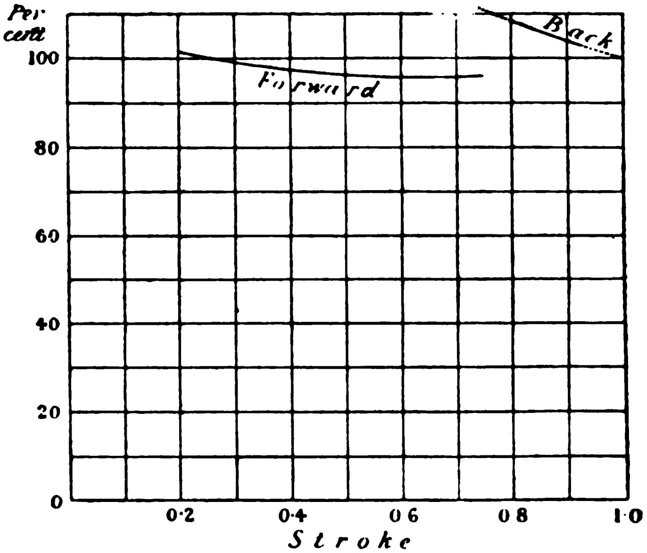
Fig. 34.



Considering the back-pressure line, it will be seen from Figs. 39 to 42 that the compression corner introduces a more or less large difference between the time pressure and the distance pressure for the bottom line of the diagram, and that the larger the compression the greater the difference between the two. The full lines of the Figs. 39 to 42 are the bottom lines of the diagrams as they would be taken by an ordinary indicator. The dotted curve is the time pressure curve. The shaded area shows the difference between the two, and represents the amount by which the time pressure differs from the distance pressure.

Where a large compression occurs with an early cut-off, as in link motion engines, then both the upper and lower lines of the diagram show a high reading on a mean pressure gauge, but being both plus results the errors tend to neutralise each other, Figs. 43, 44, and 45. Fig. 43 is the indicator diagram

Fig. 50.



when the valve gear is linked up to nearly mid-position. Fig. 44 is the top line of the diagram, and Fig. 45 is the bottom line. It is here seen that for this somewhat extreme case the error between the gauge reading and the true mean-pressure is the same in kind for both the top and bottom lines of the diagram, and that the net difference is - 1·86.

(2) Turning now from theoretical to actual diagrams, the relation between the two kinds of diagrams taken from indicators A and B respectively (Fig. 16) was obtained over a full range of powers. Figs. 46, 47, and 48 are examples of those obtained by the ordinary indicator, and Fig. 49 represents a corresponding time-pressure diagram. The relation between the two is shown, Fig. 50, by means of curves as percentage of the true diagram. It will be seen that the forward pressure line of the time-pressure diagram is always a little low, averaging throughout the trials here given a difference of - 3 per cent. The back pressure is shown by the short line to the right of the figure and averaged 5·5 per cent. above the true back pressure. The shaded areas marked 1 and 2 (Fig 49) distinguish between the compression area (1) and the lead area (2) on the back-pressure line of the diagram.

Trials of the Mean Pressure Indicator.—For the purpose of determining the true ratio between the indicator and the mean-pressure instrument for any given engine or type of engine, if ordinary indicator diagrams be taken at varying loads, and the result be then compared with the reading by the gauges of a mean-pressure instrument, the relation between the two can be noted, and the average difference throughout the range of loads determined once for all. The extent of this difference in practice may be seen from the following series of trials made on the experimental engine at University College, Sheffield (Fig. 51). The engine is of the marine type with compound cylinders 10 in. and 18 in. diameter, and 12 in. stroke, fitted with a link motion valve gear and a surface condenser. Average revolutions 100 per minute, boiler pressure 80 lbs. per square inch. The indicator diagrams, Figs. 46 to 48, are sample diagrams taken during the trials, and are numbered by letters to correspond with the letter number of the trial. The experiments were made on the high-pressure cylinder of the engine working under light, medium, and heavy loads, and under varying ranges of expansion, numbered, full steam, first grade, and second grade. The indicator diagrams were taken with Tabor indicators, the springs of which were tested before and after the trial and found correct. The pressure gauge readings were measured by means of a Schäffer & Budenberg duplex standard test gauge for the driving pressures, and by a specially standardised large dial gauge for the back pressures.

From Table 2 it will be seen that the readings of the forward and backward pressure gauges when compared with the indicator diagrams showed an average difference of — 3·1 per cent. for the forward pressure, and of — 1·4 per cent. for the backward pressure, or a net difference of — 1·7 per cent.

If it is desired to avoid the use of factors, the forward and backward pressure gauges may be graduated as shown in Fig. 20, the scale being increased by the required per cent. of the absolute pressure. The true mean effective pressure may then be read direct from the gauges without any further correction by taking the difference between them to within a limit of error not greater than 1 per cent.

It is probable that this average percentage correction will

vary for different types of engines, but experience with the instrument will determine the factor or gauge correction necessary for any given type.

Readings by Pressure Gauges.—In order to obtain a reading of the mean pressure acting upon the gauge, the writer employs two throttling cocks, one close to the instrument and one more or less close to the gauge. By the use of these regulating cocks the oscillations of the finger of the gauge may be reduced to any desired degree of steadiness without interfering with the accuracy of the reading of the mean pressure.

It is not unlikely that some engineers will object *ab initio* to the arrangement described in this paper, seeing that it is proposed to obtain such an important value as the mean effective pressure in an engine cylinder by means of an appliance so unreliable as the pressure gauge is said to be, by some authorities, and still more so when it is proposed to throttle the steam supply to the gauge, as has just been described.

But in answer to these objections the writer desires to give the results of his own experience, as, having himself been in doubt as to the accuracy of gauges and the effect of throttling,

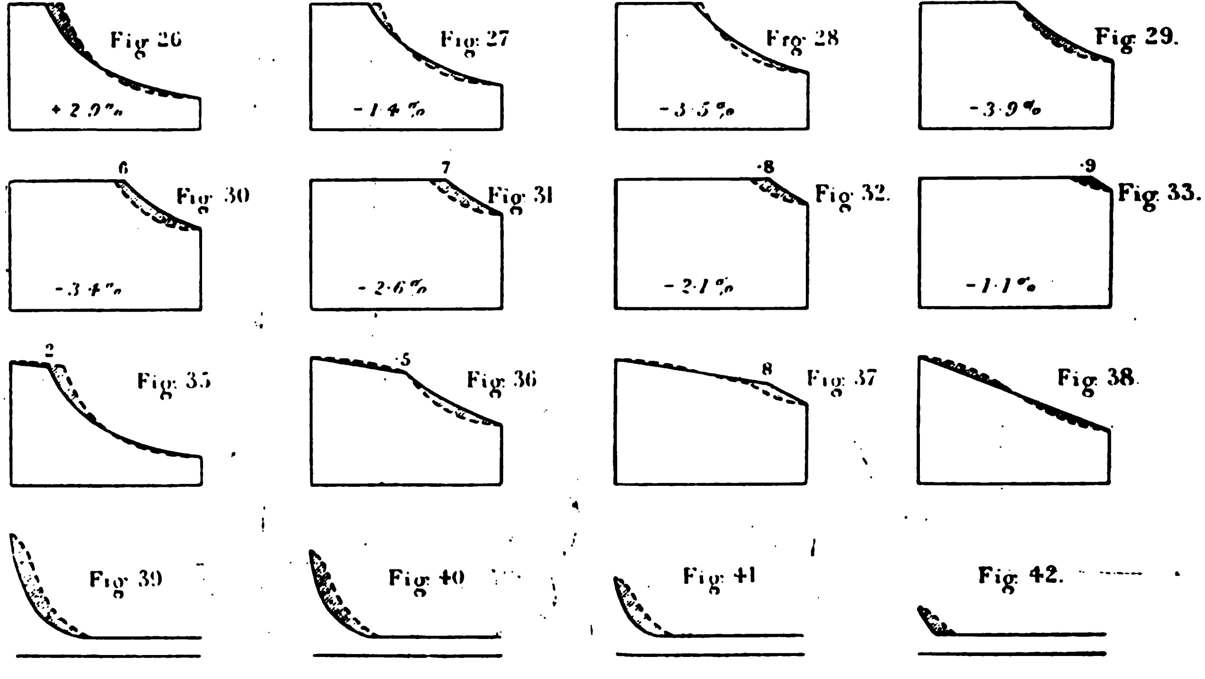
Theoretical Diagrams showing the relation between Time-Pressure and Distance-Pressure.



he has made many hundreds of experiments in order to test the extent of the error to be expected, and he has come to the conclusion that readings by a pressure gauge may be obtained which are as accurate, as consistent, and as reliable as by any known instrument for the measurement of pressure, not excepting the best of indicators; also that the throttling, when properly applied, does not endanger the accuracy of the reading, but on the contrary gives the true mean effect of the regular successions of momentary variations of pressures acting on the gauge.

In order to obtain accurate readings by means of a pressure gauge, such gauge must (1) be properly constructed; (2) be properly used. That a large number of the pressure gauges in ordinary use in practice are more or less unreliable is well known, but it will be admitted that such gauges, of the unreliable class, have not been constructed for the purpose of extremely accurate measurements, and have not received that care in the process of manufacture which is necessary to enable them to be classed as "instruments of precision." Their deficiencies are usually not due to defect in the principle upon which they are constructed, but are rather a question of quality of manufacture. But, however perfectly constructed a gauge may be, it is of course necessary that it should be carefully used, if it is to be expected to give uniformly accurate readings. Probably no instrument used by engineers receives such scant attention as the pressure gauge, and, while some of our measuring instruments must be carefully cleaned, oiled, and set, before we may have a single measurement, the pressure gauge may be dirty or rusty, or hot or cold, or its syphon may be empty or full, but under all these conditions it is expected to be equally accurate.

Mechanical Engineers 1899.

Pressure-Gauge Syphons.—The importance is admitted of maintaining a column of water in the syphon of the pressure gauge to keep the gauge cool, so that its readings may be consistent, and so as not to subject the gauge to high or variable temperatures. It is generally supposed that if the gauge has a syphon there is always water in it, and that when the syphon is once full of water, the water is easily retained therein, but these assumptions are not warranted by the facts of the case. The water will disappear from the syphon from various causes: (1) If there is the smallest leak in the gauge end of the syphon; then the water is all gone in a minute or two by being blown out by the steam, though the leak may be almost imperceptible. (2) If the pressure to which the gauge is subjected is a variable one, as is the case when the gauge is attached by its syphon to the valve chest of an engine regulated by a throttling governor; then the water will disappear from the syphon as usually constructed in a few minutes, especially on a sudden reduction of load, and consequent fall of pressure, in the same way that water in the engine cylinder disappears during expansion and exhaust. (3) When the gauge is liable to be subjected to a vacuum, as is the case when it is attached anywhere on the engine side of the throttle valve; then if the throttle valve is closed by the governor, or by hand, whilst the engine continues running, especially if it is a condensing engine, the engine becomes an air-pump and the water in the syphon is displaced by the expanding air initially contained in the spring tube of the gauge and its connections. Thus if the pressure in the engine falls to 3 lbs. absolute, the volume of water displaced in the syphon equals 15 ÷ 3 = 5 times the volume of air in the gauge. If now the steam is again suddenly turned on the engine, it is certain that the gauge readings will be different from what they were when the syphons were full of water. When there is water in the syphon the syphon pipe is practically cold with a steady pressure. When the pipe is very hot the water has probably gone from the syphon, unless it happens that the pipe is in contact with some hot metal. (4) If the gauge is subjected to a vacuum, and there is the smallest leak in the fittings at the gauge end of the syphon, then the water in the syphon is displaced by the air which enters the syphon through the leak.

To Prevent the Disappearance of Water from the Syphon.—(1) When the cause is due to the variable nature of the pressure acting on the gauge the water may be retained in the syphon by the method of double throttling already mentioned. When the mean pressure instrument was first constructed, only a single cock was fitted to the syphon of each pressure gauge,* and great difficulty was found in keeping the water in the syphon. Many devices were tried to overcome this difficulty, but without avail. A second cock would have been fitted at an early period of the experiments, at the end of the syphon farthest from the gauge—which, when throttled, would instantly have stopped the trouble—but for the fact that the writer set out with the notion that, if the throttling of the syphon cock was a throttling of water, the pressure would be

---

Experimental Engine at University College, Sheffield. Fig. 51.

transmitted to the gauge undiminished; but that, if the throttling took place in the steam, a loss of pressure would follow, and the reading of the gauge would be low. This erroneous notion cost about twelve months' experimenting to try to discover how to do without the use of water in a syphon.

One of the devices tried by the writer to overcome the difficulty may be of interest. A differential pressure gauge was constructed, as shown in Fig. 52. The driving pressure steam was admitted from the mean pressure indicator valve-box A by the pipe B against the piston C. The back pressure was admitted by the pipe D against the piston E. The pistons C and E were attached to the same rod, which was made an easy fit to prevent friction as far as possible, and the movement of the piston was regulated by the indicator spring F. To prevent violent motion of the pistons a dash-pot G was added which was filled with oil, and its piston was also made to work quite smoothly. Holes were made beyond the pistons C and E to allow of the free escape of any steam which might pass the pistons. The method of transferring the movement of the pistons to the finger of the gauge will be understood from Fig. 52. This instrument was not satisfactory, as it was not sufficiently sensitive, and a further attempt was made to improve the action of the water syphon.

Fig. 53 shows the arrangement employed for experimenting on the effect of double throttling. A short water-gauge glass A is secured between two plates B and C held together by bolts. The glass is connected at the top with the engine cylinder D by the pipe as shown, and at the bottom of the glass the gauge pipe is attached. There are regulating cocks at E and F. When the cock E is opened wide and the engine is running, the change of pressure in the cylinder between the driving and the exhaust stroke caused a more or less violent agitation of the water in A, being the more violent as the range of pressure was greater. When the range of pressure was not more than about 10 lbs. the water in the glass was quiet, but when the range of pressure exceeded this (by increasing the load on the engine) agitation again began. The action appeared to be due first to the heating of the water in the tube by the rush of steam, mixed with globules of hot water, into the tube; and, secondly, to the re-evaporation of the heated water when the pressure fell during expansion and exhaust in the cylinder. It is not possible to give numerical data as to the effect of different ranges of pressure because the behaviour of the water was most erratic. Sometimes with a given range of pressure in the engine, the water was violently agitated, and would disappear from the

Syphon for Pressure Gauge.
Scale 1/8th

glass in a few minutes; in other cases it would remain quiescent in the glass for hours, though the conditions appeared to be unchanged. Then it would suddenly commence to boil and to disappear without any apparent cause. But in all cases of agitation of the water in the tube A, when the cock E was throttled down the agitation immediately ceased.

The amount of throttling of the cock E which was necessary to stop the agitation still left a fairly large movement of the gauge finger across the scale, and the final adjustment for steadying the finger to the smallest possible movement was obtained by throttling the cock F. Throttling the cock E had no effect on the pressure reading by the gauge unless the throttling was carried too far. It was not necessary in order to stop the ebullition to throttle the cock E so far as to reduce the pressure. If any doubt remained as to whether the cock E was throttled too much, a little more opening of E would show at once whether such was the case. But it is only necessary to move E sufficiently to stop the ebullition and consequent disappearance of the water, and this leaves a good margin before the throttling of E is excessive.

With such an arrangement the effect of suitably throttling the cock E is to automatically fill up the syphon, if partly empty from any cause, and the water in the syphon will thus reach as far as the cock E when the apparatus has been at work a short time. In this way the problem of keeping the water in the syphon continuously and free from agitation was solved, and there is now practically no difficulty in obtaining a constant and accurate reading of the mean pressure by gauges subjected to variable pressures.

(2) When the cause of loss of water in the syphon is due to the gauge being subjected to a vacuum, a type of gauge is preferable from which the air in the Bourdon tube has been excluded, and the tube filled with liquid to its extremity; there is then no air to expand in the tube to expel the water from the syphon.

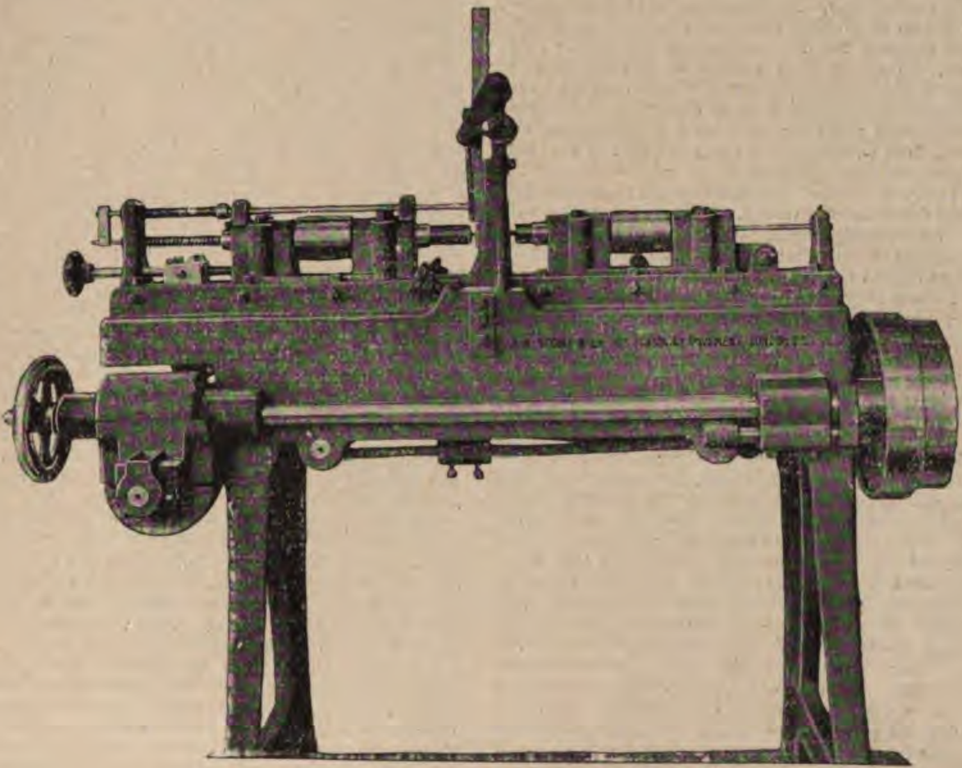
To sum up:—(1) The instrument here described gives a correct record of the mean time pressure. (2) The mean time pressure bears a definite ratio to the mean pressure as given by an ordinary indicator. (3) The correction may be made by the use of a factor, or by a corrected scale on the gauge dial. (4) Pressure gauges when properly made and properly used may be relied upon to give accurate readings.

In conclusion, the author wishes to acknowledge his indebtedness to his assistant Mr. J. W. Kershaw, M.Sc., who has rendered considerable help in carrying out the experiments

AUTOMATIC PLUG MAKING MACHINE.

We give an illustration of a machine of unique and recent design for making all kinds of cross-grain wooden plugs, which will be found a valuable addition to any factory where this class of work is required, especially shipbuilders.

It is very simple and extremely quick in its action. As an instance of its capacity, 10,000 plugs may be made in ten hours. The timber is fed in at the top and is allowed to drop by an automatic grip arrangement on to a stop with adjustment for different sizes of plug.



A cylinder saw of the required size is attached to the left-hand headstock, this cuts the plug, and a second bevelled cylinder saw attached to the right-hand headstock cuts a small chamfer on its edge.

While the timber is being worked it is held in position by a rod actuated by a spiral spring, which at the same time controls another spring rod above, and releases the timber after the cut to allow same to drop ready for the next cut.

This machine is perfectly automatic, adjustable everywhere where necessary, and can be immediately set up for making plugs of different thicknesses as well as of different diameters. It will make any size from $\frac{3}{8}$-in. upwards.

For further information apply to Messrs. J. B. Stone & Co., 135, Finsbury Pavement, London, E.C.

THE FLEETS OF THE MAIL LINES.

(*From our own Correspondent.*)

A Constructive Total Loss.

AT the time of its occurrence I mentioned the mishap to the once famous *Gallia*, of the Cunard Line. I told how this vessel, when running for the Beaver Line, had in May last, through a fault which could not be attributed to any of her officers, been stranded on Sorel Island above Quebec, and had a very narrow escape of being left high and dry in a meadow during a Canadian summer, but at an expense of some £6,000 she was got afloat and brought back to Liverpool, There she has lain ever since. At the recent Liverpool Assizes, an action was tried as to whether or not the owners could make the underwriters account for the matter on the basis of her being a total loss. She had been bought by the managers of the Beaver Line in 1897, for £23,250, and it now appeared that she had sustained such injuries that, if she were thoroughly repaired at a cost which the jury estimated would amount to £8,500, she would then be worth only some £14,000. That being so, and her value as old iron being not so very much short of her repaired value, it was concluded that she was not to be repaired, and must be paid for as a total wreck. Thus is doomed a very well-known and exceedingly popular Cunarder of twenty years ago. It is interesting to note that much of the damage which she sustained was due to the trying experiences to which her boilers were put when they were necessarilly filled, when heated, with cold water, her feed pipes at the same time being choked with grass which was floating down the river at the time. Their condition was so bad after this unaccustomed usage that one of her engineers said they had difficulty in getting steam at all on the homeward trip.

Messrs. Donald Currie & Co.,

whose fleet is doing so large a share of the national work of carrying out the troops for South Africa, have issued a very pretty and well got-up little pamphlet, giving pictures of the Royal Mail packet *Kildonan Castle* and of the other liners which are in employment as troopers. The *Kildonan Castle*, as is now generally known, is the sister ship to the *Kinfauns Castle*, whose cruise from the Clyde to Southampton I noticed in this column a few months ago. She was only launched on the 22nd August, yet she has already landed at the Cape the largest number of troops ever sent out in one bottom. The actual figure was about three thousand men. The illustrations show the *Kildonan Castle* as she was launched, as she is with the troops' accommodation in the 'tween decks, and as she will be when fitted for passenger service in the style described in the account of her sister. A very present interest attaches, too, to the pictures of the accommodation provided for the leading officers of the expedition, for Colonel Gough aboard the *Braemar Castle*, for General Buller on the *Dunnottar Castle*, and for the officer in command of the troops on the *Lismore Castle*. The view of the embarkation of General Buller on the *Dunnottar Castle* promises to become historical, and that of the departure of three Castle liners with troops from Southampton at one time is as interesting an evidence of the resources of the company as it is an excellent piece of photographer's work. The little pamphlet, which is thoroughly well written, is completed by the addition of a coloured map of South Africa. As an instance of Sir Donald's great thoughtfulness, it may be mentioned, that as a little souvenir of the event, he presented a copy of the booklet to every soldier who made passage on her in this her maiden trip. I have heard, too, that those who helped to get her ready for service with such unprecedented despatch, were also furnished with similar mementoes.

The Transport Service

is now employing steam tonnage amounting to nearly eight hundred thousand tons. This is of course contained in bottoms of great size, ranging, as the vessels do, from three to ten thousand tons. Taking into consideration vessels of small tonnage and obsolete type, which would be unfitted for any service of the kind in which our vessels are employed, the whole steam fleets of the mercantile marines of only three foreign Powers equal this total. The three nations in question are Germany, France, and the United States. Though the aggregate tonnage of the two last-named does exceed on the total at present engaged by the British Admiralty, it does so only very slightly; and it is fair to say that the combined mercantile marines of the world—outside our own—could not have undertaken the task which ours has fulfilled. Yet the ships of the Red Ensign have done it without to any very appreciable extent disarranging their ordinary work. This is the advantage of the sea-power of England, and the lesson which the fact teaches should not be allowed to pass unnoticed.

Such a work could not be expected to pass without some casualties, but so far there has fortunately been no loss of life, though some destruction of property and of much-needed war material has been suffered. The first accident was that to the *Rapidan*, which encountered heavy weather in the Irish Sea and put back to Liverpool with the loss of about 250 horses. Then came the loss of the *Ismore*, a fine screw steamship, of 5,216 tons gross register, on the rocks off Columbine Point, St. Helen's Bay, Cape Colony, when she was but 80 miles short of her destination. The *Ismore*, which was Transport No. 52, was a new ship, having only been launched on the 12th April, 1899, by Messrs. Barclay, Curle & Co., Glasgow. She carried, besides her crew, 346 troops, belonging to the 10th Hussars, the Royal Army Medical Corps, and the 63rd Field Battery. She also had about 250 horses. After she struck, things looked serious; the ship was fast settling on the rocks, and repeated voyages of the boats were needed to put the full ship's complement ashore. But the same discipline which characterised the brave soldiers who went down in the *Birkenhead* in 1852 had trained the men of the *Ismore*, and they waited patiently for their orders, prepared to show that they were worthy of their traditions, and that the half century which had passed since that terrible, if glorious, episode had not weakened the discipline or impaired the courage of the British trooper. Fortunately, the science of to-day, if it could not save the ship, at least prolonged the period of her dissolution sufficiently to allow of the landing of all on board. Some war material and some twenty horses were also saved, but there seems no further hope of salvage. A ship, however good, can be spared even at this crisis, but the loss of the trained cavalry-horses in the *Rapidan* and the *Ismore* is a more serious matter, since it takes time to replace them. Another Government loss is that of the Ropner liner *Maltby*, stranded at the mouth of the Tyne when outward bound to the Cape with a full cargo of coal for the transport fleet. She struck the Black Middens, and, though the crew were taken off by the rocket apparatus, she soon parted amidships, and, with her cargo, is a total loss. She was a ten-year old steel boat built at Stockton by Messrs. Ropner & Co., and fitted with triple-expansion engines by Messrs. Blair & Co. Fourthly comes the stranding of the Houlder Line s.s. *Denton Grange*, outward bound from Southampton, on the 5th December. with a very heavy and important cargo for Cape Town. She struck at Santa Catalina when entering the port of Las Palmas on the 11th December. She had upwards of seven thousand tons of most valuable stores aboard. Comprised in the list were large quantities of oats and hay for the cavalry horses; water-pipes for the use of the camps; steam traction-engines, steam ploughs and in short a miscellaneous assemblage of matters which were calculated to be of extreme use to our forces at the front. The vessel came broadside to the breach and H.M.S. *Furious* failed in her attempt to float her. The salvage s.s. *Herakles* was at once despatched to her assistance from Gibralter, and measures were taken to secure the safety, in any event, of the horses which formed part of the freight. The *Denton Grange* was built, three years ago, of steel, by Messrs. Workman, Clark & Co., of Belfast. She is of about 5,800 tons gross register and was fitted with seven bulkheads, and triple-expansion engines driving a single screw.

The Dominion Line

still continues to add to its fleet. The latest addition reported is the twin screw s.s. *Brasilia*, which has been acquired from the Hamburg-American Line, who used her in their Baltimore trade. She is a vessel only two years old, built and fitted with quadruple-expansion engines, by Messrs. Harland & Wolff, of Belfast. The vessel is of over 500 ft. in length, and her beam and depth are 62 ft. and 38 ft. respectively, whilst her gross tonnage exceeds 10,000 tons.

The White Star Line

is well represented amongst the transports. To the *Medic* with the Australian contingent, and the *Nomadic* and *Britannic*, which sailed amongst the earlier ships taken, have been added the mail steamer *Majestic*, and the reserve steamship *Cymric*, which latter has the distinction of being the biggest ship in the transport fleet, if she cannot claim the *Majestic's* Atlantic speed. Through their patriotic response to the call of the Admiralty, the White Star Line will, I fear, be somewhat handicapped in the Atlantic competition during the next few months, as for a sailing or two they will have to make their dispatches of passenger-ships to New York but fortnightly. But no one must expect to see the *Majestic*, which left Liverpool for the Cape amid a scene of unparalelled enthusiasm on the 18th December, break the Cape record. The Post Office had encouraged the belief that she would do so by circulating a paragraph to the effect that the fast White Star mail steamer *Majestic* would take out a special mid-weekly despatch of letters for South Africa; but the Admiralty effectually put the stopper on any attempt at pacing, for the vessel was so laden when she started that she was reported to be drawing no less than 29 ft. forward. It is unnecessary to remark here that with such a draught she will do nothing like her usual 20 knots. It is well that this point should be borne in mind, for it is certain that after comparisons will be drawn, to the disadvantage of Atlantic boats, between their performances over their 3,000-mile course and those of Cape boats—and of the *Majestic*—over the double distance to the Cape. For answer it need only be said that the chartered steamers of the Cape lines themselves have none of them done on their transport voyages anything like the speed habitual to them when running for their own owners. Admiralty conditions are such that no comparisons should be drawn from what Atlantic boats may not do at this time.

The sailing of the *Majestic* was attended with one matter which should not be lost sight of. A soldier fell from the ratlines of the steamship as her engines began to move, and the big vessel drew away from the stage. His fall was witnessed by one of the ship's cooks, Morris by name, and in spite of the bitter cold and the danger—which as a member of the ship's crew he would be one of the first to realise—of being cut to pieces by the screws, he pluckily went after him and saved him from sinking till help was forthcoming. This feat of Morris's is one which will not be forgotten, and which is fully worthy of being coupled with that of Lieutenant McKinstrey (then not yet promoted to command) on board the *Teutonic* at the Spithead review of 1887. We may rely on it that the firm whom Morris serves will take very good care that his bravery obtains public recognition. The *Majestic's* list comprised somewhere about 2,100 officers and men, whom she ought to land at Capetown ere these notes are in my readers' hands.

The "Gaspesia."

In the November issue of these notes I mentioned that the *Gaspesia*, late of the Canadian Steamship Company, was again offered for sale. Never more will be threatened by her the supremacy of New York as the mail port of North America. She has been sold to Italian shipbreakers, and has already arrived at Genoa on her final trip, for at that port she is to be broken up.

The Compagnie Generale Transatlantique.

The latest addition to the mail fleet of this company is *L'Acquitaine*, a fine 8,000-ton twin-screw steamship, built at Fairfield, and better known as the *Normannia*, though her more recent designation has been the *Patriota*. She made a name for herself in the express service of the Hamburg Line, and at the time of the Spanish-American War was purchased by the Government of Spain for use as an auxiliary cruiser. For that service, however, she was never completed, and after the war was acquired by her present owners. They thoroughly refitted her, and at the beginning of November sent her out for a trial trip. Now she has joined the New York service, sailing from Havre on her first trip on the 9th December, under the command of Captain Poirot.

The German Steamship Companies

are determined to lose no opportunity of increasing their comforts for the travelling public. An entirely new form of luxury for tropical climates has been devised for passengers. This is nothing less than the connection of the passenger accommodation with the refrigerating chambers, so that cool air can be admitted to the living rooms at will. Two of the latest steamships of each of the big companies—the Hamburg-American (whose designation now that it plies to Eastern Asia as well as to North America seems a bit of a misnomer) and the Norddeutscher Lloyd—have been fitted in this way. The latter company has added this month a new 12,000-ton steamer—the *Grosser Kurfurst*—to its fleet. She was built by Messrs. Schichau, of Elbing, and is of the improved and enlarged *Barbarossa* type, that is to say that she is suitable either for the Australian trade or for the intermediate passenger and cargo service to New York.

The "Paris."

A great case was to have been tried at the recent Liverpool Assizes. It was to settle the questions between the owners of the mail steamship *Paris* and the underwriters upon her hull and machinery. Policies had been effected upon her for sums amounting to about £225,000, and the owners, who had abandoned her to the underwriters when she first went on to the Manacles, claimed that they were entitled to refuse to take the ship back, and to demand their full insurance money. The case would have been even more instructive and interesting than that of the *Gallia*, but it never came into court. After the assizes had commenced it was announced that it was settled. The exact terms are not yet known, but it is certain that the shipowners will retain the ship and will repair her, a very substantial sum of money being paid over to them to enable them to restore her to her original condition. It is reported that the work of repairing, re-engining and reboilering the Paris (which will come back to work under a new name) has been given to Messrs. Harland & Wolf, of Belfast.

The "Merrimac."

It was not so very long ago that I chronicled the stranding of the *Merrimac*, near Heath Point, Anticosti, on her outward trip from Bristol to Montreal, a casualty which occurred about the 15th July of the year just concluded. The vessel was apparently in a bad way. She was holed, and the crew had to leave her on the 24th July. Eighty guineas were then paid to reinsure her. But on the 7th August she was floated and taken to Quebec, where it appeared that her injuries were much slighter than the most sanguine had ventured to hope. The same ship is now most seriously overdue. She left Quebec for Belfast on the 25th October, and as long ago as the 15th of November 25 guineas were paid for reinsurances. The premium had risen to 70 guineas by the 1st December, and by the middle of the month had reached 90 guineas. The vessel in question is one of the African Steamship Company's Atlantic cargo-boats. She is a steel screw steamer nine years old, of nearly 4,200 tons gross register, built and fitted with triple-expansion engines by Messrs. Harland & Wolff, of Belfast. She was formerly known as the *Alexander Elder*.

Mr. Brancker.

Liverpool has been paying its due honour to Mr. John Brancker, the chairman of the Mersey Docks and Harbour Board, who, after 29 years' service on the Board, is retiring from the chairmanship. The Lord Mayor of the city presided at a banquet in his honour, and being an excellent speaker, with a very fine subject to deal with, made a very good speech in honour of the good old town's famous citizen and guest. Mr. Brancker's reign at the Dock Board will ever be a memorable one. To him is due—if not all the credit for initiation—at least the honour of having furthered some most momentous changes and some most valuable concessions, alike to the travelling public and to the Dock Board's general customers. Rates have, in his time, been lowered in every direction. Facilities have been introduced for the rapid handling of cargo by the increase in the supply of cranes and in the provision of numerous double-storey sheds. Antiquated docks have been deepened and rendered easier of entrance. The biggest graving dock in the world has been built and brought into use. Upon another dry dock, only inferior to this, work has been commenced. The bar, thanks largely, it is true, to the influence of Mr. G. B. Crow, has been practically abolished. The berths at the landing stage have been rendered capable of accommodating the *Majestic*, the *Lucania*, the *Cymric*, and even the *Oceanic* in turn as each came out. The co-operation of the London and North-Western Railway has been won—partly owing to his influence and partly owing to that of the late Mr. Ismay—it has been induced to discover that the Waterloo Tunnel could be modernised, the Riverside Station has been constructed, and train-to-boat conveniences have been offered by the old port. The Mersey Dock Board's credit stands higher than it ever did. Mr. Brancker retires from his high position full of honour and with the satisfaction of knowing that he has neglected no interests and has honourably fulfilled his trust. His speech at the banquet given in his honour was interesting indeed. He showed that Liverpool did wisely in the year 1857 to dissociate the docks from the control of the municipality. He showed too that municipalities are not good dock managers. Indeed, there are now few ports where they attempt such work. Even important places like Hull and Southampton have their docks under railway control. Bristol seems alone of British seaports of any consideration to still allow their City Council to manage their harbour works, and to regulate the conduct of their shipping facilities. The experience of Bristol of recent years has been singularly unhappy, as has from time to time been shown in these notes. It is not unfair to assume that the vacillating, do-nothing policy which has characterised the management of Bristol docks, and which has driven traffic away from the river, has been largely due to the fact that the management has been centred in a council which, with the best intentions, lacks special knowledge and consists of men chosen for their political opinions, not their aptitude to deal with any commercial questions. Such men are always bound to think of the views which their constituents will take of their votes, and must even unconsciously be swayed by the exigencies of their position.

The Cape Lines, Limited.

On the 15th December, 1899, a most startling and important announcement was published. An arrangement for amalgamation has been reached between the Union Steamship Company and the Castle Mail Packets. The object is to carry out with greater efficiency and economy the contract for the carriage of the Cape Mails, for which the two concerns are jointly responsible to the Post Office. At the time of writing no details as to the terms of the amalgamation are made public. These will be laid before the shareholders of the two companies early in January. But it may well be remarked that the share capital and debentures of each company amount to about a million sterling, though the Union Company has a greater capital and a smaller debenture debt than the Castle Line. The latter's shares, however, stand at a better price on the Stock Exchange. A wide vista of possibilities is here opened out to us. If the amalgamation goes through we shall probably see a mid-weekly sailing of intermediate boats substituted for the double Saturday despatch. But beyond this suggestion it is now too soon to go. Next month I shall hope to give a history of the two companies, of which the elder—the Union Line—dates, as a screw collier company, from the time of the Crimean War. The Castle Line was started in opposition to its now ally about the year 1872. The development of size, luxury, and speed in this trade has been, if possible, more marked even than that noticeable on the North Atlantic. With such men as Sir Donald Currie and Sir Francis Evans at the helm of the amalgamation, it may be taken as certain that want of competition will not arrest progress in the future,

The P. & O. Company

deserves well of the public for the action it has taken in regard to its attempt to prosecute a halfpenny evening newspaper for alleged libel in that it was stated that the transport *Nubia* had been lost at sea with a large number of troops. The attempt to institute a prosecution failed, it is true. But some very strong remarks as to the wickedness of disseminating false news, and of causing an immense amount of needless pain fell from the Bench, and will doubtless be taken to heart by those who achieve a reputation for smartness, and do not mind what trouble or expense they may be causing to the public if only thereby a few halfpence be raked into their own private tills. The judges were probably right in thinking that, under the circumstances, it was unlikely that a jury would consider that an actual libel had been circulated; for juries are taken from the mass of the people, and the feelings of shipping men can hardly be expected to be fully appreciated by them. It was said - and with force—that the loss of such a ship with all hands *might* have taken place without the circumstance causing any reflection upon those who equipped and sent the ship to sea. We all—except a certain body of officials—know that ships are lost in spite of all precautions and that practically all shipowners wish to avoid loss, in spite of insurances. Certainly the managers of great lines which do their own insurance have everything to lose and nothing to gain by such losses. But at the same time it is hardly recognised generally how feminine is the reputation of a ship herself and of the line which runs for passenger traffic. A loss of any kind, even by the purest misfortune, is a slur on the management to the extent, at least, of giving them a reputation for being unlucky. The fact of the loss itself long remains vaguely in the public mind, whilst explanations, however plausible, and causes, however inevitable, are soon forgotten. By the shipping world, therefore, we may be sure that great sympathy with the directors of the P. & O. Company is felt in regard to the wanton statements that were made regarding their vessel, and much gratitude is felt alike by shipowners, by those who go down to the sea in ships, and by relatives of seafarers for the attempt which was made to force some inquiry to be made as to the genuineness of rumours which find their way into newspaper offices.

The Disaster on the Tugela River

will cause a further chartering of transports. The British India steamers *Jelunga* and the *Avoca*, primarily engaged for the Indian relief service, are put on to carry the South African reinforcements. The fine Leyland steamships *Victorian* and *Cestrian* have also been taken up. So too the Elder, Dempster liner *Lycia*, recently sailing between Bristol and the St. Lawrence, has also been engaged. The Cunarder *Umbria*, the Anchor *City of Rome*, and several others are also added to the list. Many of the transports first despatched have now reached this country again, and some of them have already started on their second journey. With the need for further troops, guns, horses, and ammunition it is probable that the demand on the part of the Admiralty for tonnage, already so large, will not for the present be slackened.

The Port of Durban

is doing well in its efforts to cope with the immense influx of troops and stores which are finding their way to Natal. Had not the public spirit of the colonists, who were not then thinking of possible military necessities, rendered the harbour equal to the demands of the day, much needed help might have been delayed to a very serious extent. The people of Durban point with justifiable pride to the fact that the Leyland Line steamship *Armenian*, of upwards of 500 ft. in length and of a draught of nearly 21 ft., passed in safety and without delay over the bar to her wharf.

Messrs. Elder, Dempster & Co.,

with their Canadian mail line, are during the winter season at least, when their ships call at Halifax, about to enter into competition with the Cunard and Dominion Lines for passenger traffic to Boston. It is announced that arrangements have been entered into with the Plant Line, whereby Boston passengers can be taken out by the Canadian mail steamers and transhipped at Halifax to comfortable vessels which will land them at the Massachussets port the day after they leave the Nova Scotian port.

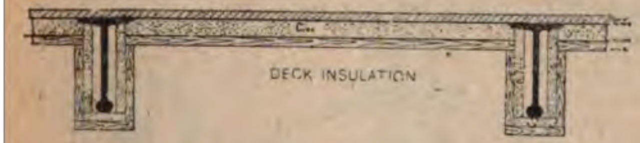
Messrs. Menzies.

the Leith firm of shipbuilders who constructed one of the earliest Transatlantic steamships in the *Sirius*, have just given signs that their enterprise is not blunted by age. They are extending their facilities for taking orders and have acquired a supplementary shipyard at Inverkeithing.

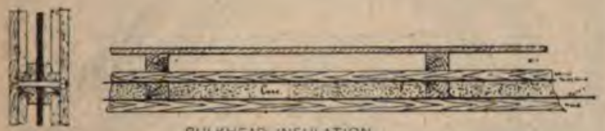
NONPAREIL CORK INSULATION.

AMONGST the many non-conductors of heat that have been known for many years the value of granulated cork has been fully recognised, but the objections to its use have been the expense, the space required, and the fact that all loose materials will, to a greater or less extent, settle and leave unprotected spaces, as is the case with mineral wood, charcoal, sawdust, and other similar materials.

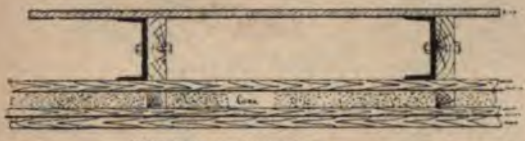
Whilst dealing with the subject of insulation, we should like to again direct the attention of the public to the theory which has been put forward that charcoal, when used as an insulating medium, is often responsible for many of the fires that have occurred on ships that are fitted with cold storage, and particularly with reference to those that carry a frozen cargo on one voyage and a general cargo on the return voyage. It is known that charcoal is peculiarly liable to spontaneous combustion owing to its great capacity for absorbing and condensing gases. Professor Vivian Lewis, in an address delivered by him at a meeting of the British Association at Nottingham, in 1893, observed that carbon is one of those substances which possess to an extraordinary degree the power of attracting and condensing gases upon their surface, and that a heap of charcoal powder of 100 bushels or more will always ignite. He gave as his reasons, that the more porous a body is the greater amount of exposed surface will be available for the condensation of gases, and the great power that charcoal has of absorption is undoubtedly due to its great porosity; and he pointed out the great danger of combustion in a substance prone to such chemical action. As evidence of this fact being fully recognised by the authorities, we have only to point to the stringency of the regulations of the Explosives Act relative to the storage of charcoal in connection with the manufacture of gunpowder. Therefore closely packed charcoal—liable to be wetted on the one hand by leakage from the decks or elsewhere, and on the other exposed to a wide range of temperatures, ranging from zero with frozen meat on board to the heat of the tropics when cargo other than meat is being carried—appears in such conditions to be likely to justify all that is affirmed as to its dangerous qualities.



DECK INSULATION



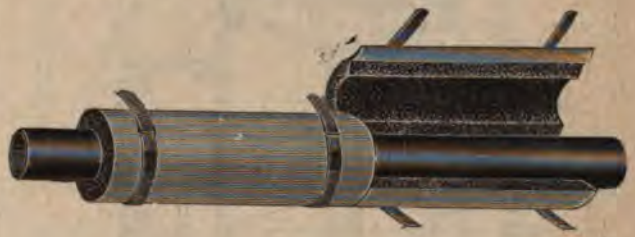
BULKHEAD INSULATION



SHIP SIDE INSULATION

The Nonpareil Cork Manufacturing Co., of New York, have placed upon the market a sheet cork insulating medium which is made of granulated cork, so as to produce an efficient article at a commercial price comparable with competitive materials now on the market. The essential feature in the process of manufacture is the treatment of the granulated cork with great heat whilst under pressure. This, by liquefying the natural gum of the cork, and without the addition of any foreign cementing substance, produces a solid sheet or block of cork; and further the pressure forms the interstices between the granules into small closed air spaces, without destroying the myriads of minute air cells which give cork its wonderful heat-non-conducting properties. In the process, 4 in. of granulated cork are reduced to 1 in. As to its efficiency as a non-conductor, tests made by experts in the United States show that with a coating of 1½ in. thickness of magnesia 28 per cent. of heat was lost from a steam pipe carrying steam at 200 lbs. per square inch as compared with the loss from a bare pipe; and with a thickness of 9 in. of Nonpareil cork under similar conditions, only 25 per cent. was lost, which shows that the cork retained more heat with less thickness.

The other advantages claimed for it are: firstly, it cannot disintegrate, as time, moisture, heat, and cold do not affect it; secondly, it is very light, weighing 15 ozs. per square ft., 1 in. thick; thirdly, it can be sawn by hand to fit irregular spaces and is thus easy of application; fourthly, the firmness and regularity of its application ensures its accuracy and renders it practically impossible to slight the work through carelessness or design, which, where loose materials are packed in place often give unsatisfactory results; fifthly, it is odourless and is not attractive to insects or vermin, and, as no foreign substance is used in its manufacture, it is very clean and cannot injure anything with which it may come in contact; and lastly, it is unaffected by vibration and occupies less space than most other insulating mediums.



We illustrate in the adjoining diagrams the usual methods employed for deck, bulkhead, and ship side insulation, also the insulation adopted for use on steam pipes, and we may also mention that this material has been largely used on the following vessels of the United States Navy with successful results, both in the cold rooms and officers' staterooms, the monitor *Monadnock*, the cruisers *Brooklyn* and *Chicago*, and the battleships *Iowa*, *Kentucky*, *Kearsarge*, *Alabama*, and *Illinois*.

The cold storage rooms on the American Liners, *St. Louis* and *St. Paul*, and also the Red Star Line steamers are lined throughout with this Sheet Cork. The results being quite satisfactory to their owners.

The agent in this country is Mr. J. F. Butterworth, of 28, Queen Street, London, E.C.

Notice of Removal.—Messrs. Estler Brothers (late of 27, Leadenhall Street), makers of ships lamps, &c., have removed to larger and more convenient premises at 25, Laurence Pountney Lane, Cannon Street, E.C.

MESSRS. COCHRAN & CO.'S NEW BOILER AND SHIPBUILDING WORKS, ANNAN.

THE large new engineering and shipbuilding works established at Annan by Messrs. Cochran & Co., Limited, who have for many years been established at Birkenhead on the Mersey, have now been in existence practically for 18 months. They represent one way of solving the problem of expansion with which every industrial establishment is at the moment face to face. In almost every direction businesses have been extended, and costly installations of modern plant have been rendered necessary to keep pace with the times. It is not always possible, however, to develop a concern both adequately and profitably, for ground in the outskirts of prosperous industrial communities becomes prohibitively dear, and a dozen other little considerations involve the question. Cheaper ground in less prosperous and less densely populated districts suggests increase in the cost of material, scarcity of labour, and several other difficulties; but one or two enterprises have proved, and others are proving, that, given a suitable situation, most of the drawbacks to pioneer movements of this description are more imaginary than real. The successful transference of a business like Messrs. Cochran's from a populous centre like Birkenhead to a sleepy country town like Annan is a case in point. The new works are better situated in a commercial sense than appears at first sight. Annan is on the Glasgow and South Western main line, and there is a branch from Newbie Junction to the establishment, over which much of the material comes by sea, and is discharged at a wharf on the riverside of the works. At Birkenhead the firm built many small boats of a great variety of types; but in Annan the manufacture of the patent vertical multitubular boiler with which the name of Cochran is associated will probably be developed most. For this purpose the buildings have been more particularly designed, and in point of arrangement and equipment they are model places of the kind. The vertical multitubular boilers were used in the last Soudan campaign, chiefly for pumping water to camping grounds, and at present the works are in full operation day and night completing another order for 18 for use by the British army in South Africa. About 30 or 40 more of both land and marine types are on order for commercial purposes, and when the installation of plant is complete the company hope to be able to stock boilers of every size for immediate delivery. Electric, hydraulic, and pneumatic power is applied to the manufacture in the most up-to-date fashion, and nothing is withheld on any account that can give stability and finish to the work turned out. The ground embraced by the new works extends to about 15 acres, four acres of which are occupied by shops mainly connected with boiler making. The firm have already launched their first vessel the *Ethelinda*, a small steam launch, and this is at present under way. A patent slipway, for hauling up and repairing purposes, is also being laid down, and altogether there are the makings of a very large establishment at Annan.

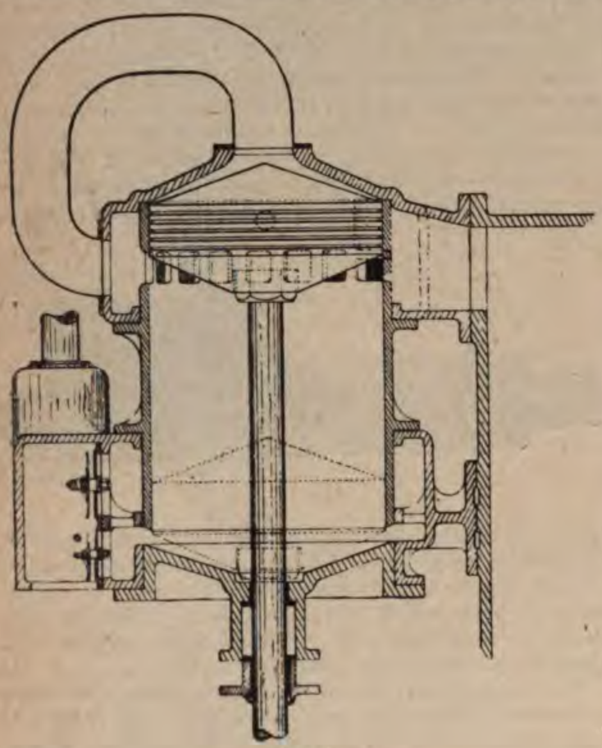


FIG. 1.

DRAKE'S AIR-PUMP.

MUCH thought has been expended of late years upon the air-pumps with reference to their efficiency of action and simplicity of construction and repair. It is now our pleasure to chronicle another departure in this direction, which has been designed by L. H. Drake & Son, M.I.N.A., of 157, Fenchurch Street, E.C., which we feel sure will be of interest to our readers.

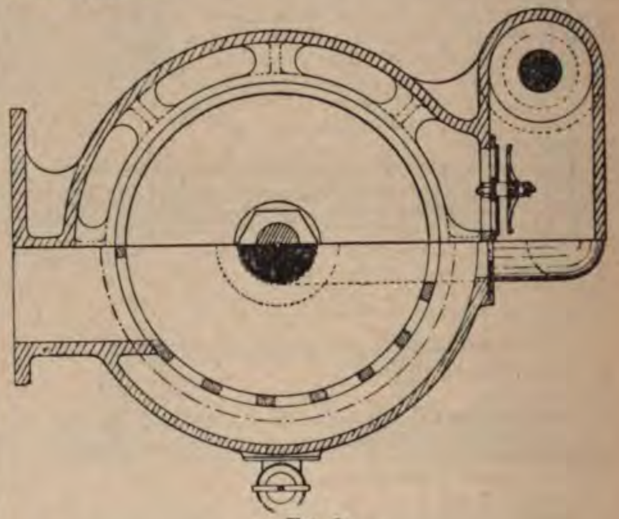

FIG. 2.

We illustrate Mr. Drake's air-pump in the adjoining diagrams, which show two arrangements in sectional plan and elevation.

It will be seen that the special feature of the arrangement is that the pump has no head, foot, or bucket-valves in the pump-chamber. However, there are head-valves only, which are placed on a division plate fitted between an annular water-chamber arranged around the pump-barrel and the hot-well. The pump-barrel is taken down to the bottom of another annular casting, which surrounds it, the bottom of which is conical. This annular chamber forms a water and air chamber. An opening is arranged in the side of the barrel opposite the inlet from the condenser of such a height as to be just opened by the bucket when at the bottom of its stroke. A pipe is taken from the conical bottom round to the annular chamber or passage, and holes are arranged in the barrel communicating therewith. The upper and lower surfaces of the bucket are made conical. The ends of the annular chamber are closed to the inlet to the condenser.

In Figs. 3 and 4 it will be seen that a slight modification is made, inasmuch as the lower annular chamber is dispensed with, and the pipe from the conical discharging direct into a single aperture through the pump-barrel. An air-vessel is arranged on the pipe close to the pump-barrel.

In each case, the arrangement of the valves is such that, in the event of the valves getting out of order, the cover on the top of the hot-well can be removed, and the valves easily repaired or replaced without stopping the engines, or causing any loss of vacuum in the condenser or loss of condensed water, as no doors are required in the pump-barrel.

The operation of the pump is as follows :—Assuming the bucket to be descending, it comes in contact as it nears the bottom of its stroke with the water that has drained from the condenser into the pipe and conical bottom. As the bucket finishes its stroke it displaces the water from beneath it through the pipe and annular chamber on to its top side, and carries it up with it on its up stroke, discharging it by gravity into the top annular chamber and through the valves to the hot-well.

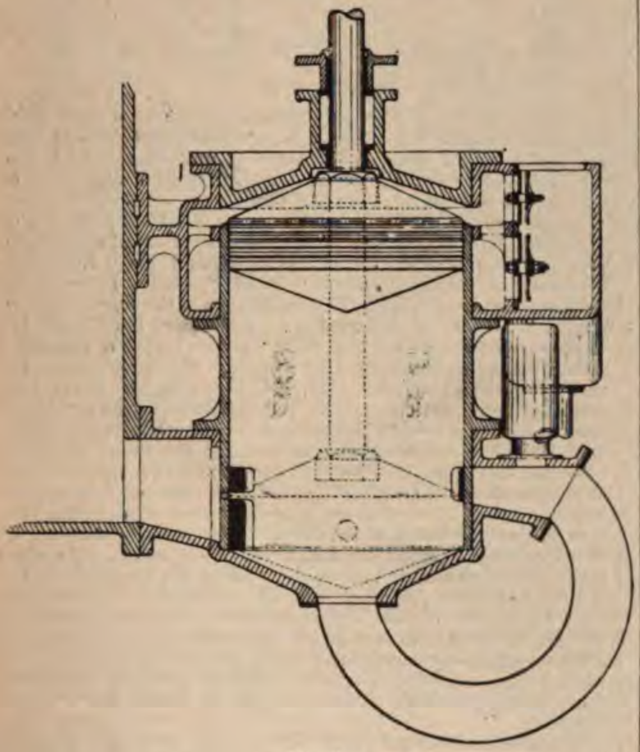

Fig. 3.

Of course, in starting, water and air will be displaced by the bucket and delivered through the head valves ; but, when the initial vacuum has been produced, the pump has practically only to deal with the water and the small amount of air that has leaked through the glands.

We shall be interested to hear the results from the trial of this class of pump.

MARINE ENGINEERS' NOTES.

(*From our own Correspondent.*)

SIR JOHN A. DURSTON presided at the meeting of the Institute of Marine Engineers, held 27th November. Before commencing the business of the evening, he said the country had sustained a great loss by the death of Mr. T. H. Ismay, the head of the White Star Line. He was a leader of men and a captain of industry, and we owed as much to him as to any man living for the development of steam shipping, both in respect of its high tonnage capacity and great speed. He was quite sure the members of the Institute of Marine Engineers would desire to join with him in expressing to the family of the late Mr. Ismay the deep regret with which they had heard of his death, and their sincere sympathy with the members of his family. The motion was carried unanimously, the whole of the members present upstanding.

The paper by Mr. Walter Houfe, on "Objectionable matter which tends to enter steam boilers, and its prevention from so doing" was further discussed. Mr. Halliday asked questions of those experienced in the working of these filters. The point upon which information was specially wanted was whether those feed-filters were of much use. Mr. Hulme, on the last occasion, pointed out that the Turkish towelling, or other material employed to filter the feed-water, generally got clogged up, and there was often great difficulty in getting it cleared with sufficient frequency. Another member said Turkish towelling put in to intercept grease could be easily cleaned, and it proved of great assistance in clearing the feed-water. Mr. Hulme thought the most effectual way of getting rid of grease was by heating the feed-water. Still another member had told them that by turning the exhaust steam on to hot plates, and the feed-water too, all the oil and dirty matter fell to the bottom and could be cleaned out. Sir John Durston said there were three methods of separating grease and other objectionable matter from feed water. Firstly, by the use of material for filtering the water; secondly, by the use of heat for filtering the water; and thirdly, the use of dash plates in the exhaust steam-pipe system. In the Navy they had tried all three methods. They had tried the Turkish towelling system or some equivalent material both in the suction of the feed-pipes and in the delivery feed-pipe. They had also tried it in a large filter tank, above the feed-tank, into which the hot well pump delivered its discharge. The water passed from the filter cloth into the feed-tank, which was the vessel from which the feed-pump took its suction. They had a further system, somewhat similar to the dash-plate, known as Stewart's separator, which was an apparatus containing several dash-plates, but it was only on a suitable plan for the auxiliary machinery of warships, because if applied to the large main engines it required cumbersome castings ; and in the mercantile marine he did not suppose that a plan of the kind would be required at all for the main engines, as they only wanted to trap the water which was used in the auxiliary engines when the engineers

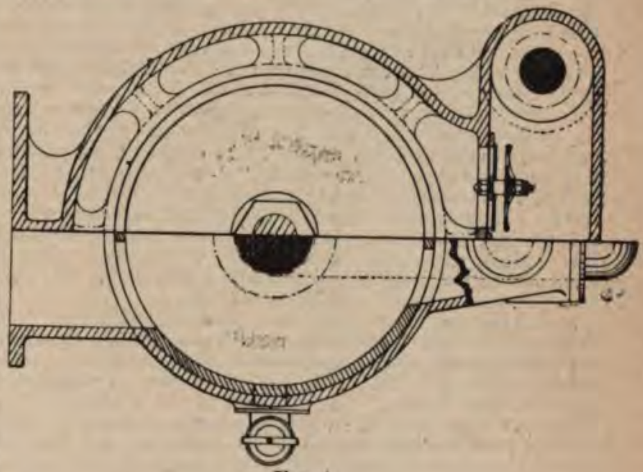

Fig. 4.

had not such a command over the lubrication. They had not tried feed-heaters very much in the Navy, but in the two or three instances where they had been tried there could be no doubt that a great deal of grease was collected in the heaters. The plan which they had largely adopted in the Navy as the result of their experience up to the present was a filter-tank containing a number of cloths; the water was passed into this and then drained away into the feed-tank. One of the things laid down in the Admiralty specifications was that when the engines were first tried alongside a jetty, the contractor was at liberty to use as much oil as he pleased for lubrication, and the air-pump discharge went into the bilges—on this trial the water for the boiler being supplied from the shore or ship's tanks. Mr. Johnston thought it would be better to put in less oil than put in feed filters. The use of oil as an internal lubricant was simply a waste of money. Steam was the best lubricant. Mr. R. D. Keay was presented with the Denny Gold Medal for his paper on "The Thermodynamics of the Steam Engine." Mr. Macartney read a paper on "The Engine Room Telegraph." It was an ingenious mechanical contrivance for keeping a record of the signals sent down to the engine-room from the bridge. With the telegraph pointed between "Stand by" and "Finished with Engines" and the valve gear at mid-position the circuit is open; move the telegraph into ahead position, put the engines in ahead gear, it still remains open; but should a mistake be made and the engines be put in astern gear, the circuit will be closed, the bell will ring and continue until the mistake is rectified. Mr. Shearer said it would be a distinct improvement on the ordinary engine-room telegraph if gongs or bells of different tones were used to signal ahead or astern. A double bell for astern would be better still. The chairman said a different-toned bell for going astern was already fitted in some ships. Mr. Hulme pointed out that with some engines, especially with compound types, it was sometimes necessary to move the engines in the opposite direction to that ordered. It occasionally happened that when the engines were ordered "ahead," they could not be moved in that direction until after a turn had been made astern. In that event this indicator would represent that a mistake had been made, whereas in point of fact the movement first made by the engine was absolutely unavoidable. Mr. F. T. Aukland proposed a cordial vote of thanks to Sir John Durston, and this was carried unanimously.

At the meeting of the institute on December 11th Mr. T. F. Aukland presided. After a few remarks being made by several members on the question of propellers, a paper was read by Mr. G. Halliday on the "Effect of circulation on evaporation in water-tube boilers." It was due to the kindness of the Editor of this journal supplying certain apparatus which enabled these experiments to be made on the institute premises. Former experiments were made to see whether molecular change in the water was the cause of the increased absorption of heat by water at the boiling point. It was found that at the boiling point there was rather less absorption of heat than at lower temperatures. This was the condition of things when the effects of more rapid motion of the water were eliminated. It was found also that the absorption of heat was at a maximum at a certain velocity and that this particular velocity depended on the quantity of heat supplied to the outside of the tube. In these last experiments it was sought to make the condition of the water as near to that which exists in an ordinary steam boiler as possible. Water when evaporating steam does not run through the tube as water, but as water and steam, and therefore the effect of the pressure of steam may change entirely the conditions. Heat was applied in different quantities to the tube whilst water moved through it at different speeds, and the quantity of steam evaporated noted under the different conditions. It may be premised that the accepted view is that the evaporation increases with the rapidity of circulation of water through the tubes. In the experiments described water was heated up to boiling point in a tank and drawn thence through a tube heated with a Fletcher burner. The steam and water as they issued from the tube were separated in a separator and separately measured. First the flame of the Fletcher burner was kept constant and the rate at which the water moved through the tube was varied. It was sought to determine whether the amount of evaporation remained constant with the heat supplied or varied with the velocity of the fluid through the tube. First, then, the tank supplying the water was heated to boiling point and it gave off steam freely. Then the Fletcher burner was lit and the flames allowed to play on the copper tube. Then the water from the tank was turned on and allowed to run. After the water had gone through the heated part of the tube, steam and water together flowed through the separator into a flask. After that the cold water was turned on at the cold-water tank and made to flow through a condenser. By that time the whole apparatus was in full working order. The period settled for each experiment was four minutes. At the end of four minutes the water in the flask was measured and the condensed steam measured also. The sum of the two gave the quantity of water which flowed through the tube for four minutes. After the first four minutes 14 cubic centimetres of water were found in the measure. This meant that 14 cubic centimetres of water had been evaporated during the same time that 175 cubic centimetres of water had flowed through the tube without being evaporated. The total water which had flowed through the tube was then 189 cubic centimetres. Here are two sets of results.

Velocity of Water.	Water evaporated.	Velocity of Water.	Water evaporated.
93½ ..	23½	54½ ..	24½
94 ..	24	93 ..	23
103 ..	23	122 ..	22
121½ ..	21½	378 ..	18
129 ..	19	575 ..	15
158 ..	18	664 ..	14
189 ..	14	762 ..	12

It will not be assumed that the figures given above show anything but comparative results. A number of factors are purposely left out of consideration, but it may be assumed that the figures show there is not an advantage in a high rate of circulation of water through the tubes of a water-tube boiler. Alderman Kidd, in the discussion which followed, said one of the tables showed that when 76 cubic centimetres of water were flowing, 40 centimetres were evaporated, and when 1,091 centimetres, only 11½ centimetres were evaporated. How did the author account for that? Mr. Halliday said the numbers were simply a matter of observation. Alderman Kidd said the experiment did not represent what went on inside a steamer's boiler, because in the boiler there was no pressure behind the water to force circulation. Mr. Halliday said his paper only dealt with one particular point, and the effect of the results of the experiments was to advise people to so construct water-tube boilers that the circulation through the tubes would be slow and not fast. Mr. Lawrie questioned the value of the experiments carried out by the author as applicable to boilers, because under no conditions that he knew of on board ship was the water heated in the same manner as that adopted by Mr. Halliday. It would be seen from the diagram that there was a considerable head of water to assist the circulation. Mr. Halliday said the difficulty with an ordinary boiler was that they could not control the circulation. They increased the circulation in an ordinary boiler by increasing the quantity of heat supplied, but he wanted to vary the circulation with the same fire, in order to observe the effect of speed of circulation upon the evaporation. An ordinary boiler would not suit the purpose.

The chairman (Mr. Auckland), referring to a suggestion made in the course of the discussion, that further apparatus should be provided for experimental purposes, said he should be happy to subscribe towards the cost, because he thought that experiments of the kind would be very valuable, and that it was for the benefit of the engineering profession that they should be continued and even extended.

The offer of Mr. Auckland to assist financially with the experimental work of the institute is of considerable importance to the advancement of engineering generally. This has been followed by a similar promise by Mr. Laurie, superintendent engineer of the New Palace Steamers. No doubt these will be followed by one or two other gentlemen who have the interests of the profession at heart, and the experimental work will then be placed on a proper foundation.

Messrs. Turner Brothers, Limited, of Spotland, Rochdale, have converted their business into a private limited company bearing the above name, the object of the conversion being to secure the many advantages incident to incorporation. The business will be carried on as heretofore without any change in the management.

DRAKE'S CYLINDRICAL MARINE WATER-TUBE BOILER.

IN the adjoining diagrams we illustrate some modifications in the construction of steam boilers which have been designed by L. H. Drake & Son, M.I N.A., of 157, Fenchurch Street, London, E.C.

The objects sought in these designs have been the provision of greater strength to the internal parts, greater heating surface, better combustion, more efficient circulation of the water, and the reduction of the quantity of water in the boiler.

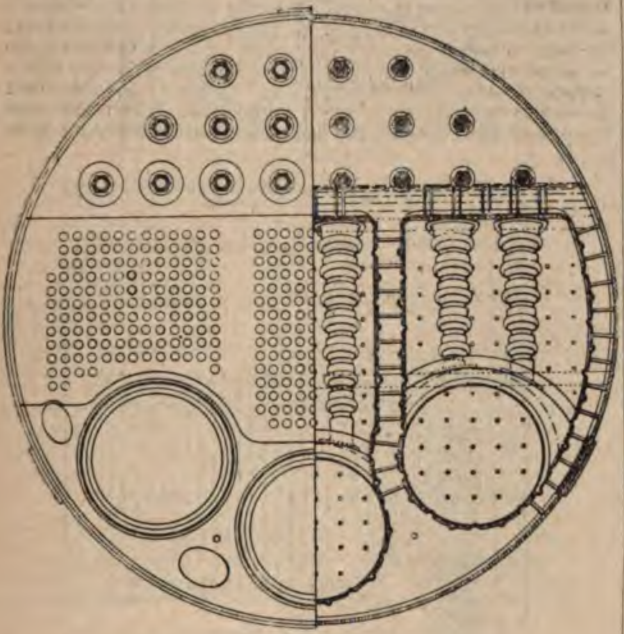

FIG. 1.

Referring to Figs. 1 and 2 of the diagrams, which represent sectional views of a boiler with fire-tubes, it will be noticed that the saddle-plates and combustion-chamber are returned over the crowns of the furnaces for such a distance as to allow of diagonal water-tubes being fitted between the saddle-plates and the crown of the combustion-chambers. The crown and back plates of the combustion-chamber are corrugated to stiffen them; and, although the fire-tubes are somewhat shortened, the water spaces are not materially contracted, and the heating surface, if anything, is somewhat increased.

Referring now to Figs. 3 and 4, we come to another modification, in which the same arrangement of diagonal water-tubes is provided; but the longitudinal fire-tubes are dispensed with, and water-tube boxes are fitted between the combustion-chambers and the front end of the boiler, with vertical water-tubes fitted therein.

It will be also noted that a number of small water-tubes are arranged in each combustion-chamber leading from the bottom water space of the boiler to the upper water space, so as to afford additional heating surface and means of circulation.

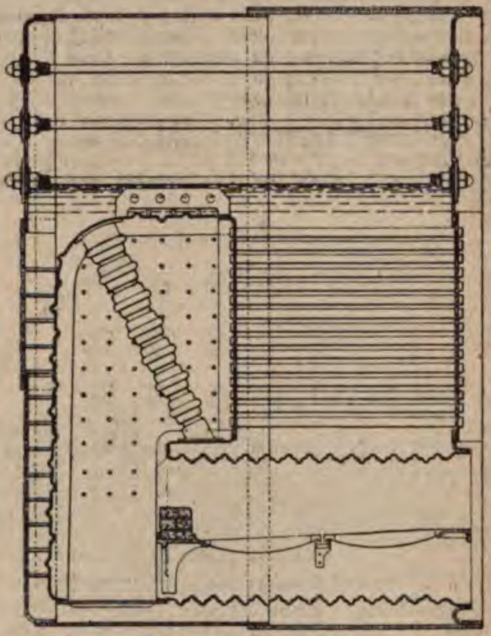

FIG. 2.

We give hereunder a table showing the comparative figures with reference to various classes of boilers in relation to Drake's type. The particulars of the boilers of the four vessels were given in a paper "On the boiler arrangement of certain recent cruisers," read by Mr. Marshall before the Institution of Naval Architects on July 19th, 1889.

Ship	Andromeda	Hermes	Don Carlos	Hai Chi	
Class and No. of Boilers.	30 Belleville	18 Belleville	12 Yarrow	8 Cylindrical 4 D.E. 4 S.E.	Drake 7 S.E.
Total heating surface in sq. ft.	40,500	24,050	32,004	27,558	30,359
Total grate surface in sq. ft.	1,439	750	587	940	378
Total weight in Tons.	559	342	217	447	245

NAVAL MATTERS—PAST AND PROSPECTIVE.

(From our own Correspondents at home and abroad.)

Help for the Widows and Orphans.

THE conference at the Mansion House, convoked by the Lord Mayor, to consider the distribution of money subscribed by the public in connection with the war had a very satisfactory result. No soldier's or sailor's widow is to receive less than 5s. a week, and in all probability a much higher rate of pension will be paid. The Lord Mayor handed over the sum of £257,364 for this purpose to the Patriotic Commissioners, and Earl Nelson, who represented the body at the meeting, remarked that the commissioners were quite willing to work in harmony with the custodians of other funds. The old policy of hoarding up money has apparently been abandoned. Over £30,000 of the Mansion House Fund is to be set aside for the sick and wounded, and £38,150 to increase the Government awards to men who lose limbs in the war. The Soldiers' and Sailors' Families Association is to have the handling of nearly £60,000. The Naval Brigade has, up to the present, a larger proportion of killed and wounded than the sister service, and, therefore, sums of money have been collected on board some of the battleships of the Channel Squadron. The *Jupiter*, for instance, contributed £92. Miss Agnes Weston has also collected money for the purpose of sending out to every member of the Naval Brigade a suitable Christmas present. Our seamen at the front are being by no means forgotten, and they certainly deserve some recognition for their work at Ladysmith and Enslin (Graspan).

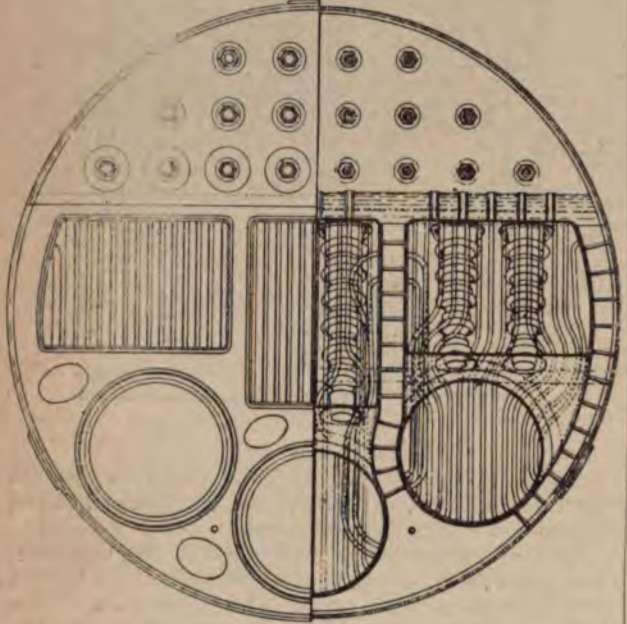

FIG. 3.

Speedy Torpedo Boats.

The speed—and of course the efficiency—of torpedo-boat destroyers is at present receiving considerable attention at the Admiralty. Oil fuel has been up to the present a failure, and therefore attention is once more directed to turbine-propelled boats, such as were first seen at the time of the Diamond Jubilee naval review. The results attained by the *Turbinia* at that time was the instigation of the Admiralty ordering the Parsons Steam Turbine Co., of Wallsend, to commence the construction of the torpedo-boat destroyer *Viper*, which at a recent trial trip was said to have made 37 knots, although this was subequently denied. The trial was made in somewhat boisterous weather, with a heavy sea running, and the result, we are told, surprised those on board. The contract speed for the *Viper* is 35 knots. She has two separate sets of engines on the port and starboard sides, giving four propelling shafts each with two screws. The four shafts are so arranged that the two outer drive the destroyer at 10,000 H.P., whilst the two inner shafts, supplied with one low-pressure motor and one small reversing turbine motor on each side, can take the vessel astern at a rate of 16 knots. Thirty-five knots is a great speed, but in the opinion of the inventor of the turbine, the Hon. Charles Parsons, it is possible to reach 44 knots in a special unarmoured cruiser—a magnified torpedo-boat destroyer of light build, but equipped with an armament of light guns and torpedoes.

The Value of the Fleet in Regard to the War.

A very good story is to hand about one of the troopships which recently left this country for South Africa going out of her course, and steaming at night with all lights out, as it was supposed that one of the vessels hired by the Transvaal Government to waylay our troopships was known to be on the look-out for her. There is probably very little truth in the story, for no suspicious vessel would have been allowed to leave a South African or other port without the knowledge of her departure coming to the ears of the naval authorities. The reason our troopships have crossed the ocean without molestation is in some degree due to the sharp look-out kept by the British Fleet for hostile vessels such as it was reported at the outbreak of war were being purchased by the Transvaal Government. The immense body of troops we are now sending across the sea would possibly be in some danger before they reached their destination were it not for the latent strength of the fleet. This fact was pointed out with characteristic pithiness by Mr. Rudyard Kipling, at a lecture given by a Mr. Wyatt, on behalf of the Navy League at Rottingdean. "In this maritime village," said Mr. Kipling, "there are a few things about Her Majesty's Navy we do not know. We sit on the beach and see occasionally a cloud of smoke in the distance, and the coastguard says, 'It is a man-of-war;' and we say, 'Yes, it is a man-of-war.' But it never occurs to us what it means unless we sit on the beach and think very hard, that under cover of those few distant puffs of smoke we are sending away a small police detachment of 66,000 men, and other things, mules and horses, and hundreds of tons of stores, to get at some people who have interfered with our ideas of right and wrong at a distance of 6,000 miles away, and that it is only possible to do these things by and through the very insignificant naval force which at present we possess."

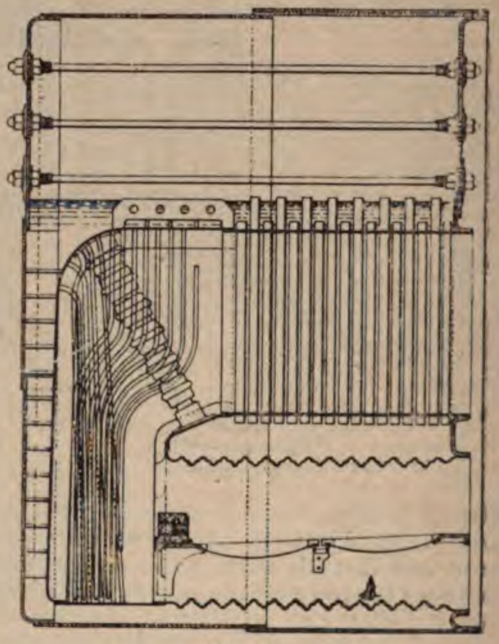

FIG. 4.

The French Navy.

There is considerable agitation at present in French naval circles over the proposal to lay down two new battleships of 15,000 tons each. It is contended that armoured cruisers of 8,000 or 10,000 tons would be more useful for the purpose of destroying English commerce. Admiral Rieunier has avowed his confidence in the battleships, but M. Pelletan considers that in building such large vessels the resources of France would be employed in work which, if war should be declared in four years, would be useless. The French Budget committee at first deferred consideration of the battleships, and then struck them out entirely, two large armoured cruisers being proposed in their place. Finally, however, it was decided not to build the cruisers, and the committee consented to vote the money demanded, provided it was used solely for the purpose of completing vessels already in hand. Considerable opposition to this plan, however, by the advocates of rapid expansion was expected in the Chamber. A large cruiser of 12,416 tons is to be commenced for the French Navy at Cherbourg next year at a cost of about £1,170,000, with a length of 474 ft. and a beam of 71 ft. Her armament will consist of four guns of 7·6 in., sixteen of 6·4 in., twenty of 1·8 in., four of 1·4 in., and five torpedo tubes, two to be submerged. Engines of 24,000 I.H.P., speed 21 knots, effective range 10,000 miles at ten knots.

Portsmouth Dockyard.

Nothing of importance has happened at this yard during the past month. A few weeks ago there was a fire at the coaling station, but happily no serious damage was done. A few hundred tons of coal was partly spoilt, but the dockyard firemen got the upper hand of the outbreak long before there was any danger of the entire stack disappearing in a blaze. This is the second affair of this kind within a month, and the only remedy seems to be a more suitable depot fitted up with electric light. The stack of coal here contains from 8,000 to 10,000 tons, and is as high as a threee story house. Fairly good progress is being made with the *Formidable* and *London*, and the *Pandora* now and then has a proper proportion of workmen on her. The commissioning of the *Canopus* leaves only two battleships in hand—those just mentioned. The armoured cruiser *Kent* has not yet been officially laid down, but a good deal of material has been collected ready to be built into her when this takes place. The armour for the *London* does not come in quite as fast as could be wished, but the barbette armour has nearly all arrived and is being rapidly placed in position, There is, however, a sufficiency of work for all concerned, and the wages bill continues to amount to more than £12,000, and has been as high as £14,000.

The Austrian Navy.

Austria is at present in the throes of a naval "scare," owing to the neglect from which it is said her Navy is suffering, and apparently what is wanted is an Austrian Navy League to impress upon the people and Government the necessity for a stronger navy than that country at present possesses. The Naval Budget which has just been presented to the Delegations provides for the building of an armoured cruiser of 7,000 tons to replace the old *Radetzky*, for the completion of the torpedo cruiser *Zenta*, and for continuing work upon two other vessels of the same class. In addition to these charges, which are upon the ordinary estimates, there is an extraordinary charge which provides for the building of a battleship of 8,340 tons, to replace the *Erzherzog Albrecht* to cost 11,000 crowns. Work upon vessels in hand is, of course, to be carried forward, and provision is made for this and also for their armament when completed. Count Goluchowski addressed the Delegations, and in the course of his speeches pointed out that the fleet as it exists at present is absolutely incapable of dealing with any foreign complication. He said that, although Austria does not contemplate creating a fleet of the first rank, it is not desirable that she should be less than a third-rate Naval Power. The *Armee Blatt* in a despondent article upon the situation, says, that the Austrian fleet, comparatively speaking, is weaker now than when the battle of Lisa was fought, and points to the downfall of the Spanish Empire as the result of the neglect of its navy by a great Power. During the month, Sir John Fisher entertained the officers of the Austrian squadron at dinner and a series of entertainments was arranged.

The Queen and the Navy League.

The Navy League is to be congratulated upon obtaining the Queen as a life member of their association, and it is admitted, as might be expected, that this is a source of considerable satisfaction to the members of the executive committee. Her Majesty graciously sent a donation of £10 to the funds of the Windsor and Eton branch of the league, in response to a letter of the hon. secretary of the Windsor branch of the organisation on the subject of the training vessel for boys which has been established. The donation came through Sir Fleetwood Edwards, accompanied by a letter expressing her Majesty's good wishes towards the league, and acknowledging the work done by it in the course of the past few years. There is no doubt that the Navy League has done a great deal of excellent work, and it is to be congratulated on its present policy, which is an extremely modified one when compared with the energetic, but sometimes rash, advocacy of proper care for the naval defences of the country displayed in earlier days.

Devonport Dockard.

A start has been made with the building of the new first-class battleship *Montagu*, which has now been in hand over a month. It was thought at first that there was little prospect of the keel of the *Montagu* being laid before this month, but material arrived in large quantities, and it was thought advisable to make a start as early as possible. The bracket frame and longitudinals were got in position a week after the keel plates were laid, and altogether work may be said to be proceeding apace. Overtime has practically ceased. No instructions have been given about the refit of the ships of the Channel Squadron, which are to spend Christmas at this yard, and probably only absolutely necessary repairs will be taken in hand. In view of this work it is impossible to say when work will be commenced on the *Anson*, which has been relieved by the *Canopus* in the Mediterranean. In any case her refit will not be completed for some months. There was a small outbreak of fire in the ropery during the past month, but it was discovered before the flames had made much headway, and the machinery only needed cleaning to once again set it in action. The enquiry into the loss of the 11,000 gallons of olive oil from this yard has resulted in the loss being put down to natural wastage. The blame had been placed at the door of Mr. T. Wills, but that gentleman died at the commencement of last month without knowing that he had been absolved from blame. The new cruiser *Highflyer* is to take the place of the *Eclipse* as flagship of the East Indies Station. She is a distinct improvement upon the present flagship of Rear-Admiral Bosanquet, as she has a superior armament, and is fitted with Belleville boilers.

The Naval Brigade in South Africa.

Her Majesty, as usual, has been prompt in recognising the services of those who are fighting for her in South Africa. No sooner did she hear of the bravery of the Naval Brigade at Enslin than she dispatched the following telegram to Sir Robert Harris: "The Queen desires that you will convey to the Naval Brigade who were present at the action at Graspan her Majesty's congratulations on their gallant conduct, and at the same time express the Queen's regret at the losses sustained by the brigade." The casualties at this and other fights have been heavy, both officers and men being killed and wounded in great numbers. Company after company of men have been landed from the vessels constituting the Cape Squadron, and have been sent with their guns to assist Lord Methuen on the western border, Sir Redvers Buller on the Tugela, and to assist in the defence of Durban. At the latter place the seamen are working an armoured train and altogether proving of great assistance. The point has been raised in the *Times* as to whether it is desirable that the *personnel* of the Navy should be drained away in military operations hundreds of miles from the sea; and whether, when such brigades are landed, they should not be under the command of an officer of the Royal Marines. These are dull times for the Navy as regards fighting, and therefore the consensus of opinion from naval officers is that naval brigades should certainly be landed where necessary, whether the men are commanded by officers of the Royal Navy or Royal Marines.

Canadian Nickel Steel for British Warships.

The favour with which nickel steel, as a material for armour plates, is now looked upon by the officials at Whitehall has once more raised the hope that they may be induced to reopen negotiations with the Government of Ontario for opening up the still unpatented nickel lands of the province, and to assist in their development for the purpose of obtaining an unlimited supply of nickel for use in the construction of British warships. In 1891 it appears that the Government of Ontario made an offer to the Admiralty with this end in view, but, as the Whitehall authorities did not have as much belief in the value of nickel steel as they have nowadays, the negotiations fell through. The Commissioner of Crown Lands at that time wrote to the Home Government about the extent of the deposits, and added that as a colony of Great Britain, and as a portion of the British Empire, Ontario was concerned in all things which contributed to the greatness and stability of the parent State; and, recognising especially how much depended on the maintenance of her historic position as a naval Power, it would be agreeable to the Canadian people that the legislature should further, in any way consistent with its obligations to the province, the means whereby that position may be most effectually safeguarded and preserved. The Home Government is once more to be communicated with, and in view of the growing importance of nickel steel in naval construction, the Admiralty may be induced to favourably consider the suggestion made. The value of nickel steel for armour plates has been tested in France and Germany, and plates made of this material rendered good service to American warships when recently engaged with the fleets of Spain.

Chatham Dockyard.

A start has not yet been made officially upon the new battleship *Albemarle*, but material for her construction is being prepared, and the keel is being temporarily put together in No. 7 slip. Her engines are to be built by the Thames Ironworks Co. and will be of the inverted vertical, three-cylinder triple-expansion type, developing 18,000 I.H.P. Steam will be supplied by 20 boilers of the Belleville water-tube type, and that it is expected that a speed of about 19 knots will be obtained under natural draught. The engines for the battleship *Venerable*, which is now completing, have not yet been delivered from Messrs. Maudsley. The *Goliath* was to have been out of hand by the end of December, but some little delay was occasioned by the late delivery of her gun shields. She has creditably passed all her engine trials, and as soon as possible is to replace the *Centurion* as flagship on the China Station. The cruiser *Pyramus* and the destroyer *Zebra* have both been placed in the Fleet Reserve, and are now ready for sea. The *Pyramus* passed through all her machinery and gunnery trials in a highly satisfactory manner, but the *Zebra*, which was delivered here nearly two years ago, has only just passed out of the dockyard hands. Of the vessels under refit here, the *Imperieuse* and *Immortalite* are being expedited as much as possible, and the old composite corvette *Tourmaline* is being converted into a coal hulk at a cost of about £6,000. The whole of the armament of the *Irresistible* has now been received, but there was not much hope, when the armour did not come in as it was expected to, that the trials would be carried out before Christmas.

The Russian Navy.

There is considerable activity at present in Russian naval shipbuilding circles, caused principally by the published intention of the Government to vigorously pursue the policy of expanding the Navy as rapidly as possible. The estimates for 1900-1 amount to a sum of 88,000 roubles, which is more than half-a-million above the expenditure for the 12 months just completed. The actual sum, however, spent upon new construction will probably be less than that spent this year, as a good deal of the money asked for will be expended upon the defences of Port Arthur and Vladivostock. It is proposed also to increase the *personnel* of the Russian Navy—at present supposed to number 41,000 officers and men—to 52,250, but it remains to be seen whether so large an addition of trained officers and men can be made to the fleet of any country in 12 months. The recently published estimates state that the construction is to be commenced of a special vessel for surveys in the Arctic regions, and a "transport" of 10,000 tons for machinists, probably a vessel of the same class as the *Vulcan*. One battleship, the *Tchesure*, is to be adapted for the consumption of liquid fuel, and several vessels now in various stages of completion are to undergo their steam-trials and hoist the pennant. Considerable additions are to be made to the Russian forces in the Far East, including the *Petropavlovsk*, and possibly another battleship, a cruiser, a gunboat, and a number of torpedo boat destroyers. The Pacific Squadron is also to be reinforced. However, there is no need for Great Britain to unduly concern herself over these proposed increases in the Russian Navy, as it will probably be several years before they are completed, especially that relating to the *personnel*.

Mechanical Stokers.

Some interesting experiments have recently been conducted by the United States Naval Department with mechanical stokers in vessels fitted with the water-tube boiler; and, although these were the first trials made in that country, the results have been, on the whole, very promising. A large steamer of 10,000 tons' displacement, fitted with Babcock & Wilcox water-tube boilers, supplying steam of about 250 lbs. pressure to quadruple-expansion engines of about 1,600 I.H.P., was fitted with the mechanical stokers, three to each boiler. The boilers have 6,000 square feet of heating surface and 65 square feet of grate, the weight being 65 tons, excluding water, which weighs 15 tons. Small coal thrown into a hopper is continually fed by a conveyer or screw into a central magazine, and in this it is gradually forced upwards, overflowing into tuyere blocks, through which air is supplied by a blower. The coal is gradually heated as it is forced up in the magazine, and thus the volatile gases are released, and are burned by the air issuing from the inside of the tuyere blocks. A sort of coke is, at the same time, furnished to the dead grates at the side of the stoker, and the air for the combustion of this is supplied by the openings on the outside of the tuyere blocks. At the side of each stoker is a door for cleaning the grate, &c., and this could be utilised for ordinary stoking if the mechanism went wrong. No air is admitted except through the tuyeres. The weight of each stoker complete is 3,500 lbs. Inferior coal was used—a cheap grade of slack—but the caloric value is not stated. The steam and water was measured for both main and auxiliary engines, and it was found that the six stokers used 138·6 lbs. of steam per hour, equal to 4·29 per cent. of the total steam generated; but when the blower-exhaust was passed through the heater the cost was only 1·68 per cent of the total. The stoker worked satisfactory in all tests.

Sheerness Dockyard.

The passing of the *Perseus* into the A Division of the Fleet Reserve has brought to an end her long connection with this yard. She was commenced in May, 1896, and has therefore been in hand over three and a-half years. Another ship which has finished her connection with this port is the *Sheldrake*, which in future will have all her defects made good at Portsmouth. She has now entered upon her duties in Scotland. Some interesting experimental trials have recently been carried out with the gunboat *Skipjack*, and, on the whole, these tests have been uniformly successful. She was to have the blades of her propellers reduced in size, and was then to run another trial. The finishing of the cruisers *Perseus* and *Prometheus* caused a good deal of overtime to be worked, especially in the electrical department. The first-named vessel has undergone a trial of her electrical fittings, but there is apparently no present intention of commissioning her, and she is to go to Chatham when completed to await orders. The *Prometheus* is to be passed into the Fleet Reserve by the middle of this month. The *Niger*, which is now lying in the harbour here, will probably be fitted with new engines and boilers, and if this takes place, she will be a much more useful and valuable vessel than at present.

The Launch of the "Cressy."

The launch of the first-class cruiser *Cressy* took place at Govan, from the yard of the Fairfield Shipbuilding Co., last month. She is in many respects an improvement upon the *Diadem* and *Argonaut* type of cruiser built at the same yard, both as regards offensive and defensive power. Dr. Elgar, the managing director of the company, at a lunch following the launch, said in the course of a speech that the *Cressy* is over 5 ft. longer than her predecessors and has 6 in. more beam, but she can be loaded over a foot deeper and has an additional 1,000 tons displacement. This increased displacement has enabled important improvements to be made in those fighting qualities which distinguish the *Cressy* class from their predecessors. The engine power has been increased, and it is expected that the new cruiser will be half a knot faster than the *Diadem*. The additional displacement has also enabled a material addition to be made to the defensive power of the ship, the whole of that portion of the ship containing the fighting power being protected by a central citadel. Mr. W. Main, one of the constructors of the Admiralty, said he had never seen a better launch. The present vessel is the third to bear the name of *Cressy* during the present century. The first was built on the Medway in 1810, at a time when we were glad to build ships anywhere. She was followed in 1853 by an 80-gun ship, built at Chatham. This vessel was originally designed as a sailing ship, but before launching was fitted with a small auxiliary engine, which gave her speed of seven knots or less, and that was practically the description of the ships in her Majesty's

Navy when he first joined it. The present *Cressy* is, of course, a vast improvement on these ships, and will prove a credit to her designer, Sir William White.

Naval Gunnery.

There is little, if any, material improvement in the gunnery of the Royal Navy over the practice made during 1897, if the annual prize-firing return dealing with the year 1898 may be taken as a criterion. Some of the ships have made very good scores indeed, but others deserve censure for their very bad records. The averages obtained with the 13·5 and 16·25-in. guns are good, and speak well for the smartness of the guns' crews. Sixteen battleships between them fired 307 rounds from these guns, and the *Rodney* headed the list with 69 per cent. of hits, a record which probably cannot be approached by the gunners of any other navy. The *Sans Pareil*, for some reason at present unknown, only fired six shots, not one of which hit the target. With the 12-in. gun the average percentage of hits was 29·1. The *Victorious* scored 52 per cent. of hits, whilst the *Prince George* only made 13 per cent. The *Collingwood* and *Colossus* are armed with 12-in. guns, but of another pattern to those of the *Victorious* and *Prince George*, and between them made an average of 32·4, the *Colossus* scoring 43 per cent. of hits, against 19 per cent. of the *Collingwood*. The shooting with the 9-in. and 8·2 guns resulted in a percentage of 43·6, the *Powerful* heading the list with 70 per cent. The average percentage of hits with the 6-in quick-firing guns was 28, and with the smaller quick-firing guns a fair record was obtained. It is suggested that in order to induce gunnery officers to work for good markmanship, an improved system of rewards and punishments should be adopted, the rewards at present being insufficient, and the punishment for bad shooting nil.

Pembroke Dockyard.

The new Royal yacht building at this yard is to be undocked, according to present arrangements, on the 3rd of this month and to undergo her preliminary steam trials on the 5th and 6th. On the 8th she is to leave for Portsmouth, there to be completed for service. Some doubt, however, has been entertained about this programme being carried out, as it was uncertain whether the alterations to be made with the object of improving her stability could be carried out in time. Her engines and boilers have satisfactorily undergone the official water test, and the result shows that great credit is due to Messrs. Humphrey & Tennant, who have built the engines and boilers in the ship. Several alterations have been made in various parts of the vessel, as, for instance, the construction of a separate chamber for the stowage of the distilling apparatus, the shortening of the masts, and the removal of a number of large ventilating cowls from the upper deck. Two new funnels are to be supplied to the vessel at Portsmouth. If all the alterations now under consideration by the Admiralty are carried out by this yard, the *Victoria and Albert* will remain at this yard for another four months. The keel of the ***Essex*** has not yet been formally laid down and no date has been given as to when this will take place. Good progress is being made on the *Spartiate*, and the bill for labour on her each week amounts to about £900.

ELECTRICAL NOTES.

(From our own Correspondent.)

Space Telegraphy.—It is unfortunate that no apparatus for telegraphing through space without wires was taken with the beleaguered forces at Kimberley and Ladysmith. Since the relieving forces have got quite close to the forces in Ladysmith and Kimberley, it does not matter so much, but before that time the want of a means of communication was extremely awkward. Marconi's system has been introduced to the British Navy as a branch study. The *Hector*, lying at Portsmouth, has been fitted out as a school of instruction, and signalmen from her are to be attached to the battleship *Canopus*, which went to the Mediterranean last month, taking Marconi instruments as part of her equipment.

Ferry Boat Run by Storage Batteries.—The Electric Boat Co. intend as a start to build a heavy ferry-boat which will be worked by a storage battery, and the experiment will be made around Philadelphia. Should the experimental stages pass off all right, the company will make a feature of the line. It is the intention of the company to organise a number of smal companies for operating launches and boats at several summer resorts and watering places.

"Holland" Submarine Boat.—This boat, which is worked electrically, has been reported on by the Inspection and Survey Board (U.S.A.), and the report states the trials were successful. Chief Engineer John Lowe was specially ordered to witness all trials; his report commends the *Holland*. He says:—"I report my belief that the *Holland* is a successful and veritable submarine torpedo-boat, capable of making a veritable attack upon the enemy unseen and undetectable, and that therefore she is an engine of warfare of terrible potency, which the Government must necessarily adopt into its service." He adds "that this Government should at once purchase the *Holland* and not let the secrets of the invention get out of the United States." This also is rich, and very American:—"We need, right off and right now, 50 submarine torpedo vessels in Long Island to protect New York, preserve the peace, and to give potency to our diplomacy." The *Holland* is now round at Washington giving an exhibition in the Potomac river, for the benefit of the Congress and Navy Department officials.

Electrical Plant of the Battleships "Kearsarge" and "Kentucky."—A paper has been read before the Society of Naval Architects and Marine Engineers of New York. The author says "All current for power and light is supplied through three main distribution boards on the splinter deck, No. 1 forward, No. 2 amidships, No. 3 aft. Each of these main distribution boards is supplied by an independent set of feeders, which run directly to the bushes of the main switchboard. Each of the feeders consists of five wires, over which is the neutral for both light and power, two of the others being the positive and the negative for the power, and the remaining two positive and negative for the lights. The reason for thus dividing the feeders is to prevent variable loads on the power system from affecting the steadiness of the lights; but, as the neutral carries but a small current the effect of having this common is inappreciable. The turret-turning motors are fed through the board amidships, No. 2, by separate feeders from the generator board. The lights are fed from these boards upon two-wire feeders and mains, and the switches controlling these individual circuits are distributed upon each side of the method, so as to give as nearly a balanced load as possible. The power is supplied either directly to the motors or through auxiliary boards located in the turrets and upon the main and berth decks. Motors for the turret-turning, exhaust fans, rammers, and elevators are run on 80 volts, and all the others are worked at 160 volts, but a switch is provided by which either 160 or 80 volts may be supplied with the corresponding difference in speed. Distribution board No. 1 is upon the splinter deck near the outer wing bulkhead, and feeds four systems of distribution. These are: (1) Incandescent lights. (2) Searchlights. (3) Communication signals. (4) Power. In 1, incandescent lights are for battle lighting circuit, for the forward turrets and handling rooms; battle circuit for the light in the chart-house, conning tower, running lights, and signal lights on both masts; also new battle circuit for lights under the fore and aft bridge; battle lighting circuit in the forward magazine and shell rooms; battle and lighting circuits supplying all lights on the protection and berth decks. In 4, power is supplied to exhaust blower in the crew's water closet; 5-in. ammunition hoist starboard on the platform deck; ventilating fans in the forward blower room; boat cranes and deck winches on the superstructure deck; all the power in the forward 8-in. and 13-in. turrets, except that of the turning motors. Wherever possible the mains have been subdivided, so that only small sections shall be dependent upon one fuse, which will open the circuit in case of trouble without disturbing the other lights supplied by the same feeder. Wherever wire enters the masts above the main deck, flexible couplings, consisting of heavy rubber hose, are inserted in the conduit in order to allow the mast to move relative to the deck without injuring the protection of the wire. There are five different kinds of controllers used in these ships, divided into three classes. The first are rheostatic in their method of operation, and are used for the purpose of starting, stopping, reversing, and controlling the speed of the motors. They are particularly designed to carry a load in either direction. The second are those which are designed to give electrical working. The third is used where the voltage of the generator is to be varied, in order to obtain a change of speed of the motor, and is, therefore, called a variable-voltage-controller. The engine of the main generating sets is of the single-crank vertical tandem compound double-acting enclosed type, and has a speed of 310 revolutions per minute at full load, with 100 lbs. steam-pressure and 25 in. vacuum. There is a heavy bed-plate bolted to the foundation supporting the engine and generator, and part of this bed-plate forms a reservoir for the oil used for lubrication. The crank-pit is accessible through a large door in front of the engine and a smaller one at the back. The normal and most economical steam-pressure is 100 lbs., but the engine will carry an overload of 50 per cent., and may be run on a steam-pressure up to 150 lbs. without any trouble. The cylinders are $10\frac{1}{2}$ in. and 18 in. diameter, and stroke 8 in. The cylinders are cast in one piece, with the low-pressure cylinder on top. Both cylinders have relief valves, and are tapped for drain and indicator valves. The clearance in the high-pressure cylinder is $7\frac{1}{2}$ per cent., and in the low-pressure cylinder $7\frac{1}{4}$ per cent. The shaft and crank are made from one solid piece of steel. Cast-iron counter-balanced weights are fastened to the crank opposite the crank-pit. A small eccentric, with $\frac{5}{8}$ in. stroke, is turned on the hub of the coupling for driving the oil-pump. The main bearings, two in number, are hollow cylindrical cast-iron shells, with flanges for bolting to the standard. The governor consists of a heavy fly-wheel keyed to the shaft, and carrying the governor parts and the high-pressure eccentric. The governing mechanism consists of a single fly-weight connected to a lever carrying the pin which operates the high-pressure valve. The motion of the fly-weight is opposed by a spring attached to the pulley. By decreasing or increasing the tension on this spring the speed may be lowered or raised. The lubricant is forced under pressure to the various bearings. The generators are compound-wound for 80 volts of the multipolar type, having six poles and an output of 50 kilowatts, with an armature speed of 310 revolutions. Each generator is secured to a cast-iron base, to which also is fastened the compound engine. The magnet frame is a cast-steel ring made in two pieces, which are held in position by keys. There are two 50-H.P. electric motors below the floor of each 13-in. turret. These motors are regulated and controlled in speed and direction by a controller situated under the sighting hood between the 13-in. guns. The operator has only to turn his controller-handle from the 'off' position in the direction in which he wishes the turret to move, and the motors will drive the turret as desired, the speed of travel depending on the amount which the handle has been displaced. The fields of the motors of the generator are separately excited from the switch-board lusbars, and are consequently independent of the voltage generated by the armature of the dynamo. The field rheostat on the generator-board is cut out, and in its place another rheostat in the turret operated by the controller is used, the generator field-wires being carried to the turret for this purpose. The series coil of the generator is shut, circuited by a switch over the head-board."

The Royal Navy List Diary and Naval Handbook for 1900. London: Witherby & Co.

This is the third year of publication of this very useful diary, The space afforded is sufficient to be of practical utility, each day having to itself a full octavo page. Space for cash accounts is also given. But the discernment of those who are responsible for the publication is most apparent in the selection of matter in the printed pages which, to the number of seventy, precede the diary. Here we find a calendar; the usual postal information; much information as to Admiralty officials, naval institutions and such-like; details as to officials of various kinds, not directly connected with the service, yet at the same time from their nature likely to be brought into the view of the naval officer; a reprint of the First Lord's statement which accompanied the last naval estimates; and interesting resume of the naval progress of the past year, by L. G. Carr Laughton; an obituary of deceased officers—including in a slip so recent a loss as that of the lamented and gallant Commander Egerton, who fell in the present Boer War—together with a full extract from Lean's "Navy List" of the war and meritorious services of the deceased officers; a table of British medal and various other notes. The selection seems admirable. But at page 56 there is one statement which seems calculated to mislead. In giving an account of the Admiralty Division the editor says "the evidence is all documentary." We think he must be mistaken. Surely we seem to have seen officers and seamen in the witness box in the Admiralty Division giving oral evidence. Perhaps next year this point will be altered, or at least made clear.

Summary of Shipbuilding Returns of United Kingdom in 1899, arranged in order of Tonnage built by each Firm.

No	Name of Firm.	Place.	No. of Ships.	Total Tons.
1	Harland & Wolff, Ltd.	Belfast	7	82,634
2	Wm. Gray & Co., Ltd.	Hartlepool	27	77,501
3	Sir W. G. Armstrong, Whitworth & Co., Ltd.	Tyne	12	57,543

LIST OF VESSELS ENGINED IN 1899.

By Bow, McLachlan & Co., Thistle Works, Paisley.

Total output for 1899, 9,550 I.H.P., comprising:—1 set triple-expansion screw engines, 1,500 I.H.P., for s.s. Bali, Stoomvaart, Maatschappij, "Nederland," Amsterdam; 3 sets paddle engines for China; 1 pair compound surface-condensing screw engines for H.M.S Upnor, British Admiralty; 1 set triple-expansion twin-screw engines for H.M.S. Assurance, British Admiralty; 1 set compound surface-condensing twin-screw engines for s.y. Seabreeze, Andrew Carnegie, Esq., Skibo Castle; 1 set compound surface-condensing stern wheel engines; and 1 set compound surface condensing twin-screw engines, shipped abroad. This firm have also supplied and fitted the steering gears for H.M.S. Pandora, Viper, Bramble, Britomart, Skipjack, Speedwell, Peterel, Spiteful, Upnor, and Assurance.

* Compound. † Triple.

By Ross & Duncan, Whitefield Works, Govan.

Set of compound surface-condensing engines of 500 I.H.P., fitted into s.s. *Fred.*

Set of triple-expansion engines of 400 I.H.P., fitted into s.s. *Mercedes.*

Set of compound surface-condensing engines of 650 I.H.P., fitted into s.s. *Formby.*

Set of compound surface-condensing engines of 500 I.H.P., fitted into s.s. *Algores.*

Set of compound surface-condensing engines of 750 I.H.P., fitted into s.s. *River Fisher.*

Set of compound surface-condensing engines of 575 I.H.P., fitted into s.s. *Blanche.*

Set of triple-expansion engines of 650 I.H.P., fitted into s.s. *Aira.*

Set of triple-expansion engines of 700 I.H.P., fitted into s.s. *Gipsy.*

Set of triple-expansion engines of 800 I.H.P., fitted into s.s. *Bellona.*

Set of triple-expansion engines of 825 I.H.P., fitted into s.s. *Val de Travers.*

Set of triple-expansion engines of 850 I.H.P., fitted into s.s. *Canganian.*

Set of compound suface-condensing engines of 550 I.H.P., fitted into s.s. *G. A. Savage.*

Two sets of compound surface-condensing engines of 120 I.H.P. each, fitted into Coasters.

Six sets of compound surface-condensing engines shipped abroad, 1,255 I.H.P.

One set of twin-screw C. S. C. engines of 100 I.H.P., shipped abroad.

Two sets of triple-expansion engines of 525 I.H.P., shipped abroad.

One set of twin-screw triple-expansion engines of 200 I.H.P., shipped abroad.

Output for 1899, 24 sets of 10,070 I.H.P.

WORK COMPLETED DURING THE YEAR.

English.

MESSRS. THE BLYTH SHIPBUILDING CO., Blyth, have carried out several extensive contracts in ship repairing throughout the year in their two large graving docks attached to their shipyard.

Messrs. R. & W. Hawthorn, Leslie & Co., Limited, St. Peter's Works, Newcastle-on-Tyne, have been well employed in their dry dock department during the year, amongst the various jobs dealt with being the insulated steamship *Buteshire*, which was seriously damaged by fire and scuttling in the colonies, and afterwards placed in this company's hands for reconstruction. The forge department has been exceptionally busy throughout the year.

Messrs. John Readhead & Sons, South Shields, have constructed the machinery and boilers for all the vessels built by them. In their graving dock department they have been well employed during the year, and have done a large amount of repairing work.

Messrs. John Stewart & Son, Limited, Blackwall, have been very busy on repair work and in their dockyard overhauling and repairing steamers, tugs, dredgers, hoppers, sailing vessels, &c.

Mr. Sidney J. Dewdney, Brixham, South Devon, has done an extensive amount of repairing during the year, but finds wooden trawlers not in demand, only launching one.

Messrs. Edward Finch & Co., Limited, have not launched any ships, being too full of general constructional work.

Messrs. the Thames Ironworks, Shipbuilding & Engineering Co., Limited, Blackwall, have not launched any ships, but the battleship *Shikishima*, a steel steamer, built for the Imperial Japanese Government, of 14,850 gross tons register and 14,500 I.H.P., with triple expansion engines, is completed.

Messrs. the Central Marine Engine Works, West Hartlepool, besides the engines built for the 27 ships launched by Messrs Wm. Gray & Co., have constructed a very large set of machinery for the s.s. *Kumara*, for Messrs. the Shaw Savill & Albion Co.'s New Zealand refrigerating trade. In the boiler department, besides the 62 boilers for he engines above named, 13 other marine boilers of various classes have been built, making altogether 75 marine boilers which have been turned out during the year. The works have continued in full employment during the whole year, and, it is gratifying to report, without any labour troubles whatever. Although the figures above given of machinery for vessels launched in 1899, as per shipbuilders' lists, are not quite equal to those of 1898, the actual number of engines fitted on board at the sheers during 1899 has really been greater than ever before, being 33 sets.

Messrs. Allen & Co., Hamworthy, Poole, Dorset, have not built any vessels of iron or wood during the year, but have been busy building barges for carrying stone to Portland Breakwater.

Messrs. S. P. Austin & Son, Limited, have again been exceptionally busy during the year with repairs to hulls and machinery of old vessels, carried out at their graving dock and repairing quays alongside the shipbuilding yard. The premises have been considerably enlarged during the year, and new engine and other repairing shops have been erected which will keep the company in the forefront in being able to execute all classes of ship and engine repairs with the utmost despatch. Electricity has been considerably used for driving machinery. New roads have been formed, and a powerful travelling crane driven by electricity has been erected for use at the graving dock and quay frontage. The graving dock is now fitted with powerful pumping plant, which will empty it in from one to two hours, and the establishment generally is on the very best footing in facilities for giving despatch for all work entrusted to the company, either in the repairing of vessels or machinery or in the construction of new vessels.

Scotch.

Messrs. Cran & Co., Leith, have during the year carried through numerous and extensive overhauls and repairs, which form an important branch of their business.

Messrs. Blackwood & Gordon, Port-Glasgow, have carried out in their dock, and on their slip, the annual overhaul and special repairs to 14 river steamers belonging to the Caledonian S. P. Co. and other companies, to 27 steam yachts, and a number of vessels of various classes.

Messrs. Hawthorns & Co., Limited, Leith, have, in addition to the list of new vessels constructed by them during this year, also carried out some very extensive repairs, including the reboilering and reclassing of Messrs. James Currie & Co.'s steamer *Toledo* and the s.s. *Dale* belonging to the London and Edinburgh Shipping Co., besides a large amount of dry-dock work and general repairs. At their Granton establishments they have been fully employed. The slipway has been well occupied throughout the year, while it is at present engaged for the purpose of lengthening and reboilering the s.s. *Equity*, owned by the Co-operative Wholesale Society, Limited.

Messrs. A. and J. Inglis, Glasgow, have supplied new boilers and engines to several steamers, in addition to a large number of repairs.

Messrs. W. Simons & Co., Limited, Renfrew, have sent to foreign and home ports during the year a large quantity of dredging machinery, boilers, and sand pump plant.

Messrs James Howden & Co., Glasgow, have been exceedingly busy during the past twelve months with contracts for their patent forced-draught system, the amount of work done being considerably greater than in any previous year. Practically every important cargo steamer and passenger liner now contracted for is being fitted with their system.

Irish.

Messrs. The Channel Dry Docks Shipbuilding and Engineering Co., Passage West, co. Cork, have built no new vessels during the past year, but this new firm has been busier than ever known before in the South of Ireland, affording extensive and much-needed employment to the workmen of the district. A very large amount of repairs have been carried out. The longest British sailing ship and a large oil tanker have been more than half rebuilt in their docks.

WORK ON HAND IN BRITISH YARDS.

ENGLISH.

Messrs. Camper & Nicholsons, Ltd., Gosport, have a steam yacht 120 tons, and a 33-ton yawl.

Mr. Sidney J. Dewdney has a ketch on stocks 50 tons, B. of T. measurement, ready for launching, a cruiser ketch building on trawler principles below, with extra quality deck and interior fittings, and another smaller cruiser, ketch rigged of 35 tons register, for Ireland.

Messrs. R. & H. Green, Limited, Blackwall, have building two composite lightships for the Trinity Corporation, and 2,350 tons hopper barges for East London Harbour.

Messrs C. Hansen & Sons.—This firm has been dissolved.—Mr. H. S. Hansen starting business in conjunction with Mr. F. J. Mursell at Minerva Yard, East Cowes, trading as H. S. Hansen & Co. They have building a 60-ft. steam launch, to be named Sir George White, and six rowing boats for the War Department, six 40-ft. steam pinnaces, and five 23-ft. steam cutters for the Admiralty, and a 90-ton yawl yacht for J. K Soames, Esq.

Messrs. Hepple & Co. have transferred their business to Hepple & Co., Limited, Wapping Street South Shields, who are now making two new docks for special accommodation for trawl fishing steamers, the docks to be completed in August, 1900. They have 245 tugs, trawlers, and steamers under repairs of hulls, boilers, or engines, and are fully employed for six months.

Messrs. T. G. Tagg & Son, East Molesey, Surrey, have building—

---

* Compound. † Triple.

Messrs. The Central Marine Engine Works, West Hartlepool, have for the coming year a large amount of work, including three sets of Mudd's patent five-crank engines, and a powerful set of twin-screw engines for an Atlantic liner.

SCOTCH.

Messrs. The Ailsa Shipbuilding Co., Troon, have one sailing barge and six screw steamers, gross tonnage 5,420.

Messrs. Blackwood & Gordon, Port-Glasgow, have a steel twin-screw crane steamer for the Mersey Docks and Harbour Board, Liverpool, of 600 gross tonnage, named *Hercules*. Repairs and overhauls to several yachts and other vessels.

Messrs. The Caledon Shipbuilding & Engineering Co., Ltd., Dundee, are building—

Lawrance, W. W., chief engineer to the *Victory*, for the *Chamois*, to date December 15th.

Liversedge, H. T. chief engineer to the *Pembroke*, additional, to date, November 24th, and to the *Dryad* on commissioning, to date December 7th.

Lonnon, W., fleet engineer to the *Vivid*, for the *Agamemnon*, to date November 25th.

Mallinson, E. D., engineer to the *President*, to assist engineer overseer in inspection of naval gun mountings at works of Messrs. Vickers, Son & Maxim, Barrow-in-Furness, to date December 15th.

Marshall, E. H., assistant engineer to the *Polyphemus*, undated.

Milton, W., staff engineer, has been advanced to the rank of fleet engineer in her Majesty's fleet.

Milton, W., staff engineer, to be fleet engineer with seniority of November 7th.

Moffett, E. G. P., staff engineer to the *Pembroke*, for the *Hawke*, to date November 27th.

Moysey, J., fleet engineer to the *Duke of Wellington*, for the *Mercury*, to date November 30th.

Murphy, J., assistant engineer to the *Latona*, to date December 12th.

Nicholls, H. E., assistant engineer to the *Vivid*, supernumerary, to date November 29th.

Pamphlett, W. F., fleet engineer to the *Vivid*, for the *Implacable*, to date December 13th.

Paul, O. R., engineer to the *Highflyer*, to date December 7th.

Peel, H. C. W., chief engineer to the *Severn*, for the *Circe*, to date November 24th.

Purkis, J. T., staff engineer, has been advanced to the rank of fleet engineer in her Majesty's fleet.

Purkis, J. T., staff engineer, to be fleet engineer, with seniority of November 18th.

Rashbrook, H. S., staff engineer, to be fleet engineer, to date December 5th.

INDUSTRIAL AND TRADE NOTES.

THE CLYDE AND SCOTLAND.

The Year's Shipbuilding.

(*From our own Correspondent.*)

INDUSTRIAL and trade matters connected with shipbuilding and engineering during the last month of the year may, as is customary, be merged in a consideration of matters for the whole twelve months which have now spent their course. The year 1899 has proved, as was almost all along evident it would, the record one in the annals of Clyde shipbuilding. Without being particular to a ton or two—considering that minor firms are included, whose work consists almost wholly of small launches and sailing boats—new shipping to the extent of 491,000 tons has been turned out by Clyde shipbuilders, as compared with 466,830 tons last year, which formed the previous record output, and 340,037 tons in 1897. There were no sea-going sailing vessels built on the Clyde during the year, the 14,618 tons of sailing craft, which the subjoined table shows, representing not sailing vessels in the regular sense, but barges and other craft in which steam or other mechanical mode of propulsion had no part. These were of a great variety of types, and for most part were sent in pieces to foreign and, sometimes, very remote regions. The steamships numbered 243, and their aggregate measurement was 476,456 tons, as compared with 284 of 458,087 tons in 1898.

Messrs. Russell & Co., Port-Glasgow, always noted for their big output, are again at the head of the Clyde firms as regards tonnage. The figure to their credit is 52,465 tons, which is 7,910 tons greater than their figure last year, but still much below their output of 1890, when, with two yards going simultaneously, they turned out 70,570 tons, and headed the list of shipbuilding firms in Great Britain. Second place on the Clyde list on this occasion is taken by John Brown & Co., Limited, Clydebank, whose output is represented by 41,400 tons, this being made up by the tonnage of four vessels, whereas Russell & Co.'s is contributed to by as many as 16 vessels, all screw steamers. Messrs. C. Connell & Co., Whiteinch, take third place—as against sixth place last year—with 33,183 tons, and they are closely followed by the Fairfield Co. with 31,624 tons, and by Messrs. Denny Bros., Dumbarton, who with 31,300 tons hold fifth place on this occasion—as against second place last year—with 34,900 tons. Mostly all the firms have bettered their previous year's output, as will be seen from an inspection of the returns.

Readers desirous of instituting a comparison of the yearly outputs over an extended period may be referred to the full table given in these notes last January, the following, however, being the figures for the decade:—

1899	491,074	1896	410,841	1893	280,160
1898	466,832	1895	360,152	1892	336,414
1897	340,037	1894	340,885	1891	326,475

In the lower reaches of the Clyde—that is to say ,below the Castle Rock of Dumbarton, and embracing Dumbarton, Port-Glasgow, and Greenock—the output of the thirteen firms involved reached 213,800 tons, which is the highest figure ever reached in the history of the district. The aggregate was contributed to by 74 vessels, a number of them of considerable tonnage and of high-class character, as will afterwards be made evident.

At the shipbuilding yards of what may be called the outports of the Clyde—viz., those at Troon, Ayr, Irvine, Ardrossan, and Campbeltown—operations during the year have resulted in every case in an increase of output over that of last year, and of the year previous. In the case of the Ailsa Co. at Troon, the increase is not very large, but helping to account for this was the work of re-disposition of berths, and the accessions to the firm's graving dock accommodation carried out during the period. The year's output amounts to 6,139 tons, as compared with 5,347 tons last year, and 4,593 the year previous. The work comprised ten vessels, all steamers, ranging from 200 to 1,200 tons, two of which were high-class steam yachts, for which class of work the company have a high reputation. There are on hand at present six screw steamers and one sailing barque, aggregating 5,420 tons. At Ayr Messrs. S. McKnight & Co., whose output last year amounted to 1,933 tons, have during 1899 turned out 2,400 tons, contributed to by four screw steamers. They have at present on hand two steamers, one of which is a paddle-steamer for the South of England to attain a speed of 20 knots. The Irvine Shipbuilding Co. at Irvine, whose work has mainly consisted of steam trawlers and fleeters has turned out 12 vessels aggregating 3,410 tons, as compared with eight vessels of 2,150 tons last year. The Ardrossan Shipbuilding Co., which, like the other firms named, conduct a repairing business as well, only built one screw steamer of 280 tons gross register. The Campbeltown Shipbuilding Co., from their yard at Trench Point, on Cambeltown Loch, launched six steamers of an average tonnage of 1,510, aggregating 9,063 tons. Last year their aggregate only reached 6,424 tons, and the year previous 4,596 tons.

Analysing in a general way the Clyde shipbuilding returns for 1899, we find that the tonnage of naval work produced amounted to approaching 42,100 tons, which is a surprisingly small proportion of the total output as compared with that of some previous years, although the figure for last year only exceeded this by 3,000 tons. As will be shown, however, the falling away is more apparent than real, as the volume of work being operated upon on the stocks is abnormally high. Considerably more than one-third of the output represents tonnage for the Japanese Government, consisting, in fact, of the 15,200-ton battleship *Asahi*, launched from Clydebank in the month of March. All the remainder represents work for the British Admiralty, and includes the armoured cruisers *Cressy* and *Sutlej*, each of 12,000 tons; two gunboats, the *Thistle* and *Dwarf*, each of 700 tons, and three steam tugs of 411 tons each. During the year also several contracts were completed, and the vessels handed over to the Admiralty. These included the second-class cruisers *Hermes*, *Highflyer*, and *Hyacinth*, each of 5,600 tons.

Deducting the 42,100 tons of naval work launched during the year from the total output leaves as high a figure as 448,900 tons, which in one form or other goes towards the augmentation of the world's mercantile fleet. The variety of purposes for which the tonnage is intended is quite as great on this occasion as in past years. Dredgers and hopper barges have formed no inconsiderable part of the whole, the work of this special class being still for most part in the hands of three firms, Messrs. William Simons & Co., Renfrew; Messrs. Lobnitz & Co., Renfrew; and Messrs. Fleming & Ferguson, Paisley. Messrs. Simons & Co. especially have produced some very notable craft in the way of barge-loading dredgers, of which, along with the notable work presently on hand, more detailed notice will be taken in a future issue. Light-draught steamers, barges, and other craft shipped abroad in pieces, mostly to foreign account, have again been largely turned out by builders who have long been noted for this class of work, *e.g.*, Messrs. Denny & Brothers, Alley & McLellan, Ritchie, Graham & Milne. Steam trawlers, fleeters, and other fishing craft have been produced in as great plenitude as before, although the work is spread over a larger number of firms. The proportion of tonnage to foreign account is not on this occasion as large as in previous years, and, with the increased enterprise of other nations in providing shipbuilding facilities for themselves, this tendency of reduced output may be expected to grow still more marked as time goes on.

The most notable, if not the most numerous, contributory items to the merchant shipping output of the year have been as usual—and more markedly so than for several years—high-class mail and passenger steamships, and huge steamers, combining great carrying capacity with moderate speed and good accommodation for a limited number of passengers. Of both these classes of steamships, and irrespective altogether of war vessels, as many as 21 were over 5,000 tons, and six were over 8,000 tons. From the famous stocks of the Clydebank establishment, now in the hands of John Brown & Co., Limited, there was ushered into her native element the huge twin-screw steamer *Saxonia* for the Cunard Line. As regards gross measurement tonnage this is really the most notable merchant steamer yet built on the Clyde. Her tonnage is, like that of her sister ship *Invernia*, launched during the year on the Tyne, about 13,900 tons gross, whereas the *Campania* and *Lucania*, although about 20 ft. longer between perpendiculars, were only 12,950 tons each. Of course, regarded from the point of view of "work to the ton," the Japanese battleship undergoing completion in the wet dock of the Clydebank Co. is still more notable, as her finished weight of 15,200 tons represents weight of material, not measurement tonnage. There are only three steamers afloat bigger in gross measurement tonnage than the *Saxonia*. These vessels are the *Oceanic* (17,270 tons), the *Deutschland*, of the Hamburg-American Line (15,500 tons), and the *Kaiser Wilhelm der Grosse*, of the North German Lloyds (14,349 tons).

If not the largest, one of the most elaborately fitted, vessels naturally was the twin-screw steamer *Bavarian*, of 10,375 tons, which Messrs. Denny Brothers, Dumbarton, produced for the Allan Line, run hard in every respect by her sister ship, the *Tunisian*, for the same line, which will shortly be launched by Messrs. A. Stephen & Sons, Linthouse. The latter builders turned out early in the year, the twin-screw *Bethania*, of 7,250 tons, for the Hamburg-American Line; and about mid-year the twin-screw steamer *Montezuma*, of about 7,345 tons, for Messrs. Elder, Dempster & Co., Liverpool. From Fairfield stocks there emanated, during the year, two magnificent South African mail steamers, the *Kinfauns Castle* and the *Kildonan Castle*, each of about 9,800 tons, for the Castle Mail Packet Co. From the renowned yard of Messrs. R. Napier & Sons, Govan, came two mail and passenger steamers, the *Tagus* and the *Trent*, each of about 5,550 tons and 7,500 I.H.P., for the Royal Mail Steam Packet Co. Messrs. Caird & Co., Greenock, turned out for their firm friends, the Peninsular and Oriental Co., the *Assaye*, of 7,376 tons, and 6,500 I.H.P.; and Messrs. Scott & Co. sent off their stocks the *Calchas*, *Machaon*, and *Alcinous*, each of 6,748 tons and 4,500 I.H.P., for the Ocean Steamship Co., of Liverpool. Other huge steamships, in which, however, internal fittings were not so elaborate, were the twin-screw *Lake Erie* of 6,532 tons and 3,750 I.H.P., built by Messrs. Barclay, Curle & Co. for Messrs. Elder, Dempster & Co., Liverpool; the twin-screw *Paparoa*, of 6,560 tons, built by Messrs. Denny Brothers for the New Zealand Shipping Co., and the *Itaura*, of 5,310 tons, by the same builders for the British India Steam Navigation Co. For the same owners Messrs. A. and J. Inglis, of Pointhouse, turned out the *Upada* and the *Urlana*, each of 5,250 tons.

The returns of work accomplished on the Clyde during the year in the matter of marine engines and boilers are to a certain extent reflected in the returns as to tonnage, but it is to be remarked that, although there is such an advance in the volume of the latter, the marine engineering side of the account is not commensurately enhanced. As a matter of fact, the indicated horse-power produced is much less for last year than for the year previous, showing that capacious cargo-carrying in conjunction with moderate speed is the order of the day. Clyde engineers constructed engines representing 478,503 I.H.P., as compared with 510,805 I H.P. last year, 373,195 I.H.P. in 1897, 510,815 in 1896, 363,490 in 1895, and 295,620 in 1894.

The firms who conduct engineering concerns independently of any particular shipyard may be referred to with a little more detail. Messrs. David Rowan & Co.'s figure of 29,600 I.H.P. consisted of 15 sets of engines, triple-expansion, the vessels fitted all having been built on the Clyde. Messrs. Muir & Houston's 24,708 I.H.P. was contributed by no fewer than 52 sets of engines, these being almost entirely for steam trawlers, all of which, with the exception of six built on the Humber, were built on the Clyde. Messrs. Dunsmuir & Jackson's 22,000 I.H.P. was spread over 16 sets of engines, fitted into vessels built at Grangemouth, Londonderry, and on the Clyde generally. Messrs. Hall-Brown, Buttery & Co.'s 18,000 I.H.P. was made up by 19 sets of engines, all fitted into vessels built on the Clyde. Messrs. Hutson & Sons' 14,600 I.H.P. was made up by 13 sets of engines, five being fitted into vessels built at Campbeltown, four at Grangemouth, and two at Irving. Messrs. Rankin & Blackmore's 13,750 I.H.P. was spread over seven sets of engines, all fitted to vessels built on the Clyde. Messrs. J. G. Kincaid & Co.'s 12,980 I.H.P. was made up by 15 sets of engines, all for vessels built on the Clyde. Messrs Ross & Duncan's 10,070 I.H.P. was spread over 24 sets of engines, a good number of them being compound surface-condensing, and many of them shipped abroad. Messrs. Bow, McLachlan & Co., Paisley, who constructed 11 sets of engines of 9,550 I.H.P., fitted into vessels built in Paisley, also supplied steering gears for H.M.S.'s *Pandora*, *Viper*, *Bramble*, *Britomart*, *Skipjack*, *Speedwell*, *Petrel*, *Spiteful*, *Upnor*, and *Assurance*. Messrs. McKie & Baxter constructed 28 sets of engines of 7,825 I.H.P., 10 of which were built for vessels launched on the Clyde, and 18 were shipped abroad, or made for special purposes at home. Messrs. Shanks, Anderson, & Co., Polmadie, constructed 14 sets of engines of 4,180 I.H.P., two of the vessels fitted being built on the Humber, two on the Tyne, one at Larne, one on the Forth, and four on the Clyde. Mr. W. V. Ledgerwood, Coatbridge, constructed eight sets of engines of 3,050 I.H.P., all of the triple-expansion type, and fitted to trawlers built on the Clyde and at Aberdeen. Messrs. Campbell & Calderwood, of Paisley, constructed 11 sets of engines of 2,390 I.H.P., fitted into vessels built on the Clyde, and at such remote places as Sebastopol, Australia, and Calcutta. Messrs. Fisher & Co., Paisley, constructed eight sets of engines of 2,085 I.H.P., all of the compound type, fitted to vessels built on the Clyde. Messrs. Lees, Anderson & Co. constructed six sets of engines of 1,500 I.H.P., fitted to twin-screw vessels built at Port-Glasgow.

As regards shipbuilding work on hand in Clyde yards the tonnage presently under construction may be roughly estimated at 450,000 tons gross measurement, including vessels afloat, undergoing completion, the naval tonnage at present on hand on the Clyde for the British and other navies reaches the considerable figure of 125,000 displacement tons. This makes rather more than one-half of the naval work on hand at all the private yards in the kingdom, and constitutes, on the whole, the biggest total for warship work on hand at one time in the history of the shipbuilding industry on the Clyde. With the exception of the Japanese battleship *Asahi*, of 15,200 tons, which the Clydebank establishment has now almost completed, the tonnage is wholly for the British Admiralty. The contracts on hand at Fairfield, including the vessels afloat, amount to 55,000 tons displacement, or more than half the total tonnage at present in hand by other Clyde builders. Besides the 12,000-ton *Cressy*, launched on the 4th of December, there is the sister cruiser *Aboukir*, which is almost entirely plated, in the berth alongside that on which the *Cressy* was erected. Alongside the *Aboukir* there is the 14,100-ton armoured cruiser *Good Hope*, 500 ft. long by 71 ft. breadth extreme, into whose structure, although operations have only been proceeding since August, as much as 1,500 tons of material have been worked. On the berth vacated by the *Cressy*, the keel is being laid of a 9,800-ton cruiser, ordered in May last. In frame, and for the most part plated, are two 30-knot torpedo-boat destroyers, the *Falcon* and *Ostrich*, and in the berth alongside this is well advanced the bottom structure of a 6,500-ton twin-screw troopship ordered by the India Office. This vessel, which is to be named *Hardinge*, is 470 ft. long; 50 ft. 10 in. beam; and 38 ft. deep. She is to steam 18 knots on a six hours' run at loaded draught. The engines, of the triple-expansion type, will indicate 8,000 H.P.

The other Govan firm undertaking Government work, the London and Glasgow Shipbuilding Co., is just at the moment indifferently off with regard to naval work. Apart from two paddle tugs of 410 tons afloat and being completed for the Admiralty, the other work on hand is represented by the 9,800-ton cruiser *Monmouth*, sister ship to the *Bedford*, under way in Fairfield.

As regards naval work on hand at Clydebank, there is afloat in the company's wet dock the battleship *Asahi*, and the cruiser *Sutlej* (sister to the *Cressy*), launched on the 18th November. On the stocks the naval work embraces the 14,100-ton armoured cruiser *Leviathan* (sister ship to the *Good Hope* on hand at Fairfield) which occupies the berth vacated by the *Sutlej*; the *Bacchante*, sister ship to the *Sutlej* and *Cressy*, which is well advanced; and two 30-knot torpedo-boat destroyers. The *Asahi*, which is the second warship built for Japan by the Clydebank establishment, is the heaviest warship ever constructed on the Clyde, and is expected to be ready for her steam-trials in April next. Her length extreme is 405 ft. 6 in.; breadth, 75 ft. 2½ in; and depth, 43 ft. 7½ in.; her displacement tonnage complete being 15,200. The engines, also supplied by the Clydebank Co., are three-cylinder triple-expansion type, and consist of two sets, each of which is expected to develop 7,500 I.H.P., or a total of 15,000. The boilers, 25 in number, are of the Belleville water-tube type with economisers. The speed to be obtained is between 18 and 19 knots per hour.

Of outstanding note in the way of mercantile tonnage still on the stocks mention may first be made of the four large steamers for the American Line in the Clydebank establishment. These vessels are to be known as the *Haverford*, *Merion*, *Vaderland*, and *Zeeland*. The Allan Line *Tunisian*, on the stocks at Messrs. Stephen & Sons has already been alluded to. Messrs. Denny, at Dumbarton, have on hand, besides a palatial steam yacht, intended to be the finest afloat, for Mr. Gordon Bennett, of New York, one or two of the high-speed cross-channel boats for which they are so justly famed, including the twin-screw *Arundel* for the London, Brighton & South Coast Railway and the Western Railway of France. This vessel, which is virtually a repeat of the well-known twin-screw vessel *Sussex*, is intended to be ready early next summer to cope with the anticipated traffic due to the Paris Exhibition on the Newhaven and Dieppe crossing. At Greenock Messrs. Caird & Co. have under progress three steamers for the P. & O. Co., including two 7,240-ton sister-ships to the *Assaye* produced during the year. Messrs. Scott & Co. have on hand, in addition to two steam yachts, four twin-screw steamers, each of 6,700 tons, for the Ocean Steamship Co., of Liverpool, similar to the three turned out during the past year.

As regards the work of the past year in shipyards and engine-shops on the East Coast of Scotland—a province we by no means wish to belittle or overlook—the limits of space unfortunately forbids any very detailed account. Forth shipbuilders, including those on the Fifeshire coast, have not done as well as last year (*tonnage* always being the measure, questionable enough of financial well-being), the aggregate of the six firms involved being 10,000 tons less than the volume of output for the year previous. The shipbuilders of the Tay—three firms included—launched 17,900 tons of new shipping, as against 14,290 tons during 1898. Shipbuilders on the Dee—three firms involved, as in the case of the Tay—beat those on the Tay in the matter of number of vessels involved, having launched 28 vessels, chiefly trawlers, of 11,973 tons.

Curtly as these particulars may appear to be given, they are, nevertheless, all that the space at present disposal permits, although readers of previous months' notes will have no difficulty in filling in important omissions.

THE TYNE.

(From our own Correspondent.)

Shipbuilding.—The year which has now drawn to a close will probably prove to be—when the returns are completed—even more productive in the matter of new ships than the previous year, which, it will be remembered, was marked by an unusually heavy output. It may even turn out to be the most productive on record in spite of the reiterated complaints about wilful loss of time by certain sections of the workmen. One fact is to be noted, that at no time throughout the year was there a dearth of work for builders at any of the centres. This, of course, is the first condition essential to the realisation of a large output; but along with it there have been several other circumstances that help to account for the remarkable increase in tonnage launched. The weather, which is not an unimportant factor in ship production has, on the whole, been favourable for the carrying on of outdoor work, and very little time has been lost in the shipyards through adverse meteorological conditions. The productive resources of most establishments in the country have been further increased by the putting down of new and improved machines, by the extended application of electrical power, and the further adoption of hydraulic and pneumatic riveting systems. It is consequently not to be wondered at that an unprecedentedly big output has been attained. whilst had it not been for the wilful abstention of workmen at all the centres, and the absolute insufficiency in number of one particular set of men, the output would undoubtedly have been much larger. The men referred to are the riveters, and it is not too much to say that every shipbuilding firm in the country have been more or less retarded in their operations through the want of sufficient labour in this branch of the trade. Time after time firms have applied to the executive of the Boilermakers', and Ironshipbuilders' Society for men, but the executive was unable to supply them. Under these circumstances builders might have made an effort to supply themselves; for, after all, riveting, which only involves the repetition of the same operation a great number of times, cannot be looked upon as a skilled trade. The "operation" is simplicity itself, and the man who could not learn to do it satisfactorily in a couple of weeks would not be good for much. Amongst the commonly called "unskilled" workers of the country, there was ample material for builders to select from, if they were so minded, and why they did not resort to this expedient in their difficulties can only be accounted for on the ground of unwillingness to risk giving offence to the officials of the union. It is perfectly well understood that the Boilermakers' Union, which had on more than one occasion to admit its inability to supply men, would not sanction the introduction of non-society men to the work of riveting. In this respect, they furnish a notable example of that aggravatingly obstructive policy which consists in preventing the fulfilment of a legitimate demand by illegitimate means. It was, as we have indicated, quite within the power of the shipbuilders to supply their own requirements if they had so chosen, and it is still within their power, if they care to act independently of the Boilermakers' Union. Having reason to believe, however, that the great majority of builders desire the continuance of pacific relations between themselves and the workmen's organisations, we do not expect that the expedient of employing non-union men, and teaching them to close rivets, will be largely adopted yet awhile; but the further development of machine riveting is a matter in which there is less danger of hurting the susceptibilities of trade unionists, and it is in this direction that we expect the employers will find a way out of their difficulty in connection with the execution of riveting work.

The returns of Tyne shipbuilding to hand show that Messrs. Palmer turned out 42,683 tons, including two torpedo-destroyers, and two cargo steamers capable of carrying over 10,000 tons each. It is remarkable that the firm's output, exclusive of the two torpedo-destroyers, comprised only five vessels, the aggregate tonnage of which, however, approximated to 42,000 tons, giving an average carrying capacity of over 8,000 tons each.

Messrs. C. S. Swan & Hunter have very nearly equalled the Palmer Co.'s output, the figures being 42,522 tons. Seven vessels went to make up the figures in the latter case, the smallest of which was the *Newholm*, of 2,534 tons capacity, and the largest, the *Ivernia*, having a carrying power equalling 15,512 tons, with an indicated propelling power equivalent to 12,000 H.P. This vessel was built to the order of the Cunard Co., and is without doubt one of the finest specimens of naval architecture afloat. The launching of such a vessel is enough to make the year a record one for the Tyne; for, though its yards have turned out many very superior merchant vessels in the last quarter of the century, never before has there been seen on the river, as one of its products, a vessel of such carrying and steaming capabilities as this. Besides making this notable contribution to the list of Atlantic liners, the firm have this year signalised their efforts by another achievement, namely, the reconstruction of the s.s. *Milwaukee*. This feat has attracted world-wide attention, and it is unnecessary to repeat here details that have been recounted many times and in many quarters already. This we may say, however, that it was a feat which was never before attempted or accomplished, and is not likely to be often repeated.

Messrs. John Redhead & Sons have built eight vessels aggregating a tonnage of 27,133 and have also constructed the machinery and boilers for them. In the graving dock department the firm have been well employed during the year, and in the time have had many important repair contracts through their hands.

The new firm which only commenced business towards the autumn of 1897, and which is known as the Northumberland Shipbuilding Co., Limited, have done remarkably well this year, outdistancing many of the older firms in the matter of tonnage launched. They have put off the stocks six vessels, all of which, excepting one, are of tolerably large tonnage, the aggregate capacity amounting to the respectable figure of 20,330 tons. This firm, like others, suffered from an inadequate supply of labour in the riveting department, and the output attained under the circumstances speaks volumes for the smartness of the management.

Messrs. Wood, Skinner & Co. launched eight vessels, but most of them were of comparatively small tonnage, accounting for the fact that the output only reached a little over 11,000 tons. The firm are understood to be well supplied with orders for next year (for vessels of a heavier class) and will doubtless be able to show a larger production at the end of 1900.

The activity of the Smith's Dock Co. (late Edwards Brothers) may be noted in that they launched during the twelve months no fewer than 23 vessels. These were all of a small class, aggregating no more than 4,432 tons; but when it is recollected that the company have completed an average number of repair contracts during the year, it will not be difficult to realise the high state of briskness that must have existed throughout.

Messrs. Dobson and Messrs. R. Stephenson & Co. come very near each other in the matter of output, the figures being 13,262 and 12,601 respectively. We do not hear of any reports regarding new developments in the case of the former firm; but with reference to the latter, a change has been effected in the constitution of the company, which is but the forerunner of other changes of an interesting and important character. Among these may be mentioned the utilisation of part of the yard area for the construction of a large graving dock, a rearrangement of the building berths, and the putting down of additional plant, which will probably include an installation of electrical machinery for lighting and power transmission.

The returns of Messrs. Armstrong, Whitworth & Co., Messrs. Wigham, Richardson & Co., Messrs. Hawthorn, Leslie & Co., and the Tyne Shipbuilding Co. are not before us; but we know they must have reached a satisfactory figure in each case, as all of them have been as busy as possible throughout the year. Messrs. Richardson launched on the 16th inst. their last vessel for the year. This was the s.s. *Schwarzenfels*, ordered by the Hansa Co., of Bremen. This German company are old customers of the firm and have been supplied by them with many fine vessels during the past two decades. It would seem that notwithstanding the rapid development of shipbuilding in Germany, there are owners in that country who still prefer to get their ships from English builders, which circumstance seems to be a proof of their belief in the superiority of English work. In other departments of industry, the soundness of British work, as compared with that done in other countries, is undisputed, and we have every confidence that this country will continue to maintain the lead in shipbuilding—both as regards quantity and quality—which has so long been held.

The Tyne Shipbuilding Co. have turned out some very fine steamers during the year, and, as their resources have been very considerably augmented, it is but reasonable to expect that their operations in the future will be conducted on a more extended scale.

Engineering.—The North-Eastern Marine Engineering Co., Wallsend, have supplied machinery to a large number of vessels during the year, and are now provided with sufficient orders to secure the establishment against slackness for nearly a couple of years. The Wallsend Slipway Co. have also had a successful year, amongst the vessels engined in the time being the big *Ivernia* and one or two others of a specially important class. The St. Peter's Engine Works are still running night and day, and the engineering department at the Palmer Co.'s works is amply provided with orders. The Neptune Works, Low Walker, are also very busy, and at the Elswick Ordnance Factory the pressure of work is quite unprecedented. Locomotive works at Newcastle are kept going briskly, and at the Felling Machine Tool Works (Messrs. Noble & Lund) the orders in hand are numerous and important. The firm's output in 1899 has considerably exceeded that of former years, and has comprised not only band-saws of the special type for which they are noted (used for cutting iron and steel cold), but also piston rings, lathes, and other machines for shipbuilding and engineering works.

Messrs. H. Watson & Sons, of the High Bridge Works, Newcastle, have been exceedingly busy throughout the year, the result being that in the various departments a highly satisfactory output is shown. The firm's "Atlas Manganese Bronze" has come into great repute as a material for propellers, and it is now being largely used. Their "Westminster" feed and ballast pumps are also in great demand, being found both economical and effective. The firm are also doing a good business with the feed-water filters which they have patented, and are now manufacturing on a large scale. These filters are said to have a larger filtering area than any other type of marine filter in use, proportionately, of course, to weight, space, and I.H.P., and they are being largely adopted for war, cargo, and passenger vessels.

Messrs. Clark, Chapman & Co. have had an exceptionally large output of windlasses, steam winches, donkey boilers, &c., during the past year, and all the departments continue to be well supplied with orders. In the electrical departments business is also brisk, and a number of ship-lighting contracts are in progress.

Messrs. Crosier, Stephens & Co, engineers and machinery merchants, of 2, Collingwood Street, have done remarkably well this year, and succeeded in further developing a demand for all the principal specialities with which they are connected in a representative sense. Amongst these may be mentioned the Meldrum furnace, whose fame as a fuel economiser has now become world-wide. A number of these furnaces were installed at Tyne Dock some time ago, and have given excellent results, and we now hear that some important local orders are being negotiated.

The Holzapfel's Compositions Co., Limited, have, we understand. had an exceptionally prosperous year in the sale of their well-known anti-fouling paint for ships' bottoms, and "Lagoline" paints for general use on shipboard. The latter are quick-drying and non-explosive, and present an appearance similar to enamel or varnished paint. The Zynkara Co. have turned out large quantities of their speciality during the year, both for home consumption and exportation, and their productive resources continue to be fully utilised in meeting the requirements of customers.

Mr. W. F. Snowdon, of 32, Side, Newcastle, has been exceedingly busy throughout the year, and has had the contracts for covering with non-conducting material the boilers of the following steamers, amongst others:—The *St. Leonards*, the *St. Andrew*, the *Kent*, the *Lucilene*, the *Manchester Importer* and the *Manchester Shipper* the *Surrey*, the *Saxoline*, the *Armand*, the *Karamea*, the *Cookham*, and the *St. Dunstan*. All of these were vessels of large size, some of them being oil-carrying steamers, whilst others are to be engaged in the colonial meat trade. Snowdon's patent removable mattresses for ships' boilers are, it may stated, in great demand.

Blyth.—The Blyth Shipbuilding Co. have increased their output in 1899, as compared with 1898, by 4,589 tons, their total for the year just closed being 10,663 tons. The company have carried out in addition a large number of important repair contracts in the graving docks connected with the yard, and their prospects for the coming year, both in new and old work, are excellent. The Blyth Dry Dock Co. are also, it is understood, having a good prospect for the last year of the century.

THE WEAR.

(*From our own Correspondent.*)

Shipbuilding.—The output of tonnage on the Wear during the past twelve months forms a record, the figure being 268,508 tons. This is the largest output yet reached, the highest previous total being 259,450 tons in 1898.

Messrs. J. L. Thompson & Sons again take the leading place with the large total of 36,013 tons, Sir James Laing coming next with 34,384 tons, and Messrs. Short Brothers third with 30,080 tons. The output of the last-named firm is especially creditable, seeing that they were obliged, early in the summer, to completely reorganise their riveting staff. The desertion of practically the whole of their old staff of riveters at the instigation of certain trade union officials is now an old story, and it is only referred to here for the purpose of showing how very possible it is for shipbuilding and other firms to carry on business without being subjected to trade union dictation. Messrs. Doxford are the fourth on the list, and are not very far behind Messrs. Short Brothers, their figure being 29,543 tons, the Sunderland Shipbuilding Co. being next in order of precedence with 26,163 tons. The output returns of the remaining eight firms range from a little under 4,000 to a little over 20,000 tons, and all excepting two show increases upon the preceding year. Reverting to the leading firm, Messrs. J. L. Thompson & Sons, it was a striking fact, and one very much to the firm's credit, that nearly all vessels launched by them during the year were for former customers, and to some of whom the firm have supplied as many as seventeen vessels previously. This fact speaks for itself, and scarcely requires comment. It may be stated that electricity has been extensively adopted as the motive power at this establishment, steam being to a large extent discarded. The firm have concentrated the frame-making branch by erecting additional sheds on new ground recently acquired, and this arrangement, it is expected, will further facilitate productive work.

It is reported that further alterations are to be carried out at the establishment of Sir James Laing & Sons, involving amongst other changes the turning of the building berths in the "high yard," to launch up the river (westwards) instead of down (eastwards) as at present. It is understood that the area of the yard will be further extended. The firm have at present a vessel in their Deptford graving dock undergoing alterations to fit her for the conveyance of military stores to South Africa.

Messrs. Priestman & Co. have added two berths to their yard, in either of which vessels of the largest class can be laid down. The largest yet built on the new ground is the s.s. *Granada*, 411 ft. long; but it is stated that there is one now on the stocks 446 ft. long. Messrs. Pickersgill have also carried out great improvements during the past year, and will soon, it is understood, have one or two additional building berths available.

A fair amount of repairing work has been executed on the Wear during the year, Messrs. Austin & Sons having had a very large proportion of the work placed. An alteration contract, involving the lengthening of a steamer by the addition of 20 ft. of new structure amidships, was carried out at Messrs. R. Thompson & Son's Bridge Dock in a remarkably short time, considering the difficult nature of the work.

Engineering.—Messrs. John Dickinson & Sons engined 16 vessels during the year, all of which were built at local yards. The aggregate I.H.P. amounted to 29,004. Messrs. George Clark, Limited, engined 24 vessels, all of which were also built at local yards, and the machinery of which aggregated 7,281 N.H.P. The North-Eastern Marine Engineering Co. fitted 20 vessels with machinery, the aggregate power of which was 27,575 I.H.P.; and Messrs. Doxford engined seven vessels (all built by themselves), the total power of which amounted to 20,870 I.H.P. Messrs. W. Allan & Co. turned out 12,900 I.H.P. for eight vessels, and Messrs. MacColl &Pollock 3,950 for 11 vessels. The latter firm, it may be stated, have been commissioned to supply the engines and boilers for a 3,000-ton boat recently ordered from Messrs. Harkess & Sons, Middlesbrough. We understand that Messrs. Mail & McFarlane, engineers and ship repairers, Tyne Dock, have, in conjunction with two Sunderland firms, acquired possession of graving docks, &c., at South Shields, and will enter on active proprietorship at the opening of the year.

The Hartlepools.—The returns of output at the shipbuilding establishments of Messrs, W. Gray & Co. show a total of 27 vessels launched, having an aggregate carrying capacity of 77,501 tons. This constitutes a record, the firm's previous highest total being 72,323 tons last year. The other Hartlepool firms have also a large output, and all of them have excellent prospects for next year. In the engineering establishments business remains brisk, and other local industries are fairly prosperous.

Stockton.—The output of tonnage at this active centre is quite up to the best records of previous years, and all the firms being well supplied with orders, a continuance of briskness over next year is looked forward to. The prospect for engineering firms is also excellent, and both bridge and boiler-making works are certain of, at least, another twelvemonths' run of activity.

Middlesbro'.—Sir Raylton Dixon & Co. have had an exceptionally large output in 1899, amongst the vessels launched being several of a superior class. Messrs. Craggs & Sons have also done well, and are understood to have some good orders for delivery next year. In the steelworks great activity continues to exist, and a very large output is maintained. Prices still show a tendency to rise. Bridge builders are busy, and in both boiler works and foundries great activity is maintained.

Darlington.—The Darlington Forge Co. continue fully employed in all departments, and have many important contracts in hand.

THE MERSEY.

(*From our own Correspondent.*)

THROUGHOUT all sections of industry connected with the engineering, iron, and coal trades of this district, the past twelve months has been a period of prosperity that for a very considerable time past has had no precedent. In fact, as far as the iron trade is concerned prices for some descriptions of material have not touched so high a point for the last twenty-four years, and the activity as regards both the using and the producing branches of the industry has more than fully taxed the resources of engineering establishments, pig and finished iron works, and collieries.

The various engineering industries have fully maintained the exceptional activity which characterised the greater part of the preceding year. In practically all the leading branches establishments have been exceedingly pressed with work with the new orders coming forward, in most cases sufficient to more than take the place of those running out, and to ensure full employment well over the ensuing year. The shipbuilding industry on the Mersey has, however, during the last few years, from various causes, been steadily on the decline—a fact to which reference has previously been made in these columns—and Messrs. Laird Brothers, of Birkenhead, now represent the only shipbuilding yard of importance remaining. This firm has, however, been exceedingly busy, and the following are the returns of the principal work turned out:—The *Glory*, steel twin-screw, 8,000 gross tons register, triple-expansion engines, 13,500 I.H.P., speed 17½ knots, for British Government; *Mabel Grace*, steel paddle, 1,314 gross tons register, compound engines 5,500 I.H.P., speed 20¼ knots, for British owners; *Som*, steel twin-screw, 320 gross tons register, triple-expansion engines, 6,000 I.P.H., 30 knots, for foreign owners. Machine tool makers, who commenced the year with work in hand to carry them over the bulk of the twelve months, have been extremely busy both in the light and heavy departments, a good deal of the work turned out having been for ordnance and marine engineering requirements, and the principal firms have had to refuse a considerable weight of new orders owing to their inability to promise anything like early delivery. Towards the close there has been a slight falling off in new work, but no real slackening of activity on orders in hand. Heavy stationary engine builders have also been fully engaged, but throughout the year there has been a decrease in the amount of new work given out, which has scarcely been adequate to replace the old contracts completed. In the boiler-making trade the position has been one of remarkable activity; in fact, establishments in many cases have had more work in hand than at any previous period, and generally close the year with orders on their books sufficient to carry them well over the ensuing twelve months, a large amount of work having been recently secured in connection with electrical power and other developments in the district. In the locomotive building trade much the same exceptional briskness has prevailed. During the year a number of important contracts have been on the market in connection with railways both at home and abroad, and establishments in this district are well booked for some time ahead. Perhaps the most prosperous branch has been that of electrical engineering. Establishments have been kept going to their utmost capacity, the enormous developments of electricity, both for lighting and for power, bringing forward an unprecedented pressure of work in this department, and the new orders offering have been altogether beyond the present capacity of electrical engineers for anything like early execution, and the year closes with no falling off whatever in the exceptional activity that has been experienced all through the twelve months. In connection with hydraulic engineering, bridge building, and general constructive work, exceeding briskness has also prevailed. The textile machine trade, although very fully engaged during the greater part of the year, has towards the close shown a falling off as regards new work coming forward in some branches. Speaking generally, engineering establishments close the year with orders in hand sufficient to keep them well employed for some time ahead, and with new work coming forward freely. The exceptional activity of trade has been fully reflected in the employment returns of workmen's unions, the number of unemployed members having fallen to a lower average than has been recorded for nine or ten years past. The percentage of unemployed has ranged from about 2 to 2½ per cent. in the Amalgamated Society of Engineers, 1 per cent. in the United Machine Workers' Association, and practically "nil" in the Steam Engine Makers' Society. With regard to any labour matters that have cropped up, these have mostly been settled by amicable arrangement between the employers and the workmen. The chief question dealt with has been the demand for a 2s. advance in wages made by the operatives in the Mid-Lancashire district early in the year. This was ultimately submitted to arbitration, with the result that an advance of 1s. per week was conceded. It may be added that during the past month the representatives of the Amalgamated Society of Engineers in Liverpool have, after meeting the local employers' association, arranged for the full acceptance of the trial trip terms offered by the employers' federation in 1897, which are regarded as considerably better than those previously in vogue at the above port.

In the iron trade the upward move in prices which took place in 1898 has been not only fully maintained, but greatly exceeded during the past 12 months. The upward move during 1899 has averaged 25s. to 27s., and even with this great rise business has been offering in excess of what makers could entertain. The year opened with a strong, healthy tone prevailing, and prices tending to harden, quotations averaging 53s. 6d. less 2½ for foundry Lancashire; 51s. 6d. net for Lincolnshire; 53s. 6d. to 55s. for Derbyshire; and 53s. 4d. to 53s. 10d. for Middlesbrough, by rail Manchester; Eglington, 55s. 6d.; Glengarnock, 55s. to 55s. 3d.; Manchester Docks, and forge qualities, delivered Warrington, 47s. 6d. to 48s. less 2½ for Lancashire, and 47s. to 47s. 6d. net for Lincolnshire. During January there was a persistent upward move in prices, especially for forge qualities. This was followed by some unsettlement in the market, owing to speculative operations in warrants. Large users were mostly well covered, and held back from buying in any quantity, but with makers correspondingly oversold, and consumers taking full deliveries under contract, there was no pressure to sell. With the commencement of the second quarter there was a gradual return of more active buying, and makers sold so heavily that some brands were practically withdrawn from the market. A strong upward move in prices set in, and successive advances during April brought the basis to 55s. 6d. to 56s. 6d. net for Lincolnshire foundry; 58s. for Derbyshire, with Middlesbrough, 63s. 4d. to 64s. 6d. net by rail Manchester, Lancashire makers not quoting at all; and Scotch iron, 67s. to 68s. Manchester Docks, with Lincolnshire forge, delivered Warrington, 54s. 2d. to 55s. 2d. American pig iron, which had by coming forward in fair quantities early in the year, ceased to become a factor in the market, stocks in this district being practically cleared off, with deliveries not coming forward on account of contracts placed in the States. American pig iron rose from about 50s. at the beginning of the year to 58s. 6d. and 60s. Manchester Docks, with only small quantities obtainable. With the increasing scarcity of the principal brands there was a further rise in prices during the next three months, Lancashire foundry getting to 77s. 6d. less 2½; Lincolnshire, 75s. 6d. net; and Derbyshire, 77s. 6d. to 80s.; Middlesbrough, 84s. by rail Manchester; Scotch iron, 78s. to 78s. 6d.; with American pig iron, 74s. for October delivery, Manchester Docks; and forge qualities, 73s. 2d. net for Lincolnshire, delivered Warrington; with Lancashire makers unable to quote. Early in August, however, an extraordinary collapse in warrants disorganised the market. In Scotch and Middlesbrough brands there was a big fall in prices in the open market, and generally there was an indisposition to operate. Makers did not follow the extraordinary drop in warrants, but they were considerably underquoted by merchants and dealers, and gradually had to back down from some of the high prices that had been quoted, although Lancashire makers still held to about their old rates. Business continued unsettled, buying being restricted to very small quantities, with merchants persistently underselling makers even at the reduced rates, until towards the end of October, when buying again became brisk, and prices quickly recovered, quotations with the close of the ensuing month getting to 79s. 6d less 2½ for Lancashire foundry; 76s. 6d. net for Lincolnshire; 80s. to 82s. 6d. for Derbyshire; 79s. 4d. to 80s. 4d. for Middlesbrough, by rail Manchester; Scotch iron 82s. 6d. to 83s, Manchester Docks; forge Lancashire 77s. less 2½, and Lincolnshire 75s. 2d. net, delivered Warrington. The closing weeks of the year brought about a somewhat less satisfactory position, owing doubtless partly to dearer money and partly to the depressing effect of the South African outlook. The chief effect has been in the depreciation of speculative brands, which has caused some easing down in makers' quotations, both for Middlesbrough and Scotch iron, and this has tended somewhat to weaken both local and district brands, owing to the curtailment of buying, and underselling by merchants in the open market. The present quotations may be given about as under—Lancashire foundry, 79s. 6d. less 2½; Lincolnshire, 76s. to 76s. 6d. net; Derbyshire, 78s. 6d. to 80s.; Middlesbrough 78s. 4d. to 79s. 4d., by rail, Manchester; Scotch iron, 81s. 6d., Manchester Docks; forge Lancashire, 77s. less 2½, and Lincolnshire 75s. 2d. net, delivered Warrington.

The upward move in finished iron has been even stronger than in raw material, and at no previous period have makers been more pressed to meet the requirements of the market. Prices have advanced about £3 per ton all round, and this has had apparently no appreciable effect in restricting buying. In January prices were £6 10s. to £6 12s. 6d. for Lancashire bars, but were almost immediately raised to £6 15s.; sheets averaged £7 5s.; and hoops £7 to £7 5s., delivered Manchester. For a while makers were very cautious about putting up their prices owing to the keenness of foreign competition, but early in the second quarter a general advance of 5s. was put on both bars and hoops, and sheets also stiffened up to some extent. With an increasing enquiry coming forward all round, and a difficulty in obtaining supplies of raw material, makers were cautious about booking beyond comparatively small quantities, and the continued pressure of demand brought forward rapid successive advances during the next three months, bars being put up 5s. in May, 10s. in June, and 10s. in July, with a similar advance in sheets and hoops. Notwithstanding these advances there was no decrease in the weight of new work coming forward, whilst there was an almost entire disappearance of both American and Continental competition, the United States in fact becoming considerable buyers of hoops in this country—a trade which had for years past been completely taken away from Lancashire, whilst in the wire rod trade American manufacturers withdrew altogether from the market, and Lancashire makers had no difficulty in filling their books with orders at £9 to £9 5s. f.o.b., Liverpool. No effect was produced by the speculative fluctuations in warrants except perhaps that there was a temporary check on buying. In face of a tendency rather to weakness than otherwise in raw material, there seemed to be no check to the continued strong upward move in manufactured material. A number of successive advances took place in bars, which brought the basis at the end of November to £9 10s., whilst sheets during the same period rose to £11, and hoops £9 17s. 6d. to £10 2s. 6d. These heavy advances tended for the time to restrict buying, but makers have closed the year so well sold into 1900 that they are quite indifferent about booking fresh business, and the temporary limitation of trade has had no effect whatever in weakening prices.

The year opened in the steel trade with a continuance of the pressing demand which had set in during 1898, and, with an exceedingly strong outlook, both makers and manufacturers were exceedingly chary about giving quotations for anything like forward delivery. With regard to hematites as the year advanced, the increasing requirements of consumers steadily forced up prices; and, although for a time they seemed to lag rather behind pig iron, this was fully made up by the rapid upward move during the second half of the year, and the advance during the twelve months has been about 25s. per ton. The collapse in warrants in August brought about some temporary retrograde movement, with merchants and dealers pushing sales at considerably under makers' prices; but the market quickly recovered, and before the close of the year makers' quotations had risen from about 65s. 6d. to 67s., and 67s. 6d. less 2½ in January to 90s. 6d. to 93s. less 2½ delivered Manchester. Billets during the year have advanced from £4 15s. net to £7 10s., bars from £7 for common and £7 12s. 6d. to £7 15s. for better qualities to £9 for common up to £9 15s. for better descriptions. Common steel plates have risen from £7 17s. 6d. to £9 2s. 6d. and £9 5s., and boiler plates from £8 10s. to £8 12s. 6d. in January to £9 10s. to £9 15s. in December, delivered Manchester district. The position all through the year has been one of exceeding activity, and although with the close there is, perhaps, a somewhat lessened pressure, works here and there, although heavily sold, being short of specifications from customers, and consequently rather lower sellers, it can scarcely be said there is any real weakening in the general outlook.

The general upward move in prices has been fully shared by the coal trade, and for all descriptions of fuel for iron-making and general manufacturing requirements there has been an exceptional pressure of demand, which has more than taxed all the resources of the collieries. House-fire qualities, business in which is largely governed by the seasons of the year and weather conditions, have scarcely met with a full average demand, but prices for these were, perforce, influenced by the strong upward move in other descriptions of fuel. The lower qualities of round coal have been in active demand all through the year for steam and forge requirements, and the whole output of the collieries has generally moved away, with a steady hardening in prices. The most noticeable feature, however, was the exceptional position of engine fuel. The output of slack was not quite up to the average, owing to the limited demand for house-fire coal; whilst, on the other hand, requirements for consumption showed a very large increase. The result was a general shortness of supplies and a strong upward movement in prices, representing an advance of about 75 per cent. during the 12 months and 125 per cent. on previous minimum rates. The following comparison of prices will show the advance that took place during the year:—Opening prices: Best Wigan Arley, 12s. to 12s. 6d.; Pemberton 4 ft. and seconds Arley, 10s. 6d. to 11s.; common round coal, 8s. 6d. to 9s. 6d.; common slack, 4s. 6d.; medium, 5s. to 5s. 6d.; best sorts, 6s. to 6s. 6d. at the pit. Present rates: Best Wigan Arley, 13s. 4d. to 13s. 10d.; Pemberton 4 ft. and seconds Arley, 11s. 8d. to 12s. 6d.; common round coal, 10s. 6d. to 11s.; common slack, 7s. 6d.; medium, 8s. to 8s. 6d.; best sorts, 9s. to 9s. 6d. On gas-coal contracts local collieries have obtained an advance of 1s. 6d. to 2s. over the 1898 prices, the rates at which these were settled being about 9s. to 9s. 3d. for the lower qualities and 9s. 6d. to 10s. for the better descriptions, as against 6s. 9d. to 7s. and 7s. 9d. to 8s. at the pit the previous year. For locomotive fuel railway companies had to settle their contracts on a minimum basis of 8s., as compared with 6s. 6d. per ton in 1898; whilst any quantities which had to be purchased later on could only be bought at 2s. above the previous year's prices. On coke, the production of which was, of course, largely affected by the scarcity of slack, and for which there was an exceptionally large demand both for furnace and foundry purposes, prices rose about 8s. per ton during the year, furnace sorts advancing from 14s. up to 22s. and foundry sorts from 20s. up to 28s. at the ovens.

The shipping trade fluctuated somewhat during the year, but with lessened supplies offering at the Mersey ports, owing to the brisk inland demand for steam coal, prices went on steadily, hardening from about 9s. 6d. at the commencement to 12s. and 12s. 6d. as the average prices at the close for steam coal delivered Mersey ports or Manchester Ship Canal.

THAMES.

(From our own Correspondent.)

THERE is considerable danger in the use of Thames water in boilers in consequence of a deposit of mineral salts on furnace crowns. Mr. Stromeyer points out that formerly the drinking water which was taken from the Thames after contamination with sewage, but not with sea water, was again discharged into the river and kept back the sea water. Now the sewage is carried further away and mixed at once with the sea water, and does not exert the same influence. Now the Thames water is much more brackish, and boilers which for years past have been fed with Thames water without giving trouble sometimes suffer from collapsed furnaces and excessive corrosion traceable to an excess of sea water. The remedy is to test with a salinometer daily.

Griffin Launch Engine.—This engine is like the ordinary marine engine of the nautical type and it has two cylinders with one crosshead and connecting rod. This arrangement of cylinders allows an impulse to be given every revolution. There is another novelty in the engine for producing the reversing of the motion of the boat. This is usually done by means of gearing on the shaft, which allows the engine to run in the same direction all the time. In the Griffin engine right and left handed screws are used. The crank shaft is coupled to either and the other is left free. The propeller nearest the boat is mounted in a hollow shaft outside the shaft of the other propeller. The starting-wheel of this propeller is connected to its shaft by a clutch, and can be let loose when not required. When loose it is moved until it goes very quickly and then flung into gear with the shaft, when its stored energy is depended on for causing the engine to make a few revolutions when a charge is drawn in and the engine begins work, and then acts automatically. The vaporiser is so constructed that low temperatures only are used for vaporising the oil. This avoids distillation, which leaves a tarry product which the engine cannot deal with. An air blast is first applied to atomise it, and divide it into small particles, and as these move they are brought in contact with hot air. The oil is not brought into contact with hot metallic surfaces, but depends more on the radiation of heat from the exhaust gases after they have left the cylinder heating those radiating surfaces. Even a little of the exhaust gases are allowed to mix with the charge to prevent it from acting too quickly and exploding too suddenly. The admission of exhaust gas can be regulated, and the effect of the action is easily distinguished in the sound of the explosion. The vaporiser is attached to the side of the cylinder. There are two pumps, one for giving air pressure, the other water circulation. The air pressure is about 10 lbs. per square inch in the reservoir in the bed of the engine. This air, sent through the sprayer, atomises the oil, and prepares it to enter the vaporiser to be heated. The vaporiser is heated on the outside with the exhaust gases. The engine is governed by varying the admission of air to the sprayer, and the explosion is entirely stopped by cutting off the air when no oil is sent into the vaporiser.

Boiler Feed Pump.—This is a direct-acting pump, with a compound tandem engine. The high pressure cylinder is 7½ in., and the low-pressure 12 in. The valves are balanced and actuated by steam. There is a cataract cylinder for machinery; the action of the valves silent; the stroke is 10½ in.; the pumps are the design of Mr. J. P. Hull.

The East London Association of Foremen Marine Engineers met at the London Tavern, when Mr. J. T. Milton, of Lloyd's Register, presided. The chairman said the association was founded mainly for the mutual improvement of its members in the knowledge of engineering. They knew how when a lot of engineers met they always talked "shop," and an association like this, when it should come together to discuss papers, was sure to lead to the spread of a good deal of valuable information. It was not given to everyone to know everything, and the beauty of an institution of this kind was that the members were communicative and generous, each being happy to supply the other with statements as to the results of his practical experience.

There was another advantage which arose from an institution of this kind. Enormous advances were made, because each generation began where their forefathers left off—the younger men commenced with the knowledge with which the older men were leaving off. There was another advantage. The foreman formed a valuable link between masters and men, and if he was worth his salt he was the friend of both master and men. There was a time when the finest ship in the world did not belong to the British nation, but to-day we possessed the wonderful ship *Oceanic*. Mr. John Kennedy said the marine engineering trade was never in a more prosperous condition. Every engineering yard in the country was full of work. A director of one of the largest firms in the North-East of England told him not long ago that he had 78 pairs of marine engines on his books, which meant that they would not take more contracts for 12 months. Mr. H. A. B. Cole said the Briton, whether he came from Cornwall, the Clyde, or Ratcliff Highway, could be trusted more than the workman engineer of any other country. He could be more trusted to go into dark holes and to do his duty without anyone to look after him.

NORTH-WEST OF ENGLAND.

(From our own Correspondent.)

Barrow.—There is not much that is new to report about the shipbuilding and marine engineering trades of Barrow this month. Unprecedented activity is evidenced at the great yard of Vickers, Sons & Maxim, at Barrow, and the orders in hand are being proceeded with very satisfactorily. The weather has been somewhat against out-door operations, and the shortness of the days in November reduced the number of hours which the platers and riveters could work, but the progress made has been very marked notwithstanding. The first-class cruiser *Hogue* for the Admiralty is receiving considerable attention, as are also the *Euryalus* and the *King Alfred*, but they will not be launched for some time after the *Hogue* is put into the water. There is a push noticeable in the construction of the Japanese battleship, and, although a couple of years must elapse before she can be delivered, the Japs are wanting her at the earliest practicable date. This battleship will be one of the largest ever built for any Power, and as she is a Barrow-designed ship, and will have Vickers armour plates for her protection, be mounted with Vickers guns, and driven by Barrow-designed and constructed engines, it is expected she will not only present many novelties but will prove a credit to her builders, to her owners, and to Mr. James Dunn, her designer. The torpedo-boat destroyer *Vixen*, for the British Admiralty, will be the first craft to be launched at the Barrow yard next year. Her hull is in frame and her plates are being fixed, whilst her engines are in a forward state of construction at the other side of the yard. Marine engineers are not only busy with the work of building the main and auxiliary engines for the several ships that are being built at Barrow, but they are full to overflowing with orders for gun-mounting for all the heavy guns built by Vickers at their Sheffield works. This new department at the Barrow yard has been enlarged twice since it was originally laid down, and now a third and very important enlargement has been decided on and the work commenced. The gun-mounting shop already contains a vast number of the highest class of machines of every sort required for this good class of work, and further new machinery has been ordered to efficiently equip the new portion now being built. Much delay in the completion of orders in hand has been caused by the non-delivery of machinery up to time, and this is likely to be a further source of annoyance in the future, as the engineering trade generally is so congested with orders that masters, generally speaking, are either unable to deliver machines as early as required or obliged to refuse orders altogether. The same fact applies to other departments of the Barrow yard, where work is being delayed in consequence, but every day brings the works more and more up to an efficient point in every department; and certainly, when the whole and complete scheme of enlargement is completed, Messrs. Vickers will not only be able to undertake a much fuller programme of work but ensure smarter delivery than is possible under conditions such as those existing at present when the firm have very big orders in hand, all of which are needed for the earliest possible delivery. The completion of H.M. battleship *Vengeance* is proceeding very satisfactorily. Her engines have been fitted in their places and her boilers fixed. One of her masts has been stepped, and good progress has been made with all her auxiliary machinery and appliances. She will be completed in the autumn of this year and will be the first battleship ever produced by a single firm, absolutely from its own resources, for the ship will be built, engined, fitted with guns, and protected with armoured plates, all produced by Vickers at their Sheffield, their Barrow, and their other works. This is a very big thing to say, and it certainly is a feather in in the cap of the Sheffield-Barrow firm. The workmen of Messrs. Vickers who are housed on the s.s. *Alaska* have increased in number since the management of the vessel has been placed in their own hands. They work it on the co-operative system, and provide good food, clean and comfortable berths, washing, mending of clothes, and all the domestic comforts and more than are to be found in ordinary lodgings. The famous liner has become a very popular home, and is serving a most admirable purpose until Messrs Vickers, or the builders and contractors of Barrow, provide a large number of new houses. These are very badly needed, and over and above the 1,000 new houses which are being built by Messrs. Vickers on Walney Island, there is need for a still further increase in the number of houses in the town of Barrow itself; for not only are there great developments in progress at Messrs. Vickers works, but at other works in the town, and to a great extent one is the cause of the other. It is evident that for many years to come Barrow will need an ever-increasing number of houses for the accommodation of workmen. At present this fact is very injurious to Barrow trade,as it is checking enterprise which it is desirable should proceed. Many workmen desirous of living in Barrow are deterred from doing so by reason of the scarcity of house accommodation. From a climatic point of view Barrow is admittedly one of the finest towns in England. It is surrounded on three sides by the sea, and is built at the nose end of a peninsula. It is healthy beyond measure, because it is a new town, and has been laid out on modern principles, with good broad, open thoroughfares, the principal ones having trees planted both sides, and with a most perfect sanitary system. The death-rate is low and the physique of the people high. Those who have lived in the place for some time are slow to go elsewhere, and are always ready to come back. The demand for new shipping tonnage is very steady and brisk, and there are several important contracts in the market, but local builders generally have their hands so well filled that they cannot at present undertake any new business which requires early attention.

West Cumberland.—There is great steadiness in the West Cumberland shipbuilding industry, and the yards at Workington and Maryport are very fully employed on light craft, generally speaking, for which there is a very good demand. Builders have no difficulty in getting orders, but they are careful not to overstock themselves in this respect. Their prospects are good, and under present conditions it is reasonable to believe that their profits afford a fair margin on the capital invested.

Shipbuilding Material.—There is a very full demand for all sorts of shipbuilding material, and the steelworks in this district are exceptionally well off for orders. There is a very full demand for both light and heavy plates. Orders are coming in freely and makers have been able to increase their prices. £8 per ton is the value of heavy plates of ordinary sections, and shipbuilders have no objection to this high figure; but the demand is so brisk that one is led to the belief that it is a reflex of the position of the shipbuilding trade itself, for, although very little new tonnage has been booked by shipbuilders in this district for some time past, they have plenty of orders to give out for material on new specifications. A very good enquiry is maintained for heavy steel castings, and the foundries are all busy night and day and are likely to remain so for a long time to come, as the demand in this department is not only for shipbuilding purposes but for marine engineering as well.

The Hematite Trade.—The hematite market remains very briskly employed. There is a full demand for Bessemer sorts, and both at the Bessemer and Siemens-Martin departments and local steelworks there is a great demand for the crude material in the shape of Bessemer iron. Prices are firm at 80s. per ton net f.o.b. for makers' iron, and warrant iron is at about 74s. per ton net cash sellers. Stocks of warrant iron have been reduced somewhat during the month, but they still total up to about 210,000 tons. From this stock much of the demand for pig iron which makers cannot at present supply will be drawn, and this will help prices to advance

LAUNCHES AND TRIAL TRIPS.

LAUNCHES.—English.

St. Dunstan.—On November 18th there was launched at Wallsend-on-Tyne, for Messrs. Rankine, Gilmour & Co., Liverpool, a steel schooner-rigged steamer of about 4,240 tons gross, named the *St. Dunstan.*

Amesbury Abbey.—On November 20th there was launched at Selby, for the Abbey Steam Fishing Co., Limited, Grimsby, an iron steam ketch, named the *Amesbury Abbey.*

Oliver Cromwell.—On November 21st there was launched at Hull, for the Yorkshire Steam Fishing Co., Limited, Hull, an iron steam ketch, named the *Oliver Cromwell.*

Northlands.—On December 2nd Messrs. William Gray & Co., Limited, launched a handsome steel screw steamer which they have built to the order of Messrs. E. O. & Trevor S. Jones, of Cardiff. She will take Lloyd's highest class and is of the following dimensions, viz.:—Length, over all, 329 ft.; breadth, 46 ft.; and depth, 23 ft. 6 in. The deck erections consist of poop, bridge, and topgallant forecastle. A tasteful saloon and cabins for officers, &c., will be fitted in the poop, engineers' room on the bridge, and the crews' berths forward. The hull is built with deep bulb-angle frames, cellular double-bottom and aft peak tank for water ballast, deep hatchways, powerful steam winches, steam steering gear amidships, hand screw gear aft, patent donkey boiler, patent direct steam windlass, boats on beam overhead, grain divisions, stockless anchors, two masts with schooner rig, and a complete outfit for first-class cargo vessel. The Central Marine Engine Works of Messrs. William Gray & Co., Limited, supply triple-expansion engines, having cylinders 23 in., 36½ in. and 62 in. diameter with 39 in. piston stroke, and two large steel boilers to work at 160 lbs. pressure per square inch. The ceremony of christening the steamer *Northlands* was gracefully performed by Mrs. Trevor Jones.

Zeeburg.—On December 2nd there was successfully launched from Messrs. Robert Thompson & Sons, Southwick Yard, an improved single-deck steamer, built to the order of the Stoomvaart Maatschappij "Amsterdam," of Amsterdam. Length, over all, 336 ft.; breadth, 48 ft. 6 in.; depth, moulded, 24 ft.; class 100 A1, three-deck rule, deep-frame principle; and is designed to carry a large cargo on a very light draught. The deck erections consists of cargo poop, bridge 102 ft. long, and topgallant forecastle for berthing of sailors and petty officers. The accommodation for captain, officers, and engineers is built in large spacious houses on top of the bridge deck leaving the entire bridge clear for cargo if required. Ample water ballast, in cellular double-bottom and peaks, for about 1,140 tons, the bottom being divided into eight compartments for trimming purposes. The deck machinery consists of six powerful steam winches for working the hatches, with double derricks and extra large donkey boiler for rapid loading and discharging of cargo—the steam steering-gear being placed at after end of engine-room and controlled by shafting from wheel on bridge. The engines having cylinders 24 in., 39 in., and 64 in., with 42 in. stroke, with very large boilers, are by the North-Eastern Marine Engineering Co., of Sunderland. During construction, ship and machinery have been personally superintended by Mr. W. Fenenga, of Amsterdam. As the vessel left the ways she was gracefully christened *Zeeburg* by Miss Tak van Poortvliet, sister of the managing owner, after which a large party of ladies and gentlemen proceeded to the offices of the builders, where the usual toasts were proposed and responded to.

August Leffler.—On December 2nd there was launched at Sunderland, from the yard of Messrs. Osbourne, Graham & Co., a screw steamer, specially designed for wood and general trades, to the order of the Aktiebolaget Orion, at Gothenburg, and built under the superintendence of Captain J. M. Dannberg, who will assume command when completed. The dimensions of the vessel are 275 ft. between perpendiculars, by 40 ft. 9 in. by 20 ft 6 in. moulded depth. She has been constructed on the deep-frame principle to Lloyd's highest classification, and has large space for water-ballast, and all latest improvements for rapid loading and discharging. The vessel was named *August Leffler* by Miss Dalman, daughter of the managing owner, Consul Dalman, senior partner of the firm of Messrs. August Leffler & Son, Gothenburg. After the launch the vessel was towed to the Palmer's Hill Engine Works, to be fitted with triple-expansion engines, having cylinders 20½ in., 33 in., and 54 in. in diameter, by 39 in. stroke.

Margaret.—On December 2nd there was launched by Messrs. John Readhead & Sons, from their shipbuilding yard, South Shields, a steamer built to the order of Messrs. Franz Rahtkens & Co., Middlesbrough, and is the largest Tees-owned vessel. Her principal dimensions are—Length, 353 ft.; breadth, 46 ft. 6 in.; and depth, 27 ft. 4 in.; and, whilst built to Lloyd's highest class, and under their special survey, both ship and engines are considerably in excess of their requirements. The vessel is supplied with iron longitudinal shifting boards throughout, except in way of hatches. She is rigged as a two-masted fore-and-aft schooner, with telescopic masts acting as ventilators, and is of the improved single-deck type, has cellular double bottom for water ballast. Poop and bridge amidships are arranged for stowage of cargo. A spacious saloon, with state and mess rooms, spare berths, &c., has been erected on the bridge, and officers and engineers are located in iron houses on the top of the bridge on each side of the engine casing. The topgallant forecastle contains the berths for seamen, firemen, and petty officers. Iron steering and chart houses are built on the top of the cabin, and a second bridge for the better look-out, with steering standard stretched across the former. Steam-steering gear is placed at the after end of the engine-room casing, and connected with both steering apparatus amidships, whilst a powerful screw gear finds place aft on the poop. For rapid loading and discharging an extra large donkey boiler, with 100 lbs. pressure, six hatches and six winches, with 13 derricks, have been provided. The engines and boilers, with all the latest improvements, have also been built by Messrs. Readhead. The cylinders are 24 in., 40 in., and 65 in. in diameter, with 45-in. stroke, and steam will be supplied by two large multitubular boilers working at 160 lbs. pressure. The vessel was named *Margaret* by Miss Rahtkens.

Manchester Merchant.—On December 2nd there was launched by Palmer's Shipbuilding and Iron Co. Limited, from their Jarrow Yard a finely-modelled steel screw cattle and cargo steamer built to the order of the Manchester Liners, Limited, of which Sir Christopher Furness is chairman. She is of the following dimensions, viz.:—Length, 467 ft. by 52 ft. beam, and 39 ft. depth. The engines are also being constructed by the Palmer's Co.; they are of the inverted triple-expansion type, having cylinders 30 in., 50 in. and 81½ in. by 54 in. stroke, steam being supplied by three double-ended boilers 14 ft. 6 in. diameter by 17 ft. 6 in. long, with a working pressure of 180 lbs. The vessel was named *Manchester Merchant* by Mrs. R. B. Stoker, wife of the managing director of the Manchester Liners, Limited.

City of Manchester.—On December 2nd there was launched at North Shields for Hull owners a steel steam ketch of about 189 tons, named the *City of Manchester.*

Hercules.—On December 2nd Messrs. R. Craggs & Sons launched at Middlesbrough the large cargo vessel *Hercules* to the order of Mr. John Lockie, of Newcastle, which is of the following dimensions:—Length, over all, 372 ft.; breadth, extreme, 48 ft.; and depth, moulded, 30 ft. 10 in., and designed to carry about 6,900 tons all told. This vessel has been built to the highest class under Lloyd's spar-deck rule. The machinery will be supplied by Messrs. Sir C. Furness, Westgarth & Co., Limited, of Middlesbrough, and will have cylinders 25 in., 40 in., and 68 in. in diameter, by 48-in. stroke, and steam will be supplied by three large single-ended boilers.

Rosalie.—On December 4th there was launched by the Northumberland Shipbuilding Co., Limited, at Howden-on-Tyne, a large steel spar-deck steamer, of 7,000 tons deadweight capacity, built to the order of Messrs. John Cory & Sons, Limited, Cardiff. This vessel is built to the highest class at Lloyd's, and is 370 ft. long by 48 ft. beam by 30 ft. 10 in. depth, moulded. The steamer was christened the *Rosalie* by Mrs. Rowland Hodge, the wife of the managing director. She will be fitted with the latest type of machinery, of 2,000 I.H.P., by the Wallsend Slipway and Engineering Co.

Battenhall.—On December 5th the screw steamer *Battenhall*, built for London account, was launched from the shipbuilding and repairing works of the Blyth Shipbuilding Co., Limited, of Blyth. The *Battenhall* is 259 ft. long, and is of the raised quarter-deck type, having cabin accommodation on the bridge. Her engines are of large size, and will be supplied by Messrs. MacColl & Pollock, of Sunderland. The naming of the steamer was gracefully performed by Miss Vera Vaughan, younger daughter of the chairman of the Blyth Shipbuilding Co., Limited.

Molopo.—On December 7th there was launched from the yard of Messrs. Earle's Shipbuilding and Engineering Co., a steam trawler built to the order of Messrs. Thomas Hamling & Co., Limited. The vessel is 125 ft. long, by 21 ft. 6 in. beam, by 11 ft. 3 in. moulded depth, and will be fitted with triple-compound engines, having cylinders 13 in., 22 in., and 36 in. by 24 in. stroke, working at 200 lbs. pressure, supplied with steam from a large steel boiler. Mr. Hamling's granddaughter, Miss Florence Hudson, undertook the launching ceremony, and named the vessel the *Molopo.*

Linnet and **Swallow.**—On December 14th, there was launched at Hull, from the yard of Earle's Shipbuilding and Engineering Co., two steam trawlers, built to the order of Messrs. Moody & Kelly, of Grimsby, for the Pioneer Steam Fishing Co., Limited. Their dimensions are: 118 ft. 9 in. (over all) by 21 ft. beam by 11 ft. 6 in. moulded depth. They will be fitted with triple-expansion engines, supplied with steam from a large steel boiler, working at 200 lbs. pressure. The launching ceremony was undertaken by the Misses Lily and Olive Bryant, who named the vessels *Linnet* and *Swallow* respectively.

London Bridge.—On December 15th Messrs. Ropner & Son, of Stockton-on-Tees, launched a steel screw steamer of the following dimensions, viz.:—Length between perpendiculars, 325 ft.; breadth, extreme, 48 ft.; depth, moulded, 24 ft. 3 in. The steamer has been built to the order of Messrs. Furness, Withy & Co., Limited, West Hartlepool, for Messrs. Moore, Innes & Co., London. The vessel is built on the three-decked rule with one deck laid, having full poop, long bridge, and topgallant forecastle. The saloon and cabins for the captain and officers will be fitted up in the poop, the accommodation for engineers in iron house on the bridge deck, and the crew will be berthed in the forecastle as usual. She has double bottom on the cellular principle for water ballast throughout, and is also fitted with large after peak ballast tank. The vessel will carry about 5,000 tons deadweight on Lloyd's freeboard. She is fitted with direct steam windlass, stockless anchors, steam-steering gear amidships, with powerful screw gear aft, five large steam winches, supplied with steam from an ample horizontal multitubular donkey boiler, with a general outfit fully up to date for a modern cargo steamer. She will be fitted with a set of triple-expansion engines by Messrs. Blair & Co., Limited, of about 1,100 I.H.P., steam being supplied by two large steel boilers, 15 ft. 3 in. by 10 ft. 3 in., the working pressure being 160 lbs. per square inch. The christening ceremony was gracefully performed by Miss Ropner, of Preston Hall, who gave the vessel the name of *London Bridge.*

Adriana.—On December 16th Sir Raylton Dixon & Co., Limited, launched from their Cleveland Dockyards, Middlesbrough, the large steel screw cargo steamer *Adriana*, built to the order of the British Maritime Trust, Limited, of West Hartlepool. She is built to Lloyd's spar-deck rule, 100 A1 class, and has a deadweight carrying capacity of about 4,700 tons on a light draught of water. The upper decks are of steel and iron, and poop bridge and forecastle decks of pitch pine. The accommodation for officers, &c., will be handsomely fitted up in houses on bridge deck, and the crew will be located in the forecastle. Triple expansion engines will be fitted by Messrs. T. Richardson & Sons, Limited, Hartlepool, having cylinders 23 in., 36 in., 59 in. by 42 in. stroke, supplied with steam by two large boilers working at 180 lbs. pressure.

Huddersfield.—On December 16th Messrs. S. P. Austin & Son, Limited, launched from their shipbuilding and repairing premises, at the Wear Dockyard, Sunderland, the steel screw steamer *Huddersfield*, which has been built to the order of Messrs. John Ruthen & Co., of Cardiff, for the general trades, and to carry a large deadweight cargo on an exceptionally light draught of water. The vessel is built of steel, of the single-deck type, to class 100A1 under special survey in Lloyd's register, with dimensions as follow:—Length, between perpendiculars, 289 ft.; breadth, extreme, 45 ft.; depth, moulded, 21 ft. 2 in. She has poop, bridge, and forecastle, and the accommodation for the captain and officers will be provided in a large iron house on the bridge. Large water ballast capacity is provided for in the cellular bottom. The powerful steam winches have been supplied by Messrs. Roger & Co., direct steam windlass by Emerson & Walker, steam-steering gear (fitted in engine-room) by Donkin & Co., multitubular donkey boiler by Cochran & Co. The machinery will be supplied by Messrs George Clark, Limited, of Southwick Engine Works, Sunderland, of the triple-compound type, with large boiler power. The construction of the vessel has been carried out under the superintendence of Captain Harney, of Blyth, on behalf of the owners. The launch was successfully carried out in the presence of a number of friends of the builders and owners, and the vessel was named by Miss Ruthen, sister of the managing owner.

Schwarzenfels. — On December 16th Messrs. Wigham-Richardson & Co., Limited, launched from their Neptune Shipyard, Newcastle-on-Tyne, a steel screw steamer which they are building to the order of the Deutsche Dampfschiff fahrts Gesellschaft "Hansa," of Bremen. The steamer is 370 ft. long by 46 ft. beam by 30 ft. deep, and she is to be fitted with quadruple-expansion engines on the Yarrow, Schlick & Tweedy system, working at 210 lbs. pressure, which, together with the boilers, are being constructed by Messrs. Wigham-Richardson & Co., Limited. As the vessel left the ways she was named the *Schwarzenfels*, the christening ceremony being smartly performed by Master T. W. Bridge.

Shirley.—On December 18th Messrs. William Gray & Co., Limited, launched a large steel screw steamer for Messrs. Houlder, Middleton & Co., London. She will take the highest class in Lloyd's, and is of the following dimensions, viz.:—Length, over all, 341 ft.; breadth, 47 ft.; depth, 27 ft. 4 in.; with long bridge, poop, and topgallant forecastle. The saloon, staterooms, captain's and officers' rooms, &c., will be fitted up in the poop, the engineers' accommodation in houses on the bridge-deck, and the crew's berths in the forecastle. The hull is built with deep frames, cellular double bottom, and aft peak ballast tank, six steam winches, steam steering-gear amidships, hand screw gear aft, patent direct steam windlass, two patent donkey boilers, shifting boards throughout, stockless anchors, telescopic masts, with fore and aft rig, boats on beams overhead, and all requirements for a first-class cargo steamer, Triple-expansion engines are being supplied by the Central Marine Engine Works of Messrs. William Gray & Co., Limited, having cylinders 25 in., 40 in., and 65 in. diameter, with a piston stroke of 42 in., and large steel boilers for a working pressure of 160 lbs. per square inch. The ship is being completed under the superintendence of Captain Satchell. The ceremony of naming the steamer *Shirley* was gracefully performed by Miss Mabel Rawlings, of Hartlepool.

Norfolk.—On December 18th there was launched from the yard of the Sunderland Shipbuilding Co., Limited, a handsome steel screw steamer built to the order of Messrs. Birt, Potter & Hughes, Limited, of London, for their well-known line of Australian steamers. The length of the vessel is 420 ft. between perpendiculars; breadth, 54 ft.; and depth, moulded, 32 ft. Classed 100 A1 Lloyd's special survey, three-deck grade, with shelter deck, also Board of Trade certificate for passengers. The sailors and firemen are berthed under the shelter deck aft. Accommodation for captain, officers, engineers, and a few passengers is made on the top of the shelter deck in large deck-houses. The saloon is tastefully fitted up in polished oak and replete with every comfort. The vessel is constructed on the deep-frame principle, thus dispensing with hold beams, and has cellular double bottom for water ballast all fore and aft, and both peaks fitted as tanks. The shelter, upper and main decks are of steel; her deadweight carrying capacity is about 9,000 tons. The deck machinery consists of ten large steam winches by Mr. R. Welford, of Pallion, direct steam windlass by Messrs. Emerson, Walker & Thompson Brothers, Limited; and Messrs. Donkin & Co.'s steam-steering gear, which is placed in the engine room and worked from the flying bridge, together with all the usual appliances for handling cargo and working the ship with the greatest possible despatch. The vessel is lighted by electricity by Messrs. J. H. Holmes & Co., of Newcastle-on-Tyne. The main engines are upon the tri-compound principle, by Messrs. The North-Eastern Marine Engineering Co., Limited, Wallsend-on-Tyne, having cylinders, 30 in., 48 in., and 78 in., by 54 in. stroke, steam being supplied by three large steel boilers working at a pressure of 160 lbs. per square inch, with Howden's forced draught, also one large auxiliary donkey boiler. The vessel is being insulated throughout for the carriage of frozen meat, and the refrigerating machinery is being supplied by Messrs. J. & E. Hall, of Dartford. During construction the steamer and her machinery have been inspected, on behalf of the owners, by their superintendent, Mr. Morrison Upon leaving the ways the vessel was gracefully named *Norfolk* by Miss K. J. Adam, of Newcastle-on-Tyne, after which she was towed into the South Dock for the purpose of masting, &c.

Winkfield.—On December 19th there was launched from the works of Messrs. Short Brothers a large and handsomely modelled steel screw steamer built for the Australian trade, to the order of the Seafield Steam Shipping Co., Limited, of London, of which Messrs. Lawther, Latta & Co. are the managers. This vessel, which is constructed of steel, has been built under special survey to the highest class, in Lloyd's register, and is of the following dimensions: Length, 382 ft.; breadth, 48 ft.: and depth moulded, 30 ft.; having a large deadweight and measurement capacity of 10,000 tons. The erections consist of continuous shade deck from stem to stern, with large and commodious deckhouses on top of shade deck amidships for the accommodation of captain, officers and engineers, with large and handsomely fitted saloon, the panelling being in polished hardwood tastefully arranged. On the flying bridge deck a large and commodious teak wheel and chart house is fitted; the steam steering-gear is placed in the engine-room with controlling rods to the wheelhouse and flying bridge. The crew are berthed under the fore end of shade deck with separate berths for petty officers, &c. The double bottom is constructed on the cellular system, subdivided into trimming tanks, the peaks being also fitted for water-ballast. The holds are four in number for rapid loading and discharging, for which nine powerful steam winches have been fitted, steam for the same being supplied by a large multitubular donkey boiler placed in the boiler room. In addition the vessel is fitted out with all the newest appliances for despatch and economical handling of cargoes. A complete installation of electric light is also fitted. On leaving the ways the vessel was named *Winkfield*, the ceremony being performed by Mrs. R A. Lawther, of London. The vessel is to be fitted with triple-expansion engines by Messrs. George Clark, Limited, of Sunderland, having cylinders 26 in., 43 in., and 71 in. diameter with a stroke of 51 in. and having two large steel boilers of 180 lbs. working pressure fitted with Howden's system of forced draught.

LAUNCHES.—Scotch.

Jurupary.—On November 29th Messrs. Murdoch & Murray launched at Port-Glasgow a steel screw steamer named *Jurupary*, being another of the fleet which this firm are building for passenger and cargo service in South American waters. This vessel was towed to Glasgow to be engined by Messrs. Lees, Anderson & Co.

Engineer.—On November 30th the Grangemouth Dockyard Co. launched from their yard at Grangemouth a handsomely modelled steel screw steamer, which has been built to the order of Messrs. Tatham, Bromage & Co., of London. The dimensions of the vessel are 198 ft. between perpendiculars by 30 ft. by 15 ft. 4 in. moulded, and she has been built specially with a view to the carriage of heavy weights. The engines are fitted in the after part of the vessel, the entire length to the collision bulkhead being one clear hold, free from pillars and such obstructions, and the main hatch 48 ft. long, so as to admit long pieces of machinery, boilers, or other goods. Steel derricks and unusually powerful steam winches are provided for the purpose of handling weights up to 15 tons. Comfortable accommodation is provided in the bridge before machinery space for captain, a few staterooms, and saloon. A cellular double bottom for water ballast is fitted the whole length of the hold, and the net tonnage of the vessel has been reduced to the lowest possible point. As she left the ways the vessel was gracefully named *Engineer* by Miss Edith Millar, daughter of Mr. Millar, of the Dockyard Co. Triple-expansion engines of large power, with large boiler working at 170 lbs. pressure, will be fitted, and the vessel equipped with all the latest appliances, including steam windlass, steam-steering gear, steam warping capstan, and special hold ventilation.

Citrine.—On November 30th Messrs. A. Rodger & Co. launched at Port-Glasgow a steel screw steamer of 1,750 tons gross register, to carry 2,750 tons deadweight, for Mr. William Robertson, Glasgow. The dimensions are: Length, 260 ft.; breadth, 37 ft.; depth, 19 ft. 5 in. Miss Jean Kay Rodger performed the ceremony of naming the steamer *Citrine*. Messrs. Muir & Houston, Glasgow, will supply the machinery.

Horatia.—On December 3rd there was launched from the Inverkeithing yard of Messrs. Menzies & Co, Limited, Leith and Inverkeithing, the first of two steam welled fishing vessels for the Rushworth Steam Fishing Co., Limited, Grimsby, of the following dimensions:—120 ft. by 21 ft. 6 in. by 12 ft., and fitted with triple-expansion engines, having cylinders 12 in., 20 in., and 34 in. in diameter, by 24 in. stroke, with a large boiler working at a pressure of 200 lbs. This vessel has been built for the Iceland trawling and line fishing industry, and has been designed with a large subdivided well amidships, in which the fish are kept alive after being caught till landed in the British markets. The well is in direct communication with the sea, and a constant circulation of sea water is provided for. The bunkers are of large dimensions, carrying over 100 tons of coal, so as to enable the vessel to steam to Iceland and back without coaling. Independent of the well for keeping the fish alive, the vessel is fitted with fish holds in which a portion of the catch of fish is kept in ice, and a large insulated ice hold is fitted, with easy access to fish hold. This is the first welled vessel which has been built on the River Forth, and when completed will be one of the largest and most powerful vessels fishing out of an English port. The whole of the material used in the construction of the vessel is 20 per cent. above Lloyd's requirements, and all fittings, such as winch, &c., are of the strongest and most modern design. The vessel on leaving the ways was named *Horatia* by Miss Menzies, Elstree, Edinburgh, and after the launch was towed to Leith to ship her machinery.

Lucy.—On December 6th Messrs. Fleming & Ferguson, Limited, launched at Paisley the *Lucy*, a steel hopper dredger, built for the Llanelly Harbour and Bury Navigation Commission. The dredger is to be capable of raising 450 tons of material per hour from a depth of 30 ft, and is designed to enable her to cut in front and make her own flotation. She is fitted with all the latest improvements for vessels of this type.

Setter.—On December 6th there was launched by Messrs. Hall, Russell & Co., Limited, at Aberdeen, a steam trawler, built to the order of Captain Burn, St. Andrews. It is about 175 tons gross, has been constructed to class 100 A1 at Lloyd's, and will be fitted with a steel boiler and triple-expansion engines of 320 I.H.P. The vessel was named the *Setter*.

Bellona.—On December 7th Messrs Russell & Co. launched from their Greenock yard a steel screw steamer named *Bellona*, of 1,625 tons gross, for German owners. This is one of the vessels laid down by Messrs Carmichael, M'Lean & Co., and which Messrs. Russell & Co. undertook to complete when they took over the yard.

Rourik.—On December 7th, Messrs. Archibald McMillan & Son, Limited, Dumbarton, launched the steel screw steamer *Rourik*, which they have built to the order of the Volga Steam Shipping Co., of St. Petersburg. The dimensions of the *Rourik* are 178 ft. by 26 ft. by 14 ft., and she is built to Lloyd's 100 A.1 class.

Pena Sagra.—On December 7th Messrs. Robert Duncan & Co., Limited, launched at Port-Glasgow a steel screw-steamer of 1,600 tons gross to carry 2,700 tons deadweight for the Campania Santanderina de Navegacion, of Santander. The dimensions are:—Length 260 ft.; breadth, 37 ft.; depth, 20 ft. 6 in. The vessel, which is of the single-deck type, was named *Pena Sagra* by Miss Denny, Dumbarton, daughter of Mr. Archibald Denny, shipbuilder. Triple-expansion engines will be supplied by Messrs. Hall-Brown, Buttery & Co., Glasgow, the cylinders being 19 in., 30½ in., and 50 in. by 36 in. stroke.

Alcinous.—On December 7th, Messrs. Scott & Co. launched at Greenock a steel screw steamer named *Alcinous*, for the Ocean Steamship Co., Liverpool, the fourth of an order for eight steamers. Dimensions:—Length, 440 ft.; breadth 52 ft.; depth 33½ ft.; of 6,700 tons gross and 8,200 tons carrying capacity. The builders will supply engines of 4,500 I.H.P.

Cracker.—On December 7th, the London and Glasgow Engineering and Shipbuilding Co., Limited, launched from their shipyard, Govan, the second of the two powerful paddle steamers ordered from them by the British Admiralty. Her principal dimensions are:—Length 144 ft.; breadth 27 ft. 3 in., of 700 tons displacement. The engines are of the twin-paddle type, with diagonal oscillating cylinders, and boilers of the multitubular type, they being also supplied by the builders. As the vessel left the ways she was named *Cracker*, by Miss Jago, Carrickarden, Bearsden.

Teresa.—On December 8th Messrs. Russell & Co. launched from their Kingston Yard, Port-Glasgow, a steel screw steamer of 6,400 tons deadweight carrying capacity. The dimensions are: Length, 345 ft.; breadth, 49 ft. 9 in.; depth, 28 ft. 5 in. The steamer is named *Teresa*, and is built to the order of Messrs. Fratelli Cosulich, of Trieste, making the second steamer built by Messrs. Russell & Co. for this firm. Triple-expansion engines will be supplied by Messrs. Blackwood & Gordon, Port-Glasgow, the cylinders being 25 in., 41 in., and 67 in., by 45 in. stroke.

Titania.—On December 14th Messrs. A. Hall & Co. launched at Aberdeen a steam trawler, built to the order of the Hellyer Steam Fishing Co., Hull. She has a gross tonnage of about 200, and will be fitted with triple-expansion engines. She was named the *Titania*.

Goldseeker.—On December 14th Messrs. John Duthie, Sons & Co launched at Aberdeen, a finely modelled steel trawler, built to the order of Messrs. North, Ellis & Co., Grimsby. The vessel, which was named the *Goldseeker*, has a gross tonnage of 190, and will be fitted with triple-expansion engines.

Dunlossit and **Helen.**—On December 14th there was launched from the shipbuilding yard of Messrs. John Shearer & Son, at Kelvinhaugh, two steel screw steamers, viz., *Dunlossit*, for Messrs. Paton & Hendry, and *Helen*, for Mr. J. Cameron, Glasgow. Dimensions are: 124 ft. by 22 ft. by 10 ft. 3 in. moulded, with raised quarterdeck, short bridge, and topgallant-forecastle. They have been built to Lloyd's highest class, with extra scantlings to enable them to be loaded on the ground. Deadweight carrying capacity with Lloyd's freeboard about 280 tons. Fore and aft peaks are trimming tanks. Compound surface-condensing engines, 14 in. and 29 in. by 21 in. are being fitted on board by Messrs. Muir & Houston, Limited, Kinning Park.

Canganian.—On December 14th Messrs. Mackie & Thomson launched at Govan a steamer 225 ft. by 34 ft. by 16 ft. 6 in. depth, moulded, with fullpoop, raised quarter-deck, bridge, and topgallant forecastle. The vessel is fitted out with all the latest improvements for the rapid handling of coal and other cargoes. Triple-expansion engines will be fitted by Messrs. Ross & Duncan, having cylinders 17 in., 28 in., and 45 in., by 33 in. stroke, working at 180 lbs. pressure. The vessel has been built for Messrs. Owen & Watkin Williams & Co.. of Cardiff, and has been superintended during construction by Captain Watkin Williams. The vessel was christened *Canganian* by Mrs. Griffith, wife of the commodore engineer to the owners.

Vladimir.—On December 15th Messrs. Archd. M'Millan & Son, Limited, launched at Dumbarton, the steamer *Vladimir*, which they have built to the order of the Volga Steamship Co., of St. Petersburg. Her dimensions are 178 ft. by 26 ft. by 14 ft. and she is built to Lloyd's 100 A1 class. The machinery is being supplied by Messrs. M'Kie & Baxter, Glasgow.

Tupa.—On December 15th Messrs. Murdoch & Murray, Port-Glasgow, launched another of the fleet of steamers they have on order for cargo and passenger service on the River Amazon. The steamer is named *Tupa*, and will be engined by Messrs. Kincaid & Co., Greenock.

Fleswick.—On December 16th the Ailsa Shipbuilding Co., Troon, launched from their yard a steel screw steamer for Mr. Robert Simpson, of Whitehaven. The dimensions are:—Length, 178 ft. 6 in.; breadth, 27 ft. 6 in.; depth, moulded, 13 ft. 9 in. The machinery is being supplied by Messrs. M'Kie & Baxter, Govan. The steamer was named *Fleswick* by Miss Crockett, Logan Bank, Troon.

Marwarri.—On December 16th there was launched by Gourlay Brothers & Co. at Dundee the large vessel *Marwarri*, for T. & J. Brocklebank, Limited, Liverpool. She has a gross tonnage of 5,820, and her other principal dimensions are:—Length, 445 ft.; beam, 50 ft.; depth, 33 ft. The *Marwarri* will sail chiefly between Dundee and Calcutta, having been specially designed for the jute trade.

Val de Travers.—On December 16th there was launched from the shipyard of Messrs. S. McKnight & Co., Limited, Ayr, a handsomely modelled screw steamer of about 1,000 tons. The vessel has been constructed of steel to the highest class of Lloyd's registry for general trade, and to the order of a well-known London shipowner. The vessel on leaving the ways was gracefully christened *Val de Travers* by Mrs. John S. Watson, Woodcroft, Ayr. The vessel proceeded to Glasgow in order to receive her machinery, which is being supplied by Messrs. Ross & Duncan, Govan.

Saxonia.—On December 16th Messrs. John Brown & Co., Limited, launched at Clydebank the *Saxonia*, a twin-screw steamer of about 14,000 tons gross, and of the following dimensions:—Length, between perpendiculars, 580 ft.; length, over all, 600 ft.; breadth, extreme, 64 ft. 3 in.; moulded depth from upper deck, 41 ft. 6 in., which they have built for the intermediate Atlantic service of the Cunard Line. More than ordinary interest centred in the floating of the vessel, for she is not only the biggest ever built on the Clyde, but is also one of the ten largest in the world. The Fairfield greyhounds, *Campania* and *Lucania*, are, it is true, both longer than the new boat, but in point of tonnage the *Saxonia* is easily greater. The vessel is of the complete shelter-deck type, with lofty erections amidships intended for the accommodation of passengers. The numbers provided for are:—First-class, 164, and third-class about 500. There is also provision for a very large number of steerage passengers. The first-class passengers are berthed in handsome and commodious rooms on the bridge deck. The dining saloon, in which 150 passengers may be seated, is on the shelter deck, and is lighted and ventilated by a large and handsomely decorated skylight overhead, and by ventilating lights at the sides. The whole of the third-class accommodation is fitted so as to be readily removed in case the space is required for cargo. Considerable space has been reserved in the ship in a position which is eminently suited for second-class accommodation, if the owners should deem it expedient to make provision for carrying this class of travellers. The whole of the upper deck at the after end will be fitted for the safe carriage of horses and cattle. The hull is generally of mild steel, and the scantlings are somewhat in excess of the requirements for Lloyd's highest classification. The subdivision is such that the vessel would be unsinkable by any damage not of an extraordinary kind. The arrangements for the carriage and working of cargo are of a very complete description. The four masts with a large number of derricks and cargo spans, are fitted so that the work of discharging will be carried out with the greatest expedition. A considerable volume of 'tween-deck space is insulated and fitted up for the safe carriage of perishable cargoes. A very large fresh-water capacity has been provided, so that there may be no lack of this necessary, both in respect of passengers, crew, and cattle. To meet the necessary conditions of seaworthiness when going westward only partially laden, deep water ballast holds have been provided, in addition to the usual water-ballast tanks within the limits of the double-bottom compartments. The ship is lighted throughout by electricity, and the latest pattern appliances in the way of capstans, warping and cargo winches, steering-gear, &c., are included in her equipment. Twin screws have been provided, each actuated by quadruple-expansion engines, and the steam is supplied from nine single-ended boilers working under forced draught. The Hon. Mrs. G. A. Burns performed the christening ceremony.

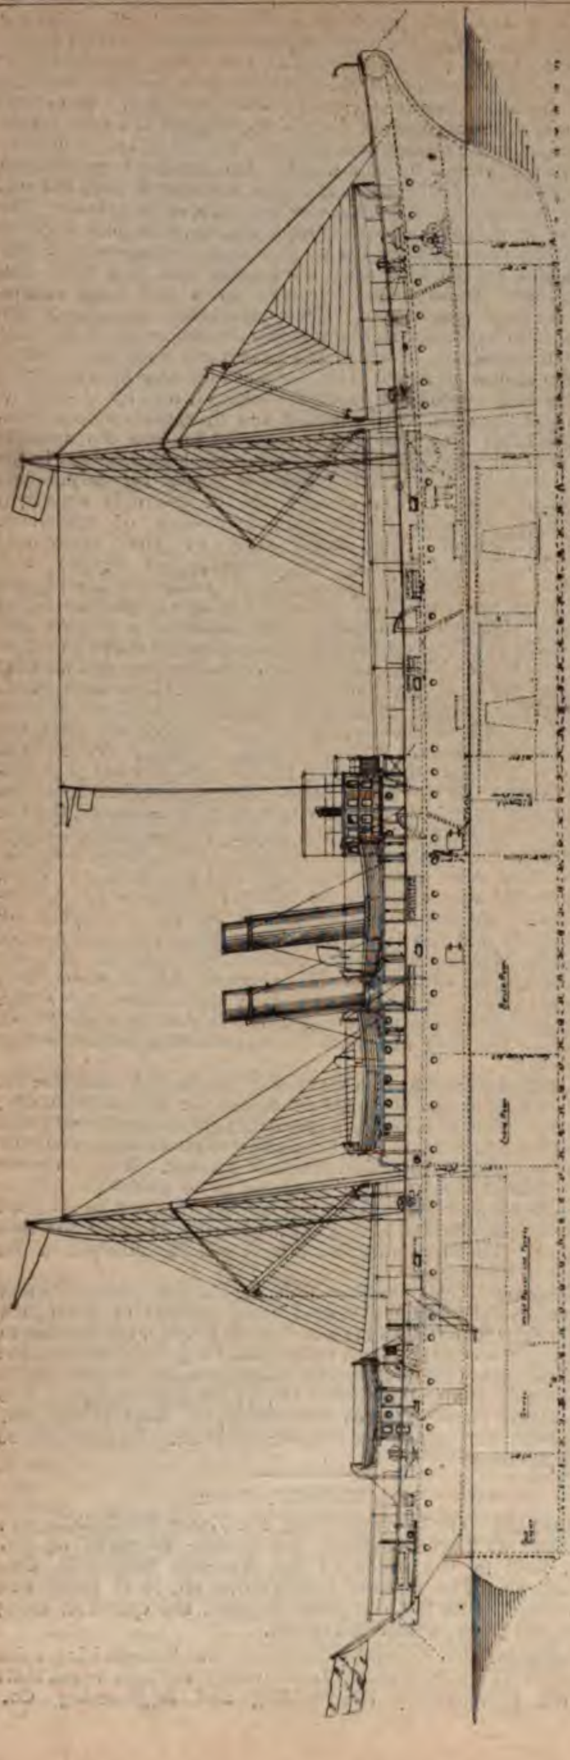
H.M.S. Assurance.—On December 18th H.M.S. *Assurance* was launched from the shipyard of Messrs. J. M'Arthur & Co., Paisley. The *Assurance* is a powerful light-draught steel twin-screw tug, and is fitted with twin-screw triple-expansion engines by Messrs. Bow, M'Lachlan & Co., of Paisley. The *Assurance* is the first of three similar steamers to be completed by the above firms, and these tugs, when handed over, will be attached to the torpedo flotilla, having been specially designed for that purpose. The remaining two vessels will be launched in the course of a few weeks.

Mambare.—On December 18th the Campbeltown Shipping Co. successfully launched a steel screw steamer of 2,200 tons deadweight, built to the highest class at Lloyd's, for Australian owners. The vessel, which is designed for general trading, has accommodation for 40 first-class passengers, and is the second supplied by the Campbeltown Co. to the Sydney firm. The christening ceremony was performed by Miss Macfadyen, Beachhill, who named the steamer *Mambare*. Engines will be fitted at Glasgow.

LAUNCHES.—Irish.

Riverside.—On November 22nd the Larne Shipbuilding Co. launched at Larne Harbour the steamer *Riverside*, of 165 tons, built to the order of the Riverside Steamship Co., Portadown. The steamer is 95 ft. over all, 19 ft. broad, and 9 ft. deep. She has compound engines, the cylinders being 12 in. and 24 in., with 18 in. stroke.

Parkside.—On December 16th there was launched from the Foyle Shipbuilding Yard at Londonderry the first vessel built by the Londonderry Shipbuilding and Engineering Co.



TWIN-SCREW CABLE STEAMER VON PODBIELSKI, BUILT AND ENGINED BY MESSRS. DAVID J. DUNLOP & CO., INCH WORKS, PORT-GLASGOW.

(See December issue page 419.)

Limited. She has been constructed to the order of Mr. Marshall, of Liverpool. Her principal dimensions are:—Length over all, 372 ft.; breadth, 46 ft. 3 in.; depth, 28 ft. 6 in.; to upper deck beams. The vessel has been designed to carry a deadweight of 6,200 tons, and has a gross register tonnage of about 3,680 tons, and has been constructed of steel throughout to Lloyd's highest class 100 A1, with poop, long bridge, and forecastle, and with large capacity for water-ballast in double bottom, which extends the full length of the ship. The peaks, or forward and after ends, are also arranged for water-ballast. There are two complete steel docks running the whole length of the ship, and five extra large hatchways, worked by 10 derricks, four of which are stepped on each mast, and two on crane posts, which have been introduced on the bridge deck. The engines, which are of the usual triple-expansion type, together with boilers, &c., are being supplied by a firm of engineers on the Clyde. Her Grace the Duchess of Abercorn performed the christening ceremony, the vessel receiving the name of *Parkside*.

TRIAL TRIPS.

Don Hugo.—On November 21st and 22nd the steamer *Don Hugo*, built by David J. Dunlop & Co. (of which we gave full particulars in our Launch columns, October issue, page 330), ran her speed trials on the Clyde. The trials were made at the Skelmorlie measured mile, when the builders' progressive runs were satisfactorily completed. The results proved the steamer's capability of easily attaining, when loaded with a deadweight of 2,500 tons, her guaranteed speed of 12½ knots.

Hannover.—On November 25th the steamer *Hannover*, built by Messrs. Wigham-Richardson & Co., of Newcastle-on-Tyne, for the North German Lloyd Company, of Bremen (of which we gave particulars in our Launch columns, September issue, page 283), was taken on her official trial trip, when she behaved in a manner quite satisfactory to her builders and to the representatives of those to whose order she has been constructed. The speed attained exceeded that guaranteed.

Gadsby.—On November 29th the new steamer *Gadsby*, built by Messrs. Ropner & Son, of Stockton-on-Tees, to the order of Messrs. R. Ropner & Co., of West Hartlepool (of which we gave particulars in our November issue, page 369), made her official trial trip in the Tees Bay, after loading a full cargo in the Tees. After the adjustment of compasses, the vessel proceeded on her way to Beira, Africa. The vessel has been built under the inspection of Mr. Nicholson, the owners' superintendent surveyor, and he was present at the trial trip, which passed off very satisfactorily in all respects.

Hyson.—On November 29th the large new steamer *Hyson*, built by Messrs. David & W. Henderson & Co., to the order of Messrs. the China Mutual S.N. Co., Limited, London (of which we gave particulars in our November issue, page 371), proceeded down the river, and in the course of the day ran trials on the firth. During the day the machinery worked without a hitch, and gave every satisfaction to the owners, who were represented by W. A. Gulland, Esq., managing director, Captain J. S. Hogg and Mr. H. G. Seal. A speed of 13½ knots was easily obtained, which was considered most satisfactory. Immediately after the trials the vessel left for Liverpool, where she will complete loading for the East.

Sandsend.—On November 29th the large steel screw steamer *Sandsend*, built by Messrs. W. Gray & Co., Limited, to the order of Messrs. the Pyman Steamship Co., Limited, West Hartlepool (of which we gave particulars in our November issue, page 369), was taken to sea for her trial trip, when a very successful trial was made, everything in the engine-room working with the utmost smoothness and precision, and the ship averaging a speed of 11¾ knots against the tide. On the conclusion of the trial the vessel proceeded to the Tyne, where she loads for a Mediterranean port.

Mora.—On November 29th the screw steamer *Mora*, built by Messrs. J. Readhead & Sons, West Docks, South Shields, went on her official trip from the Tyne, which proved eminently satisfactory, 11½ knots being registered. The steamer has been built to the order of the English and American Shipping Co., Limited, of which the managers are Messrs. C. T. Bowring & Co., of London, and is of the following dimensions:—Length, 335 ft. over all; breadth, 47 ft.; and depth, moulded, 25 ft. She is of the improved single-deck type, with full poop, long bridge amidships, cabin houses on deck for captain, officers, and engineers, and topgallant forecastle for crew, iron shifting boards, &c., and has a large deadweight capacity on a light draught. She has been built under special survey, is classed 100 A1 at Lloyd's, and fitted with all the latest improvements and appliances for the working of the steamer, and for the rapid loading and discharging of cargo. Her engines, also built by Messrs. John Readhead & Sons, are of the triple-expansion type, having cylinders 24 in., 40 in., and 64 in., by 45 in. stroke, steam being supplied by two large steel boilers working at a pressure of 160 lbs. per square inch. The steamer has been specially fitted for the grain trade, and it may be also mentioned that she is the seventh vessel built by Messrs. J. Readhead & Sons for the same owners. The *Mora* proceeded to Tyne Dock later in the day to take in cargo for Genoa, Captain J. Nicholson being in command.

Sebriana.—On November 30th the screw steamer *Sebriana*, built by Messrs. Short Brothers to the order of the British Maritime Trust, Limited, of London (of which we gave particulars in our November issue, page 370), went out on trial with very satisfactory results. After adjusting compasses the vessel was taken a series of runs over the measured mile, when a mean speed of 13 knots was attained.

Korea.—On November 30th the s.s. *Korea*, which has been built by the Flensburg Shipbuilding Co., Flensburg (of which we gave particulars in our November issue, page 373) put out to sea for her official trial trip. Before this the vessel was transferred to the Russian flag, on which occasion the unique ceremony of blessing the vessel and crew in accordance with the Russian custom was witnessed. The Russian priest, in blessing the ship, sprinkled consecrated water in all parts, after which the same ceremony was gone through in the case of each of the crew, the whole being a most impressive scene. Both the Russian and Danish companies' representatives expressed themselves as highly satisfied with both the ship and machinery, which ran at a speed of 13¾ knots during the trial.

Kilnsea.—On November 30th the large steel screw steamer *Kilnsea* had her official trial. She has been built by Messrs. W. Gray & Co., Limited, to the order of Messrs. W. Brown, Atkinson & Co., Limited, for the Sea Steamship Co., Limited, Hull, (of which we gave particulars in our December issue, page 415). An average speed of 11 knots was recorded with the log overboard. The vessel proceeded to the Tyne to load for Genoa.

Humber.—On December 2nd the s.s. *Humber*, built by the Ardrossan Dry Dock and Shipbuilding Co., Limited, to the order of the Grangemouth Dockyard Co., Grangemouth, on behalf of Mr. E. P. Hutchinson, of Hull, proceeded to sea on her trial trip. After a run of about two hours, in which the vessel attained a speed of nine knots, loaded, and satisfactorily acquitted herself in every respect, she returned to Ardrossan preparatory to making her maiden voyage. Messrs. Walker, Henderson & Co., Glasgow, supplied and fitted the engines.

Everingham.—On December 6th the steamer *Everingham*, built to the order of Messrs. Alexander Meek & Sons, of Goole and Hull, for the East Yorkshire Steamship Co., by the Blyth Shipbuilding Co., Limited, of Blyth, was taken to sea for her official trial trip. The vessel measures 337 ft. in length; 47 ft. beam; and 24 ft. 10 in. depth, and has been constructed on the three-deck principle with single deck laid. She has an open poop, long bridge with accommodation on top of same in iron houses for captain, officers, and engineers, topgallant forecastle, iron shifting boards, and complete outfit for the quick working of the vessel and her cargo. The machinery has been supplied and fitted by Messrs. Blair & Co., Limited, of Stockton-on-Tees. The triple cylinders are 24 in., 40 in., and 65 in., with a stroke of 42 in., steam being supplied from two large boilers. The trial was in every way successful to all interested. Both the hull and machinery have been constructed under the superintendence of Mr. T. H. Jenkins, of Messrs, J. Jamieson & Co., of Hull. The *Everingham*, after adjusting compasses, sailed for Odessa under the command of Captain Newlove.

Heemskerk.—On December 7th this vessel was taken to sea for trial, from the yard of Messrs. Cochrane & Cooper, Limited, where she has been built by them to the order of Messrs. Van Vliet & Co., of Ymuiden, Holland. The vessel (of which we gave particulars in our November issue, page 370) is the sister ship to the s.s. *Barendez*, built and tried by the same firm, and has been designed and constructed under the supervision of Messrs. Flannery, Baggallay & Johnson, of London and Liverpool. An exhaustive trial of the machinery was made, everything proved satisfactory and the vessel sailed on her maiden voyage.

Stanleyville.—On December 7th the fine twin-screw mail and passenger steamer *Stanleyville*, built by Sir Raylton Dixon & Co., Limited, Cleveland Dockyards, Middlesbrough, to the order of Messrs. Elder Dempster & Co., of Liverpool, for the Compagnie Belge Industrielle du Congo, of Antwerp, proceeded to sea under the command of Captain G. B. Sparrow. This vessel is intended to run in the Belgian Mail Line between Antwerp and the Congo, and is the seventh vessel built by Sir Raylton Dixon & Co., Limited, for the same trade. Her dimensions are:—382 ft. by 46 ft. by 25 ft. moulded. Accommodation is provided in most spacious and handsomely fitted cabins for 108 first-class and 80 second-class passengers, with large dining-room in house on deck panelled in marble and inlaid wood. The smoking rooms and cabin entrances are elaborately fitted and decorated, and the vessel is lighted throughout with electric light. A powerful refrigerating machine with large cooling chambers is also provided for the conveyance of fresh meat, provisions, etc. Twin-screw triple-expansion engines have been fitted by Messrs. the Wallsend Slipway and Engineering Co. Limited, Newcastle on-Tyne, having cylinders 21½ in., 34 in., 59 in. by 42 in. stroke, supplied with steam by four single-ended boilers, working at 180 lbs. pressure, and fitted with Howden's system of forced draught. The hull and engines have been built under the personal supervision of Mr. Butterworth. A number of friends were on board during the trial trip, which passed off most successfully, the vessel afterwards proceeding to Antwerp.

Glencoe.—On December 9th the s.s. *Glencoe*, the first of a fleet of seven built by A. & J. Inglis, Glasgow, for Mr. R. G. Reid, of Newfoundland, was tried on the Firth of Clyde with satisfactory results. The *Glencoe*, though of moderate size, has been fitted up in the most comfortable manner for passengers, the first-class being amidships, the sleeping cabins on lower deck, and the saloon above main deck in a steel deck house lighted by large square ports. She is electrically lighted throughout, and a powerful searchlight is placed on the upper bridge to facilitate entering harbour in the night time. The speed on trial was 12·8 knots, which was maintained with ease.

Eduard Bary.—On December 12th the new steamer *Eduard Bary*, built by Messrs. Ropner & Son, of Stockton-on-Tees, to the order of Messrs. Furness Withy & Co., Limited, of West Hartlepool, for account of Mr. Paul Morch, of St. Petersburg (of which we gave particulars in our December issue, page 417), made her official trial trip in the Tees Bay. After the adjustment of compasses, she proceeded on her run to the Tyne to load for the Mediterranean. The vessel has been built under the inspection of Captain Ingersley, the owner's superintendent surveyor, who was present at the trial trip, and who expressed entire satisfaction with the vessel in all respects.

Hesperides.—On December 13th the steamship *Hesperides*, which has been built by Messrs. Bartram & Sons, Sunderland, for Messrs. R. P. Houston & Co., Liverpool (of which we gave particulars in our Launch columns, December issue, page 415), was taken for a trial trip. The weather was very stormy, but the vessel showed first-rate seagoing qualities, and attained a speed of 14 knots, everything working smoothly and satisfactorily. At the completion of the trial trip the *Hesperides* proceeded to Glasgow, under the command of Captain Marsh.

British Prince.—On December 14th the finely modelled steel twin-screw steamer *British Prince*, built by the Palmer's Shipbuilding and Iron Co., Limited, Jarrow-on-Tyne (of which we gave particulars in our Launch columns December issue, page 415) was taken out to sea for her official steam trials. The engines, which have also been constructed by the Palmer's Co., are of the triple-expansion twin screw type, with cylinders 26 in., 43 in., and 71 in. diameter, by 48 in. stroke, steam being supplied by two double-ended boilers, 15 ft. 3 in. diameter by 17 ft. 6 in. long, and two single-ended boilers 15 ft. 3 in. diameter by 11 ft. long, with a working pressure of 190 lbs. During the trial the engines worked in a highly satisfactory manner.

Hope.—On December 14th the trial trip of the steam trawler *Hope* took place and proved highly satisfactory, a speed of 10¼ knots being obtained on the measured mile. The vessel (of which we gave particulars in our December issue, page 421) was built by the Irvine Shipbuilding and Engineering Co., Limited, for the Peterhead Trawling Co., Limited.

Manchester Commerce.—Lately the trial trip of the *Manchester Commerce* took place in Hartlepool Bay, the results being most satisfactory. The vessel (of which we gave particulars in our Launch columns, September issue, page 283) has been built for the regular Canadian service of the Manchester Liners, Limited, by Messrs. Furness, Withy & Co., Limited.

The Marine Engineer.

LONDON, FEBRUARY 1, 1900.

ALTHOUGH seamen are excluded from the benefits of the Workmen's Compensation Act of 1897, other parts of the shipping industry constitute one of the largest employments to which this statute applies. The very high rates payable for insuring the liability of employers in this trade for compensation to their workmen who suffer accidental personal injuries in the ordinary course of their labour became a serious and vexatious grievance for several months after the Act came into force. It may, however, be now justly stated that there are but comparatively few complaints about the amount of premiums charged by the insurance companies for undertaking the liability referred to, on account of the increased keenness of competition for such risk. Indeed, so great is the scramble for this and other risks under the Workmen's Compensation Act that, it has been well said by a contemporary on this point, so strong are the efforts to secure this business that they are but little restrained by prudential considerations, and that the order of the day concerning employers' liability insurance appears to be, "Get business—profitably if you can—but in any case get business." As regards the rates payable for different classes of risks in the shipping trade, these vary greatly, and also often materially differ from similar risks in the same locality. The average rates for shipbuilders and ship repairers range from 10s. to 25s.; for marine engineers, from 7s. 6d. to 12s. 6d.; and for loaders and unloaders generally, from 25s. to 35s.; and for stevedores only, from 35s. to 50s. per cent. on the amount of wages paid. Some insurance offices will not undertake stevedores' risks. We have been informed by leading insurance officials that one large shipbuilding company on the Thames have had full employers' liability policies granted to them very recently at a premium of 5s. per cent. This is an extremely low rate, and it was refused by several of the insurance offices. About a year ago, or a little earlier, this shipbuilding company would have had to pay 30s. per cent. of the wages payable for the same risk to the then tariff insurance companies, and about 20s. nine months ago; whilst about half these rates would have been required for the same business by the non-tariff offices. As there is practically no limit to the amount of compensation to be paid in the event of injuries which involve permanent disablement, the Workmen's Compensation Act is very unsatisfactory to employers. It has been advocated that specific sums should be paid as compensation for specific injuries according to scale, so as to avoid accumulating liabilities and their dangers, and to correct the present inequalities of compensation payable to young and old in the event of loss of limbs and other serious personal injuries. It has often happened that there has been reasonable doubt as to whether the injury to a workman resulted from the negligence of the employer or of some person entrusted with superintendence and authority; and, as it is possible to recover full wages in regard to such injury under the Employers' Liability Act of 1880, with some amounts for medical fees, pain, and suffering, many men have claimed compensation under that statute instead of under the 1897 Act. In cases, however, when the injury has caused permanent, partial, or total disablement, claims have been made under the latter Act, because there is no limit to the time for which compensation can be recovered. The consequence is that in many instances the injured man has refused to accept half his weekly wages when offered by his employer in order to bring an action under the 1880 statute, or at common law, in the hope of being awarded heavy damages. It has been recommended that, to prevent money being wasted in legal proceedings which should have gone in compensation in consequence of claims being thus made, the law should be so altered that all claims for personal injury to workmen for accidents in the course of their employment should only be made under the Workmen's Compensation Act, and on the basis therein stated for ascertaining such compensation. Several important decisions have been pronounced in the Court of Appeal and the Court of Session of Scotland, respecting claims for compensation under the statute, of such great interest that we think it right to refer briefly to them. In the case of "Flowers *v.* Chambers" it was held that employment on a ship lying in a dock does not come within the Act, nor does employment on staging affixed to the outside of a ship, as decided in the case of "Durrie *v.* Warren & Co." It was held in the case of "Medd *v.* D. & C. MacIver" that iron gangway doors in the side of a ship through which cargo is taken and discharged are not plant used in the process of loading and unloading, and therefore a workman who was injured in closing these doors could not recover compensation for such injury. A dock, wharf, quay, warehouse, machinery, or plant does not come within section 7 of the Act, according to the judgment in the case of "Hall *v.* Snowden, Hubbard & Co., unless some provision of the Factory Acts is applied to it by the Factory and Workshop Act, 1895, and some such provision has been enforced with regard to it. It was held therefore that a wharf which abutted on the Regent's Canal, and which was used for loading mud or street sweepings into barges, and on which wharf there was no machinery used, was not a factory within the Workmen's Compensation Act. It was held in the case of "Chambers *v.* Whitehaven Harbour Commissioners" that employment on a hopper which is discharging one and half mile out at sea mud, which has been taken from a harbour by the workmen using a steam dredger, is not, within the meaning of this statute, employment on, in, or about an engineering work. A ship in dock was unloading by means of an hydraulic crane standing on the quay. It was decided in the case of "Woodham *v.* Atlantic Transport Co." that employment on the ship, at the end of the chain worked by the crane, was employment in, on, or about a factory, as the crane was machinery or plant used for unloading the ship to the quay. These six cases were decided by the Court of Appeal. The next three to which we will refer were adjudicated in the Court of Session of Scotland. In that of "the Aberdeen Steam Trawling and Fishing Co. *v.* Peters" it was held that machinery on board ship, although used in dock for loading or unloading, is not a factory within the meaning of the Factory and Workshop Act, 1895, and consequently not within the meaning of the Workmen's Compensation Act; and employment on this machinery is not an employment to which the latter statute applies. In the case of "Barclay, Curle & Co. *v.* McMillan" a workman was injured whilst working on a ship which had been removed from the shipbuilding yard to a dock about two miles away. In a claim under this Act it was held that the dock was "near" the yard, according to the interpretation of sub-section 3 of section 7 of the statute, and the Court awarded compensation. Lastly, in the case of "Jackson *v.* A. Rodger & Co.," a firm of shipbuilders, whose shipbuilding yard was at Port-Glasgow, contracted to build a ship and engines. After the ship had been constructed at Port-Glasgow, and launched there, she was sent from that place to the Cessnock Dock, Glasgow, between 15 and 20 miles away, to have her engines erected and fitted there by a firm of engineers with whom the shipbuilders had contracted for the supply of the engines. Whilst the ship was lying in this dock having her engines put in, a workman in the employment of the firm of engineers was injured whilst working at the undertaking. It was decided that under the Workmen's Compensation Act, section 7 (2), and the Factory and Workshop Act, 1895, section 23 (1), the shipbuilders were "occupiers" of the dock as a factory at the time when the accident occurred, and were consequently liable as the "undertakers" to pay compensation to the injured workman. The Lord Justice Clerk and Lord Trayner were of opinion that the place where the accident occurred was not a dock, river, or tidal water "near" the shipbuilders' yard within the meaning of section 7 (3), of the Workmen's Compensation Act. Another significant result of this Act is the non-employment of very many men over a certain age, and the discharge of many old workmen. The cause of this is said to be that the older the workman is the greater is his risk of having a serious accident. This system is mostly adopted by those employers who are uninsured, or join mutual associations. It is stated in the *Review* that this fact has probably caused "more heartburning amongst trade unionists than any other outcome of recent legislation, and it has been rightly argued that if the effect of the passing of the Act is to throw out of employment thousands of well-conducted and experienced workmen, merely because they have grown old in the service of their employers, then the sooner some well-conceived scheme of old-age pensions is started the better it will be for society at large." Insurance companies, on the other hand, beyond stipulating that reasonable precautions should be taken to guard against injuries to workmen by their employers, undertake the liability of the latter for their injuries without imposing any condition upon the employers as to whether their workmen should be young or old, hale or infirm; and this practice has no perceptible influence on premiums having regard to the great extent of accident insurance business.

THE present scarcity in the coal supplies is a serious matter for all steamship and engineering works proprietors. We think the present excessively inflated prices, due to exceptional demand, are not likely to last when the higher prices have produced the natural result of further supplies from all quarters. It must not be forgotten that Great Britain is not the only source of coal supply. We may not think much, and probably with justice, of the Belgian, French, or German coal, but it may not be generally known that already the United States are only about six million tons behind Great Britain as a coal-producing State, and so rapid has been the rate of increase that the United States will probably soon head the list. Within the last twenty years the output of the United States has doubled. The coal fields are also there yet almost virgin, so that the labour of getting is small, and it is credibly reported that coal is raised at the pit head in the United States for an average cost of 4s. 9d. per ton. This is less than the average rate in the United Kingdom or on the Continent. It is, therefore, the cheapest coal in the world except that of British India, which is computed to cost only 3s. 8d. at the pit. It is stated that West Virginia has 16,000 square miles of coal fields, as compared with 12,000 in Pennsylvania, although the output from the former field is as yet only one-tenth of the latter. Of last year's production 55 per cent. was from the Pennsylvania coal fields, consequently other fields in West Virginia, in

Illinois, in Ohio, and in Alabama, have hardly yet been touched. At present it is reported that considerable supplies are on their way from the United States to the Canaries, to Marseilles, Barcelona, the River Plate, Rio Janeiro, and the West Indies, which will soon remove the excessive demand upon the British supplies, and should soon bring prices down.

THE building of ice-breakers for Russia has now developed this class of vessel into a scientific success. We see that the *Odessa* has just arrived at the port of that name for service there to keep open the port for a period largely in excess of that usual, if not for the entire winter. More serious ice troubles are encountered in the Baltic than in the southern seas, and already the *Ermack*, the joint design of Vice-Admiral Makaroff and Mr. Arthur Gulston, of Newcastle-on-Tyne, has already made a name by her services in clearing navigable ways through the ice of the Baltic to the harbours of Cronstadt and Revel. She arrived at Cronstadt with the ice 18 in. thick, with a good deal of snow on the top, but the *Ermack* seems to steer and move as well in such ice as in open water. She steamed through this ice at 6½ knots up to the sea-wall, and entered the harbour through an entrance 95 ft. wide, the beam of the ship being 71 ft. She swung once inside the harbour, and one charge astern put her into her berth alongside the coal-store. Some manœuvres were made in ice of about 2 ft. to 3 ft. in thickness, and the turning circle was found to be about 600 ft., the length of the vessel being 305 ft. With 3,000 tons of coal on board, she has a displacement of 8,000 tons. At the stern are three screws, one in the centre and the other two one on either side, as in twin-screws. She has also a fourth screw forward in her bows, but this is not for propulsion so much as for the shattering of the ice and the formation of the stream under the hull, or away from the bows when going astern to shift loose pieces of ice which may have lodged under the ice field or under the vessel. Her engines can develop 8,000 H.P., and in open water she can make a speed of 15¼ knots. The whole of the propelling machinery is designed with 35 to 60 per cent. excess margin for strength above the requirements of Lloyd's and the Board of Trade; and her propellers are of nickel steel, and so strongly fashioned that they will stand the shock, as will also the engines, of being brought up suddenly by impact from the ice if she cannot break it. Snow on top of the ice seems to be the most difficult form of resistance for this vessel to overcome. If the ice is clear, her overhanging prow rides on the ice and breaks through by the sheer weight of the vessel, aided no doubt by the piercing or shattering action of the small forward propeller. The admiral has such confidence in his vessel that he has taken her during last summer for a pleasure trip through the Polar seas. He traversed 230 miles of Polar ice during five weeks, and he believes that such a vessel, or a pair of such vessels, adapted to aid one another stem to stern, might easily pierce to the North Pole in a summer season. She thinks nothing of ice 14 ft. thick. We have often said that it will require a marine engineer to reach the North Pole.

RECEIVER DROP IN MULTIPLE EXPANSION ENGINES.*

BY PROFESSOR R. L. WEIGHTON, M.A., VICE-PRESIDENT.

THE object of this paper is to give and explain the results obtained from certain trials recently completed on the experimental engines at the College of Science, Newcastle-upon-Tyne. These trials were made with a view to determine the most economical point of steam cut-off in the larger cylinders of multiple-expansion engines—that is to say, in the low pressure cylinder of double expansion, in the intermediate and low pressure cylinders of triple expansion, and in the two intermediate and low pressure cylinders of quadruple-expansion engines.

The importance of this question was brought into view very early in the course of the trials generally with those engines. In the last paper which the writer had the privilege of bringing before the Institution the matter was referred to as requiring elucidation.†

As far as the writer is aware, there has hitherto been no experimental determination of the point in question. During the course of engine trials having various objects in view, it very soon became evident that the point of cut-off in the larger cylinders had a considerable effect upon the results obtained, economical and otherwise. In order that this disturbing cause should be eliminated from the results, it appeared that prior to any further experiments it would be necessary to determine what *was* the best point of cut-off in each cylinder. Independent of this, however, it was also obvious that the question had in itself an important bearing upon practice, from the point of view of engine design, proportions, and working generally. For this twofold reason the several series of trials here recorded were undertaken.

The specific object of the trials was to determine *the* receiver drop (often referred to as free or intermediate expansion) between any two cylinders, with which was associated maximum economy, and incidentally to discover, in addition, the general effects of varying amounts of receiver drop in given conditions.

The principal results are tabulated in Tables I. to V., and are graphically recorded on Diagrams I. to X.

Table I. refers to results obtained from triple-expansion engines having cylinders 7 in., 15½ in., and 23 in. diameter. The stroke in all cases is 18 in. From this table it will be seen that the method adopted was to change or vary only one condition at a time, viz., the cut-off, first in the intermediate pressure and next in the low-pressure cylinder, all the other conditions being kept as nearly as possible constant and unvarying throughout the trials of a series.

During the first six trials the intermediate pressure cut-off was varied, and during the second six the low pressure cut-off was the condition which was varied. In Diagram I. the results of Table I. are recorded. The base line represents in inches the point of cut-off in intermediate pressure and in low pressure respectively. Ordinates represent: (1) Water used per hour. (2) Brake horse power. (3) Water used per brake horse power per hour.

The water used per hour at constant revolutions—in these tables 140 revolutions per minute are chosen throughout—lies in a straight line, marked "W" on the diagram. This line shows that the water consumption at constant revolutions increases with the cut-off in the larger cylinders, and that the rate of increase is much greater when the intermediate pressure cut-off is made later than when the low pressure cut-off is made later. A notable exception to this occurs when the jackets are in use, Diagram VI., in which case the consumption is constant at all cut-offs, as would naturally be expected from the temperature-equalising effect of the jackets. The brake horse power lies in a curve, which curve attains in most of the trials a maximum height, and then falls as the cut-off is further increased. The water per brake horse power, being the straight line ordinates divided by the curve ordinates, lies also in a curve. The lowest point of this curve indicates the cut-off at which maximum economy of water per horse power occurs. In Diagram I. the maximum economy cut-off in the intermediate pressure cylinder is about 6⅝ in. and in the low-pressure about 10½ in.

---

* Read before the North-East Coast Institution of Engineers and Shipbuilders, in Newcastle-on-Tyne, on January 19th, 1900.

† See "Transactions of the North-East Coast Institution of Engineers and Shipbuilders," vol. xiii., page 88.

Table II. and Diagram II. refer to cylinders 7 in., 10½ in., and 23 in. diameter, and here it will be noticed that the best cut-offs occur in the intermediate pressure cylinder at 11 in., and in the low pressure at about 6⅝ in.

Diagram III. refers to cylinders 10½ in., 15½ in., and 23 in. diameter, and shows the best cut-offs in both intermediate pressure and low pressure cylinders to be about 10¾ in. In this diagram and the next one let it be noted that the boiler pressure is 120 lbs. per square inch as against 210 lbs. in the two previous diagrams.

Diagram IV. shows results under exactly the same conditions as No. III., with the single exception that the high pressure cut-off is 9 in., instead of 6 in., as in No. III. This series was made to discover what influence—if any—the total number of expansions had upon the maximum economy cut-offs in the larger cylinders of the engines. It will be seen that the best cut-off in Diagram IV. for both cylinders is about 10¾ in., which agrees with the result of Diagram III. The high pressure cut-off point has therefore no apparent effect, this is confirmed in Diagram V. for quadruples, referred to further on. Neither has the boiler pressure any effect upon the maximum economy cut-off, as is evidenced by a comparison of the cut-offs in low pressure and intermediate pressure of Diagrams I. and II. respectively with the cut-offs in intermediate pressure and low pressure of Diagrams III. and IV. These cut-ofts, taking them in the order mentioned, are 10½ in., 11in., 10¾ in., and 10¾ in., the cylinder ratios being in all these cases practically the same, viz., 2·195 and 2·296.

Diagram V. gives the curves of water used per brake horse-power per hour for quadruples having cylinders 7 in., 10½ in., 15½ in., and 23 in. diameter, at various degrees of total expansion of the steam, ranging from that corresponding to a high pressure cut-off of 3 in., down to a cut-off of 12 in.

From this diagram two conclusions may be drawn: first, that degree of total expansion does not affect materially the point of maximum-economy cut-off in the larger cylinders, thus corroborating the comparison of Nos. III. and IV.; and second, that the best points of cut-off in the larger cylinders of quadruples

are governed by the same influences as in triples. The ratios of the quadruple cylinders are practically all the same, and are identical with the ratios of Diagrams III. and IV. The best cut-off is about 10½ in. on the average. This is to be compared with the best cut-off in Diagrams I., II., III., and IV. for the same cylinder ratio.

Owing to the space they would occupy, it has not been thought desirable to give tables for all the diagrams. Those corresponding to Diagrams III., IV., and V. are therefore omitted.

All the trials so far referred to were made without jacket steam. In order to determine what influence jackets might have on the results, a series of trials were made, the results of which are given in Table III. and Diagram VI. The curves of this diagram are to be compared with those of Diagram II. when the low pressure cut-off was varied.

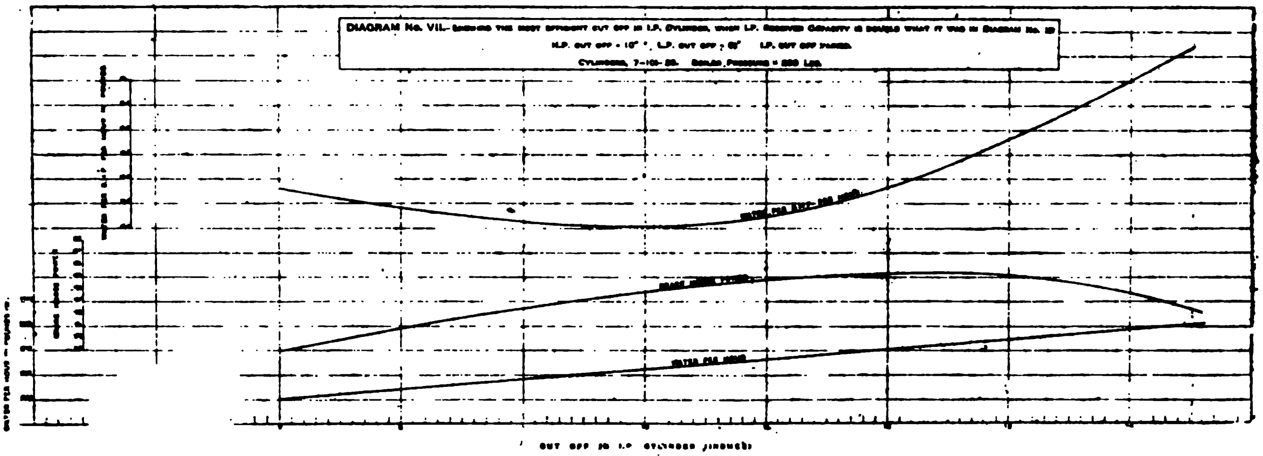
The best cut-off in the low-pressure cylinder with steam in the jackets is about 5¾ in., as against 6⅜ in. without jacket steam. The legitimate conclusion seems to be that jackets have no material effect upon the cut-off of maximum economy.

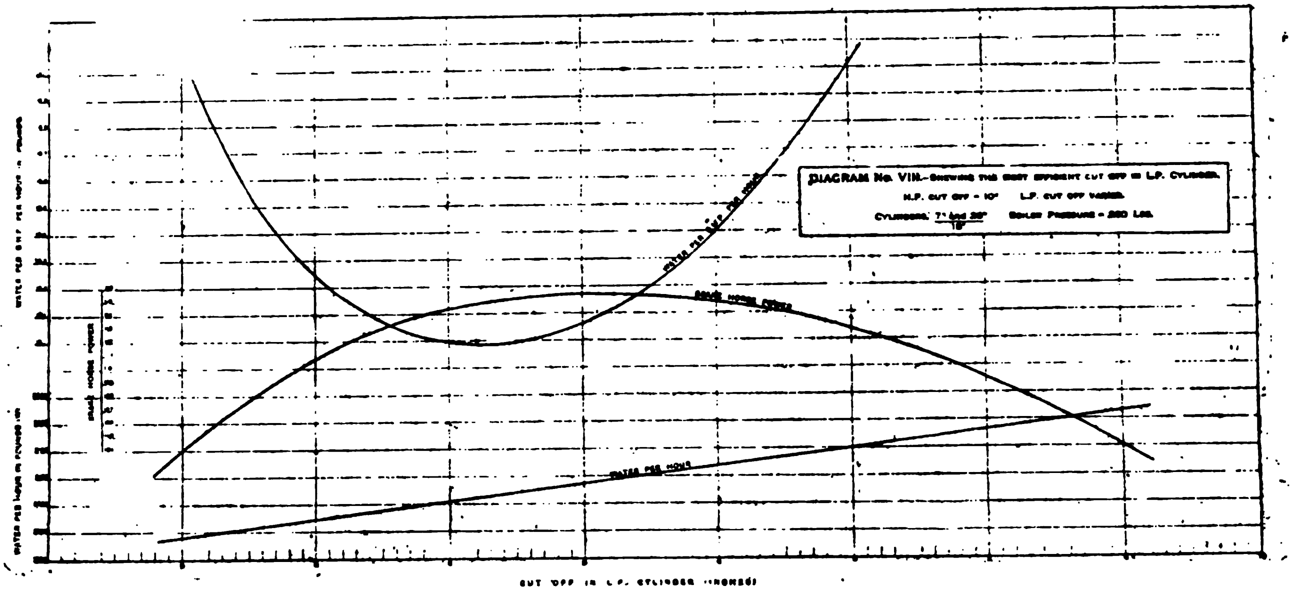
Table IV. and Diagram VII. show results of trials made with the intermediate-pressure receiver capacity doubled as compared with its capacity under the conditions of Diagram II. An inspection of Diagram VII. shows that the best cut-off in the intermediate-pressure cylinder is practically identical with that of Diagram II. It may therefore be concluded that variation in receiver capacity—at least within limits generally possible in practice—has no sensible effect upon the maximum economy cut-off in the larger cylinders.

It was not thought necessary in the two last series of trials to duplicate the experiments by varying the cut-off in the other cylinder, as had been done in all the previous trials.

Table V. and Diagram VIII. give results from the engines arranged as double expansion or compound engines, with cylinders 7 in. and 23 in. diameter, corresponding to a cylinder ratio of 11. In this case maximum economy cut-off in the low pressure occurs very early in the stroke, viz., at about 4⅜ in.

Of course the cylinder ratios in these trials have been purposely chosen as different from each other as the design of the engines allowed, in order to show as definitely as possible the connection which subsists between cylinder ratio and the cut-off corresponding to highest efficiency. This paper does not profess to deal with the entirely distinct questions of the best cylinder ratios or the best total number of expansions for steam of different pressures. The particular values of the cylinder ratios used in these trials are therefore of no economic significance, except in so far as they are associated with the best cut-offs in the larger cylinders of the engines. And it is obvious that the more widely the experimental ratios differ from each other the more clearly will their special connection with the point we are in search of be indicated. Hence the reason for the trials of Diagram VIII., and such an unusual ratio as 11 to 1.





An examination of the whole of these results shows that the one and only factor which affects materially the cut-off of maximum economy in any one of the cylinders following the high pressure cylinder is the ratio between the cylinder in question and the immediately preceding cylinder. In other words, the ratio between any two successive cylinders is the one factor which determines the point of of maximum economy cut-off in the second of the two cylinders.

In the subjoined table, column II. sums up the results from all the trials, in the shape of the best cut-off for each value of cylinder ratio (R). The figures in column III. represent maximum economy ratios of free expansion in the receivers.

I. Any Cylinder Capacity. / Preceding Cylinder Capacity. R.	II. Best Cut-off in Inches of Stroke.	III $R \times \frac{\text{Best Cut-off}}{\text{Stroke.}}$
2·195	$10\frac{1}{2}$	1·28
2·195	$10\frac{1}{2}$	1·28
2·195	$10\frac{1}{2}$	1·28
2·195	$10\frac{3}{4}$	1·31
2·195	$10\frac{3}{4}$	1·31
2·296	10	1·275
2·296	11	1·4
4·86	$6\frac{3}{8}$	1·72
5·04	$6\frac{5}{8}$	1·85
11·00	$4\frac{3}{8}$	2·67

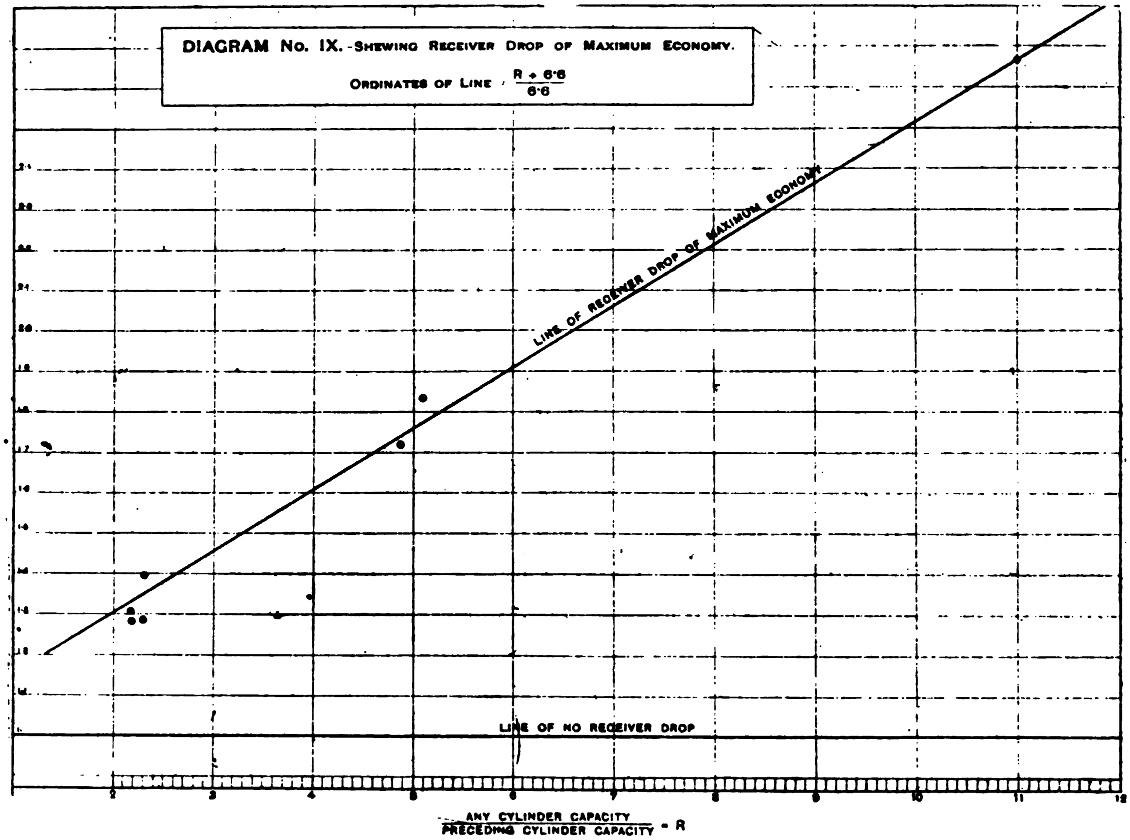
These figures are therefore proportional to the receiver drop, with which is associated maximum economy in the several cases. The values in column III., when plotted to a base of R, as in Diagram IX., will be seen to lie practically in a straight line. The equation to this line will be found to be as follows:—

$$R \times \frac{\text{Best cut-off}}{\text{Stroke}} = \frac{R + 6\cdot 6}{6\cdot 6}.$$

From this follows the best cut-off in terms of R, viz.:—

$$\frac{\text{Best cut-off}}{\text{Stroke}} = \frac{R + 6\cdot 6}{6\cdot 6\,R}.$$

This last expression is an equation to a curve which is plotted in Diagram X., and from which diagram the best cut-off for any cylinder ratio can be read off by inspection in fractions of the stroke. On the same diagram is shown, merely for comparison, the curve of cut-off for no receiver drop.

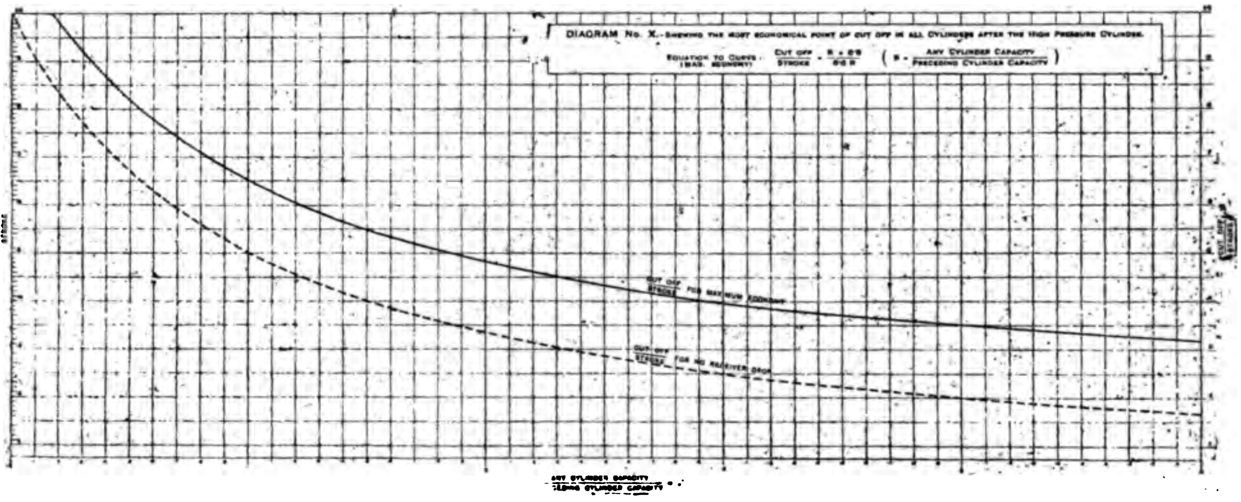


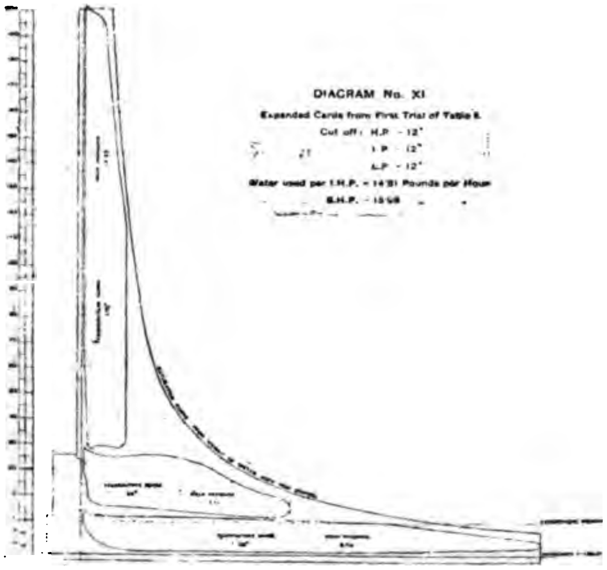
In the tabulated values of R, allowance is made for clearances, and also for areas of piston rods. By "best cut-off" is meant the particular cut-off in the larger cylinders at which maximum economy occurs.

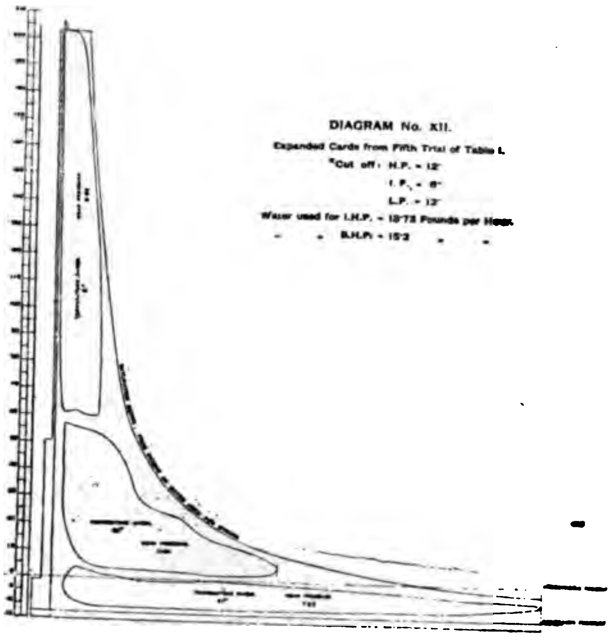
It was very noticeable in the working of the engines that late cut-offs were distinctly conducive to smoothness of running, uniformity of turning moment, and durability of bearings; whilst early cut-offs were always accompanied by a comparative absence of these desirable qualities. With early cut-off in any cylinder the engines always appeared to labour heavily, and to work with jars and thumps, which symptoms entirely disappeared when the cut-off was increased. Owing to the absence of a fly-wheel any tendency towards inequality of turning was rendered very evident, and was, in addition, automatically recorded on the brake diagram.

Moreover, late cut-offs, being associated with smallness of valve travel, and all that this entails, are *constructively* preferable to early cut-offs. Late cut-offs also favour handiness in starting and reversing. From many points of view, therefore, it follows that late cut-offs are greatly preferable to early cut-offs. But, as shown by Diagram X., late cut-offs, in the larger cylinders at least, can only be adopted with economy when the cylinder ratios are small. This leads to the conclusion that, other things being equal, the most satisfactory engine as regards smoothness of working, durability, and economy, in so far as affected by receiver drop, will be that engine which attains a given degree of total expansion with the smallest cylinder ratios, or at least with ratios not exceeding a certain limit.

It was necessary to bear in mind that, although results are here given from double, triple, and quadruple expansion, no valid comparison can—on the results as they now stand—be instituted between these three methods of working. To institute such a comparison all the different results must be reduced to a common basis as regards vacuum, barometer, steam pressure, &c., and this has not been done in the paper because not necessary for the purposes in view.







In Diagrams XI. to XV. inclusive, are given some samples of expanded indicator cards. These particular cards have been selected from a very large number, in order to show the effects, by contrast, of extreme variations in cut-off. The notes on the diagrams are sufficiently explanatory without further reference. The "mean pressure" on each card is that reduced to the low pressure cylinder. It therefore represents comparative power in the several cylinders. It will be noticed that there is no marked evidence that maximum economy is associated either with equality of power or with equality of temperature ranges in the several cylinders.

Deductions from the Results.—The following is a summary of the more important of the deductions which may be made from the results of the trials:—

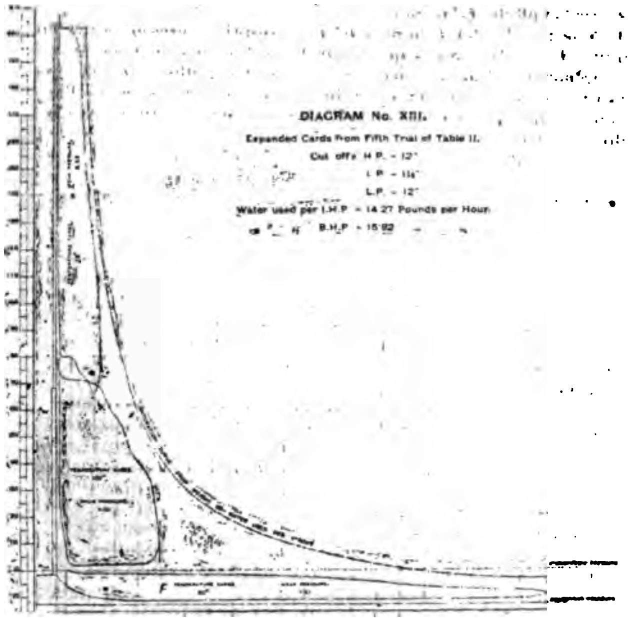
1. For maximum economy of consumption, steam must be cut off at a certain point of the stroke in the larger cylinders of multiple-expansion engines. For any given cylinder this point depends solely upon the ratio between the capacities of that cylinder and the preceding cylinder (R), and is expressed as follows, viz.:—

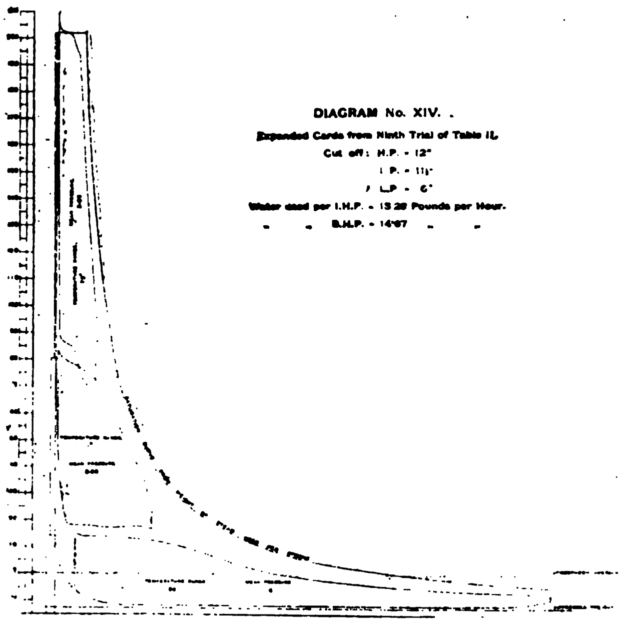
$$\frac{\text{Maximum economy cut-off}}{\text{stroke}} = \frac{R + 6{\cdot}6}{6{\cdot}6\,R}.$$

This is the principal and most important conclusion deduced from the trials, and—as already explained—is embodied in Diagram X.

2. It follows from No. 1 that the cut-off in the larger cylinders, once fixed, should never be altered, whatever may be the cut-off in the high pressure cylinder, or the steam pressure employed. This means that automatic expansion governors, or linking-up gear, should act upon the high pressure cylinder only, if maximum economy at all powers is to be preserved.

3. The cut-off in the larger cylinders affects materially the total horse power developed by the engines. As regards the low pressure cylinder of triples, and the second intermediate

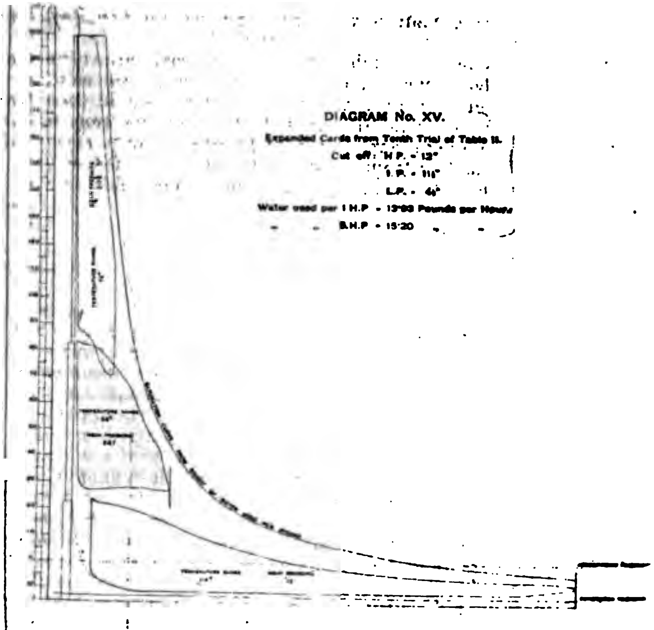




and low pressure cylinders of quadruples, maximum power cut-off in these cylinders coincides with the cut-off of maximum economy. As regards the second cylinder of triples and quadruples, maximum power cut-off is very considerably later than that of maximum economy. In compounds the maximum power cut-off in the low pressure cylinder is only slightly later than that of maximum economy. See Diagrams I. to VIII.

4. When cylinder ratio (R) is small—say from 2 to 2·5—the cut-off in the larger cylinders may be varied considerably from that corresponding to maximum economy, without any appreciable fall in economy. But when R is large, there is no such permissible deviation without entailing as a consequence a fall in efficiency.

5. With given efficiency in receiver drop, smallness of cylinder ratio is conducive to smoothness of working, uniformity of turning, durability, handiness in starting and reversing, and compactness of design.



MOSSBERG'S PATENT ROLLER THRUST BLOCK

In our issue of October last year we gave a description and illustrations of the patent roller bearing of the Mossberg Roller Bearings, Limited, of 68 Victoria Street, London, S.W., which clearly set forth the general principles and arrangement of parts which obtain in these devices. We have now the pleasure of illustrating the roller bearing in the form of a thrust block for a propeller shaft. By reference to the adjoining diagram it will be seen that Fig. 1 is a perspective view of the thrust block complete, whilst Fig. 2 is a similar view with the cover over the roller elements removed.

The block generally is in the main casting similar to those now used with horseshoe collars, the central portion or recess forming an oil bath. This main casting carries a cylindrical bearing at the fore and aft ends, within which the shaft is journalled. The shaft carries centrally disposed the live roller path collar, a path being arranged upon both faces. This collar is in halves and bolted together by through bolts around the shaft.

The stationary roller paths are arranged one on each cylindrical bearing; these are also in halves. Between the pairs of live and stationary paths rings carrying the rollers are inserted. These rollers are conical, so that the peripheral speed along their length is proportional to the distance at which any particular part of the roller is situated from the centre of the shaft. These rings are also in halves, and are constructed to hold the rollers in place when the parts of the thrust bearing are being assembled.

The stationary paths are adjusted and set up in proper position relative to the live paths by means of set screws, two of which are arranged at each end of the main casting.

As an interesting fact relative to this particular class of bearing, we illustrate in Fig. 3 one of the Mossberg patent end thrust bearings loaded with 8,000 lbs., which, on actual test, we understand, only required a force of 20 lbs. at a radius of 10½ in. to overcome the friction due to such load, whilst with a plain bearing 400 lbs. pull was required. We presume this ratio of 20 to 1 was without any lubricant between the surfaces, as we have found, from actual experiments of a similar nature, that with lubricant the ratio was about 7 to 1.

We consider that any advance in the reduction of waste energy by friction is an important gain, and has an appreciable effect upon the final result, for by reason of the great improvements made in recent years with reference to steam as a motive fluid it is unreasonable to suppose that much greater improvement can be made in this particular direction, and hence the necessity for taking advantage of every improvement in mechanical devices to improve the general efficiency of the machine as a transmitter of power from a motor fluid.

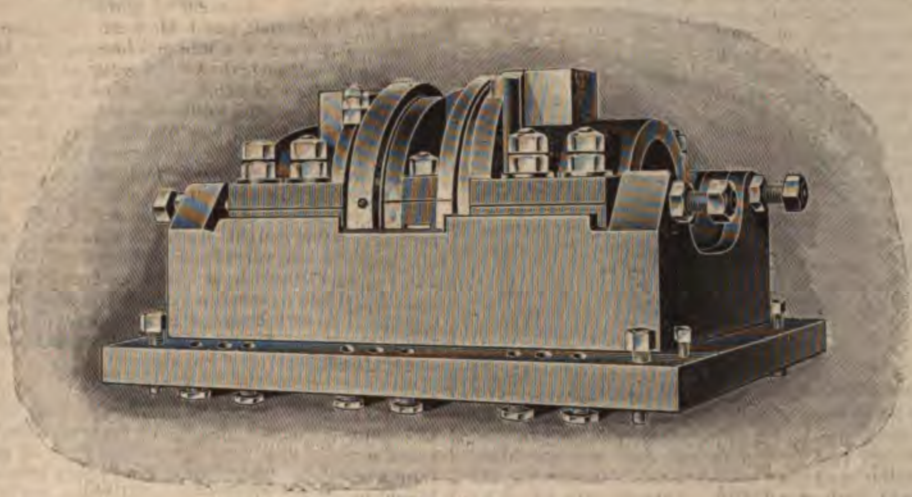

Fig. 2.

Mossberg's Patent Roller Thrust Block.

THE FLEETS OF THE MAIL LINES.

(From our own Correspondent.)

The Norddeutscher Lloyd

has increased its already enormous tonnage by a trifle of 19,339 tons in that it has taken over the fleet of the Scottish Oriental Steamship Company, Limited. The fleet in question is contained in some thirteen bottoms. Of these the largest and most modern is the screw steamer *Wong Koi*, built and fitted with triple-expansion engines by the Fairfield Company, of Glasgow, in the year 1896. This vessel has two sisters, the *Chow Tai* and the *Keong Wai*, built about the same time as herself and hailing from the same yard. Indeed, of the whole fleet, 11 are to be put down to Fairfield and the remaining two to Messrs. Caird & Co., of Greenock. The smallest and one of the oldest of the company is the *Bangkok*, built 15 years ago. She has compound engines driving twin screws. Her gross tonnage is but 307. The *Tai Chiow*, one of the largest boats, has recently been in trouble, having been in collision with a German steamship on the bar at Bangkok. The *Tai Chiow* was seriously damaged, the estimate of her repairs being put at about £3,500, and the time for executing them being computed to take 11 weeks. But the blame for the casualty is placed by the court of inquiry to the credit of the other vessel.

In the Atlantic service the Norddeutscher Lloyd Company's *Kaiser Wilhelm der Grosse* undoubtedly maintains her reputation as quite the fastest steamship at work. Exceptional causes may aid towards the accomplishment of an occasional exceptional run and mean speed for single day's runs, and even for whole voyages may be subject to some comment. But average speeds over long series of consecutives voyages are a very searching test, and the *Kaiser Wilhelm der Grosse* passes this triumphantly enough. Taking the average of 11 successive voyages in the year 1899, her average speed to the westward has been 21·84 knots, and to the eastward 22·13 knots. Her mean speed therefore on these 11 round voyages was, as near as may be, 22 knots at sea, summer and winter, clear and fog. She began the year 1900 with a record. Leaving Sandy Hook on the 4th January at 12.35 p.m., she had Cherbourg Breakwater abeam at 9.25 a.m. on the 10th. She had run a course of 3,077 miles in 5 days, 16 hours, with a mean speed of 22·63 knots. This beats her own record for the eastward crossing. Her runs were singularly even. The worst was that of the first day, which, of course, was 35 minutes short of its full time. That 35 minutes may be taken as being equivalent to, say, 12 miles. Her whole run in the broken day was 500 miles. Allowing for the fraction of time when she was not running, the day may be credited with 512 miles. This is only 25 miles worse than the run of the best day of the voyage, which, curiously enough, was the second day out. The sea was reported as "smooth" on the first day, when the run was worst, and "moderate" next day, when she did so well. The direction and force of the wind on these days are not stated, but it would be interesting to know these details.

FIG. 3.
MOSSBERG'S PATENT END THRUST BEARING.

We in this country are deploring the extinction of the sailing ship because of the supposed desirability of training deck officers and seamen to the management of sparred ships, but we are confining our efforts to meet the new situation by making arrangements in some lines of steamships for the carriage of apprentices who shall learn the art of navigation without ever having anything to do with canvas. The Norddeutscher Lloyd, on the other hand, believes that experience in sailing ships is essential if all the qualities of "the handy man" are to be brought out. So it is elaborating a scheme to train its future officers in a sailing vessel on the plan which was some time ago recommended by Lord Brassey and tried in a practical way by Messrs. Devitt & Moore, the well-known London sailing-ship owners. The Norddeutscher Lloyd's ship will give the youngsters a three-years' course at a charge of about £30 a year, inclusive of kit, board, and instruction. Whilst they are being taught their practical work their theoretical and general education will not be neglected, as a schoolmaster with university training will be borne in the vessel. The staff of the ship will comprise an experienced shipmaster, assisted by four officers, and an adequate crew of petty officers and seamen. From sixty to eighty cadets will be taken. Of these about twenty will be in each of the three years of the course. They will be treated for the first year of their time as ship's boys, for the second as ordinary seamen, and for the third as A B.'s. At the close of the third year junior positions will be found for them on board the steamships of the line. Though the ship is to be owned and managed by the Norddeutscher Lloyd for its own service, the Bremen school of navigation will aid the experiment and give facilities to the cadets when they come up to pass their examinations for their certificates of navigation. Marine engineers—who cannot avoid taking an interest in the development of the position which steam has brought to their shipmates, the navigating officers—will watch the progress of this experiment with some interest.

The "Paris."

After five months in dry dock at Milford the *Paris* has been again floated, and arrangements have been completed whereby she is to be thoroughly overhauled and modernised by Messrs. Harland & Wolff, who seem to have the confidence of all large shipowners—whether they be regular customers of the firm or not—in regard to these big overhauling jobs. In support of this remark I need only instance the lengthening of the *Scot*, built by Messrs. Denny, of Dumbarton, for the Union Company; that of the *Augusta Victoria*, built by the Vulcan Company, of Stettin, for the Hamburg-American Company; and that of the *China*, built by themselves for the Peninsular and Oriental Company. The *Paris*, when she leaves the Belfast yard, will do so under the name of an American city, and it is to be hoped that her old ill-luck has been left on the Manacles.

The "Meteoro."

It will be remembered that at the time of the Hispano-American War the Spanish Government bought some three Atlantic mail steamers for the purpose of fitting them out as auxiliary armed cruisers. None of the three ever went to sea, and two of them (one under the flag of La Compagnie Générale Transatlantique, and the other under that of the Hamburg-American Company) have returned to their old labours. The *Havel*, however, formerly owned by the Norddeutscher Lloyd, still remains the property of the Spanish Government, who have renamed her the *Meteoro*. They now wish to dispose of her, and have sought for tenders for her purchase. She is a single-screw steamer of about 7,000 tons, built ten years ago by the Vulcan Company, of Stettin. Her engines are of the five-cylinder triple-expansion type. The tenders, which had to be deposited on or before the 26th January, will be opened on the 3rd February. No offer of less than 2,000,000 pesetas will be entertained.

Liquid Fuel.

Most marine engineers are aware that the Shell Transport Company (of which Messrs. M. Samuel & Co. are the managers) owns a large and very up-to-date fleet of petroleum-carrying tank steamers. They are also probably aware that the later of these vessels are fitted with appliances for burning liquid fuel as an alternative to coal when it may be commercially advisable to do so. The burning of liquid fuel in these ships has now got beyond the stage of experiment, and it has been found that the results of its use are in many ways satisfactory. There is a great reduction in the weight of fuel to be carried—or what is the same thing, with an equal weight of fuel, a great increase of potential energy is stowed in the bunkers. Further than this, stokers are practically dispensed with, and the amount of work that the boilers are capable of is very largely increased. The relation of these facts is not quite news. Yet no shipowners seem to have used the knowledge till the Hamburg-American Company made the plunge. It is now announced that the shipowners in question have entered into a contract whereby supplies of oil fuel are to be provided for their vessels by Messrs. M. Samuel & Co. at Suez, Colombo, Singapore, Hong Kong, and Shanghai. Seven steamers of the Hamburg Company's eastern service are to be fitted for the consumption of this fuel, and the first vessel is to commence the use of it in May. The number of steamers so fitted, for which a supply is to be provided, can be increased to twenty, if the shipowners desire it and give due notice to that effect. The contract is to extend for ten years. If, as the experiments of Messrs. Samuel with the Shell Transport Company's steamer *Strombus* show, the consumption is reduced in the proportion of from 26 tons of Welsh coal to 18 tons of liquid fuel a day, whilst there is a coincident increase of half a knot in the speed of the ship although the number of boilers in action is reduced by one-third, it would seem that the Hamburg Company has done very wisely in making this new departure. But probably before 1900 is out we shall know whether or not the claimed advantages of the system have any serious, and as yet undisclosed, drawbacks to set against them.

Atlantic Passenger Traffic.

I am able to give a table showing the details of the New York passenger traffic in 1899, compared with that of the previous year.

Line.	No. of cabin passengers carried 1899.	Increase over those of 1898.	No. of steerage passengers carried 1899.	Increase over those of 1898.
Cunard	19,045	2,353	20,853	393
Norddeutscher Lloyd (from Bremen)	17,759	1,965	53,646	21,441
Norddeutscher Lloyd (from Mediterranean)	2,235	124	21,645	627
American	14,398	9,361	11,341	5,522
Red Star	4,315	434	20,120	8,232
White Star	12,741	2,469	25,208	4,444
Atlantic Transport	2,657	285	—	—
Hamburg-American (from Hamburg)	14,168	8,656	38,059	20,092
Hamburg-American (from Mediterranean)	426	*4	2,539	*1,614
Compagnie Générale	6,124	921	22,883	7,372
Nederland Line (from Rotterdam)	4,010	857	17,219	4,141
Nederlands Line (from Amsterdam)	135	*97	892	*303
Prince Line (from Mediterranean)	251	10	14,244	657
Fabre Line (from Mediterranean)	35	16	14,104	*1,484
Allan State (from Glasgow)	1,647	303	1,247	119
Anchor Line (from Glasgow)	6,182	1,102	5,512	1,385
Anchor Line (from Mediterranean)	14	*5	13,784	*1,804
Navigazione Generale Italiana (from Mediterranean)	80	80	8,838	8,838
Linha de Vapores (from Oporto)	70	25	1,515	848
Empreza Insulane de Navegaçao (from Lisbon)	140	22	1,369	444
Thingvalla (from Copenhagen)	752	73	3,463	804
Union (from Hamburg)	—	—	4,728	3,273
Various	281	5	551	234

* Figures marked with an asterisk are decreases.

From the figures set out above it will be seen that the Navigazione Generale Italiana has come into the competition during the year. It is also remarkable that there has been a great growth in traffic from French ports, for—although the steamships of the American, Norddeutscher Lloyd, and Hamburg-American lines, as well as some of the vessels of the Nederlands Line, now make calls off French ports and pick up passengers there—there is a distanct increase in the numbers carried by the purely French line, La Compagnie Générale Transatlantique. The decrease in the Hamburg-American Line's Mediterranean traffic is due to the fact that during the year its vessels made only five trips to the westward instead of eight, the number of the previous year. Their actual average number on each voyage showed a distinct improvement. The Anchor Line's Mediterranean service on the other hand, which also shows a decrease, made the same number of trips in each of the two years under comparison. Perhaps the most remarkable increase shown is that of the Atlantic Transport Company, which only carries one class of passengers. As one fewer trip was made in 1899 than in 1898, and as 785 more passengers were carried, we reach the remarkable result that the average numbers carried per trip rose in the year from 42¼ to 61¾ passengers, which is very nearly a 50 per cent. increase.

The Cape Lines, Limited.

Down to the time of writing nothing further has been disclosed with regard to the details and terms of the agreement for amalgamation reached between the Union and the Castle lines. Both offices are, no doubt, fully worked with the business brought to them by the South African War, and this extra matter may well take longer to get through than had been anticipated. But that it is going through admits of no manner of doubt. As the delay has come, however, the detailed history of the two lines may stand over till there is less pressure on the space in this column.

The American Line.

A very interesting and important statement, and one which bears very greatly on the future prospects of the American Mercantile Marine, has been made by Mr. Clement A. Griscom, the president of the International Navigation Company, in his evidence before a committee of the United States Congress. He stated as a fact that the working of his line was carried on at a net annual loss of no less than 415,600 dollars. He further added the significant remark that unless some new—and presumably more beneficial—arrangement was reached, his company would be compelled at the close of the current contract to re-register its vessels under some flag which would *not* be the Stars and Stripes. Now, as is well-known, the company of which Mr. Griscom speaks has many important advantages from the American Government over and above the extremely large subsidy which is paid to it. As an instance of the little aids which it receives may be mentioned the fact that an agreement for an international parcel post has never been reached between our own Post Office and that of the United States. Nor is it likely that whilst the American Line flies the United States flag, such an arrangement will ever be made. As the United States are a highly Protectionist country, the Custom authorities can make a parcel post into New York almost an impossibility. The policy of England being that of Free Trade, there is no difficulty in sending parcels to our ports unless indeed they contain spirits or tobacco. A privilege to a mail line to carry an eastward parcel post across the Atlantic would be almost valueless. That to the west is an important concession. The United States Government, who have the power to control the entry of parcels into New York, have given the privileges of a parcel mail to the private American steamship company, and there is no way in which a corresponding advantage can be given by our Government to our lines which work in competition with it. And yet in spite of all assistance and all fostering—not only by the American Government on the other side of the Atlantic, but even by the London and South-Western Railway on this side—it is practically admitted that the company is qualifying to follow the example of the famous Collins Line, which 45 years ago came to grief in its State-aided attempt "to run the Cunarders off the Atlantic."

THE NEW YO
PUBLIC LIBRA

The "Merrimac."

In last month's Fleets I referred to the steamship *Merrimac* of Messrs. Elder, Dempster & Co.'s fleet as seriously overdue on her voyage from Quebec to Belfast. The unfortunate vessel is now officially posted as missing. She was timber-laden on this last disastrous voyage, and was under the command of Captain Thomas A. Purcell. Her crew comprised about forty-two hands all told, and there would be a dozen or more cattlemen aboard. I give the names of the engineers who are reported as having sailed in her. Mr H. E. Collins, of Pill, chief engineer; Mr. J. Clue, of the Polygon, Clifton, second engineer; Mr. Thomas Beard, of Liverpool, third engineer; Mr. C. Houselander, of Keynsham, fourth engineer; Mr. W. W. Ballantyne, of Cardiff, fifth engineer. The donkeyman, Mr. J. W. Jones, though a native of Liverpool, was last resident at Avonmouth. The fact that Pill, Avonmouth, and Clifton are given as the addresses of so many of the ill-fated crew will be accounted for by the statement that the recent employment of the *Merrimac* had been in the line which Messrs. Elder, Dempster & Co. run between the Avon and the St. Lawrence.

American Mails.

Some time ago it was chronicled that the Saturday mail would leave Euston Station at 4.10 p.m. to catch the Sunday Cunarder at Queenstown, so that the long wait at the Irish port for the coming of the mail train might be curtailed. It was known that the delay at Queenstown was a great annoyance to passengers, as well as a serious expense to the shipowners, whilst, as ships got faster and more expensive to build and work, the delay tended to become more prolonged and to be in every way more aggravated. There was no corresponding advantage to the customers of the Post Office, for few letters are written in City houses on Saturday afternoon, so the change in regard to the Cunard mail was felt to be a beneficial one. After some experience of its advantages the mid-weekly mail has been treated in the same way, and with and after the sailing of the *Oceanic* on the 10th January, 1900, the long wait at Queenstown has been largely curtailed, owing to the earlier starting and acceleration in running of the mail train from Euston on Wednesday afternoon.

The War in South Africa

has largely affected the arrangements of the companies which carry the British New York mails. Both Cunard's and the White Star Line have sent their two reserve ships to work in the transport service. Each line has also sent a mail steamer for the same work. Thus the spare vessels, *Servia* and *Aurania*, of the one service, are busy and unable to take the place of the *Umbria* for Cunard's in the same way as neither the *Britannic* nor the *Cymric* is available to fill the sailing left blank by the engagement of the *Majestic*. Thus, on January 21st, from Queenstown, a westward mail, which should have been taken by the *Umbria*, is omitted. The mails, in so far as they will be ready in time, went forward by the American liner *St. Louis*, from Southampton, on the Saturday morning, and for such as might be too late for her the White Star cargo boat *Cufic* put into Queenstown on Sunday morning. The fact that this vessel and the *Tauric*—as mentioned last month—have been elevated for the moment to the rank of mail steamers, has caused some foolish writing, even in shipping papers. Those who find fault with the Post Office have done so—whether they knew it themselves or not—with the object of getting the British mails sent in American bottoms. For this occasion, what they seek is now being done. The *Cufic* only carries what the American line—through the action of the senders of the letters themselves—cannot wait for. Surely it is better for them to sail on time by a cargo boat, whose speed is not by any means despicable, than to wait till the sailing of the next American liner a week later. This unfortunate moment, when all her fellows are so deeply engaged, has been chosen by the *Etruria* to develop a suspicious-looking flaw in her shafting. This was discovered by her engineers when looking over her machinery at New York. Cunard's, with their proverbial caution, would not risk sending her to sea under the circumstances, and so keep her waiting till a new shaft can be sent out and fitted. Thus, on her account, the Cunard sailing from New York on January 20th had to be passed. The eastward mails of that day are coming to Plymouth by the great Hamburg-American cargo steamer *Pennsylvania*, a fact which should be noted as showing that even the American Post Office thinks freighters a useful substitute for mail steamers when the latter cannot be got.

The Hamburg-American Line

has been indeed unfortunate in the case of the fine twin-screw steamship *Patria*, which, as noted in the Fleets of December, 1899, was sunk off Deal after being on fire for some time in the German Ocean in mid-November. A Danish salvage company soon commenced operations on the sunken vessel, and, after persistent work, succeeded in floating her on the morning tide of January 3rd. But no sooner had they done this than there was a loud bursting sound far down in the vessel, and she sank instantly in deep water. So sudden was the accident that there was no time to cut the painter of a boat which was towing astern with the Danish diver aboard. This poor fellow's helmet had been removed, and he consequently had no chance of saving himself when his little craft was dragged under. Two Deal boatmen, who were stationed on the *Patria's* bridge, also lost their lives. There now seems no chance of making further attempts at salvage, though a Whitstable company is said to be going into the matter, and the wreck will probably be dispersed.

The Transport Service.

As was expected under the circumstances the *Majestic* did not break the Cape record, though she landed her troops in very good time. The fact that she did not do so has raised a fine crop of explanations as to the reasons for the alleged powerlessness of Atlantic steamers to maintain their full speed on the Cape voyage. The simple truth that she was ordered not to exceed a certain speed is not good enough to meet with credence. Those who criticise Western ocean boats adversely on account of this matter may be reminded that the firm which built the *Majestic* also constructed the *Norman* and the *Briton* and are responsible for the reconstruction of the *Scot*. Let me add that they also built for the White Star Company the steamship *Doric*, a vessel which holds a record unknown perhaps to these writers, but as valuable in its way as most; for the *Doric* is the ship which steamed from Liverpool round the Horn to San Francisco without a break, a feat unequalled and unattempted by any other vessel.

As regards the casualties to transports it appears from the report of inquiry that the loss of the *Ismore* was due to the default of her master in not using his lead on the fatal night. His vessel was 13 miles inside of her supposed position, and it is remarked he had the advantage of having a Sir William Thomson's sounding machine aboard his ship had he thought fit to use it.

The *Maltby's* loss on the Black Middens when outward-bound to the Cape with coal for the fleet was laid at the door of her pilot.

The *Denton Grange*, in spite of all care and much hard work, has suffered severely from gales during the month she has lain on the rocks at Las Palmas.

As regards movements and engagements of transports it is difficult to state in the prescribed limits all that is being done. A large number of vessels are carrying troops and horses from Indian ports to South Africa, whilst others are taking mules from the Plate, from Naples, and from the Southern States. Of the engagements of these vessels—highly necessary as is the work they are doing—I cannot do more than say that Messrs. Elder, Dempster & Co.'s, Houston's, and Houlder's lines are doing good work in this direction. In respect of the transfer of the further Canadian contingents to the Cape the Allan Line steamships *Pomeranian*, *Laurentian*, and *Parisian* have been engaged, together with the *Milwaukee* and *Monterey* of the Elder, Dempster Company.

The *Rapidan* has returned to her own station, as have the P. & O. steamers *Oriental* and *Malta*, whilst the Cunarder *Aurania*, the White Star Line *Britannic* and *Nomadic*, the National Line *America*, the Castle Line *Kildonan Castle*, the Allan Line *Bavarian*, the Manchester Liners s.s. *Manchester Port*, the Orient Line *Orient*, the Anchor Line *Persia*, the Glen Line *Glengyle*, and the Brocklebank Line *Pindari* have started on their second trips. Three West India Royal Mail steamers, the *Severn*, *Nile*, and *Minho*, are now engaged. The White Star *Afric* has been secured to take a contingent of the Imperial Yeomanry next month. The Dominion Line *Norseman* has also been chartered. This vessel was till a few weeks ago the Hamburg-American Company's *Brasilia*. Messrs. Elder, Dempster & Co.'s *Lycia* is also chartered, as is their new steamship the *Lake Erie*; so too are the Leyland Line *Winifredian*, the West India and Pacific *American*, and the National Line *Manhattan*. Amongst the more important transports recently starting may be noted the White Star Line *Cymric* on the 1st January, the new P. & O steamship *Assaye* on the 4th, the Cunarder *Umbria* on the 11th, and the Anchor Line *City of Rome* (from her final port Queenstown) on the 18th January.

Many of the Castle and Union liners which took troops on their regular trips are of course on their second voyages. I can only here note the generosity of the managers of these lines, who on their steamships *Briton* and *Garth Castle*, sailing on the 13th of January, took between them 500 men of the City Imperial Volunteers free of cost, and made arrangements whereby the discomforts even to-day attending the voyage of the private soldier under ordinary circumstances would be reduced to a minimum. The little incident of the substitution of china for tinware at the troopers' meals on the *Garth Castle* is one of those little touches of thoughtfulness which make us appreciate how it is that to know Sir Donald Currie is to respect and admire him. Messrs. Wilson, of Hull, are on the same generous terms taking out a further contingent of these troops in their s.s. *Ariosto*.

When the war is over something will have to be said to the contractors who undertook the supply of food for the troops. The meat on the *Arawa*—now returned to the Canadian trade—was condemned. Now there has been trouble over that supplied for the use of the West India and Pacific steamship *American*. Both these cases occurred at Southampton. It is curious indeed how ill luck hangs about the same spots in this matter. The *Ismore*, which stranded at St. Helena Bay, had had two misfortunes previously—one when she had to shelter in Moelfra Bay on account of stress of weather, another when she put into Milford with her horses sick. Now the *Manchester Corporation*, which, with much needed artillery, had to put into Gibraltar to replace two broken blades, has been sighted just south of the Equator, and reports that she has again two blades broken. This steamer, it may be noted, is one of Sir Christopher Furness's new Manchester Liners, Limited.

Messrs. C. W. Kellock & Co.

announce that they will offer for sale by auction on the 15th of February the well-known Union liner *Arab*, built for the Union Company at Clydebank in 1879 by Messrs. J. & G. Thomson & Company. The vessel is of course now too small for the requirements of the company, her gross tonnage not being quite 3,200 tons. She was, however, a very famous and speedy ship in her day, and has in her machinery department been modernised, having had her engines tripled, and having been re-boilered by her builders in the year 1889.

The removal of the *Arab* will leave only four single screw-ships in the Union fleet. The remaining ships are all in active occupation. Two of them, the *Mexican* and the *Moor* (the latter recently modernised and lengthened), are employed to this day in the mail service. The *Spartan* and the *Trojan*, specially fitted out for the Government as hospital ships for the South African campaign, are said to have been at the time they sailed the two best fitted ships that ever flew the Red Cross.

The Isle of Man Steam Packet Company

has ordered a new boat, to be an improved repeat of the *Empress-Queen*, from the Fairfield yard. The vessel in question will probably be ready to do her share of the ensuing summer's service, but it is unfortunate to see that this line has returned to the antiquated paddle. They are possibly too happy in their monopoly. Competition would soon make them appreciate the extravagance of the paddle as compared with the economy and safety of the twin-screw.

The White Star Line

has issued an attractive little souvenir of the *Oceanic*. It is in the form of a little booklet, and rather suggests in its appearance a belated Christmas card. Its front page bears an excellent representation of the biggest ship in the world, lying at the landing stage in the Mersey off the riverside station. Inside are another nine excellent views of the vessel. They show her on the stocks, taking the water, afloat, and in dry dock. They also give several representations of the more remarkable of her interiors. The whole is as tastefully got up as the productions of the firm usually are. One may especially note the harmony between the neutral tint of the cover and the lighter shades of the platino-type print which forms its centre.

DUNCAN'S PATENT AUTOMATIC THROTTLE VALVE.

THE serious consequences which often result from the racing of engines on board ship or the fracture of steam pipes have been the means of directing the minds of engineers from time to time to the problem of how to reduce to a minimum the risk attending such a condition of things. Most of the governing devices operate indirectly upon the controlling valve, and are dependent for their action upon an appreciable acceleration of the moving mechanism, hence a certain considerable interval of time and change of speed must take place at each action of the governor, and much variation of speed often occurs in the movement of the engines.

In the adjoining diagram we illustrate an arrangement which has been designed by Mr. George Duncan, of 106, Victoria Road, Aberdeen, as a simple solution of the problem.

By reference to the illustrations it will be seen that Fig. 1 is a part sectional elevation of the device, Fig. 2 is a plan, Fig. 3 a side elevation of the control arrangement, and Fig. 4 an end elevation of the same.

The device consists of a steam chest a, which is placed in the main steam pipe leading from the boilers to the engine, preferably immediately adjacent to the main stop valve on the boilers. Within the chest a disc a is mounted on a lever $a1$, carried by a shaft $a2$ journalled in the cover of the chest. This disc is adapted to move to and fro in an enlarged portion of the steam chest. On one end of the shaft outside the chest a spiral spring is arranged, one end of the spring being anchored to the steam chest cover and the other end being attached to an adjustable disc carried by the shaft, so that the tension of the spring can be adjusted at will according to the pressure exerted by the steam on the disc a during its passage thereby. On the other end of the shaft $a2$ a lever b is fixed, carrying at its end a tripping detent adapted to engage with a toothed rack to prevent the lever returning, when the device is operated as the result of an explosion.

On the boiler side of the device a throttle valve E is provided, which is operated by an auxiliary cylinder D. The valve controlling the admission of steam to this cylinder is operated by lever $a1$.

In the event of a steam pipe bursting, a casing door in the high-pressure cylinder giving way, or a tail shaft breaking, the increased velocity of steam above that to which the spring B has been set to work acts on the disc a, and moves the slide valve of the cylinder D, which in turn closes the throttle valve E, thereby preventing a further inrush of steam into the engine-room or stokehold.

It will be noticed that the toothed rack c is provided with a bolt $c1$ adapted to be operated from the platform in the engine-room. When the bolt is withdrawn it allows the rack to fall out of sphere of action of the detent, so that, when the spring B is properly adjusted, the device may be used as a governor for the main engines at sea.

Devices having such objects in view as this one are worthy of the attention of shipowners and underwriters, providing means as they do for minimising the risk and safeguarding against the loss of life and property by the bursting of steam pipes and breakdown of machinery.

James Howden & Co.—Mr. James Howden has the pleasure of informing us that, as from 1st January last, he has assumed as a partner his nephew Mr. James Howden Hume, who, for many years, has been associated with him in conducting his business of James Howden & Co., and on whom, during recent years, the greater share of the management has devolved The business will in future be carried on by both of them under the old name.

MARINE ENGINEERS' NOTES.

(From our own Correspondent.)

A MEETING of the Institute of Marine Engineers took place on January 8th at the institute premises, when an interesting discussion took place on the paper read at a previous meeting by Mr. Halliday on "Experiments showing Decrease in the Rate of Evaporation in consequence of Increase in the Rate of Circulation through the Tubes of Water-tube Boilers." An abstract of the paper was given in last month's "Engineers' Notes." Mr. Halliday opened the discussion by explaining that the figures given were not absolute numbers but comparative. Corrections would necessarily require to be made in order that the numbers should represent the whole evaporation in each experiment. For example, if it is assumed that the water to be supplied for the experiment is at a less temperature than the boiling point, that temperature will require to be made up before the generation of steam begins. And the quantity of heat necessary to be given to the water flowing in the tube must be deducted from the whole quantity given to the tube by the former. Should a greater quantity of water be set flowing, then a greater quantity of heat must be deducted from the total quantity of heat supplied. Virtually, then, it is equivalent to saying that a less quantity of heat is available for causing evaporation when the rate of flow is greater. There si also a loss of heat by the water as it flows from the tube, and this is approximately a constant quantity whatever quantity may be flowing through. The effect, therefore, of the loss of heat due to this will be an approximately constant deduction from the quantity of water evaporated. At the separator there will also be some trouble. Corrections will require to be made in consequence of the loss of heat at the surface. The effect of this will be a fairly constant loss to the quantity of water evaporated as shown by the results. It is desirable that results should be obtained which are very nearly correct, but even without them the results show comparatively what goes on when the velocity of the flow is changed. Mr. Lawrie had objections to the tank with a greater head being used for obtaining the necessary rate of circulation. He thought that the circulation should be produced by heat as it was in the case of water-tube boilers. When Mr. Halliday said, "First of all it may be premised that the accepted view is that the evaporation increases with the rapidity of circulation of water through tubes; that is, the faster the water runs through the tubes, it is believed, the quicker is the evaporation of steam. This is the universal view with one exception." In this paragraph the author made a statement that was not absolutely correct. If he had said that this was the view of experts, he would have been nearer the truth, because most practical men held that circulation was not everything, for in the case of water-tube boilers which had a free discharge from the upper ends of their tubes the results were not better than in the case of boilers with drowned tubes.

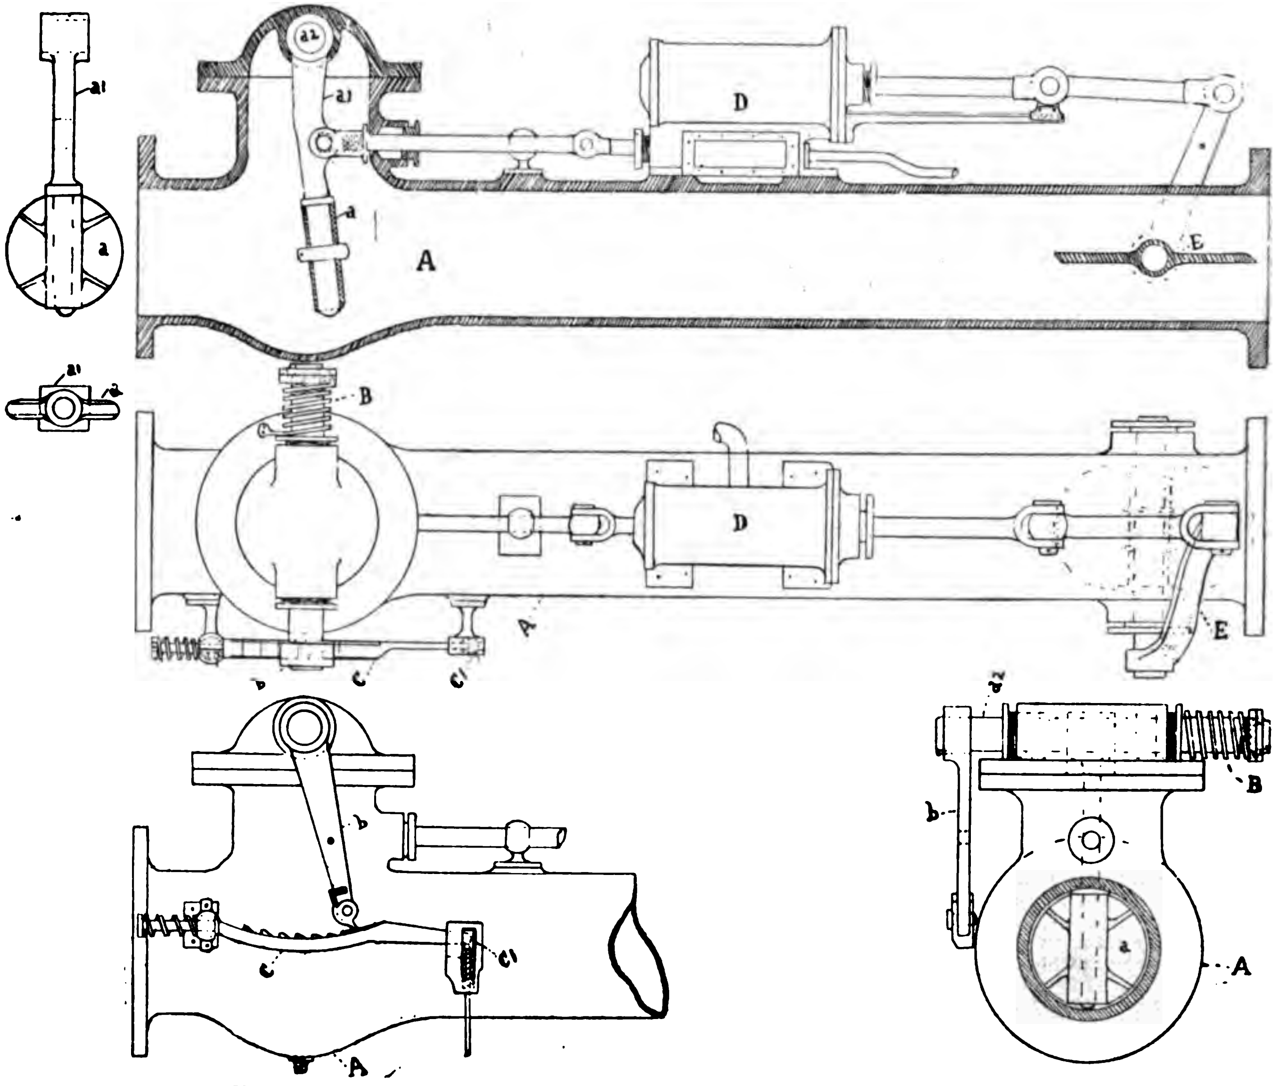

Fig. 1.

Fig. 2.

Fig. 3 DUNCAN'S PATENT AUTOMATIC THROTTLE VALVE. Fig. 4.

He had no reason to doubt the tables included in the paper, because he had himself had a turn with the apparatus, and one or two of his results compared very fairly with those obtained by Mr. Halliday. In answer, Mr. Halliday said that in undertaking those experiments, what he sought to ascertain was how the quantity of steam formed was affected by the quantity of water which flowed through the tubes, the heat employed being constant. As a matter of fact it did not matter in the least in what manner the circulation was produced as long as different rates of flow could be obtained without affecting the quantity of heat applied. If he kept the temperature of the water, going into the tubes, fairly constant, and the amount of heat playing into the tubes fairly constant, and thus varied the speed at which he sent the water through the tubes he could improve the effect of different speeds of flow on the evaporation. As the result of his investigations his advice to makers of water-tube boilers was not to increase the speed of circulation but to decrease it. Mr. Noble showed a sketch of a generator and circulator which he fitted in a ship twelve years ago. In front of the boiler there was fitted a gun-metal cock with a hollow plug. Connected to this there was an internal pipe leading to the bottom of the boiler. A breecher firer was connected to the other end of the cock, into which were jointed two wrought-iron pipes which passed along the furnace crown to a corresponding piece in the combustion chamber, uniting in a single tube leading to a hole in the top of the tube plate. The tube was jointed through the plate to an internal cluck valve. Mr. McLaren expressed the opinion that without a rapid circulation a water-tube boiler would have a very short life. Mr. Halliday said those water-tube boilers in which the circulation was slow lasted about twice as long as those in which the circulation was fast. Mr. Shearer asked in what way the circulation could be retarded, and Mr. Halliday replied it was not his business to show how the circulation should be retarded. Schemes had been designed for promoting or increasing the circulation, and it was conceivable that measures might be devised for retarding the circulation, but the present object was simply to show that a very high rate of circulation did not give the best results.

The conversazione of the institute takes place at the Stratford Town Hall on Wednesday, the 31st of January.

The experimental committee have asked Mr. Aukland to join them in assisting with their work, and Mr. Aukland has kindly consented to do as much as he can for them.

The voting papers for new members of council are now distributed amongst members.

A meeting of the institute took place on Monday, January 22nd, on Mr. Halliday's paper on "The Effects of Circulation on Evaporation in Tubes." The discussion was opened by Mr. Halliday, who said it would be perhaps as well to go through the several points which had been settled by the experiments from the beginning. The first question which was attempted to be determined was one which had been discussed by certain French experimenters. The theory held by these gentlemen, was that molecular change in the water was the cause of the increased absorption of heat at the boiling point. This theory was probably due to engineers finding an advantage by heating the water separately before they sent it into the steam boiler. They heated the water to the boiling point, and then afterwards pumped it into the boiler. That brought an increased efficiency of 19 per cent. in some cases. Now the question which was to be determined by the experiments was whether or not there was an increased efficiency in the transmission of heat just at the boiling point. It was necessary under these conditions to apply as nearly as possible the same quantity of heat each time. When this was done, it was found that more heat was taken in by the water at temperatures below the boiling-point than when it was just at the boiling-point. This completely gave the negative to the theory that molecular change was the cause of the increased efficiency. The second question was whether the increased efficiency was due to increased rate of motion over the heating surface. It was found that when the heat applied was kept constant, and when the velocity of the water over the heating surface was increased, there followed an increase in the rate of absorption of heat by the water. The third question to be determined was whether this increased rate of efficiency continued without limit. It was found that it did not. After a stage in the velocity the absorption co-efficient began to fall off. There was in every case a maximum point. When the amount of heat applied was small, this maximum point came very soon; when it was great, the maximum point came late. The maximum point of some experiments showed four times the velocity of others. When a tube was used, and heat from gas burners was applied to it, a very considerable quantity of heat was absorbed by the water before the maximum point was reached. The fourth set of experiments was to determine what happened when the water which flowed through the tubes was sent through at the boiling point. The results of this last set of experiments were shown in the last paper under discussion. The committee are at the present time determining several questions connected with the feed-water heater. In the experiments which have already been made an insufficient quantity of steam could only be obtained and the limiting effects could not be found. The committee has now obtained a boiler of considerable size for supplying steam, and they will therefore be able to obtain the limit of the effects when steam is supplied in excess. Mr. Lawrie wished to know if the size of the tube through which the water circulated had any influence. It was also stated by Mr. Thornycroft that when his boiler was in full working order 105 lbs. of water circulated through the tubes for every pound evaporated. A higher circulation than that was even given. Could Mr. Halliday give any information as to the best rate of circulation? Mr. Drake explained the construction and working of his patent boiler. Mr. Adamson, Mr. McLaren, and others spoke. Mr. Halliday said Mr. Lawrie's question was answered by the diagrams supplied. It is shown by these that the quantity of steam evaporated when the tube is small, and when 500 cubic centimetres are flowing through it every five minutes, is much greater in a small tube than in a large one, supposing the same quantity of heat supplied on the outside of the tubes. It does not, therefore, follow that a small tube is better than a large one. Experiments were also tried to determine the quantity of heat which might be applied to the outside of different-sized tubes, and the large tube could in every case take more heat than a small one. This appears to point to the fact that a higher circulation could go on in a large tube than could in a small one, and a greater quantity of heat would be absorbed by the water in the large tube, therefore a higher evaporation would go on. It may be pointed out that leading engineers, both in this country and the United States, have a prejudice in favour of large tubes. It would be difficult to say what circulation would be best, the conditions vary so much. But the rates reported as taking place in certain boilers are only rates for the particular cases, and give us no data as to the best rate.

A NEW MARINE SOUNDING MACHINE.

THE recording of the depths of the sea, and especially of off-shore waters, by mechanical means is a branch of inventive research which has long been very attractive to scientists and mechanicians. The importance of sea captains and officers being able to ascertain readily and accurately the depth of the water in which their ships may be moving is recognised to be so great that inventive genius has long devoted itself to the perfecting of sounding apparatus as an obligation to humanity and commerce. Inventors have therefore set for themselves the task of devising and perfecting an ideal sounder, an instrument, that is to say, which shall be suitable for accurately recording moderate sea-depths, and of improving upon the duty of the hand lead-line in shallow waters, and, withal, of giving a continuous record if required. Twelve months ago it was announced that a Liverpool engineer, Mr. Edwin S. Cornish, had produced a sounding machine which came nearer to fulfilling these *desiderata* than any sounder at that time in use. The new machine gave good results in practice, but there was a detail which the inventor found could be modified with advantage. The modification has been made, and the improved instrument or "automatic-lead," as it is termed, is now being manufactured by Messrs. Capstick & Carefull, engineers, of Liverpool, for Cornish's Marine Automatic-Lead Syndicate, Limited, the proprietors of the machine.

Fig. 1.

The inventor has for the last eight years filled the responsible position of superintendent of the dredging operations at the bar of the river Mersey, under the Mersey Docks and Harbour Board, of Liverpool. During these eight years a passage has been dredged through the bar, so that, for some time past, the largest ocean-going steamers and sailing ships have been able to enter and leave the Mersey at any state of the tide, which could not be done before the dredging operations referred to began. During the operations sounding has gone on almost without interruption, the effect of the dredging being closely watched. In designing his automatic-lead, Mr. Cornish had the advantage of a large experience of marine sounding, and of the effects of strong currents and different depths in relation to currents upon sounding apparatus. He aimed at producing a sounder which should be easy to use and give a correct and continuous automatic record—on deck, on the bridge, or in a captain's cabin. The apparatus may be described as consisting of two main parts: a winding and recording machine, which is placed at a desired spot on the ship, and a set of three "towing wires" and a "lead-wire," which are submerged for ascertaining the depth of the water. The purpose of the three towing wires is to furnish means of working an efficient "sinker," which is towed or "trailed" along the bottom as the vessel using the automatic-lead moves forward. When the length of ship admits thereof the drum carrying the towing wires will usually be placed well forward on the ship, and the lead-wire, which is the recording-wire, will be worked through an outrigger placed aft. When in use the towing wires are paid out, and the disc, or lead, trails along the bottom and the depth will be ascertained by means of the lead-wire which is fastened to the lead or sinker. The lead-wire will pass in-board on the ship and the wire will be prevented from drifting by being secured to the sinker which is trailed after the ship. As the sinker rises or falls in following the form of the bottom of the sea, the lead-wire is automatically paid out or hauled in, so as to be maintained in a state of approximate tautness. Each lengthening or shortening is shown by the recorder of the machine on deck, so that a continuous record of the variation in the depth of the water may be obtained.

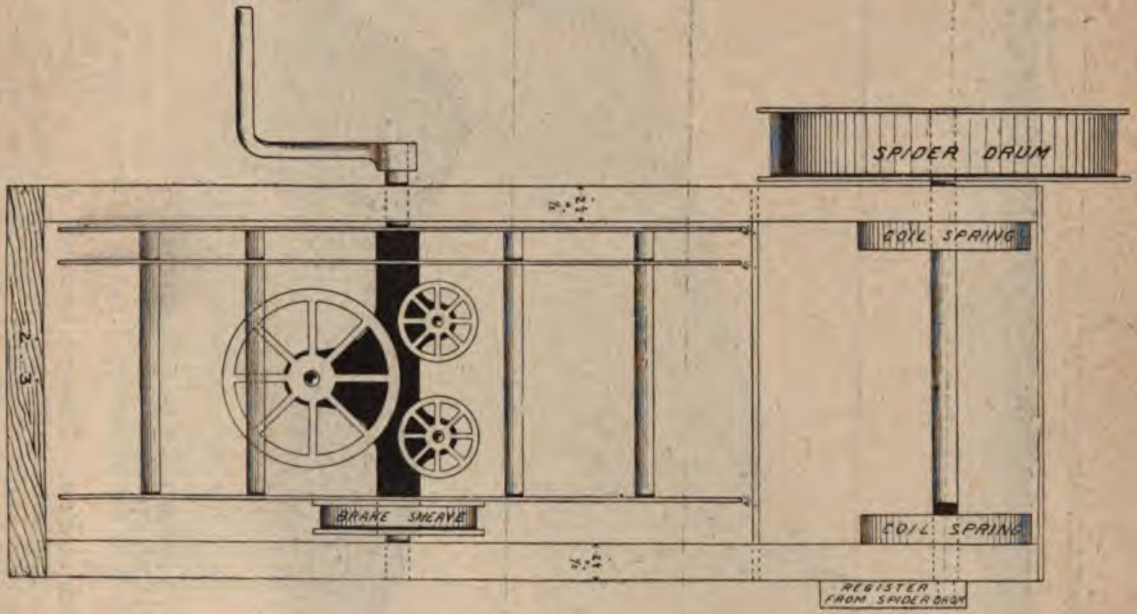

Fig. 2.

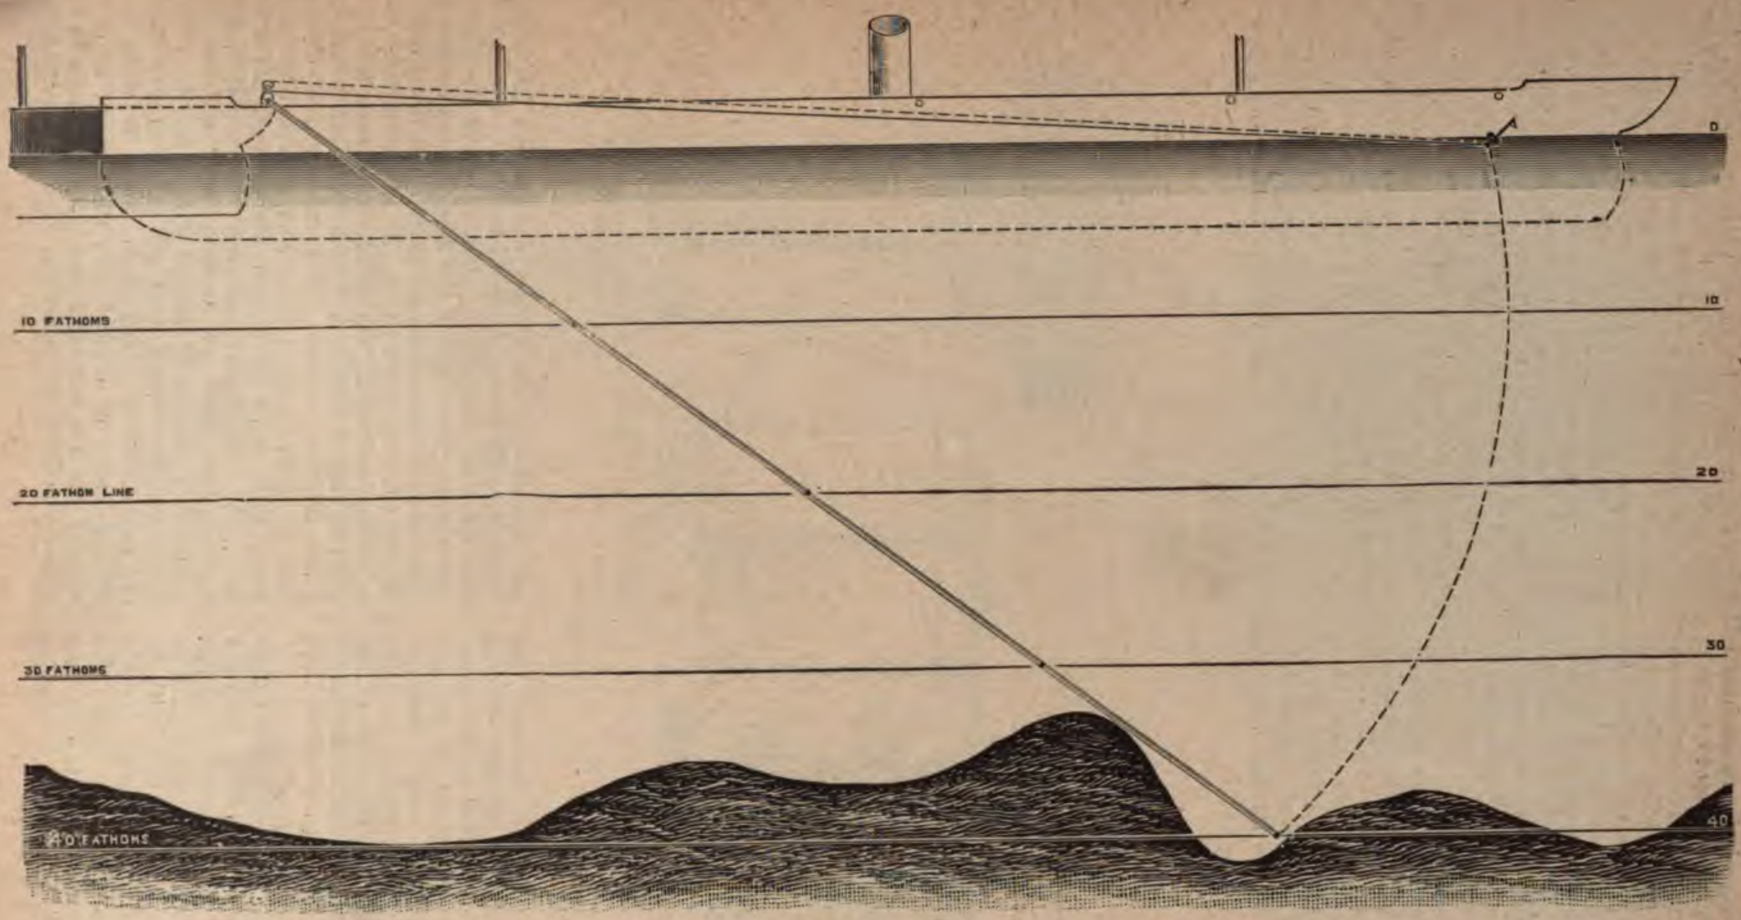
When used on ships of short length the practice is somewhat different. In this case, the drum carrying the trailing or towing wires is placed at the stern of the ship, and a float carrying a sheave is towed astern at the end of a rope the same length as the wires paid out to tow the lead or sinker. The lead-wire passes from the sinker upwards to the sheave on the float, and through the sheave to the drum of the recording machine on the ship. Whether in shallow or deep water, the action of the automatic lead is the same. The lead is trailed along the bottom of the sea, and as it follows the irregularities of the bottom, the lead-wire automatically pays out or is hauled in. The automatic lead can be worked over the stern of any ship for shallow or deep soundings, and at the side of ships which are of sufficient length to admit of such use.

The details of the automatic lead apparatus will be made clear by reference to the diagrams. Figure 1 shows the side elevation of the improved machine. This comprises a drum for the towing wires, and an upper and smaller drum for the lead-line, with an arrangement of wheels for reducing the revolutions of this drum to the necessary movements on the face of a registering dial. The machine is contained in a light steel frame, which has a base 2 ft. 6 in. wide, is 6 ft. 6 in. high, and narrows to about 10 in. at the top. The sides of the frame are 2 ft. 6 in. apart. The lower drum is fitted with a double quick-pitch adjusting screw, and two other adjusting screws for regulating the length of two of the towing wires and the angle of certain discs which are used with the wires. There is a handle for winding in the wires, and a brake for controlling the run when paying out.

The upper drum which is used for the lead-line only, is a spider drum, which, as will be seen from Figure 2, showing the back elevation of the machine, is hung outside the frame. This drum is 2 ft. in diameter. The registering mechanism is placed outside the frame at the other end of the drum spindle. Inside of the frame at each side, also on this spindle, there is a coil-spring which performs an important duty. In the machine as at first made, a counterpoise weight was used in conjunction with the lead-line drum, to cause the drum to revolve and wind in the slack of the lead-line as the sinker rose through the water becoming shallower, so as to maintain a constant and automatic movement. The weight of the sinker was greater than that of the counterpoise weight at the drum, so that as the sinker fell to a lower depth it drew the lead-line with it. At the same time the counterpoise weight was sufficient to keep the line taut, so that a steady and reliable record could be given on the register. The counterpoise weight was found to be inconvenient, so it was dispensed with, and in its place two coil-springs are now used. As the drum pays out the lead-line, the springs are coiled or "wound up," and acquire a sufficient reserve of energy to cause the drum to revolve the reverse way and wind in any slack of the lead-line which there may be with the varying depth of water. The substitution of coil-springs for the original counterpoise weight was an unquestionable improvement as regards convenience.



A NEW MARINE SOUNDING MACHINE. FIG. 3.

The two drums, it should be noted, are entirely independent of each other as regards position and movement. They are ordinarily placed in the one frame as a matter of convenience. The lead-line of the upper drum is of No. 20, S.W.G. ·037 in. wire.

As stated, the towing arrangement consists of three wires. These are flat, and of ·250 in. by ·060 in. S.W.G., and in conjunction with them a set of "plate discs" is used. The ends of the three towing wires are attached to a disc 15 in. in diameter, which is known as the "lead-disc" or the "lead." It is this disc which has been referred to above as the "sinker" and the "lead," and is the part of the apparatus which is dragged over the bottom of the sea by the progress of the ship during the taking of soundings. The lead-line is attached to this lead-disc, and the disc, by means of the line, imparts motion to the registering hand of the dial on board the ship. The automatic lead can be made as a 20, 30 or 40-fathom sounder, as it is constructed in 100 feet lengths, which give 10-fathom soundings, 4 lengths giving 40 fathoms.

At distances of 100 ft., measuring from the lead-disc, three other discs, each 12 in. in diameter, are placed. Two of the towing wires are connected with the upper edge of the discs, and the third wire with the lower edge. The purpose of the discs is to prevent parabolic curvature of the towing line or lines when in use. By means of the adjusting screws on the lower drum of the machine, either of the upper wires may be eased or tightened to admit of steering the lead in narrow waterways, or, the lower wire may be adjusted so as to cause the discs to ascend or sink in the water, as desired, by the alteration of the angle which they present to the water.

Figure 3 shows the respective lines being used from the stern of the ship, the lead-line in this case passing through the small block at the underside of the float which is being towed astern. After use, the towing wires are wound in on the drum, and the discs stowed on the drum or hung on hooks along the rail. The lead-line will be wound on its own drum, and the machine be compact until wanted for further use.

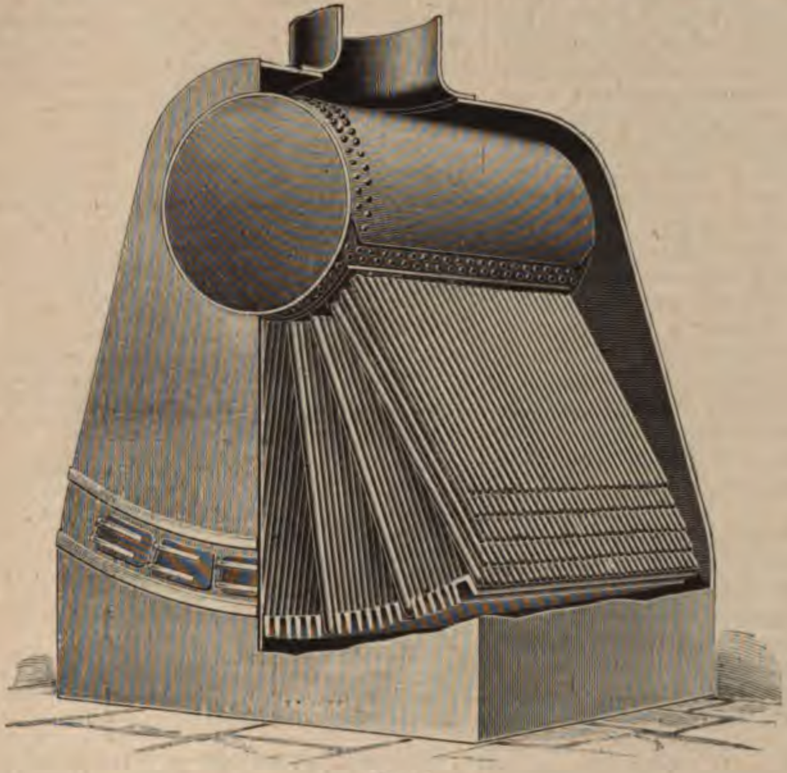


FIG. 1.

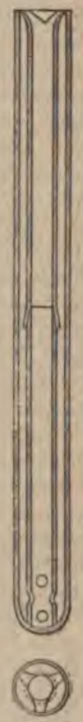

FIG. 2.

This marine automatic-lead has been patented in England, America, Germany, and other countries, and by the operations of the syndicate who now control it will doubtless soon be in large use.

Marine Engineers' Examination.—At the examination held on January 9th, 10th, and 11th the following candidates passed for extra first-class engineers: Mr. N. Nasservanjee, of Bombay; Mr. Banks, of Bishop Anckland; Mr. Kluge, of Swansea, and Mr. H. A. Williams, of Dartmouth. They were prepared by Mr. W. H. Thorn, 5, Waterville Terrace, North Shields, making 67 pupils who have passed in the above grade from this establishment. Mr. N. Nasservanjee came from Bombay expressly to become a pupil at this school, and passed the first time of going up.

PHILLIPS'S WATER-TUBE BOILER.

THE attention that has of late years been devoted to the water-tube boiler for marine purposes has given a considerable impetus to inventors to find means to remedy the various defects and disadvantages that have been brought to light from time to time in relation to water-tube boilers under the conditions of working that at present obtain.

In the adjoining diagrams we illustrate a new design of water-tube boiler which has been invented by Mr. Horatio Phillips, of Roedean, Brighton, and for general simplicity of design, construction, and arrangement it will be readily conceded that it ranks high amongst similar devices which have had a practical trial up to date. The boiler consists essentially of a drum as the main water-and-steam chamber, from the under side of which a number of tubes project radially in a downward direction. These tubes are of the Field type, and each carries a down circulating pipe. Fig. 1 is a perspective view of the complete boiler with a part of the casing removed to show the tubes. Fig. 2 is a detail view of one of the water-tubes to an enlarged scale. It will be noted that the tubes are arranged in double rows, and their ends pass between the bars of the grate. In this way they divide the grate into five separate divisions. It is claimed by Mr. Phillips that by these means he obtains many important advantages. Firstly, nearly the whole of the tubes are exposed to the radiant heat of the fuel, and for this reason a high evaporative efficiency is obtainable from this heating surface. Secondly, the many difficulties of stoking a water-tube boiler are overcome, as it is made much easier, and can be done by men of little or no skill. The large grate surface of the ordinary water-tube boiler has the serious drawback that it is very difficult to maintain a uniformly thin fire over it. The usual thing with untrained men is that the fuel is heaped in some parts, whilst in other parts the grate is uncovered, and, to maintain a fairly even result, they run with much thicker fires than is necessary or desirable; very imperfect combustion ensues, and the worst conditions obtain for a result of high efficiency.

The width of the grate between the double rows of tubes is 15 in., and it is found that these strips of grate can be easily stoked to produce a uniform result over the whole grate surface. A further advantage is claimed that, as the gases evolved from the fuel on each grate have to pass the tubes into the next space on their way to the chimney, should they be unburnt in their passage past the first tubes, they will be burnt in the next space over the second fire. Of course, this does not apply to the wing grates; but, on the whole, unburnt gases have a much greater chance of being burnt than obtains when they can pass unobstructed to the chimney, losing their temperature rapidly on the way.

In the use of Field tubes in the ordinary way their ends are situated in the hottest zone of the furnace, and when the fire is forced they are very liable to be burnt. This objectionable feature is overcome by carrying the ends of the tubes below the bars.

An important feature of construction is the facility with which an internal and external inspection of the tubes can be made, and a faulty tube can be readily replaced without disturbing the remainder. The circulating tubes are in two halves, to permit of withdrawal upwards, and each water-tube can be emptied by inserting a hose to the bottom and sucking out the water, so that the interior can be inspected by the aid of an electric incandescent lamp.

As the tubes are each supported independent of one another, they are free to expand and contract, and are not liable to be bent by variation of temperature.

In comparing this boiler with others of its class it is claimed that the cost of construction is 25 per cent. less, the saving of weight is 20 per cent., and the space occupied is less than any other boiler of the same power. There are no heavy bottom chambers with their contained dead water, and very little fire-brick is used in the furnace casing. A further important point appears to us to be the fact that, as the fire-doors are five in number, their size is small, and, consequently, the amount of cold air let in over the fire in the act of stoking is much reduced compared with the usual conditions that obtain.

Many trials have proved that with a width of 15 in., a length of fire-bar of 6 ft. 6 in. can easily be stoked.

A miniature boiler of 200 H.P., with which a great many trials have been carried out, has five furnaces, each furnace being only 8 in. wide and 4 ft. long, and by using special firing tools can be stoked with the greatest ease. A labourer, who was totally ignorant of stoking, succeeded in the presence of an Admiralty official in evaporating 3717·5 lbs. of water in one hour with 480·5 lbs. of coal. The steam pressure 250 lbs. per square inch. Temperature of feed 60°.

ELECTRICAL NOTES.

(From our own Correspondent.)

MR. R. E. CROMPTON read a valuable paper on the "Influence of Cheap Fuel on the Cost of Electrical Energy" before the Institution of Electrical Engineers. He had put himself in communication with several colliery proprietors, and he had ascertained that in the Midland district, Nottinghamshire, Derbyshire, and Yorkshire there are supplies of slack coal available, the average price of which during the last ten years has been about 2s. 6d. per ton at the pits, and it could be delivered by railway carriage within a radius of 50 miles for about 5s. 4d. per ton. The freight is the same whatever the quality of the coal may be. It would pay to use this kind of coal at greater distances than 50 miles. At Chelmsford it would cost 14s. There are three distinct classes of cheap fuel. First, the anthracite and small Welsh coals; second, free burning small coals of the Midlands; and, third, small dirty or earthy bituminous coals of the north. The first is dealt with by having large water ashpans, the steam rising from which appears to have the effect of preventing the clinker from clinging to the bars. In the second class automatic stokers have been much applied. For the third class coking stokers have been used These spread the coal on the front end of the grate. This method has not worked out well in practice. The simplest and most efficient method is by using the old Jucke's revolving grate, which has been in use for upwards of 30 years. At Fowler's works, at Leeds, it has been in use for 28 years. Most improvements in smoke consumption have been made by introducing more air, but the excess of air lowers the efficiency by supplying too much of a body to absorb heat. It is better to have a special combustion chamber. He would place a bridge immediately above that part of the grate in which the fuel is ignited. This bridge should be an extended firebrick arch, each arch-shaped brick having a fin-like projection hanging down from its lower surface into the path of the gases. The extended surface of firebrick acts as a reservoir of heat when the fire-door is frequently opened, but it acts better when the fire is automatically served. That it is important that excess of air should be kept down is shown by the following table:—

	Test of water-tube boiler at St. Pancras.		Test of water-tube boiler at Glasgow.		Result (with excess of air kept down) at Glasgow.	
	B.T.U.	P. ct.	B.T.U.	P. ct.	B.T.U.	P. ct.
Heat transferred to water	10,463	72·6	8,228	68	9,960	83
Heat carried off with products of combustion and excess air	1,792	12·4	2,959	25·25	1,440	12
B.T.U. in fuel ..	14,400		12,012		12,001	

Electrical Power for Marine Propulsion.—Mr. C. T. Child has been investigating the conditions under which electrical appliances are used in marine propulsion. The disadvantage of accumulators lies in their great weight, and he finds that under the very best conditions the weight of an electrical equipment is about 234 lbs. per H.P. as compared with 57·5 lbs. in the case of steam outfit. His plan would be in the case of ferry boats to charge them from a shore station at the end of each trip. This he thinks would show a much higher efficiency than other means of propulsion. He also thinks that torpedo boats could be driven by electric accumulators and keep up a speed of 22 knots for one hour, or 12 knots an hour for twenty-four hours, with the same battery.

Electric Traction on the Erie Canal.—Barges and other craft are pulled along the side of the canal by horses, for there is a tow-path; but a company has been formed to improve the means of haulage. This company, the Erie Electric Traction Co., has adopted the storage battery system for its motive power. The *Electric Review* says:—"An electric traction engine will run along the towpath of the canal. It will tow a canal boat fitted with storage batteries of sufficient capacity to furnish current for the traction engine, and for a reasonable number of canal boats with cargoes towed behind the battery boat."

Marconi's Visit to the United States.—Simple great men like Faraday and Bunsen did not trouble themselves greatly about the pecuniary value of their work. They were content to allow it to remain invaluable. Mr. Edison and M. Marconi, who deal more with the application to the industries of the principles of science, have other ideas. The United States Navy Department has ordered off four officers to inspect and report on the system of wireless telegraphy by M. Marconi as to its advantages for signalling purposes aboard ships and between vessels and the shore, M. Marconi has put down the price of his part at 1,000,000 dollars for its unlimited use or 500 dollars a set and 500 dollars royalty a set. An American paper says that the Government think the price high and are considering the availability of another inventor's system.

A New Possible Electric Lamp.—A light of an expensive kind has been promised by a prominent London electrician. It is said to be possible to get several hundred candle-power with a pressure of 8,000 volts, at an expenditure of one watt per candle power. The light was obtained from cathode rays, which are the bombardment of the highly attenuated particles of matter in a highly attenuated form. These rays were concentrated at one point, setting up there an extremely high temperature comparable with that of the electric arc. When a disc of thoria, one of the emissive substances used in Welsbach mantles was employed, the high temperature obtained gave a highly efficient light.

Mr. A. Siemens says there is a great advantage in electric power on board ship in the absence of clumsy and leaky pipes. The difficulty is the variation in the loads in auxiliary machinery. The strain on a winch often stops it. In such cases shunt-wound motors driving through friction clutches are used, or else series-wound motors, with a special cut-out arranged to break the main circuit on occasion and only allow a certain current to flow through a by-pass circuit. Mr. Siemens had seen an electric steering gear and rudder indicator worked with shunt-wound motors at the electric pumping station at the United States Navy Yard. There is to be an underground electric pumping station for dry dock No. 1, costing about 40,000 dollars. This station is to be underground in order to save space in the Navy Yard. It is to be located at the head of stone dry dock No. 1, and will replace the old station, which was built in 1854. Centrifugal pumps worked by electricity, and having a capacity for throwing 80,000 gallons of water out of the dry dock a minute, will be placed, and 350 E.H.P. electric motors will be used to operate the pumps. When the new plant is completed, the dock can be emptied in one-third of the time now required and at one-half the cost. It will take five months to build the new pumping station.

Electric Power in Engineering Shops.—A paper was read by Mr. G. H. Bowden before the Glasgow University Engineering Society on this subject. He pointed out that there was great waste by driving isolated tools and groups of machines by small steam engines and long lengths of shafting. Sometimes there was as much as a consumption of 20 lbs. to 30 lbs. of coal per H.P. burnt, while a well designed electric power plant reduced this to 3 lb. or 4 lbs. The engineering works on the North-East Coast had a capital expenditure of £8,000, and the annual saving exceeded £3,000 per annum. At Messrs. Furness, Withy & Co.'s the electric plant was double the power of the old steam system, yet the power costs were less than before. Works, equipped with shafting well lined up and efficiently loaded, such as some types of machine shops and textile factories, did not present the same inducement for their owners to apply electric power. A good arrangement in a works of 300 H P. would be to put down two units, one of 200 H.P. and a second of 100 H.P. During the day the 200 H.P. set would meet the demand; as the lighting load came on, the 100 H.P. set could be put on and run in parallel. For a night shift the-100 H.P. set would do. At Middlesbrough one large plant had three sets of 750 H.P. each. The generator seldom need exceed 60 to 65 per cent. of the motor H.P. installed. At Messrs. Furness, Withy & Co.'s works the generating plant was 450 H.P., whilst the motors installed aggregated 800 H.P. For outputs up to 200 H.P. high-speed engines are preferable. From that to 400 and 500 H.P. medium-speed engines were better. Messrs. Workman, Clark & Co, Belfast, had slow-speed horizontal engines driving a multipolar dynamo of the fly-wheel type. Furness, Withy & Co. had marine-type engines driving the dynamos by link belts. Messrs. Scott & Co., Greenock, had their three shipbuilding yards recently equipped with electric power. In this generating station there were three units, having an output of 200 E.H.P. each, coupled to high-speed engines. The hydraulic and compressed-air plant were in the same engine-room. He thought the works ought to be split into sections and supplied from panels in the switchboard. It was always best to use bare wires for feeders where possible, carrying them on insulators along the shop walls. The insulators were of tin of the petticoat type. Punches, shears, &c., could often be fitted with an enclosed motor. In driving a number of small machines judicious grouping to a small centre shaft was best. In this connection it was desirable to place the motor so that it would drive on to the middle of the shaft, and not the end. All motors should be of one or two standard sizes. For instance, 10 H.P., 15 H.P., and 20 H.P. motors might be used instead of several odd sizes. In one case only 20 H.P. motors were used. Shunt motors gave good results. Polyphase machines should not be used. Their advantage was that there was no commutator; but against this there were many disadvantages. Their power factor was so low when starting that he had seen a 100 H.P. generator overloaded when starting a 20 H.P. motor.

Wireless Telegraphy in the Navy.—The Admiralty have determined to fit several vessels of the Channel Squadron, the *Majestic*, *Magnificent*, *Hannibal*, and *Jupiter*, with wireless telegraphic instruments on the Marconi system; and the signal boatswains of the two flagships, and two petty signal officers on each of the ships in question are now being instructed in wireless telegraphy on board the *Hector* at Portsmouth.

Glow-Lamp Explosions.—Mr. G. C. T. Bartley, M.P., has written to the *Times* a warning to users of glow-lamps. It is said that in turning on an electric lamp it exploded with a report like a pistol, the socket of the lamp was blown out, and the glass, in "myriads" of atoms, was sent in all directions, although a tilted shade saved his face. The lamps had been supplied by the Westminster Co. shortly before Christmas, when the pressure was doubled. The *Electrical Review* explains the matter by stating that it was the lamp-socket which exploded, and that it was due to a short circuit in the holder, which at 200 volts would act with explosive violence. Such a short circuit sometimes occurs when the cap is being inserted into a live holder, and several lamps have exploded in the act of insertion into a holder without first switching off. The danger lies in carelessness in putting the lamp in place and neglecting to switch off before doing so.

THE S.S. "KOREA."

AFTER the opening of the Copenhagen free port in 1895 the shipowners and managers of that city considered that, owing to the go-ahead and prosperous state of the trade in this and other ports, new lines and larger ships could be profitably run. This theory was at once put into action, and we now see (five years afterwards) new and regular lines running to America and the East, the latter line being under the control of the East Asiatic Co., of Copenhagen, by whom orders were placed for three new vessels—one, the s.s. *Malaya*, with Messrs. William Hamilton & Co., of Port-Glasgow; another, the s.s. *Cathay*, with Messrs. Ramage & Ferguson, of Leith; and a third, the s s. *Siam*, with the Flensburg Shipbuilding Co.—all of about 6,000 tons deadweight. Unfortunately, owing to the engineers' strike, the Scotch builders were unable to deliver their vessels within the stipulated time. The honour of opening the new route, therefore, devolved itself upon the Flensburg-built steamer *Siam*. However, some little time after, the company found it necessary to enlarge their fleet. Orders were, therefore, placed for three more vessels two in Copenhagen and one in Flensburg. At the same time the company, having made a contract with the Russian Government, by whom it is subsidised, opened a branch in Russia, and their route now extends to Vladivostock. Our first illustration shows the passenger and cargo steamer *Korea* (*see* November issue, page 373)—her principal dimensions are: 428 ft. by 49 ft. 8 in. by 30 ft. 6 in. moulded, having a deadweight-carrying capacity of about 7,000 tons—the latest addition to the East Asiatic Co.'s fleet, leaving the Flensburg harbour under the Russian flag; the second, the quaint and interesting ceremony of the vessel being blessed by a Russian priest, according to Russian rites.

THE S.S. "KOREA" BUILT BY THE FLENSBURG SHIPBUILDING CO.

NAVAL MATTERS—PAST AND PROSPECTIVE.

(*From our own Correspondents at home and abroad.*)

The Mishap to the Royal Yacht.

CONSIDERABLE alarm was occasioned early last month by an accident which happened to the new royal yacht *Victoria and Albert*, whilst she was being undocked at Pembroke. It seems that she heeled over to port about 25 degrees in the dock as soon as sufficient water had been admitted to float her, and when this was realised by the dockyard officials, the caisson at the dock entrance was replaced, and every effort made to keep her afloat until measures could be adopted to right her. The caisson, however, jammed before it was completely closed, and, despite the fact that water was kept continuously pouring into the dock from every available source of supply, the depth of water inside steadily decreased, leaving the yacht in a most precarious position. A considerable strain to the ship and her machinery must have been caused by the accident, but there is no reason to believe the stories put about that the vessel can never entirely recover her original shape.

The vessel was partly righted by the stowing of 140 tons of iron ballast on board. The worst damage sustained by the vessel is where a 6-in. frame is said to have been completely sheared through. The engines are said to be entirely without damage, but the propellers were uncoupled at the time of the accident, and it is possible that the shaft of the starboard propeller has been strained. The yacht is now lying at Portsmouth. New plates are to be supplied in place of those dented at Pembroke.

The Guns of the "Handy Man."

Almost every day accounts are published of the excellent work carried out by the naval brigade and their guns both on the eastern and western borders of the Boer Republics. Both 4·7-in. and 12-pounder naval guns have been sent round to the eastern border to reinforce the artillery operating with Lord Methuen, some of them mounted on the 40-pounder muzzle-loading gun-carriage. In all the battles in which Lord Methuen's forces have been engaged the guns of the naval brigade with him have played an important part, the terrific power of the lyddite shells carrying death and destruction into the Boer trenches. On the western border, with General Buller, the naval gunners have also been busy. At Colenso, two 4·7-in. and 14 long range 12-pounders, all belonging to the *Terrible*, and on Captain Scott's mountings, were engaged. As many as 28 oxen were required to draw the big guns, and the naval contingent altogether consisted of 254 men, under Captain Jones, of the *Forte*. The naval guns began the bombardment of the Boer position two days before the battle of Colenso at a range of 7,200 yards. The two larger guns, we are told, were fitted with telescopic sights designed by Captain Scott. According to the account sent home, the part played by the navy during the battle of Colenso was a most important one. The native drivers of the oxen, dragging the 12-pounders, ran away when the enemy opened fire, but the sailors took their places, and with great difficulty brought their guns into action. For nearly three hours, too, the naval battery was in action entirely unsupported, and, although there were only four naval men wounded, there were several extraordinary escapes. Lieutenant Ogilvy, for instance, had three shells from a Hotchkiss pass between his legs. The 4·7-in. guns also did good work, and, as an example of the excellent practice made, the destruction of the road bridge across the Tugela may be mentioned. At a range of 7,200 yards, chief petty officer Bates, of the *Terrible*, wrecked the centre span at the tenth round. Some of the naval guns are accompanying General Buller in his advance towards Ladysmith, and are playing a very useful part. Captain Scott's inventive genius has given the guns great mobility, and the ease with which these big pieces are moved from place to place is little short of marvellous. In order that full benefit may be taken of the quick-firing mechanism, a system of anchoring the mountings has been devised. By means of a stout wire and grapnel, the recoil of the mounting is prevented, the carriage being quite strong enough to allow of this. There are also several naval guns locked up with the force in Ladysmith, including a 4·7 mounted on the carriage of a 6-in. howitzer, with the recoil gear for a fixed platform removed.

THE S.S. "KOREA."—CEREMONY OF THE VESSEL BEING BLESSED BY A RUSSIAN PRIEST.

Portsmouth Dockyard.

The *Pandora* has at last been floated out of dock, and a commencement has been made upon the construction of the armoured cruiser *Kent*. This vessel is to be of 9,800 tons displacement, and is almost the last of her class to be put in hand. An ample supply of material has been prepared, and it is hoped that before April considerable progress will have been made with the vessel, although it will be quite twelve months before she takes the water. Five torpedo-boat destroyers, with a speed of 30 knots, have been delivered at this yard during the month. They have all been built by the Clydebank Shipbuilding Co., and carried out their steam trials on the Clyde. They are the *Vulture*, *Kestrel*, *Electra*, *Brazen*, and *Recruit*. All these vessels are to be prepared for sea as early as possible. The number of vessels now in this dockyard is so great that an extension will have to be made before long. One ship, however, which has been got rid of is the *Invincible*, which has been sent round to Sheerness as an extra torpedo school. She has been equipped with a few small quick-firing guns, but the money spent in this direction could have been much better laid out on more modern vessels. The new Royal yacht is now being overhauled, and it has been found necessary to supply new plates in place of those dented in, as the vessel heeled over in dock at Pembroke. The ships of the Channel Squadron have also required a good deal of attention, for the list of defects seems to have no end. All the alterations sanctioned during the last 18 months were to be carried out by the 27th ult. Considerable satisfaction has been expressed at this yard on the promotion of the chief engineer, Mr. J. T. Corner, to the post of inspector of machinery. It is to hoped that Portsmouth will still have the benefit of his services.

Increasing the German Navy.

An extraordinary article recently appeared in the *Deutsche Heeres-Zeitung*, in which an increase in the present strength of the German Navy is very strongly advocated, and curiously enough, the article is published in connection with the trouble in South Africa. In the opinion of the writer, Germany must have a far more powerful fleet than she at present possesses, or on the other hand must be contented to be a second-rate Power in the world. Frederick the Great, says the writer, found his difficulties vastly increased, by the want of pontoons for his bridges, and a great many more lives were lost on this account than were necessary. Possibly the writer intended to compare the pontoons needed at the battle of Moldau to the warships which Germany is in need of at present, in order to carry out her colonial enterprises. The article goes on to say that England possesses one sixth of the land, and the whole of the sea of the world. In the opinion of many other German critics, the only way in which German colonial policy can be pursued is by means of a strong navy. The declaration of Prince Hohenloe that it is the intention of the German Government to double the fleet of battleships, has roused, among other Powers, Austria, and almost daily in the Austrian Press may be found articles advocating the extension of the fleet of the Dual Monarchy.

The Navy and Wireless Telegraphy.

Since the value of wireless telegraphy for naval uses was demonstrated some few months ago when the naval manœuvres were in progress, considerable attention has been given to this form of communication by the naval authorities. Experiments have been continually in progress, and several vessels have been fitted with the Marconi apparatus. The *Canopus* for instance, has been fitted with an installation of the system, and should therefore be particularly useful in the Mediterranean. In the Channel Squadron there will be when the fleet assembles early this month, at least four vessels able to communicate with each other by means of the wireless telegraphy. Both flagships have an installation as well as the *Hannibal* and *Jupiter*, and in all probability, the whole of the ships constituting the squadron will be fitted with the apparatus. A new course has also been added to the signalling school, every man passing through being instructed in the use of the Marconi instrument. Lord Charles Beresford, too, the new second-in-command on the Mediterranean station, has taken a course of lessons at Portsmouth, where Captain Jackson has been making some independent experiments from a gunboat at sea, and the *Hector* in Portsmouth Harbour. However, now that he is commanding the *Vulcan* he will probably carry out many experiments with the new system of signalling from that vessel, in which he will have the support of a staff of skilled mechanics. In the opinion of the United States Navy Board wireless telegraphy is good for squadron signalling, being unaffected by darkness or weather, the only drawback being that two transmitters working simultaneously interfere, but Signor Marconi claims to have a method in reserve for overcoming this drawback. The Board recommends a trial of the system in the American Navy.

Devonport Dockyard.

The chief attention at this yard for the past month has been directed to the completion of the *Ocean*, *Implacable*, *Bulwark*, and the first-class battleship *Montagu*, which was commenced in November last. As regards the *Ocean*, overtime has been worked on her nightly, as it was intended on the 26th ult. to transfer her to the Fleet Reserve, and to commission her on the 20th of this month to relieve the battleship *Hood* in the Mediterranean. Almost every week consignments of armour for the *Implacable* and general material for the *Bulwark* come to hand. When the *Hood* returns she is to undergo a refit costing over £15,000, and is to be prepared for service with the Reserve Squadron. An effort has been made at last to clear away some of the obsolete specimens of naval architecture from this yard. Negotiations have at last been completed for the sale of the obsolete cruisers *Carysfort*, *Shannon*, *Prince Albert*, and *Constance*. The congested state of the Hamoaze has been the cause of much serious concern for some time, and it is hoped that before long some more of these ancient vessels will be cleared away. There was another scare in the store department last month in consequence of 250 gallons of oil being reported to have disappeared in one night. However, it was subsequently discovered that no oil was lost at all, and that merely the readings of the gauge indicator of one vat showed the contents to be less than indicated on the previous night. The instrument, it was discovered, had been affected by the cold weather, and had not acted properly.

The Speed of the "Viper."

It has been decided to send the *Viper* to Devonport, there to equip her for sea service, and to prepare her for a series of experimental trials. This vessel, it will be remembered, was built by Messrs. Hawthorn, Leslie & Co., of Newcastle-on-Tyne, and she is fitted with engines on the turbine principle, constructed by the Parsons Steam Turbine Co. She was ordered to be built by the Admiralty, principally for experimental purposes, and she is intended to attain a speed of 33 knots. She was designed in 1897, but was not launched until September last, the subsequent time being occupied in getting her machinery on board. The propelling machinery consists of four steam turbines, each driving a separate shaft, fitted with two propellers of 3 ft. 4 in. diameter, and 4 ft. 6 in. pitch. The speed of the turbines at the maximum power is 1,000 revolutions per minute, steam being supplied by four Yarrow water-tube boilers. The vessel has a length of 210 ft., with 21 ft. beam, and is built on lines which are an exact copy of the destroyers of the *Mermaid* type. The steering capabilities of the *Viper* have been tested, and are said to be perfect, and at a trial in the North Sea a mean speed of 35½ knots was obtained. At present, therefore, she holds the record of being the fastest ship in the Navy, possibly in the world, and the results of the experimental trials will be eagerly looked forward to.

Rear-Admiral Melville's Opinion of Naval Engineers.

A most interesting letter has just appeared in an evening contemporary, written by Rear-Admiral S. W. Melville, engineer-in-chief of the United States Navy, who naturally holds a very high opinion of naval engineers, dealing with the pay of British naval officers generally. Rear-Admiral Melville is of opinion that there has never been any such question in the United States Navy as seems to obtain in the British service, of officers of the same rank and length of service getting such different rates of pay, and, indeed, while there was at one time a difference in the rates of pay of the line and staff officers, due to the fact that the staff did not attain the flag rank, even that matter was satisfactorily settled to all concerned last spring by the passage of the Personnel Bill, which put all sea-going officers absolutely on the same basis as to pay, rank for rank. It is pretty generally conceived in the United States that, after the commanding officer, the most important man on a modern battleship is the chief engineer, and this, it is claimed, was shown with remarkable clearness in the case of the *Oregon* at the battle of Santiago. Rear-Admiral Melville considers that, apart from justice, a mere worldly policy would dictate proper payment for such important men as the engineers of our big ships, because, otherwise, there is the constant tendency for them to look for more lucrative work outside the service. The United States has experienced the loss of some of its best engineers for this very reason, private firms being willing to pay so much higher compensation than they could ever hope to have received in the navy. Since the passage of the American Personnel Bill, which not only gave a fairer scale of pay, but also an assured rate of promotion, there have been very few resignations. "I wish," says the Engineer-in-Chief of the United States Navy, "my English friends every success in their efforts to get their pay properly adjusted, and can say, as a result of our own experience, that patience, combined with persistent effort, will be rewarded at last.

Chatham Dockyard.

Good progress is being made on the new battleships *Venerable*, *Irresistible*, and *Goliath*, completing at this yard, and also with the building of the *Albemarle*, which was laid down officially on the first day of the present year. The *Albemarle* is building on a slip only 360 ft. long, so that the vessel itself projects 80 ft. beyond the slip. Although this yard possesses five slips, there is only one on which large vessels can be constructed. A new slipway was provided for in the current year's estimates, and £100,000 was voted for it, but at present there are no signs of a start being made with the work. Every effort is to be made to build as much material as possible into the hull of the *Albemarle* before the end of the present financial year. As regards the *Venerable*, which was launched in October last, she has now received nearly the whole of her armour, which has been fixed in position, and the machinery is arriving daily. The *Irresistible* was practically ready for her steam and gun trials several weeks ago. These trials were to have taken place in October last, and the *Irresistible* was to have been commissioned by April, but the non-delivery of her barbette armour upset all these plans. She will not be ready for sea for at least six months. The *Goliath* is not, after all, to relieve the *Centurion* on the China Station, but is to replace the *Victorious*, and this vessel will return to the Mediterranean. Amongst the vessels refitting at this yard was the *Blenheim*, which has now been placed in the Fleet Reserve, the *Archer*, which is ready to be passed into the Medway Reserve, and four vessels belonging to the Chatham division of the Channel Squadron. The *Blenheim* will probably take the place of the *Eclipse* on the East Indies Station. The *Northampton* is to be ready in two months' time to resume her recruiting duties.

The Right of Search.

The British cruisers in the neighbourhood of Delagoa Bay have been displaying a praiseworthy assiduity in the capture and searching of foreign merchant vessels, in which it is suspected contraband of war is concealed. Despite their vigilance, however, guns and ammunition continue to pour into the Transvaal. A writer in the *Times* remarks the configuration of the coast seems fortunately to render it difficult for ships making for Lourenco Marquez to defeat the vigilance of our cruisers by hugging the land and reaching their destination within the shelter of Portuguese waters. This may be the case with vessels making for Lourenco Marques, but there are without doubt numbers of vessels which have been and are unloading cargoes of food and ammunition intended for use by the forces of the Transvaal and Orange Free State Republics. German merchant vessels suspected of carrying guns and ammunition, and American vessels with cargoes of flour have been stopped on suspicion that their cargoes are intended for use by the enemy, but have been subsequently released, and compensation will have to be paid to their owners for damage by detention. The difficulty which the authorities have to contend with at present is to prove that the goods carried by the suspected vessels are intended for the Boers. The cargoes in most cases are consigned to agents in Portuguese South Africa, who have no trouble in forwarding the consignments across the Portuguese border and overcoming the vigilance, real or imaginary, of the officials at Delagoa Bay.

The Naval Strength of the Powers.

Some interesting facts and figures relating to the naval strength of different countries were recently given in a Parliamentary paper. According to this paper Great Britain has 53 battleships built, against 43 of France and Russia combined, and 17 building, against 16 of France and Russia combined. Of armoured cruisers, we have 31 built and building, against 32 built and building of our two principal rivals on the sea. Then we have 116 protected cruisers built and building, against 52 of these two countries, and 15 unprotected against 17 French and Russian vessels. Of course, amongst the 53 battleships built there are many ancient vessels and several armed with muzzle-loading guns; therefore the figures are a little misleading to the man in the street. The comments on the return published in the daily press are most interesting. The *Times* points out that it is the fixed and unalterable policy of this country to have a fleet able to meet the combined fleets of any two powers on at least equal terms, and the steady increase of the naval armaments of Germany necessarily tends to bring that country more prominently into the comparison than heretofore. The *Pall Mall Gazette* asserts that the figures are delusive owing to the fact that we still keep in the list of effective ships, 16 battleships and eight armoured cruisers, armed with muzzle-loading guns, and protests against the stuffing of the Navy List with such "hoary shams." The general opinion, however, seems to be that the return is a very just one, and that the inclusion of obsolete vessels belonging to other countries makes the return a very fair official estimate of naval strength.

Pembroke Dockyard.

The keel of the first-class cruiser *Essex*, was officially laid down on the first day of the present year. A good deal of material has been got together ready to be worked into her hull, and a great deal more would have been prepared if the new Royal yacht had not engaged the attention of so many hands. The *Essex* is what may be termed a commerce protector, for she is to be fitted with engines of 22,000 H.P., and is expected to maintain a speed of 23 knots for eight hours on the contractors' trials. Condensers are to be fitted to the Belleville boilers, and stowage will be provided for 1,000 tons of coal. She has two sister ships building, the *Kent*, and the *Bedford*. The departure of the Royal yacht has released a great number of men, who have been sent to the *Spartiate*, and this ship may therefore be expected to make rapid headway. When the accident happened to the *Victoria and Albert*, shipwrights were drawn from every other vessel in hand to assist in righting her, and when she was at last towed clear of the dock, loud cheers were given, in which Sir William White is said to have joined.

Admiral Cervera's Dash from Santiago.

The official and personal correspondence which Admiral Cervera received permission from the Spanish government to publish as a defence of his conduct in the Spanish American war, has been translated and published by the United States naval intelligence office. In this correspondence, Admiral Cervera states that he reported on April 24th, 1898, that the *Viscaya*, on account of her foul bottom, was "no better than a buoy." We also learn that it was decided that he should escape from Santiago Harbour a week after his arrival, but the departure was postponed owing to a storm. Finally the Admiral practically refused to leave the harbour on his own responsibility, saying that "it is for the Captain-General to decide whether I am to go out to suicide, dragging along with me those 2,000 sons of Spain." The correspondence also shows that the original suggestion to escape came from Marshal Blanco in a telegram to General Linares, "it is my opinion that Cervera should go out from Santiago as early as possible." But Cervera was aware of the great risks he ran in pursuing such a course, and therefore declined to attempt to escape unless he received orders to that effect from Marshal Blanco. Blanco settled the case by cabling to the Government at Madrid, who at once adopted his view. The crews were therefore re-embarked, and on July 3rd, the ships put out to sea, and with what disastrous results is now well known,

Additions to the Fleet.

The keel of the new third-class cruiser which is to be constructed at Devonport Dockyard is to be laid almost immediately, and her principal dimensions will be:—Length, 310 ft.; breadth, 36 ft. 6 in.; mean load draught, 13 ft. 6 in.; displacement, 2,200 tons. Her engines will develop 7,000 I.H.P., which will give her a speed of twenty knots an hour. Her armament will consist of eight 4-in. and eight 3-pounder quick-firing guns, two Whitehead torpedo dischargers, and four Maxim machine guns. The total cost of the vessel when completed for sea is estimated at about £145,000. The report of Earle's Shipbuilding Co., issued a week or so back, shows a loss of £50,000 on the year's working, which arises in great measure from the abnormal costs of constructing the new cruisers *Perseus* and *Prometheus*, the first of which is completing at Sheerness, and the second named awaiting transfer to the Fleet Reserve. These vessels, say the directors of the company in question, were contracted for in 1896, when work was scarce and prices were low, and their cost has been affected by labour strikes, and also by the rise in wages which has taken place within the last three years. In these vessels, it may be mentioned, the amount of woodwork has been very much reduced, as is the case with all other vessels commenced within the past few years, although we have not taken wood out of ships built previous to the Spanish-American War. The removal of woodwork, of course, means wrecking the interior of the ships, and, if this is to be done at all, it should not be left until the outbreak of war.

Sheerness Dockyard.

The *Perseus* and *Prometheus* are at last almost ready for transfer to the A Division of the Fleet Reserve. It may be pointed out that nearly four years have gone by since the laying of their keels, although they are only third-class cruisers, with a displacement of a little more than 2,000 tons. Great activity has been apparent on the *Rosario*, owing to her being prepared for her steam trials. The dockyard engineering staff delivered the machinery for the *Rosario* a little later than that delivered by the Thames Shipbuilding Co. for the *Condor*, but the *Rosario* was ready for her trials first, although men were kept working overtime until very late hours at night. The *Rosario* is the first sloop to be fitted with water-tube boilers, and both she and the *Condor*, *Vestal*, and *Shearwater* have been fitted with boilers of the Belleville type. The keels of the new sloops *Fantome*, and *Espiegle* were laid about two weeks ago. The *Fantome* has been commenced in No. 5 dock, but she will have to be floated into No. 2 dock before she can be completed, as the first named dock is not of sufficient length to allow of her being completed in it. Amongst the vessels undergoing refit here is the torpedo-boat destroyer *Snapper*. She is to have her boilers retubed, so that it will be some time before she is out of the dockyard hands. The *Hearty* is also undergoing her annual refit, and the *Sparrow* is to be taken in hand as soon as possible.

Engines for Warships.

According to the returns of the leading firms engaged in the construction of machinery for warships, the past year has been in every respect a busy and prosperous one. At many of the establishments double shifts and overtime has been continuous, for in many cases, in addition to supplying the engines, the firms have built the vessel for which these are intended, and where vessels are built in the Royal dockyards, the contracts for the engines have in nearly every case been given to private firms. The Thames Ironworks and Shipbuilding Co., in which is now incorporated the business of Messrs. John Penn & Sons, has had its full share of Government work. The firm has turned out machinery at least for three battleships, including the *Duncan*, *Cornwallis*, and *Albermarle*, the engines of all three ships having a horse power of 18,000. Messrs. John Penn & Sons, before they joined hands with the Thames Ironworks Co., constructed the machinery for the *Goliath* and the third-class cruiser *Pomone*. Messrs. Humphreys, Tennant & Co. were fortunate in securing the contracts for the engines of the new Royal yacht, and the machinery of the Japanese battleship, *Shikishima*, and the Japanese cruisers *Asama* and *Tokiwa*, whilst Messrs. Maudsley Sons & Field delivered the engines for the battleship *Albion*, and for the cruiser *Spartiate*. Messrs. Yarrow & Co. have been responsible for the engines of five 31-knot torpedo boat destroyers for the Japanese Navy, two torpedo boats for the Austrian Government, and the machinery for a few shallow draught steamers. The aggregate I.H.P. of the marine engines completed on the Clyde last year amounted to 478,503, which is some 30,000 less than that of the previous year. Messrs. John Brown & Co., Limited, have delivered engines with an aggregate horse power of 53,480, and the Fairfield Co. of 51,650, the work carried out by Messrs. John Brown included the engining of the Japanese battleship *Asahi*, and the first-class British cruiser *Sutlej*. The Vickers Co. at Barrow-in-Furness, have been responsible for the engines of the *Vengeance* and six other vessels.

The Launch of the "Pandora."

The third-class cruiser *Pandora* was christened and floated out of Portsmouth Dockyard about a week ago. This vessel, it will be remembered, was laid down on January 3rd, 1898, so that she has been a little over two years on the building slip. However, the fact that she has been built in dock has allowed of her being brought to a more advanced state of completion than would have been the case had she been built on a slip. She is one of two third-class unsheathed protected cruisers now building, the other vessel being the *Pioneer*, now under construction at Chatham. Mrs. Napier, the daughter of Admiral Sir Michael Culme Seymour, Commander-in-Chief at Portsmouth, officiated at the christening ceremony when the vessel took the water. The principal dimensions of the *Pandora* are: length, between perpendiculars, 305 ft.; length, over all, 318 ft. 6 in.; breadth, extreme, 37 ft.; mean draught of water, 13 ft. 6 in.; displacement, 2,200 tons. A steel deck sloped at the sides, and varying in thickness from $\frac{1}{2}$ in. to 2 in., has been worked throughout the length of the ship in the neighbourhood of the water line, forming a watertight boundary, and affording protection to the engines, boilers, magazines, &c. The *Pandora* will be propelled by twin screws, each driven by an independent set of vertical triple-expansion engines, capable of developing, at the working pressure of 250 lbs. to the square inch, an I.H.P. of 3,500 or 7,000 for the two sets of engines. With this H.P. a speed of about 20 knots will be realised. Steam will be supplied by eight water-tube boilers of the Thornycroft type. These engines and boilers are being built in Portsmouth Yard. The quantity of coal carried at the above draught is 250 tons, although provision is made for stowing a much larger amount. The armament will consist of eight 4-in. quick-firing guns—two being on the forecastle, two on the poop, and the remainder in the waist of the ship—eight 3-pounder quick-firing guns, and three ·45-in. Maxims. Two above-water torpedo-tubes will be carried. These tubes will be armoured, the thickness of the armour varying from 1 in. to 3 in. The complement of the *Pandora* when commissioned will be 224 officers and men.

RIPPER'S MEAN-PRESSURE INDICATOR.

THE accompanying illustrations show a new departure in indicators for steam engines, designed and patented by Professor William Ripper, and manufactured by Messrs. Schäffer & Budenberg, Whitworth Street, Manchester. Professor Ripper first brought forward his new invention before the Institute of Mechanical Engineers at a recent meeting, of which a report was given in our last issue; but he has since further developed the apparatus, and introduced important improvements in its construction, which we are now able to set fully before our readers. In this instrument the mean pressures acting on the two sides of the engine piston are indicated continuously on the separate dials of the pressure gauges, the reading of one gauge being the mean effect of the driving pressures acting on the piston, and the reading of the other the mean effect of the back pressures acting against the piston; the difference between the two readings representing the mean effective pressure on the piston. Considering the very great importance of Professor Ripper's invention, especially to marine engineers, the two sets of illustrations we are enabled to give will be of interest. Our illustration Fig. 1 shows the indicator as it had been designed and perfected by the Professor up to the time of reading his paper before the Institution of Mechanical Engineers, although this particular type of the indicator was not brought before the meeting. Our illustration Fig. 2 shows the further improvements since introduced by Professor Ripper, in some measure as the result of the criticism and discussion at the above meeting, one new feature being the dirt-collecting pockets, whilst there has been a considerable strengthening of the apparatus in other parts. The form shown in our sectional illustration is adapted for use on vertical engines, and is supplied with coupling nuts *A* and *B* for $\frac{3}{8}$ in. or $\frac{1}{2}$ in. bore brass pipes for connecting the instrument to the indicator pipes or direct to the cylinder ends. If it is desired to use $\frac{3}{4}$ in. bore connecting pipes the instrument is fitted with a special coupling nut. The pressure gauges are connected with the valve box by copper pipes *C* and *D*, and fine regulating valves *E* and *F* serve for throttling the pressure gauges; whilst there are two throttling cocks *G* and *H* on the valve box for the purpose of initial throttling to prevent the disappearance of the water from the gauge syphons. Screwed plugs *J* and *K* are provided for blowing through the instrument when required and for filling the syphons with water. The constant communication of the forward-pressure gauge with the forward-pressure side of the piston is secured by a ball valve *M*, which is pushed forward at the end of every stroke by the greater pressure of the incoming steam, thus making communication between the gauge *P* and the high-pressure side of the piston, and closing the communication to the other side of the piston. Similarly a double-beat valve *N*, under the action of the steam, makes the communication between the back-pressure gauge *Q* and the back-pressure side of the piston; *S* and *T* are dirt-collecting pockets, which are cleared by removing the plugs *V* and *W*. This instrument, which is automatic, and requires no driving gear, will give for all ordinary cases a very close approximation to the result obtained with an ordinary indicator; but in engines sometimes working under a very large and varying degree of compression, such as locomotive engines, an error is introduced, owing to the reversal of the valves taking place too early in the stroke, and a special arrangement has been designed to obviate this difficulty. The Ripper indicator possesses, amongst other advantages, that of enabling the load at which the engine is running to be seen at a glance; and in compound or triple-expansion engines it shows whether the load is evenly or unevenly distributed over the different cylinders. It is also readily ascertained how far above or below the "rated load" the engine is working, whilst the power required to drive any machine or portion of a workshop can be

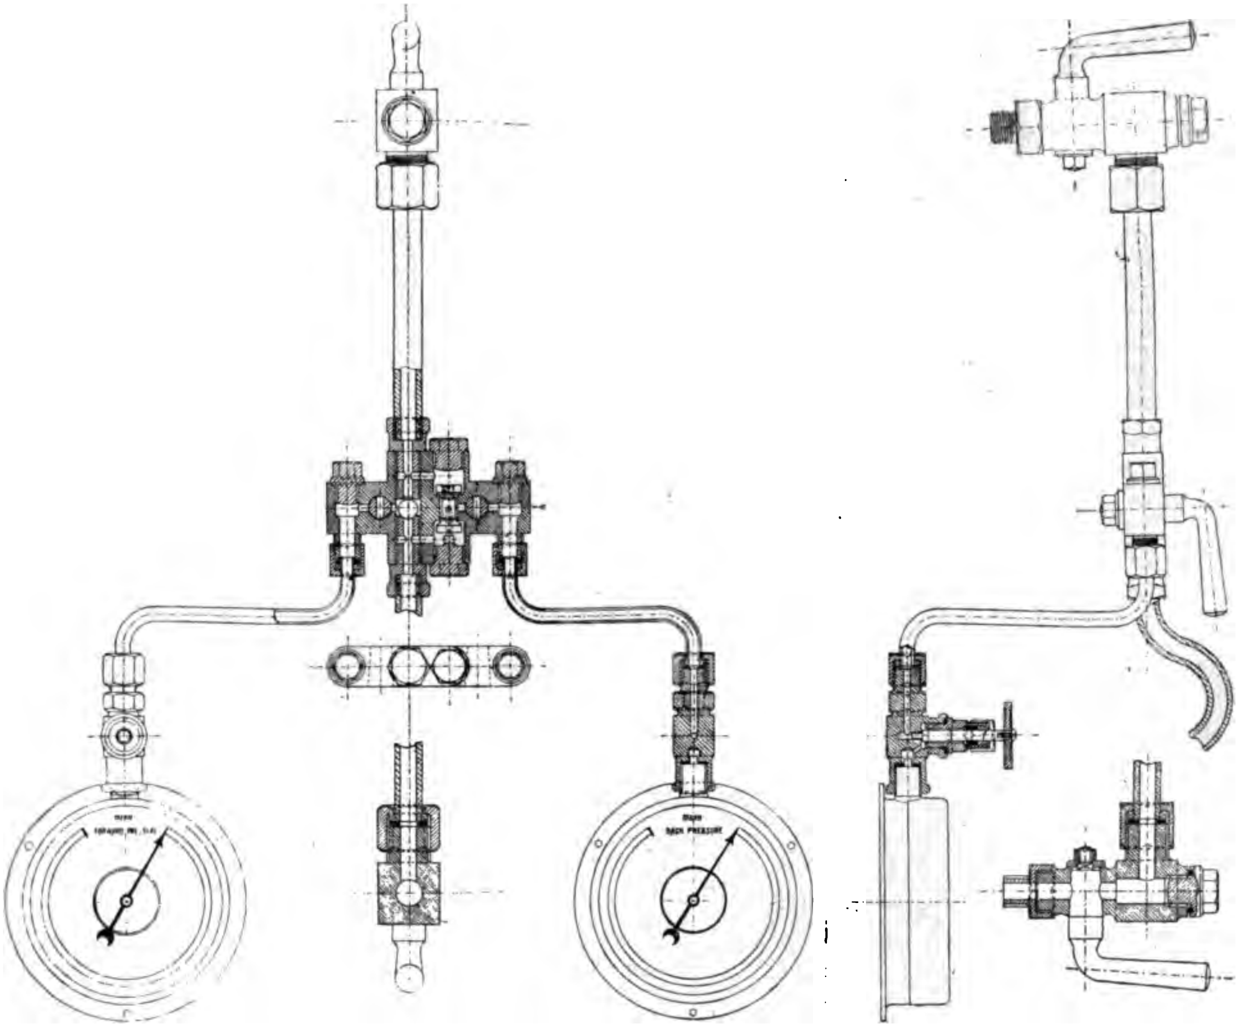

FIG. 1.

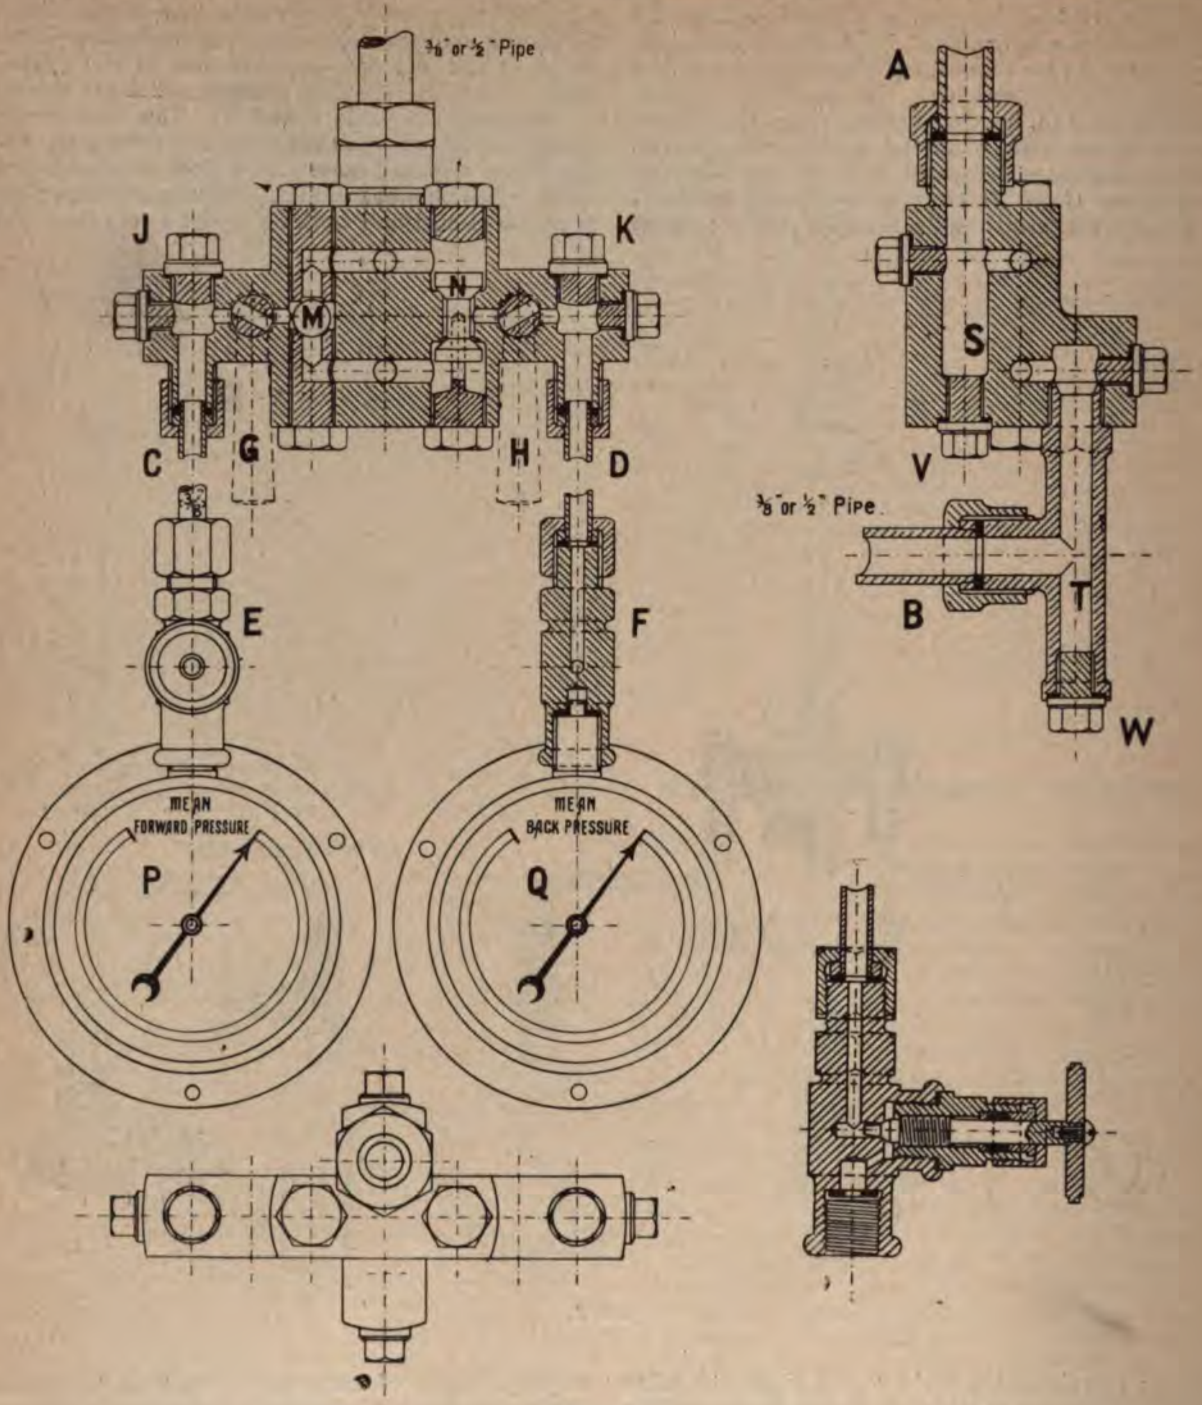

Fig. 2.

easily determined by noting the differences in the reading of the gauges when the respective loads are "on" and "off." If anything has suddenly gone wrong with the engine, it is possible, with the aid of this instrument, to at once locate the fault, or to see whether the fault is within the engines or outside them. By closing one admission cock to the instrument whilst the other is open, and afterwards reversing the operation, an equal, or nearly equal, reading of the forward-pressure gauge in the two cases respectively will show that the main valves of the engines are properly set. For marine work in particular the instrument should be found extremely useful in enabling the chief engineer of a steamship to satisfy himself at a glance at any moment, and without the necessity of "indicating," as to the actual power the engines are developing; and to see whether the power is distributed equally over the different cylinders, so as to always ensure the greatest possible uniformity of the turning effort on the engines, which not only tends to steady working of the engines, but also ensures more uniform pressures on the bearings. If the engineer alters the link motion of the engine, he can see at once what is the effect upon the total power and the distribution of the power of every change in the position of each link. It also appears likely that this instrument will be found extremely useful in connection with trial trips in giving a continuous record of the power developed by the engines, thereby saving an immense amount of labour now expended on the frequent indicating of the engines, and showing instantly every change of power.

NAVAL ENGINEER APPOINTMENTS.

The following appointments have been made at the Admiralty, from November 27th to December 21st, 1899:—

Rattey, W., engineer to the *Duke of Wellington*, for the *Bullfinch*, to date November 10th, in lieu of a chief engineer.

Screech, S. A., chief engineer to the *Monarch*, for transport staff, to date November 30th.

Screech, S. A., chief engineer, to be staff engineer, to date December 1st.

Shean, F. E., inspector of machinery, has been placed on the retired list.

Shirvell, J., fleet engineer to the *Highflyer*, to date December, 7th.

Sillince, W. P., assistant engineer to the *Highflyer*, to date December 7th.

Skinner, W. H., fleet engineer to the *Vivid*, for the *Talbot*, to date November 24th.

Smith, F. P., chief engineer, has been advanced to the rank of staff engineer in her Majesty's fleet.

Stevens, W. C., engineer to the *Victoria and Albert*, for the *Alberta*, to date November 23rd.

Swinney, E., chief engineer to the *Scout*, to date December 5th.

Taylor, G. R., chief engineer, has been advanced to the rank of staff engineer in her Majesty's fleet.

Walker, J. J., fleet engineer to the *Royal Arthur*, for the *Katoomba*, lent to the *Ringarooma*, to date December 12th.

Ward, J. T. H., chief engineer to the *Pembroke*, for the *Northumberland*, to date December 12th.

Ware, C. G., engineer to the *Furious*, to date November 10th.

Warren, C. L. (probationary), assistant engineer to the *Indefatigable*, and for recommissioning, to date December 12th.

Whebby, T., fleet engineer to the *Hotspur*, to date November 30th.

Wise, F., engineer to the *Pembroke*, for the *Cyclops*, to date November 25th, in lieu of a chief engineer.

Wooldridge, G. W., assistant engineer to the *Highflyer*, to date December 7th.

From December 22nd, 1899, to January 23rd, 1900:—

Abbott, H., chief engineer to the *Duke of Wellington*, for the *Pandora*, to date February 20th.

Abbott, W. J., fleet engineer to the *Duke of Welligton*, for the *Neptune*, to date January 10th.

Agnew, T., fleet engineer to the *Vivid*, for service in Reserve Office, undated.

Alexander, J. W., assistant engineer to the *Ramillies*, to date January 1st.

Amor, Edward R., assistant engineer to the *Vernon*, additional, for torpedo store, to date January 2nd.

Anderson, W. J., chief engineer to the *Duke of Wellington*, for the *Gladiator*, to date January 5th.

Anstey, H. C., engineer, to be lent to the *Vernon* and *Excellent* for course of torpedo and hydraulic instruction, commencing January 3rd.

Aston, S., staff engineer to the *Pembroke*, for the *Diana*, to date January 4th.

Baldwin, G. W., engineer, to be lent to the *Vernon* and *Excellent* for course of torpedo and hydraulic instruction, commencing January 3rd.

Baron, R., engineer to the *Pembroke*, for the *Cygnet*, to date December 21st.

Barker, H. C. D., assistant engineer for temporary service, to be lent to the *Vernon* and *Excellent* for course of torpedo and hydraulic instruction, commencing January 3rd.

Cleave, Richard C., assistant engineer to the *Galatea*, to date January 1st.

Corner, John T., fleet engineer, has been promoted to the rank of Inspector of Machinery, in her Majesty's fleet.

Cornish, E., staff engineer, has been advanced to the rank of fleet engineer in her Majesty's fleet.

Cunningham, J. E. G. (probationary), assistant engineer to the *Vivid*, additional, for the *Ocean*, to date January 15th.

Dalrymple, J. H., chief engineer to the *Vivid*, additional, for the *Rainbow*, to date January 1st.

Drake, P. G., engineer to the *Pembroke*, additional, for the *Spitfire*, to date January 1st.

Eyre, C. V., engineer to the *Pembroke*, additional, for the *Bittern*, in lieu of a chief engineer, undated.

George, F. T., staff engineer to the *Theseus*, additional, and as part complement on recommissioning of *Ramillies*, to date January 4th.

Gordon, H. V. (probationary), assistant engineer to the *Majestic*, to date January 1st.

Griffin, D., fleet engineer to the *Duke of Wellington*, for the *London*, to date January 20th.

Guyer, F., acting engineer to the *Wildfire*, for general duties in Sheerness Dockyard Reserve, to date December 21st.

Hammond, H., assistant engineer, to be lent to the *Vernon* and *Excellent* for course of torpedo and hydraulic instruction, commencing January 3rd.

Harding, R., fleet engineer to the *Vernon*, additional, for torpedo-boats and such tenders as have no engineer officers attached to them, to date January 5th.

Haves, J. E., engineer to the *Pembroke*, additional, for the *Cheerful*, undated.

Hefford, E. O., engineer to the *Hibernia*, for service in connection with gun mountings, to date December 22nd.

Hicks, J. A. H., staff engineer to the *Duke of Wellington*, additional, for the *Rodney*, to date January 10th.

Holgate, G. S., engineer to the *Ramillies*, undated.

Hopkyns, J. W., assistant engineer to the *Northampton*, to date January 1st.

Huddy, J. B., engineer, has been placed on the Retired list of his rank

Hughes, T. C. E., staff engineer for the *Duke of Wellington*, for the *Hecla*, to date January 5th.

James, F. W., has been appointed assistant engineer R.N.R.

Jenkins, J. E., staff engineer to the *Diadem*, to date January 5th.

Johnson, H. H., assistant engineer to the *Vivid*, for the *Ocean*, to date January 10th.

Leighton, W. J., engineer to the *Research*, to date January 10th.

Lewis, E. E., engineer to the *Magnificent*, to date January 1st.

Lobb, H. T. G., assistant engineer to the *Resolution*, to date January 1st.

Lock, H. J., fleet engineer, has been placed on the Retired List of his rank at his own request.

Lyon, W. H., has been appointed engineer R.N.R.

Markham, R. G. L., engineer to the *Vulcan*, to date December 22nd.

Mathew, G. W. (probationary), assistant engineer to the *Devastation*, to date January 10th.

Matthews, W. H., fleet engineer to the *Duke of Wellington*, additional for the *Inflexible*.

Meiklem, R. A. R., assistant engineer to the *Europa*, to date January 10th.

Moore, F. J., fleet engineer to the *Pembroke*, for the *Ajax*, to date January 4th.

Moorshead, H. B., engineer to the *Vivid*, for the *Osprey*, to date January 1st.

Morgan, T. J., engineer to the *Mars*, to date January 1st.

Moss, F. S., engineer to the *Vivid*, additional for tender *Ferret*, to date January 1st

Newton, W. W., assistant engineer, for temporary service to be lent to the *Vernon* and *Excellent* for course of torpedo and hydraulic instruction, commencing January 3rd.

Nicholls, H. E., assistant engineer, to be lent to the *Vernon* and *Excellent* for course of torpedo and hydraulic instruction, commencing January 3rd.

O'Dougherty, H. B. (probationary), assistant engineer to the *Vivid*, supernumerary, to date January 17th.

Olive, W. E. (probationary), assistant engineer to the *Cæsar*, to date December 22nd.

Paton, F. C. R. (probationary), assistant engineer to the *Orlando*, to date January 17th.
Pring, F., engineer to the *Duke of Wellington*, for the *Glory*, to date January 10th.
Pulliblank J. B., (probationary), assistant engineer to the *Illustrious*, to date December 22nd.
Rashbrook, H. S., staff engineer, has been advanced to the rank of fleet engineer in her Majesty's fleet.
Rashbrook, H. S., fleet engineer to the *Wildfire*, for the *Edinburgh*, to date January 10th.
Reynolds, H. E. J., acting engineer to the *Pembroke*, for the *Sparrow*, to date January 19th.
Richards, P. B., assistant engineer, for temporary service, to be lent to the *Vernon* and *Excellent* for course of torpedo and hydraulic instruction, commencing January 3rd.
Richards, P. B., assistant engineer to the *Duke of Wellington*, supernumerary temporary, to date January 10th.
Sawyer, Arthur F., assistant engineer to the *Hannibal*, to date January 1st.
Scott, E. B. (probationary), assistant engineer to the *Diadem*, to date January 10th.
Screech, S. A., chief engineer, has been advanced to the rank of staff engineer, in her Majesty's fleet.
Scullard, G. H., assistant engineer, to be lent to the *Vernon* and *Excellent* for course of torpedo and hydraulic instruction, commencing January 3rd.
Simmons, G. T., fleet engineer to the *Ramillies*, undated.
Spence, R., engineer, to be lent to the *Vernon* and *Excellent* for course of torpedo and hydraulic instruction, commencing January 3rd.
Start, S. P., assistant engineer to the *Ramillies*, to date January 1st.
Summerford, H. G., engineer to the *Pembroke*, for the *Goliath*, to date January 2nd.
Sutton, A. W., engineer to the *Tamar*, for charge of engineers' reserve stores, and to assist inspector of machinery at Hong Kong, to date January 17th.

INDUSTRIAL AND TRADE NOTES.

THE CLYDE AND SCOTLAND.

(From our own Correspondent.)

THE tonnage presently under construction in Clyde yards—which in last month's Notes was stated to amount to about 450,000 tons gross measurement—has been reduced by a number of launches (one or two of considerable note) since the resumption of work after the New Year holidays. Altogether considerably more than the average January output has taken place, one item alone, the Allan Line twin-screw *Tunisian*, amounting to 10,200 tons. Compensating for this, however, there has been a gratifying amount of new tonnage placed, East Coast of Scotland, as well as Clyde firms, sharing in the contracts. About 40,000 tons in all have been ordered, particulars of the contracts being given in the course of these Notes.

Messrs. William Simons & Co., Renfrew, whose 12,000 tons of output during the year now numbered with the past embraced several very notable vessels for dredging purposes, have early in the new year begun to consign the work they have in hand to the water. Early in the month, and the year, they launched complete a steel twin screw hopper dredger, named the *Shunkai Maru*, No. 1, constructed to the order of the Osaka Harbour Board, Osaka, and intended for work in connection with the improvement of that Japanese port.

Other noteworthy contributory items to the month's aggregate output are two sailing ships, these being the first vessels of the sailing order to be launched in Scotland for a number of years—except, of course, small coasting or fishing craft and sailing yachts. Both vessels, moreover, are of a type very unusual on this side of the Atlantic, although common enough on the American seaboard, being four-masted schooners, the masts being all of about the same height, and fitted with fore-and-aft sails only. These and other features connected with the rig are designed to enable the vessels to be worked by the minimum number of hands. One was launched by the Grangemouth Dockyard Co. for Mr. W. L. Lovitt, of Yarmouth, Nova Scotia; and the other by Messrs. R. Duncan & Co., Port-Glasgow, for Mr. John Ena, of Honolulu, for whom they have already built one similar vessel. Both vessels are constructed with very clear holds for the stowage of large cargoes of timber.

The Fairfield Shipbuilding and Engineering Co., Limited, has contracted with the Isle of Man Steam Packet Co. to build and engine a fast paddle steamer for that Company's Isle of Man passenger service. The new vessel will be somewhat similar in size and design to the paddle steamer *Empress-Queen*, built about three years ago for the Isle of Man Company, which is at present lying in the Fairfield Co.'s tidal dock.

Messrs. A. Stephen & Son, of Linthouse, and Messrs. Barclay, Curle & Co., Whiteinch, are to share, in some measure, with Messrs. Caird & Co., Greenock, the requirements in the way of new tonnage of the Peninsular and Oriental Co. This vast and enterprising concern has not for many years gone to any other builders on the Clyde than Messrs. Caird & Co. for new vessels, but they have recently placed orders in all for four large steamers. Two of between 7,000 and 8,000 tons have been placed with Messrs. Caird, who have already three other vessels on hand for the company, and one each of about 7,000 tons has been placed with the firms above named. Whilst the vessels to be built by the Greenock firm are of the high class mail and passenger type, so many of which have emanated from their stocks, the vessels placed higher up the river are to partake more of the intermediate or cargo carrying class.

Messrs. McKie & Baxter, of Copland Engine Works, Govan, as we mentioned last month, in addition to other work, have in hand six sets of engines, aggregating 3,050 I.H.P., for shipment abroad, some being for Singapore and Colombo, built under the superintendence of Mr. David Pollock, M.I.N.A., 128, Hope Street, Glasgow.

The shipbuilding yard of Messrs. A. Rodger & Co., Port Glasgow, was on Saturday, 20th ult., the scene of a somewhat disastrous fire. This appears to have originated in the joiners' shop, which was a brick building of three flats, and, although the fire brigade was promptly in attendance, the building was soon in flames. Adjoining this building, separated only by a fireproof wall, are the drawing and commercial offices of the firm. For a time it seemed as if the fire, fanned by a strong westerly wind, would spread in this direction, and models, drawings, and valuable documents were removed to a place of safety. The conflagration was happily kept under and confined to the building in which it had originated, and eventually the roof and floors of the shops fell in, several men being injured. The whole of the machinery, much valuable finished work and material were completely destroyed, whilst the walls of the building also collapsed. Besides the joiners' shop, the building comprised the polishing shop, the engineers' and blacksmiths' shops; and these with their contents were completely ruined. The destruction of the main driving engine, &c., has thrown 150 men out of employment. The damage, which is fully covered by insurance, was estimated at £12,000.

Menzies & Co., Limited, of Leith and Inverkeithing, who during 1899 were very busy at their Leith works with ship and engine repairs—two of the biggest contracts being on Her Majesty's ships *Caledonia* and *Redwing*—also had a fair start at their recently acquired shipbuilding premises at Inverkeithing, although hampered, like many other firms, by the slow delivery and high price of materials. The fourth annual general meeting of the company, as a limited liability concern, was held early in this month, when a dividend of five per cent. on preference, and ten per cent. on ordinary shares was declared. The company have in hand at present, at Inverkeithing, two steamers, one a twin-screw steamer of 300 tons, and 800 I.H.P., for owners at Para, and the other a fishing steamer of 220 tons and 700 I.H.P., for Grimsby owners. At their Leith works the company continue to add to the equipment of their extended workshops, modern labour-saving machines, and to their facilities for docking and repairing the hulls and engines of all classes of steamers.

At Dundee, operations in the shipyards and engine shops were duly resumed after the New Year's holidays, and already 1900 has brought some fresh work for shipbuilders. The Caledonian Shipbuilding and Engineering Co., Limited, has received an order to build and engine a screw steamer, 230 ft. long, 36 ft. beam, and 15 ft. deep, for the African Steamship Co.

The shipbuilding yard at Kinghorn, formerly occupied by Messrs. John Scott & Co., and for a number of years past carried on under the same name by Mr. Samuel Crawford, formerly manager at Clydebank shipyard, ceased operations owing to financial difficulties shortly before the end of the year. Between 400 and 500 workmen were employed at the time of the stoppage, they being informed that until further notice their services would not be required. Some time ago, when the yard was very busy, over 1,000 men were in steady employment. Two vessels are at present in course of construction, one of 1,500 tons for a Hull firm, which is well advanced. Most of the workmen have found employment elsewhere, but hopes are entertained that operations at the yard, which is the mainstay of Kinghorn, will soon again be resumed.

In the steel trade there is no finality either as regards increasing facilities for output, or in respect of improved modes and character of manufacture. In all the works of the West of Scotland extensions and alterations have been proceeding, contemporaneously with the conduct of affairs at full pressure to cope with the enormous demand for material which has been pouring in from all sides. Extensions and improvements have been under way throughout last year, and in some cases they have been, or are being still, enlarged upon. Messrs. Colville, of Dalzell Steel Works, Motherwell, are adding to their new plant of steel smelting furnaces. The Lanarkshire Steel Co., Limited, have now almost completed the laying down of a splendid new plant. Many acres of ground have been acquired, and on this has been laid down a 40 in. cogging mill—the largest of its kind in the country—two bar mills, a 36in. and 27in. mill respectively, together with the necessary reheating plant. This will increase the present output of 2,000 tons per week by 300 tons per week. It is expected that the new plant will be partly in operation by the beginning of March. The Calderbank Works have been restarted for the production of ship plates. The Steel Co. of Scotland are continuing to remodel their works, and have to a large extent reconstructed their steel foundry at Newton. The Glasgow Iron and Steel Co. have added two melting furnaces to their plant at Wishaw. Mr. James Riley, who has retired from the management of these splendid works at the expiry of his five years' engagement, and who has purchased steel works at Stockton-on-Tees, has successfully inaugurated there the use of fluid metal taken direct from the blast furnaces and immediately charged into the Siemens melting furnace—many thousands of tons having been thus successfully treated in the course of last year.

The works of Messrs. William Beardmore & Co. have now fully established, as their leading branch of industry, armour-plate manufacture. Not only in this but in other departments of the works the year 1899 was one of extreme pressure. Beginning this year with a full order book, including the large order for side-armour for H.M. *Cressy* and *Aboukir*, and casemate-armour for *Cressy*, *Aboukir*, *Sutlej*, and *Implacable*, which the British Government placed with the firm towards the end of 1898, and the Danish Government's order for the side-armour of their new warship *Herluf Trolle*; the manufacturing and finishing capabilities of the Parkshead plant have been stretched to their utmost capacity. This was particularly noticeable during the latter months of the year recently closed, when the manufacture had reached such a pitch that with the great 12,000 ton hydraulic press and the 4,000 ton press continuously at work, and the rolling, machining, bending, chilling, and finishing processes actually pressing upon each other, the delivery of finished armour reached a total of about 500 tons per month. Such a result was, of course, only attained through the further considerable additions to the finishing machinery, which were made during the past year. Consequent upon their vigorous adoption of armour-plate manufacture, and the great increase in plant thereby entailed, Messrs. Beardmore & Co. have in further contemplation for the immediate future a large extension to their works on ground adjoining their present property.

Lloyd's General Committee have, after some negotiations and correspondence with a committee representing all the bodies interested, agreed to the establishment of a branch committee of the society in Glasgow for the Clyde district, and have referred to a sub-committee the arrangement of details. Last spring the Clyde Steamship Owners' Association communicated with all the bodies in Glasgow who elected representatives to Lloyd's Register Committee, and pointed out that the present representation to Lloyd's from Glasgow was inadequate, considering that in the year 1898 the Clyde district owned 1,918,799 tons, and in the same year 466,832 tons of shipping was produced on the Clyde. The result was that a conference was held of representatives of all the bodies in Glasgow, and the outcome of that conference was a unanimous request being sent to Lloyd's in London requesting that a local committee be established in Glasgow. The constitution of the local committee will be discussed and arranged at a meeting to be held some time this month, and it is thought that this will be regulated in a large measure by the lines laid down in connection with the similar Liverpool branch committee, where there were sixteen members and a chairman ex-officio. Eight of these representatives are sent to London as representing the Liverpool Committee.

The committee of the British Corporation for the Survey and Registration of Shipping have recently made additional appointments of non-exclusive surveyors at the foreign ports herewith named:—Philadelphia, Mr. John T. Boyt, 302, Walnut Street; Cleveland, Ohio, Mr. Robert Logan, 810, Western Reserve Buildings; Suez, Mr. A. G. Austick; Singapore, Mr. A. Kitching; Fremantle, West Australia, Mr. John Denny. At least two of the above-named have had a Clyde training. Mr. Logan was for many years chief draughtsman to the now defunct firm of Aitken & Mansel; and Mr. John Denny, who is a cousin of the Messrs. Denny, of Leven Shipyard, Dumbarton, served his apprenticeship in the works of the Clydebank shipbuilding Co., now John Brown & Co., Limited.

Mr. John Carmichael, until recently of the Greenock shipbuilding firm of Carmichael & McLean, and formerly an assistant manager at Fairfield, has been appointed manager to Messrs. Craig, Taylor & Co., Stockton-on-Tees, whose establishment has undergone great extensions of late.

The Institution of Electrical Engineers has granted the prayer of a petition, on the part of between 70 and 80 gentlemen connected with electrical industries in and around Glasgow, for the formation of a local section of the institution, with its headquarters in Glasgow. In pursuance of this a meeting was held on the 18th ult., in the rooms of the Institution of Engineers and Shipbuilders, Bath Street, Glasgow, at which several of the principal office-bearers of the head institution were present, and arrangements were entered into for the formation of the section. A provisional committee was appointed to draft local rules and to carry on the work of the section till May.

Death has been busy of late amongst the ranks of shipbuilders and engineers of the Clyde district, and has claimed as victims Mr. James Deas, the engineer-in-chief to the Clyde Trust—of whose career and great work on the Clyde something will be said in our next issue—and Mr. Archibald Gilchrist, chairman of the old concern of Barclay, Curle & Co., of Whiteinch and Stobcross, and himself one of the very few remaining shipbuilders whose connection with shipbuilding on the Clyde carries us back to the early days of marine engineering as an industry. Two other men of note who have of late passed away are Mr. A. H. Wilson, senior partner of Messrs. Hall, Russell & Co., Aberdeen; and Mr. John Napier, only surviving son of the famous shipbuilder and engineer, the late Robert Napier, of Shandon, and founder of the great Govan firm of Robert Napier & Sons. Mr. Wilson, who died abroad—at Mentone—on Christmas night, learned iron shipbuilding with Messrs. Barclay, Curle & Co., and about 35 years ago, became a partner in the shipbuilding and engineering firm at Aberdeen. Mr. John Napier, until his retirement, about 20 years ago, from the business founded by his father at Govan, was a well-known and able engineer, and resided at Sauchfield, Gilmorehill, one of the very few remaining old-time Glasgow mansions. After his retirement he took up his residence in London, having investments in various shipping concerns managed there. He died in his 77th year, and his remains were brought to Glasgow and there interred.

The Watt Anniversary Lecture, at Greenock, was, on this occasion, delivered on the 19th ult., in the Watt Institute, by Professor Oliver Lodge, of Liverpool, his subject being "Wireless Telegraphy." On the previous evening he delivered a lecture on the same topic in Glasgow, as one of the course organised by the Glasgow Lectures Association, and in this way interest in the Watt Lecture of 1900 was somewhat miminised, or at least was not so general over Clydeside as on previous occasions. The Watt Dinner, which is more and more becoming the recognised annual festive function of the Institution of Engineers and Shipbuilders rather than as the celebration of Watt's anniversary, was held on Saturday evening, the 20th ult., in the Windsor Hotel, Glasgow. There were about 270 persons present, the chair being occupied by Mr. Robert Caird, F.R.S.E., president of the Instit[illegible] Professor W. H. Watkinson, vice-president [illegible] ex-vice-president, acted as cr[illegible] Sir William Arrol, M[illegible] of H.M.S. *Ben*[illegible]

Captain Usui and other officers of the Imperial Japanese Navy; Mr. John Inglis, LL.D. ; Bailie James M. Thomson, Professor J. H. Biles, Colonel Archibald Denny, and Mr. Edward H. Parker, secretary of Institution. The toast list was shortened somewhat from previous years—even that of the "Memory of Watt" having been expunged—and there was quite an evident effort on all sides to eliminate "shop!" At the conclusion of the toast list the function resolved itself into a smoking concert.

THE TYNE.

(From our own Correspondent.)

Shipbuilding.—The customary lull in business which makes itself felt in the first weeks of a new year is now disappearing, and briskness is again becoming the preponderating feature in all the principal industries. Under other circumstances the sudden and extraordinary rise in the price of coal might have checked business in the shipbuilding and engineering trades for a time; but such an effect is not discernible on the present occasion, the reason being doubtless that there are too many orders in hand, and owners are too urgent for prompt delivery, to admit of any delays being indulged in by builders which could by any means be avoided. The dearness of coal will, of course, have its effect on the prices of work now offering, and we should imagine that it will be impossible to place orders, excepting at considerably enhanced prices as compared with those prevalent in December, 1899. In these notes, the probability of this contingency arising has been foreshadowed on more than one occasion towards the close of last year, and the circumstance has consequently not occasioned us any surprise. If we may again venture upon the hazardous task of prediction, we think it will not be far from the truth to say that the cost of new tonnage is likely to be further advanced in the immediate future, and that many months will elapse before the inevitable retrograde movement begins to show itself.

It appears that, through the desire of some shipbuilding firms to occupy more prominent positions in the output lists than they were entitled to, the returns of tonnage built last year are somewhat exaggerated. In certain districts, indeed, where an increase upon the previous year's record was announced; it turns out that instead of an increase of output there was a decrease. It is a pity that, for the sake of a little brief notoriety, firms of good and honourable standing in the shipbuilding world, should resort to the misleading tactics mentioned, and we sincerely hope they will in future see the uselessness of such a proceeding. There is one legitimate mode of measurement by which the tonnage of all vessels built is determined, and nothing but this true standard should be recognised. If every builder is permitted to put fancy measurements of his own before the public as indicating the output from his establishment, it will become impossible to place any reliance on published lists, and such information will consequently become valueless.

One of the disabilities under which shipbuilders labour at the opening of the century is a scarcity of skilled workers, and particularly of riveters. We note that in the current number of the Boilermakers' and Iron-shipbuilders' Report, not only private firms, but also a Government department are making applications for men of the last-named class, and it is very much a matter of doubt whether the society officials will be able to supply them. During the whole of last year the insufficiency of hands was a source of constant hindrance and loss to shipbuilders; but the drain of men from shipyards and other works, caused by the calling up of the Reserves and the Militia contingents, has greatly accentuated the difficulties of the situation, and it is already quite evident that some drastic measures will have to be taken if the work of our shipyards is to go on without serious interruption this year. If the trade union, which arrogates to itself the right to settle who shall, or who shall not, work at the trade, should confess itself unable to supply the requirements of shipbuilders, then the latter should supply themselves by opening their yards to all eligible candidates for employment.

The two yards belonging to Messrs. Armstrong, Whitworth & Co., at Elswick and Low Walker, are well stocked with work—the former with cruisers, &c., in various stages of progress, and the latter with merchant vessels, some of which are of exceptionally large size. The extensions and improvements which have been in progress for a considerable time are now nearing completion, and a substantial increase in the productive capabilities of the establishment will be provided. At the adjoining yard of Messrs. William Dobson & Co. there are three vessels on the stocks, one of which is in an early stage, whilst the others are well advanced. Messrs. Wood, Skinner & Co. have their berths fully occupied, one of the vessels on the stocks being almost ready for launching.

Messrs. Wigham-Richardson & Co. have some half-dozen vessels in progress on the stocks, besides a number on the water being fitted out or getting repaired. One of the very large vessels building, is understood to be for the North German Lloyd, whilst another—of equal size—is said to be for the Pacific Steam Shipping Co., Limited. Both these vessels are not only of exceptionally large dimensions, but are specially designed for high speed, and will be fitted out in full accordance with modern ideas of effective steamship equipment.

Messrs. Hawthorn, Leslie & Co. launched a large meat ship recently, and have one or two others on the stocks. They have also in progress other merchant steamers of an important class, besides torpedo-destroyers, and are, on the whole, exceedingly busy. The graving dock, which is just now occupied with a vessel undergoing repair, was scarcely ever without an occupant during last year, and must have proved a good source of income to the firm.

Messrs. C. S. Swan & Hunter are said to have received from a firm at Montreal an order for four steamers, to form part of a canal fleet to run between Port Colbourne and Montreal. The vessels will be 245 ft. in length by 80 ft. in width, and will be capable of carrying 80,000 bushels of grain. It is probable that the machinery for these vessels will be constructed on the Tyne also. At Messrs. Stephenson's yard, quietude now exists, but the establishment is in a transition state, and it is probable that before the end of the year a very marked change for the better will have to be noted.

The Palmer Co. are now exceedingly busy in the shipbuilding departments, and are pushing on the work of both merchant-ships and war-ships, with all possible despatch. It is found necessary to keep a night shift going in the frame turning and adjusting departments, and in the repairing section of the works quite an exceptional pressure of activity exists. Not less than half-a-dozen vessels of various descriptions are on the water being fitted out. The Commercial Dry Dock Co. at Jarrow are also having a busy time, both the large graving docks being occupied with vessels under repairs. Last year's business at this establishment was, we understand, of an extremely satisfactory character.

The Tyne Shipbuilding Co. have made their first contribution to the year's output by launching on the 16th inst. the s.s. *Zinnia*, ordered by the owners of the Stag Line, North Shields. The keel for another large vessel has already been placed in the vacated berth, and this promptitude may be taken as an indication that the firm have other orders to follow. The Northumberland Shipbuilding Co.'s yard continues to be well supplied with work, and at Messrs. Readhead's establishment the whole of the four building berths are occupied with vessels of large size in the various stages of plating, framing, keel-laying, &c. There are also vessels being fitted out in the water, and the repairing department is exceptionally busy. The smaller yards at Shields are as busy as could be desired, and most of the graving dock proprietors are having as much work as they can deal with.

Engineering.—Almost the first vessel fitted with engines this year by the North-Eastern Engineering Co., Wallsend, was the s.s. *Dordrecht*, which was built in Holland, to the order of a Rotterdam firm. We presume it is not the first time that a foreign-built vessel has been supplied with English engines; but the circumstance is sufficiently rare to be noticeable. It is understood that the company have the contract to fit the machinery of a sister ship, to be built also in Holland, and which is expected to be ready for the engines in two or three months from now.

The Wallsend Slipway and Engineering Co. are understood to have booked some additional orders lately, and night shift is now general throughout the works. At the St. Peter's Engine Works business is exceedingly brisk, and the same may be said respecting the principal departments of the Neptune Works, Low Walker. The Elswick Ordnance Works are, if anything, busier than before the advent of the new year, and the Forth Banks Engineering Works, Newcastle, are understood to be greatly pressed with orders.

In the manufacture of ship and engine forgings, great activity now exists, and prices are tending upwards. Cast steel stern frames and rudders, which at one time were much sought after, are now less extensively used, the preference of owners being apparently for the forged articles. In the ironfoundries business is good, and brass foundries continue to be well employed.

THE WEAR.

(From our own Correspondent.)

Shipbuilding.—During the month of January there have been no vessels launched on the Wear; but nevertheless a good deal of work has been done, many vessels having been advanced almost to the point of completion, and the result will doubtless be seen by the number of launches which are likely to take place in February. It has not transpired that any new orders have been booked this year; but it is well known that enquiries are numerous, and, if no negotiations have been brought to a successful issue, it is doubtless because builders find themselves unable to make concessions. One of these sectional strikes which, during the past few years, have been the source of so much inconvenience to shipbuilders, has caused a partial stoppage at Sir James Laing's yard during the first two weeks of the year. We refer to a strike of the platers' helpers for an extra man in each squad, when the plating of a vessel was commenced toward the end of December. It will be seen from this that there are more things than wages and hours, about which disputes may be made, and the relations of employers and employed embittered. These helpers appear to be blind to the fact that when striking for "more help," they are aiming at a thing which is of greater advantage to the platers than to themselves. Such is the state of affairs, however; for, whenever additional help is obtained, it is the employer and not the plater who has to pay for it. More help, of course, means more work (or ought to mean it), and the plater being paid by results, is the real gainer. If it could only be made plain to the helpers—how much they lose and how much the platers gain—by these ridiculous strikes for "help," they would soon get rid of their predilection for this particular form of folly.

There is a fair amount of repair work in the port just now, most of the shipbuilding firms having repair contracts in hand, and it is understood that negotiations for the acquisition of other contracts are under way.

Engineering.—The s.s. *Silvertown*, owned by the Eastern Telegraph Co., has arrived at the works of Messrs. George Clark, Limited, to undergo a thorough overhaul of her machinery and boilers. That the contract is rather an extensive one will be seen from the circumstance that new cylinders will be fitted, and the boilers will be provided with new furnaces. A large amount of other work will have to be carried out in connection with the vessel's machinery before she leaves the hands of the engineers to resume the important service of laying submarine cables. The resources of the Southwick Engine Works, however, are large; and it is expected that the repairs will be completed by the end of April. The *Silvertown* was built in 1873 at a well-known Tyneside dockyard, and was at the date of launching one of the very largest vessels afloat. She was originally named the *Hooper*, and occupied exactly 100 days in the building. Considering the vessel's size, which is 338 ft. in length by 54 ft. beam, this was a rare achievement at the time, and notwithstanding the numerous labour-saving and time-saving appliances that have since been introduced in shipbuilding, it is very much to be doubted whether—in the majority of yards—the feat could be accomplished at the present day. The vessel's interior fittings are of a much more elaborate character than is customary in merchant ships that are not intended for the accommodation of passengers, the manufacture of the huge tanks for containing the cable involving in itself a vast amount of labour. It should be stated that the vessel was originally engined by a firm which has now ceased to exist—Messrs. T. Clark & Co., of Elswick.

At the Palmer's Hill Works business is still brisk, and the same may be said in reference to the North-Eastern Works, South Docks, Messrs. Doxford's, and Messrs. Allan's. The smaller engine works generally are kept steadily going, and in the foundries orders are plentiful.

At the Sunderland Forge and Electrical Works trade still continues good, the latter department having some important contracts in progress, and the former being so full of work as to necessitate the running of the machinery night and day. The other forges are kept fairly busy, and anchor manufacturers are having plenty to do.

It is understood that the great work of dock extension contemplated by the Wear Commissioners, and which is estimated to cost £150,000, is to be commenced almost immediately, the fact that at other northern ports extensions are announced having doubtless had its effect in stimulating the Commissioners to brisk action. There is not likely to be much difficulty about the labour supply, as the class of workers who will be at first required appear to be plentiful enough.

The Hartlepools.—Shipbuilding work at this centre is still very active, and there have already been one or two launches this year. At all the yards vessels are in advanced stages, and a good many will be put off the stocks during the next month. In the engineering and boiler works orders are abundant, but a scarcity of labour is seriously impeding operations in the latter departments. The Hartlepool Steel Works are kept going night and day, and at the docks coal shipping is moderately brisk.

Stockton.—Messrs. Ropner & Sons have introduced another design of trunk steamers, which, however, does not appear to possess much claim to originality, combining, as it appears to do, some of the more salient features of Doxford's "turret" and Priestman's "sloping deck." After all, the "turret" design seems to be the only innovation which has achieved an extended popularity; for no other has been taken up by the more important shipping companies, and no other has so many representatives afloat. All the imitators of the "turret" design would doubtless have followed it very closely were it not for a wholesome dread of the consequences of infringement. They have accordingly been obliged to adopt modifications, but these have not met with the approval accorded to the original, and are, in fact, little to be distinguished from failures. The conclusion to which this leads is that, in spite of the apparent ineffectiveness of the patent law to protect inventors, the "turret" design, which was the first departure from the ordinary routine of ship construction, continues to hold its own. At Messrs. Blair & Co.'s engine works sustained activity is the feature, and at other engineering establishments there is a fair amount of work in progress. Steel works have again got into full swing after a somewhat prolonged holiday at the new year, and in the forges, foundries, and shops considerable activity continues to be apparent.

Middlesbrough.—The shipbuilding establishments are fully supplied with work, both in the new and repairing lines, and at all the engine works briskness is well sustained. Steel works are kept actively going, and both bridge and boiler works are busy. In the docks there is not much doing, the timber import trade being now at its dullest period.

Consett.—The Consett Iron Co. have a great amount of work in hand, and a large weekly output is maintained.

THE MERSEY.

(From our own Correspondent.)

THE position as regards the marine and general engineering industries of this district remains much as last reported. In practically all the leading branches establishments continue exceedingly well engaged, with full employment ensured for some time to come. Amongst machine-tool makers there is some slackening off in new orders coming forward, which in some cases are not sufficient to replace contracts that are being completed, but the prevailing opinion is that a good deal of new work is just now simply being held back. Other sections, such as locomotive and stationary engine building and boiler-making continue very actively engaged, and in all departments of electrical engineering there is no falling off in the exceptional pressure reported for some time back.

The usual monthly returns of the engineering trade unions still show a very low unemployed list. The Amalgamated Society of Engineers reports an increase of out-of-work members as compared with last month, but this is due almost entirely to holiday suspensions, which are a usual occurrence at the commencement of the year, and is not due to any decline in trade. The proportion is now about 2·6 per cent. throughout the organisation, and a little over 2 per cent. in this district. The Steam Engine Makers' Society has now only ½ per cent. of the total membership on donation, and practically none locally; with a demand for men, especially from the Government dockyards, which the officials are unable to supply. In the United Machine Workers' Association there are less than 2 per cent. on benefit, both locally and throughout the country. Returns from branches as to the state of trade continue of a very favourable character.

Messrs. Laird Brothers have received the order for the propelling machinery for the battleship *Montague*, now building at Devonport Dockyard .The engines are to develop 18,000 I.H.P., or 3,000 in excess of those of other ships of the *Bulwark* type. The difference will give the *Montague* a knot more speed.

Mr. Henry Hodgson, president of the Manchester Association of Engineers, in his inaugural address on January 13th, dealt with the question of foreign competition in the mechanical industries. There was, he said, one branch of engineering in which up to the present competition had not invaded our shores. He alluded to shipbuilding and marine engine building, but even in this branch of engineering our two competitors (America and Germany) were now in a position to supply almost without exception their own requirements, and, especially the latter, were supplying some other countries with a large portion of their requirements in this line. He ascribed this more particularly to political influences than to economical causes. Our supremacy in this, which we might term our national branch of engineering, was, however, being successfully assailed, and we would have to take greater heed to our ships than we had done recently if we were to maintain our supremacy. We had allowed Germany to make herself the possessor of the blue ribbon in the races across the Atlantic; we had also allowed her for a time the honour of having built the largest steamer the world had yet seen, and he did not think it would be long before she again took the position.

The Klein Engineering Co., Limited, of Manchester, are supplying to Messrs. Vickers, Sons & Maxim, Limited, of Barrow-in-Furness, a central condensing plant of their special type. In connection with this plant a Klein patent chimney cooler will be used, whereby a continuous supply of condensing water is obtained, the water being cooled by falling over a stack of cooling frames in the base of the chimney, a current of air being produced by the difference in temperature between the air in the chimney and the outside atmosphere. Only a small quantity of water is required for condensing to make up the loss by evaporation, which does not at any time exceed the weight of steam condensed, so that less water is required when working condensing than when working non-condensing. The jet-condenser is on the counter-current principle, which is now generally recognised as the most effective and suitable type for condensing large quantities of steam with a central plant, which in this case is designed to deal with the exhaust steam from engines of 1,500 H.P. A similar plant is being erected to the order of the Liverpool Corporation for their new Lister Drive Power Station to deal with the exhaust from engines of 3,600 H.P.

During the earlier part of the month the iron market here, as far as raw material was concerned, was somewhat unsettled, owing largely to the fall in warrants, and there was a good deal of underquoting by merchants, with very little business being put through; but towards the close a stronger tone has come over the market, and prices show again a hardening tendency, with an increased enquiry coming forward. Local makers have stiffened up to 80s. 6d. less 2½ for No. 3 foundry, with Lincolnshire firm at 75s. 6d. to 76s. net, and Derbyshire foundry 80s. net. delivered Manchester; with forge qualities 76s. to 76s. 6d., less 2½, for Lancashire, and 74s. 2d. to 74s. 8d. net for Lincolnshire delivered Warrington. Middlesbrough and Scotch brands, which at the commencement of the year were being offered by merchants at considerably under makers' prices, are now much steadier, the general quotations being 78s. 4d. to 79s. 4d. net for Middlesbrough by rail Manchester, and 81s. 6d. to 83s. for Eglinton and Glengarnock delivered Manchester Docks; whilst American pig-iron, which is now offering more freely, has been sold at 78s. net Manchester Docks.

In the finished-iron trade there has been a further substantial advance in prices, and, although in some directions this has tended to check buying, makers are so fully booked that they can afford to be indifferent about further orders just at present. Lancashire bars have been put up 10s. per ton, the list rate being now £10, with makers asking 5s. more on any small lots they can offer for prompt delivery. North Staffordshire bars remain nominally at £10, but makers would not take under £10 5s., and an official advance even beyond this latter figure is probable before very long. Sheets are now quoted £11 to £11 5s. Hoops have been raised 10s. per ton, bringing list rates to £10 7s. 6d. for random to £10 12s. 6d. for special cut lengths, delivered Manchester district, and 2s. 6d. less for shipment. The Manchester iron merchants have put up their stock prices 10s. per ton.

A fairly active business is reported in the steel trade, with prices tending to stiffen up. Hematites have fluctated considerably during the month in the open market, but are now recovering somewhat, and makers are quoting 91s. to 93s., less 2½, delivered Manchester. Local bars have in some cases been advanced 10s., but general quotations still range from £9 to £9 15s., whilst boiler plates are scarcely now quoted under £9 15s., and hoops have risen 10s. per ton, £10 10s. being the new basis, delivered in this district.

The metal market maintains a steady tone as regards prices, and the demand is brisk, particularly for locomotive and boiler fittings. Delivered Manchester district list rates remain as under: solid-drawn brass boiler tubes 9d.; condenser tubes 10½d.; copper tubes 11½d.; brazed copper gas and steam tube 11¼d.; brazed brass tubes 10d.; common rolled brass 8¾d.; common brass wire 8½d.; copper wire 8½d. per lb.

Particulars that have come to hand respecting the tonnage employed in the timber trade to Liverpool, including Garston and the Manchester Ship Canal, show a total of 776,984 during the past year, as against 715,636 in 1898 and 765,342 in 1897. Business during the year was, as the above figures show, again very large, and it was generally of a sound and satisfactory nature. With the advantage of fairly moderate stocks at the opening of the season, early arrivals found a ready sale; and, notwithstanding the large import later on, the exceptionally active demand more than kept pace with this, leaving stocks at the close generally lighter than usual. Values opened steady, and for most articles continued to advance to the end of the season, owing partly to advanced freights, but more particularly to the higher f.o.b. rates. Freights, with the exception of some low charters effected early, continued firm, and steadily rose throughout the year. The heavy premiums now ruling for late shipments call for shippers' special attention. Of the total import of timber the Manchester Ship Canal claims a large percentage, some 350,000 loads—being a heavy increase on any previous year. In commenting on this fact a Liverpool firm of timber brokers state that it is largely due to the insufficient accommodation provided for this trade in Liverpool by the Mersey Docks and Harbour Board, and has been further aggravated during the year by a number of their tenants at the Canada Dock having been served with six months' notice to quit, thus still further reducing the already too limited area for conducting the business. "Notwithstanding" they proceed, "the repeated and strong representations made to the Board by the Timber Trade Association to provide storage accommodation, as well as discharging berths to replace that which has already been and which is now to be taken from them, they have hitherto turned a deaf ear to their representations, and refused to make any adequate provision for the preservation of this trade to the port of Liverpool; therefore it would appear that a large portion of what is still left to Liverpool will have to be transferred to Manchester, Fleetwood, and Preston." The arrivals of teak during the year were 348,000 cubic feet, as against 319,000 the previous year. For squares the demand was rather quiet, but there was still a fair consumption, and the stock is not now too heavy, with prices steady. Planks, scantlings cut to specifications, &c., were in more active request. There was a large import, but with the consumption good, prices were well maintained. There is, however, a fair stock in hand. The consumption of greenheart was smaller than in 1898, but kept up with the import. Logs of large sizes and piling timber fully maintained their values. For medium-sized logs there was not much enquiry. Prices during the summer showed some weakness, but recovered later on. Stocks at present are moderate.

In the coal trade the pressure of demand, particularly for all descriptions of fuel, suitable for iron making, steam and general manufacturing purposes, and the difficulty experienced by collieries in meeting the requirements of customers, combined with the further upward move in miners' wages, have led to another advance in selling prices, which in the Manchester district represents about 10d. per ton, and in the south-west Lancashire district, of which Wigan is the centre, 1s. 3d. to 1s. 8d. per ton. The pit prices are now about 14s. 6d. to 15s. for best Wigan Arley; 13s. to 13s. 6d. for common Arley and Pemberton four-foot; 12s. to 12s. 6d. common house coal, with pit prices in the Manchester district for corresponding qualities about 5d. to 10d. more. Steam and forge coals are about 12s. to 12s. 6d., and engine fuel 9s. 6d. to 10s. for medium, and 10s. 6d. to 11s. for best sorts, at the pit.

Shipping prices are even higher than inland quotations, and 16s. is the general figure that has been readily got for ordinary steam coal delivered Mersey ports.

In the coke trade also an upward move is taking place.

LIVERPOOL AND BIRKENHEAD NOTES.

(*From our own Correspondent.*)

THE first month of 1900 has been a good one to the principal companies engaged in shipbuilding and engineering on the Liverpool and Birkenhead sides of the Mersey. Last year left orders enough in hand to give the new year a fair start, and to create a firm belief that trade, during the early part of 1900, would be as good as it was during the closing months of 1899. Apart from new work, the continued taking of steamers for transports by the Government has made a lot of work for local yards and fitters, and as the steamers have all been wanted at short notice, the work of adapting and overhauling has gone on briskly night and day. As regards the adaptation, this has chiefly required woodwork, and has meant the putting up of partitions and berths for the accommodation of troops, and for the safe housing of the horses, being sent to the Cape. The overhauling of the machinery to insure that all working parts were in fit condition for a quick run to the Cape, has however, been a big and important job, and has kept fitters and iron workers very busy. Everything has had to be overhauled; main engines, pumps, electric-lighting plant, steering gear and telegraphs. The overhauling of bridge and engine-room telegraphs, has made the principal firms manufacturing these appliances busy, whilst the work at the heavier engines has kept a strong body of fitters going continually for nearly four months past. Messrs. Laird Brothers have had a good deal of this transport outfitting, and Messrs. Clover, Clayton & Co. and the Messrs. Grayson have also had a fair run of it. Now that the larger steamers are being chartered for transport service, less of the work of overhauling machinery is likely to fall into the hands of private companies and firms, as front-rank steamship companies—like the Cunard, White Star, Allan and Elder Dempster companies—have well equipped engine works of their own, or have such arrangements operative as amply suffice to meet any ordinary demands on overhaul or replacement account. The chance of the private firms coming in for a further share of the work will lie in the quick despatch which the Government require. Though the first-class boats of the Atlantic and Cape service have been in good trim when chartered, the working parts of all of them have been seen to before a single valve has been moved on the outward journey. The Government were a long time in coming to the conclusion that the best boats were what they wanted for the South African transport work; but having made up their minds upon this they have not been slow to call for the boats. Among the latest to be requisitioned were the Johnstone Line steamer *Ulstermore*, the Elder Dempster steamers *Lake Erie*—the new steamer intended for the Canadian Mail service—the *Milwaukee*, the *Monteagle*, and the *Mount Royal;* the White Star liner *Afric*, the Dominion liner *Norseman* and the Lamport & Holt liner *Cavour.* A list prepared by the Liverpool Underwriters' Association gave the names of 161 vessels, including re-charters, which had been requisitioned by the Government for transport work up to about January 23rd. The *City of Rome* left Liverpool with troops on January 17th, and the fine new *Winifredian* of the Leyland Line is now chartered. All of this means good business for fitters and electric light people. There will not be much slack time in the Mersey fitting shops for the next three months.

As regards new work, the year opened with a considerable amount of new work in hand, in the Liverpool and Birkenhead engine and boiler shops. At Messrs. Laird Bros. the building of the first-class battleship *Exmouth* had reached an advanced stage at the close of the year, the frame being up to the protecting deck. Two single-screw sloops the *Mutine* and the *Rinaldo* of 980 tons displacement, and 1,400 H.P., were also nearing the launching stage and two thirty-knot destroyers, for the British Government were being proceeded with. This new work has been forwarded considerably during the month. The acceptance of Messrs. Laird Bros'. tender for supplying the engines for the first-class battleship *Montague*, has brought another desirable order to this Birkenhead firm. Two sets of triple-expansion engines to develop 18,000 I.H.P. are required under this order. Steam will be supplied by means of 30 Belleville water-tube boilers which Messrs. Laird Bros. will also manufacture, The cost of engines and boilers will be £150,000.

Much interest has been aroused in the Mersey engineering and shipping trades by the announcement that Messrs. Laird Bros. have obtained, from the Liverpool Corporation, a new 75 years' lease of the site on which their works in Church-street, Birkenhead, stand. Under the new lease, the firm will also acquire the site occupied for some years past by the Royal Mersey Yacht Club, which will give them room for the construction of two or three more launching ways, or for a re-arrangement of their existing "ways" in order to obtain more dry dock accommodation. It has been well known in the district that Messrs. Laird Bros. have at times been prevented from taking work owing to their single dry dock being occupied. An extension of their works is therefore now regarded as certain. The acceptance of the new lease is viewed in the light of a municipal boon at Birkenhead, for rumours had lately got abroad that Messrs. Laird Bros. were contemplating a removal to some other port. This, happily for Birkenhead, is not to be.

The steady output of new tonnage has made a good deal of work for the makers of side-lights and ventilators, and some large orders for these adjuncts have come to Liverpool. Messrs. T. Utley & Co., whose works are at Tue Brook, Liverpool, have been particulary busy making side-lights and ventilators of some half-dozen patented types. Last year this company made a heavy delivery of high-grade side-lights for the Queen's new yacht. About the same time their works at Tue Brook were extended to give more room for working.

Two recent changes in the Liverpool marine engineering trade deserve passing notice. The Liverpool Engineering and Condenser Co., Limited, who worked up an excellent business in Brasenose Road, at the north end of the city; recently erected a new and well planned block of works in Perry Street, at the south end. The entire plant and business has been transferred to what are now, the Perry Street Engine Works. Here, with more room, and with machines arranged to best advantage, a brisk trade is being done in the ship's condensers which are the company's speciality.

Messrs. C. & A. Musker, Limited, the well-known makers of hydraulic cranes, lifts, high-speed engines, electric motors, and dynamos, have just removed from their old works, Dundas Street, Bootle; to more extensive works at Tue Brook. This company have been very busy for months past. There has been a large demand in the district for hydraulic passenger and goods lifts, and for electric motors. These last seem to be coming into use for every kind of light driving, where speed is required. Work of the class has been plentiful in Liverpool, and 1900 has opened full of promise to the makers of such machinery.

The engineering department of the Mersey Docks and Harbour Board has done much important work of late. In 1898 Parliamentary powers were sought by the Board for an expenditure of £3,561,204 upon new works on the dock estate at Liverpool. The works contemplated by the Board have been rapidly pushed on during the past year. Though very largely of the nature of constructive works—the making, widening, deepening, or altering of docks—work of a marine, mechanical engineering nature, entered largely into the details of the scheme. Four swing bridges with hydraulic appliances, for example, were specified for in the estimates, whilst, during the actual work of construction, engines, pumps, and mechanical aids, almost innumerable, have been brought into requisition. The ordinary work of the engineering department of the Mersey Docks and Harbour Board is on a most extensive and varied scale. The Board's accounts for the year ending July 1st, 1899, showed that the year's outlay on general repairs, maintenance, and improvements, carried out by the department at Liverpool and Birkenhead, had been £251,580 19s. 8d. This total included such substantial single items as:—"Providing additional engine power at hydraulic power centre, Toxteth Dock, including accumulator at Harrington Dock, £3,480 10s. 6d."; "Additional hydraulic central power, Waterloo Dock and northwards, £25,283 17s. 8d."; "Hydraulic power, &c., £24,431 19s. 3d." At a recent meeting of the Board a recommendation of the Works Committee that the Board provide accommodation for the repair of pontoons by the engineering department at the Canada Works, Birkenhead, at an estimated cost of £1,600, was approved of without question.

The Liverpool Salvage Association are another enterprising body who are continually on the watch for new methods or appliances which may enable the work of marine salvage to be done more efficiently or expeditiously. On January 16th, Mr. Page, superintendent engineer of the association, with Captains Young and Pomeroy, witnessed a series of trials of new diving apparatus, from the salvage steamer *Ranger*, at the South Carriers' Dock, Liverpool. The main feature of the new diving gear is the introduction of means of telephonic communication between the diver and a steamer's deck. The trials passed off satisfactorily, the diver stating that he was able to hear the communications from the deck, whilst he was under water, distinctly. Submarine telephony promises to play an important part in the difficult work of diving.

Marine boiler makers at Liverpool and Birkenhead have had a good run of trade, and began the year with orders which will carry them on for some time. Steam winches have been in steady demand. Apart from the requirements for new ships, the desire of builders and owners has been to provide all kinds of craft with handy steam winches, as these appliances are now assessed at their true value, and give an independence to a vessel unknown in the old capstan and windlass days. Messrs. Dunlop, Bell & Co. keep very busy on winch work.

About 150 members and guests of the Liverpool Engineering Society assembled at the Adelphi Hotel, Liverpool, on the evening of January 11th, on the occasion of the annual dinner of the society. Mr. J. Bromley Holmes, president of the society, presided, and was influentially supported, the Lord Mayor of Liverpool and the American Consul being amongst the guests. Responding to the toast of "The Engineering Profession and the Liverpool Engineering Society," which had been proposed by the American Consul and supported by Dr. Tudsbery, secretary of the Institution of Civil Engineers, the President congratulated the society that their membership had increased from 51 in 1876 to nearly 500 in 1900. Speaking of the position of British engineering, he said that it was not satisfactory that this country should be losing its position in the markets of the world as a manufacturer of machinery, and that it should have to go either to America or Germany for plant that English engineers ought to be able to make for themselves. They were apt to excuse themselves on the ground that lower wages were paid on the Continent, but they shut their eyes to the fact of the better technical education there provided—statements which were warmly applauded by the Liverpool engineers.

On the evening of January 12th the members of the Birkenhead branches of the Amalgamated Society of Engineers met in the Queen's Hall, Birkenhead, for their annual concert and ball. During the concert Mr. C. Gatehouse presided, and at the interval Mr. F. Rose, organising delegate, addressed the assemblage. Mr. Rose spoke in glowing terms of the progress of the society. Its membership had, he said, increased during the last year by 2,000, and their financial balance which stood at £300,000 at the close of the last year, had increased to the extent of over £93,000. The prospects for the coming year were, he said, full of hope, and he could safely say that the Birkenhead members would not be in the rear ranks in supporting and furthering any movement that aimed at progress. A dance followed this cheering announcement of the position of the society, and the hours sped all too swiftly for the merry-making members of the A.S.E.

THAMES.

(From our own Correspondent.)

MR. W. F. STANLEY, of Great Turnstile, High Holborn, is the maker of an excellent inclinometer theodolite. It is capable of doing very rapidly work which can in the ordinary way only be done with a great expenditure of time. On steep ground the ordinary instrument has to be shifted many times, since it is necessary to pump down from the ends of the chain. With the new theodolite the work is done as easily as on level ground. When the instrument has been levelled the telescope can be set to any angle. When this has been done, the staff is placed at any point cut perpendicular to the line of sight. The distance is then taken along the slope, and the angle which the line of sight makes with the horizontal is observed. To effect this the telescope is mounted on a supplemental axis at right angles to the ordinary transverse axis

Diesel Oil Engine.—The excellent results obtained from the trials of this oil engine should be of considerable interest to other makers of marine oil engines. Herr Diesel, the inventor, considers that steam, gas, and air engines, are worked on a defective principle. His own engine he bases on an entirely new theory. In the steam engine he sets down the loss in the boiler at from 20 to 30 per cent. He raises the objections of small theoretical efficiency, sensitiveness of steam to changes of temperature and tendency to condense on the walls of cylinders. He thinks a greater range of temperature in the cylinder is desirable, and he thinks, since the temperature is limited downwards, it must be raised in the other direction by increasing the pressure or by combustion in the cylinder itself. Gas and oil engines have been designed on those lines. Diesel, however, regulates the combustion of the stuff in his engines. He sets the heat losses down in the ordinary gas and oil engines at between 75 to 80 per cent. He tried first to reduce the losses by isothermal combustion instead of by combustion at constant volume. He did this by introducing a small quantity of combustible into a volume of compressed and highly-heated air, when it kindles spontaneously, and the piston moves out in such a way that no increase of temperature takes place, the heat developed being absorbed in expanding the gas. His fundamental conditions of working were:—1. Production of the highest temperature of the cycle, not by and during combustion, but before and independently of it entirely, by mechanical compression of the air. 2. Gradual introduction of a small and carefully regulated quantity of finely divided combustible into the highly compressed and heated air in such a way that no increase of temperature takes place during the motor stroke, but all the heat generated is at once carried off by the expansion of the gases of combustion 3. Introduction of a large quantity of air in excess, instead of admitting only as much air as is required to obtain proper combustion of the fuel in cylinder. Adinbatic compression of from 30 to 50 atmospheres was adopted. About 100 per cent. excess of air is used, so as to absorb all the heat in the oil. Diesel found it very difficult to get high pressures in his compression. There were three cylinders. The central piston compressed the air, and sent it on to the side piston to be further compressed. Fuel was then injected into the tops of the working cylinders combustion, and partial expansion took place during the down stroke, and then passed to the large cylinder, where it compounded completely and discharged to the atmosphere. The three cranks were 180° apart. For small powers only one cylinder is used. Diesel claims a theoretical heat efficiency of 50 per cent. for his single cylinder engine, and 70 per cent. for the compound type. The brake efficiency is 26 per cent. With a 20 H.P. engine trials were made at full and half power. Piston diameter was 9·8 in., stroke 15·7 in., air pump 2·7 in., stroke 7·8 inch. The tests were as follows:—

Number of Test.	Full Power.		Half Power.	
	I.	II.	III.	IV.
Revolutions	171·8	154·2	154	158
Metric I.H.P.	27·85	24·71	17·71	17·72
,, B.H.P.	19·87	17·82	9·58	9·84
Oil per I.H.P. per hour	·4	·39	·61	·61
Temperature of exhaust gases ..	404	378	260	260
Piston Speed	450	400	400	410

HEAT BALANCE SHEET.

	I.	II.
Percentage of heat in oil turned into I.H.P.	33·7	34·7
Percentage of heat in oil lost to cooling jacket water	39	40·3
Percentage of heat in oil lost in other ways	27·3	25

NORTH-WEST OF ENGLAND.

(From our own Correspondent.)

Barrow.—The shipbuilding industry in this district remains in a very active state, and the work which is proceeding is not only considerable, but is being pushed forward with all the energy which builders can command, and all the men that can be obtained are being employed in every department. There is, however, the old difficulty of housing the very largely increased number of men who are now required to do the work in local shipbuilding yards; and, although a large number of houses are being built in various parts of Barrow, the accommodation is still fully a thousand below the requirements of the town at present, and probably still another thousand houses below the requirements of the town in the immediate future. Indeed, there is a growth in the demand which is in greater ratio than the present rate at which new house property is being built, for one thing is certain, that since Messrs. Vickers, Sons & Maxim took over the Naval Construction Works here, there has been an expansion of enterprise in other industrial directions, showing that as soon as this great firm displayed its confidence in the future of Barrow other firms were prepared to come in and share the results of what has already been proved to be a great industrial development. But this great enterprise is causing the great demand for houses in the town to be even greater, and whilst this is all very well in its way, it is certainly tending to check large schemes which have been formed, and which it is well should be proceeded with when times are brisk and trade plentiful. Even the war with the Transvaal is indirectly helping the trade of Barrow not only in a shipbuilding sense, but in a general sense as well. The newest department at Messrs. Vickers's works is the one set apart for gun-mounting It has already outgrown its original dimensions, and is now twice the size originally contemplated, but it has been determined to double it again, and thus make it four times the size it was originally intended to be. This department is now very congested with work, and orders are still coming in; indeed, an order was given out the other day by the Government to Messrs. Vickers to make certain types of guns, and as many as them as possible until the order to stop is given. This is something like an order, and it is certainly one which would have been all the more welcome if local makers had been as well fitted up for the work as they hope to be in the course of a year or two, when their present plans have been thoroughly matured. In the meantime, it is interesting to know that the newest branch of Barrow's industry is the most active, and that it has before it a very much longer spell of briskness than any other of Barrow's industries, and that is, of course, saying a great deal, when it is remembered that shipbuilders have about three years' work in hand, and that the iron and steel trades are more actively employed than they have been for years, and that they have an outlook before them which has not been exceeded for brightness and hopefulness at any time in the industrial history of this district.

No new orders have been accepted by Barrow builders during the month, as they are so very fully employed in every department of their business, but it is highly probable that before the close of the present year their orders now in hand will be so far advanced that it will be practically possible to give attention to the initial stages of new work which is destined in the ordinary course of things to take the place of that which at present is engaging the attention of builders. There is one thing certain, that when builders are ready for orders, orders are ready for them. There is not at the moment a big demand for commercial tonnage, but there are indications that as soon as this war is over there will be a revival in shipbuilding at any rate in two, if not in three, directions. In the first place it is clear a larger and faster fleet of steamers will be put on the Cape service, and if the present lines are not equal to the demand, and are not able to meet the emergency, well, new lines will start and take the matter up; indeed, there is already some talk about this, although it is not in any sense identified with Barrow builders, at any rate, up to the present time. There is also the prospect of further enterprise in connection with the Atlantic trade. British owners are not disposed to allow all the honours for speed and size of ships to go to Germany and America, and there is sufficient enterprise amongst British owners to put in hand a comprehensive and ambitious programme which will, at any rate for the time, put British precedence beyond the shadow of doubt. There is the further prospect of a fuller development of steam navigation between this country and India, besides a large growth in the ordinary cargo steamers employed in the foreign trade under the British flag.

Much progress has been made at the Naval Construction Works at Barrow during the past month with the work in hand, and, as a far larger number of men are employed and the work is distributed over so many ships, progress is being simultaneously made with a very large programme of work. The most forward ship in progress is H.M. first-class cruiser *Hogue*, which is armoured, and of the same class as the *Sutlej*, *Cressy*, and *Aboukir*. She is making very rapid progress towards completion; it is not, however, likely she will be launched before next autumn, in consequence of the works now in hand at the docks at Barrow. As has already been stated in the MARINE ENGINEER, this deepening scheme is intended to give an entrance into all the docks at Barrow 6 ft. deeper than at present. Now the floating depth over the Ramsden Dock lock-sill is only 24 ft., but when this deepening scheme is completed the depth will be increased to 30 ft. The work has already commenced, and it will probably be August or September before it is completed. By that time the *Hogue* will be ready for launching, if not before, but she cannot be docked until this deepening of the dock sill has been completed, nor can H.M. battleship *Vengeance*, now being fitted with her engines and boilers, &c., be able to leave the docks until this deepened way has been provided. The *Vengeance*, however, will be ready to hand over to the Admiralty by the autumn, so that the dock authorities have two reasons for pushing forward this work; indeed, there are two other cruisers building for the Admiralty at Barrow which will also require this deep-water accommodation, as well as the Japanese battleship *Mikasa*, which is rearing up her gigantic sides, and which, with the *Euryalus* and the *King Alfred*, will be ready for launching soon after the *Hogue*. The engineering department of Messrs. Vickers's works is very busily employed, and is indeed thronged with orders. There is a marked growth of facilities for the speedy and excellent production of all classes of goods required in the engineering department, and new shops are springing up on every hand which are destined to make the firm more dependent on its own sources of production.

West Cumberland.—The shipbuilding trade in West Cumberland is very busy both at Workington and at Maryport, and it is evident from the activity shown at the shipbuilding yards at both these places that the briskness observable all over the country in the heavier class of tonnage under construction is also evidenced in yards where the smaller craft are built. Orders are quite as plentiful as builders are able to deal with them, and it is satisfactory to learn that as work progresses at both Workington and Maryport there is plenty of new business ready when builders are in a position to undertake it.

Shipbuilding Material.—There is a very brisk demand for all classes of shipbuilding material, and, although orders have not recently been booked for new ships, it is evident builders find their requirements still very large, and are preparing probably for other work which is in embryo at present, but which will doubtless engage their attention when the present heavy strain of Admiralty work has been disposed of. Heavy plates are in very full request, and are quoted firmly at £8 per ton, whilst light plates are in equally full demand and are quoted at £9 per ton. Makers are very fully sold forward in all departments, and keeping their mills in very regular and constant work. The demand for heavy steel castings is maintained. There is now a very large trade doing in nuts and bolts at Barrow, and a large crucible steel plant is being put down for the manufacture of special steel for use in shipbuilding, engineering, and other work. A very large steel casting plant is also being put down, together with a large brass and bronze foundry, and other departments which will help to concentrate in Barrow every possible branch connected with the shipbuilding and engineering trades.

The Hematite Trade.—A very brisk business is being done in the hematite pig-iron trade, and the demand still exceeds the production. Prices are therefore very firm for makers' iron at 80s. per ton, and for warrant iron at 76s. 4d. net cash sellers, with every prospect of a considerable improvement in prices during the year. There are 47 furnaces in blast as compared with 40 at the corresponding period of last year. Stocks have been reduced from the beginning of the year to a considerable extent, and now represent 192.530 tons,

Shipping.—There is very great activity in the shipping trade of this district. Since the beginning of the year 46,736 tons of pig iron have been shipped from West Coast ports, and 16,648 tons of steel, showing, as compared with the corresponding period of last year, an increase of 27,736 tons of pig iron and a decrease of 5,604 tons of steel. Shipping generally is well employed, and good prices are obtained for freights.

Oro.—On January 19th the fine steel screw steamer *Oro*, built by Sir Raylton Dixon & Co., Limited, Cleveland Dockyards, Middlesbrough, to the order of Messrs. Gellatly, Hankey & Co., London, for the Plate Steamship Co., Limited (of which we gave particulars in our November issue, page 370), was taken out to sea for her official trials under the command of Captain Fowler,

LAUNCHES AND TRIAL TRIPS.

LAUNCHES—English.

Indradevi. — On December 14th there was launched at Sunderland, for Mr. T. B. Royden, of Liverpool, a steel schooner-rigged steamer of about 5,423 tons gross, named the *Indradevi.*

Atlas.—On December 18th there was launched at South Shields, for Messrs. Bensaube & Co., a steel steam ketch, of about 323 tons gross, named the *Atlas.*

Lockwood.—On December 21st Messrs. Craig, Taylor & Co. launched from their Thornaby Shipbuilding Yard, Thornaby-on-Tees, a steel screw steamer of the following dimensions, viz.:—299 ft. by 43 ft. by 21 ft. 3 in. moulded. She is of the single-deck type, built of steel, to Lloyd's highest class, under special survey. The deck erections consist of poop, bridge, and topgallant forecastle, large deckhouse being placed on bridge for accommodation of captain and officers. She has water ballast in double bottom fore and aft, and in peak. She is fitted with four double-powered steam winches, patent direct steam windlass, patent steam-steering gear, large donkey boiler, screw gear aft, telescopic masts, and all the latest improvements. The machinery has been constructed by the North-Eastern Marine Engineering Co., Limited, Sunderland, the cylinders being 21 in., 35 in., 57 in., by 39 in. stroke, two large steel boilers working at 160 lbs. pressure. The owners of the vessel are Messrs. Constantine, Pickering & Co., of Middlesbrough, and, as she left the ways, she was gracefully christened the *Lockwood*, by Miss Ella Pickering, daughter of one of the owners.

Nina. — On December 28th there was launched at Low Walker-on-Tyne, by Messrs. William Dobson & Co., a steel screw steamer, which they have built to the order of Messrs. Fenwick, Stobart & Co., London. The vessel is built to Lloyd's highest class, and is of the following dimensions:—Length, 220 ft.; breadth, 35 ft.; depth, moulded, 16 ft. 5 in.; and has been specially constructed for the owners' coasting trade between London and Goole. The machinery is being constructed by the North-Eastern Marine Engineering Co., Wallsend, and consists of a set of triple-expansion engines having cylinders 18½ in., 30 in., and 49 in. by 33 in. stroke, steam being supplied by one large single-ended boiler, working at 160 lbs. pressure. Before leaving the ways the vessel was christened *Nina* by Miss Winifred Squance, daughter of the marine superintendent for Messrs. Fenwick, Stobart & Co.

Chulmleigh.—On December 30th Messrs. Richardson, Duck & Co. launched from their yard a steel screw steamer of the following dimensions, viz.:—Length over all, 352 ft.; breadth extreme, 48 ft.; depth, moulded, 28 ft. 4 in.; tonnage, gross, about 3,950 tons, with a carrying capacity of about 6,500 tons. This steamer, which has been built to the order of W.J. Tatem, Esq., of Cardiff, will class 100 A1 on Lloyd's Register, and has been built under special survey. She is of the three-deck type, with one deck laid, having poop, long extended bridge, and topgallant forecastle. Accommodation for captain, officers, and engineers is provided in iron houses on bridge deck, crew being berthed in poop aft, and petty officers in topgallant forecastle. A cellular double bottom, and fore and aft peak tanks are fitted for water ballast, and equipment includes six steam winches, large horizontal donkey boiler, steam windlass, stockless anchors, steam steering gear, etc. The engines by Messrs. Blair & Co., Limited, have cylinders 25 in., 42 in. and 68 ins., by 45 in. stroke, steam being supplied by two single-ended boilers, having a working pressure of 180 lbs. As the vessel left the ways she was christened *Chulmleigh* by Miss G. Mence, of London.

Crown Point. — On December 30th there was launched from the shipbuilding yard of Messrs. Joseph L. Thompson & Sons, Limited, North Sands, Sunderland, a fine steel screw steamer, built to the order of Messrs. the Norfolk and North American Steamship Co., Limited, of 1, Crosby Square, London, E.C. The vessel is 390 ft. long between perpendiculars, and has a beam of 51 ft., with a moulded depth of 30 ft. 6 in. She is built on the three-deck rules, with shelter deck extending from the afterside of mainmast to stem, with suitable doors, fittings and ventilators, to meet the requirements of the cattle trade. She is rigged as a two-masted fore-and-aft schooner with telescopic topmasts to meet the requirements of the Manchester Ship Canal. The accommodation for the captain and spare berths is in a large house amidships, and for the officers and engineers, alongside the engine casings. The crew, firemen, and petty officers, and cattlemen are berthed under the poop. The forecastle is also fitted up for the accommodation of cattlemen. The vessel is built to Lloyd's highest class, and is in every way a handsome vessel, built to meet the requirements of the American trade, for which she is intended. She is fitted with 16 derricks, 10 steam winches, and all the most modern machinery for the rapid handling of cargoes. Her deadweight capacity is about 7,500 tons, and provision is made for the carrying of 1,900 tons of water ballast in the cellular double bottom, and a large deep tank fitted immediately aft of the engine-room, and extending to the main deck. The engines are being built by Messrs. J. Dickinson & Sons, Limited, Palmer's Hill Engine Works, Sunderland, and are of the triple-expansion type, the sizes of the cyclinders being 25 in., 43 in., 74 in., by 48 in. stroke, with three single-ended boilers, working at 200 lbs. pressure of steam, and fitted with Howden's forced draught. As the vessel left the ways she was gracefully christened *Crown Point* by Miss Nora Young, daughter of Mr. W. M. Young (London), Messrs. Simpson, Spence & Young, of London and Newcastle, are the managers for Messrs. the Norfolk and North American Steamship Co., Limited, and were represented by Mr. W. M. Young, managing director; Mr. J. G. Hocken (London), director; Mr. Howard Dale, secretary; and Mrs Dale, Miss Norah Young, Miss Florrie Dunford, Miss Taylor, Mr and Mrs. Muir, Mr. James Bain, Captain Ford, Mr. and Mrs. Dunlop (Liverpool), Mr. Kitching (London), Mr. J. Baxter (Newcastle), superintendent engineer to the company. The builders were represented by Mr. Robert Thompson, J.P., managing director, and Mrs. Robert Thompson, Miss May Thompson Master Jack Thompson, and Mrs. J. L. Thompson, Mr. James Marr, director and general manager; Mr. and Mrs. C. E. Thompson, Mr. Joseph Thompson, and Mr. and Mrs. P. Phorson. The engine builders were represented by Mr. and Mrs. F. T. Dickinson, Mr. and Mrs. A. Dickinson, Mr. T. S. Hunter, and others. After the launch, which was most successful, the company adjourned to the firm's luncheon room, where the usual toasts were duly honoured.

Telefon.—On December 30th there was successfully launched from the shipbuilding yard of Messrs. Wood, Skinner & Co., Limited, of Bill Quay, Newcastle-on-Tyne, a handsome steel screw steamer which has been built to the order of Mr. P. A. Gron, of Sandefjord, Norway. The vessel is of the following dimensions, viz.:—Length, 255 ft.; breadth, 36 ft.; depth, moulded, 18ft. She is of the long-raised quarter-deck type, with bridge and topgallant forecastle, and is designed to carry about 2,300 tons deadweight on a light draught. Water ballast is provided in the cellular double bottom all fore-and aft, and also in the after-peak. The vessel will be rigged as a fore-and-aft schooner with telescopic topmasts, and when finished will be replete with the latest types of deck machinery and other appliances for economical working and rapid loading and discharging of cargo, as well as all the means for safe navigation. The saloon, captain's accommodation, and spare berths are arranged in a large house on the bridge deck amidships, with chartroom on flying bridge above, the officers' accommodation being in side houses at aft end of bridge deck on either side of the vessel, whilst the crew are berthed in the topgallant forecastle. On leaving the ways the vessel was named *Telefon* by Miss Ida Bodin, daughter of Mr. Lauritz M. Bodin, of Det Norske Veritas, Sunderland. The steamer will have a set of improved triple-expansion engines having cylinders 18½ in., 30 in., and 49 in. diameter, respectively, with a stroke of 33 in., supplied with steam by a large steel multitubular boiler working at a pressure of 160 lbs. per square inch, which have been constructed and will be fitted by the North Eastern Marine Engineering Co., Limited, at their Northumberland Engine Works, Wallsend-on-Tyne. Both the ship and engines have been built under the special survey of Det Norske Veritas for their A1 classification, and have also been superintended on behalf of the owner by Mr. J. Johnsen, of Sandefjord, Norway. When completed the vessel will be commanded by Captain A. D. Christensen, of Skein, Norway.

Adrian.—On January 4th Messrs. Cochrane & Cooper, Limited, launched from their Grovehill Shipyard, Beverley, a new steam trawler of the following dimensions: 110 ft. by 210 ft. 6 in., by 11 ft. by 6 in. depth of hold, built to the order of the Allen Steam Fishing Co., Limited, Grimsby. Engines of triple-expansion type of 58 N.P. are being supplied by Messrs.

Tindall of Hull. The vessel will be replete with all the modern appliances for trawling, the launching ceremony was performed by Miss Allen, of Grimsby, who named the vessel the s.s. *Adrian*, the company then adjourned to the office of the builders for luncheon.

Braeside—On January 4th there was launched from the yard of Messrs. R. Williamson & Son, Workington, a steel steamer classed 100 A1 at Lloyds, for Messrs. T. Pinkney & Son, of Sunderland. The steamer is intended for the general coasting trade, and is of the following dimensions:—Length, 128 ft. between perpendiculars; breadth, 20 ft. 2 in.; depth, moulded, 10 ft. 4 in. Compound surface condensing engines with cylinders 15 ft. and 32 in. diameter by 24-in. stroke will be fitted by Messrs. McKie & Baxter, of Glasgow. The ceremony of naming the vessel *Braeside* was performed by Miss Hine, of Maryport.

Sussex.—On January 16th there was launched at Hebburn-on-Tyne by Messrs. R. & W. Hawthorn, Leslie & Co., Limited, a large four-masted steel screw steamer constructed for the Federal Steamship Co. of London. Her principal dimensions are:—Length over all, 435 ft,; breadth, 54 ft.; depth, 40 ft. to shelter deck. The vessel has been built in excess of the highest class at Lloyd's. The engines of the vessel are of the triple-expansion surface-condensing type, with cylinders of 30 in., 48 in., and 78 in. diameter and 54-in. stroke, with four large single-ended boilers working at 160 lbs. pressure. On leaving the ways the vessel was named the *Sussex* by Mrs. Mathieson, of Hebburn.

Aqua.—On January 16th Messrs. Ropner & Son, Stockton-on-Tees, launched a steel screw steamer of the following dimensions, viz.:—Length between perpendiculars, 325 ft.; breadth extreme 48 ft.; depth, moulded, 24 ft. 3 in. The steamer has been built to the order of Sir Christopher Furness, West Hartlepool, for account of Messrs. Newman & Dale, London. The vessel is built on the three-deck rule, with one deck laid, having full poop, long bridge, and top-gallant forecastle. The saloon and cabins for the captain and officers will be fitted up in the poop, the accommodation for engineers under the bridge deck, and the crew will be berthed in the forecastle as usual. She has double bottom for water ballast on the cellular principle, fore and aft, and in large after peak tank. The vessel will carry about 5,200 tons deadweight on Lloyd's freeboard, is fitted with direct steam windlass, stockless anchors, steam steering gear amidships, with powerful screw gear aft, five large steam winches, supplied with steam from a horizontal multitubular donkey boiler, &c. She will be fitted with a set of triple-expansion engines by Messrs. Blair & Co., Limited, of about 1,100 I.H.P., steam being supplied by two steel boilers 15 ft. 3 in. by 10 ft. 3 in., their pressure being 160 lbs. per square inch. The christening ceremony was gracefully performed by Mrs. Newman, wife of the managing owner, who gave the vessel the name of *Aqua*.

Duncan.—On January 16th Messrs Cochrane & Cooper, Limited, launched from their Grovehill ship yard, Beverley, a new steam trawler of the following dimensions—113 ft. 8 in. by 21 ft. 6 in. by 11 ft. 6 in. depth of hold, built to the order of Mr. William Grant, Grimsby. Engines of triple-expansion type, 12 in., 20 in., and 32 in., by 23 in. are being supplied by Messrs. J. Cran & Co., of Leith. The vessel will be completed ready for sea with all the most modern appliances for trawling. Mrs. Cochrane named the vessel s.s. *Duncan*.

Penmount.—On January 16th Messrs. William Gray & Co., Limited, launched the fine steel screw steamer *Penmount* to the order of Mr. Richard B. Chellew, of Truro. The vessel will take Lloyd's highest class, and her dimensions are: Length over all 312 ft., breadth 43 ft., and depth 22 ft. 3½ in. She has a full poop, long bridge, and top-gallant forecastle, joined by fore and aft gangways, tasteful saloon and cabins for officers, &c., will be fitted up aft, the engineers' rooms are in the bridge, and the crew's accommodation forward. The hull is built of the web frame system, with a cellular double bottom, and large aft peak tank for water ballast, large hatchways, five steam winches, steam steering gear amidships, hand-screw gear aft, large patent donkey boiler, patent direct steam windlass, boats on beams overhead, iron grain divisions, stockless anchors, two masts with schooner rig, and a complete outfit for a first-class cargo vessel. The Central Marine Engine Works of Messrs. William Gray & Co., Limited, supply fine triple-expansion engines of over 1,000 H.P., having cylinders, 22in., 35 in., and 59 in. diameter, with a 39-in. piston stroke, and two large steel boilers to work at a pressure of 160 lbs per square inch. The vessel has been built under the superintendence of Mr. John Chellew and Mr. George Hobson, and the ceremony of christening the steamer *Penmount* was gracefully performed by Miss Amy Corner, West Hartlepool. The *Penmount* is the seventh ship built by Messrs. William Gray & Co., Limited, for Mr. Richard B. Chellew.

Zinnia.—On January 16th there was launched from the yard of the Tyne Iron Shipbuilding Co., Limited, of Willington Quay-on-Tyne, a steel screw steamer, built to the order of Messrs. the Stag Line, Limited, of North Shields, and of the following dimensions, viz.:—Length 345 ft; breadth 46ft. depth, 28 ft.: and to class 100 A1 at Lloyd's on the spar-decked rule. This vessel has water ballast fitted right fore and aft on the cellular system, and is also fitted with all modern improvements for the rapid loading and discharging of cargo, including five double cylindered steam winches, direct acting steam windlass, large donkey boiler, steam steering gear by Messrs. Clarke Chapman & Co., Limited, and Hastie's screw gear aft. The engines which are to be supplied by Messrs. the North Eastern Marine Engineering Co., Limited, are of the triple-expansion type, having cylinders 23 in., 38½ in., and 64 in. by 42-in. stroke, and working at a pressure of 180 lbs. On leaving the ways the vessel was named the *Zinnia*, by Miss Kittie Robinson, of Ingleside, North Shields. This is the 19th vessel built by the Tyne Iron Shipbuilding Co., Limited, for Messrs. the Stag Line Limited.

Chester.—On January 16th there was launched by Mr. Joseph Scarr, Grovehill, Beverley, a steel tug boat of the following dimensions: 80 ft. by 17 ft. by 10 ft. She is the first built to the order of Mr. Bowman, of Hull, and was christened *Chester* on leaving the ways.

Vauxhall.—On January 17th Messrs. Irvine's Shipbuilding and Dry Docks Co., Limited, launched from their shipyard at West Hartlepool a finely modelled steel screw steamer, built for the West Hartlepool Steam Navigation Co., Limited. She is of the following dimensions:—Length, 352 ft.; breadth, 48 ft.; depth, 27¾ ft.: and of a measurement cargo capacity of 8,000 tons. She is of the single-deck type with poop, bridge and forecastle. The vessel is built to Lloyd's highest class under special survey, and is capable of carrying a large cargo on a light draught. A double bottom is fitted throughout on the cellular principle for water ballast, and the after peak is arranged as a trimming tank. She is constructed with deep frames, web frames, and longitudinal stringers, thus dispensing with hold beams, which gives clear holds for the storing of bulky cargoes. Six watertight bulkheads divide the holds; each hold is fitted with iron grain divisions. She also has extra large cargo hatches and is equipped with double derricks at each hatch, six steam winches, and all the latest improvements for rapid loading and discharging. The saloon and captain's and officers' accommodation is provided at the fore end of the bridge. The sanitary, ventilating and lighting arrangements are on the most approved lines. Engines of the triple-expansion type are being supplied by Messrs. Sir Christopher Furness, Westgarth & Co., Limited, Middlesbrough, with cylinders 25 in., 40 in., and 66 in. in diameter with a stroke of 45 in., steam being supplied by two single-ended boilers constructed to work at a pressure of 160 lbs. The hull and machinery have been supervised during construction by Messrs. R. Craig and A. B. France, the owners' superintendents. A large company was present to witness the launch, and as the vessel left the ways the christening ceremony was gracefully performed by Miss Guthe, daughter of the managing director of the owners' company, who named the vessel *Vauxhall*.

LAUNCHES—Scotch.

Alpha.—On December 19th there was launched at Leith by Messrs. Hawthorn & Co. a steel screw steamer named the *Alpha*, built to the order of the Royal National Missions to Deep Sea Fishermen.

Argyll—On December 19th there was launched at Pointhouse, Partick, by Messrs. Inglis, the steel screw steamer *Argyll*, built for Mr. R. G. Reid, Newfoundland. The vessel is of 600 tons gross, and will have triple-expansion engines by the builders. She is the first of an order for six intended for trading on the coast of Newfoundland.

Anglia.—On December 20th there was launched at Dumbarton by Messrs. Wm. Denny & Brothers, a twin-screw steamer built for the London & North-Western Railway Co.'s channel service between Holyhead and Northwall. The vessel is a sister ship of the *Hibernia*, recently launched by Messrs. Denny, and a repeat of the *Cambria*, one of the most popular vessels engaged in the channel trade. She is a twin-screw steamer, having a length of about 340 ft., beam 39 ft., and a depth of 24 ft. to the awning-deck. She is practically a passenger steamer, carrying only parcels and passengers' luggage, and is intended to take her place along with the *Cambria* and her sister ship the *Hibernia*, on the company's Holyhead and Dublin service. This is the sixth vessel built by Messrs. Wm. Denny & Brothers, who have been entrusted with the contract of practically renewing the company's fleet of mail steamers. The ceremony of launching the vessel was performed by Mrs. Dorrington, wife of one of the directors of the London & North-Western Railway Co., who named the vessel *Anglia*.

Kharki.—On December 22nd there was launched at Irvine by the Irvine Shipbuilding and Engineering Co., Limited, a steel screw cargo steamer of about 850 tons deadweight for London owners. The vessel was contracted for through John White, Esq., shipbroker, London, and has been built to Lloyd's highest class under special survey, her dimensions being 185 ft. by 29 ft. by 14 ft., moulded. The vessel is of the raised quarter-deck type, with engines amidships, and has water ballast accommodation in cellular double-bottom throughout the vessel's length, also in fore and after peak tanks; powerful and compact deck machinery is being supplied, also steam steering gear, direct-acting steam windlass, &c. Triple - expansion machinery is being supplied by McKie & Baxter, Govan, Glasgow. The vessel on leaving the ways was gracefully named *Kharki* by Mrs. Hetherington, Greenbank, Cambuslang.

Lord Erne.—On December 22nd there was launched at Dumbarton, by Messrs. Archibald M'Millan & Son, Limited, the steel screw steamer *Lord Erne*, which is an addition to the fleet of the Lord Line of Messrs. Thomas Dixon & Sons, Belfast. The dimensions of the *Lord Erne* are 388 ft. by 48 ft. 6 in. by 29 ft. Her gross register is 4,320 tons, and her cargo capacity about 7,000 tons.

Pydna.—On December 29th there was launched at Port-Glasgow by Messrs. Russell & Co. a steel screw steamer of 4,650 tons deadweight carrying capacity named *Pydna*, for Messrs. Wm. Thomson & Co., St. John, New Brunswick. This makes the eleventh vessel built at Kingston for same owners during the last two years. Machinery will be supplied by Messrs. Kincaid & Co., Greenock.

Tilia.—On January 6th there was launched at Port-Glasgow, for the North-Eastern Steam Fishing Co., Limited, of Grimsby, an iron steam trawler, of about 185 tons gross, named the *Tilia*.

Saint Kevin.—On January 16th there was launched at Paisley, by Messrs. John Fullerton & Co., a steel screw steamer of about 700 tons gross register, which has been built to the order of Messrs. T. Heiton & Co., Limited, Dublin—Mr. Robert Harper, Glasgow, managing owner—and is a sister ship to the steamships *St. Mirren* and *St. Olaf*, built for the same owners. The steamer is specially designed and constructed for the Channel-carrying trade. Compound engines of 800 I.H.P. are to be supplied by Messrs. Hall-Brown, Buttery & Co., Ellen Street Engine Works, Govan. As the steamer started on the ways she was named the *Saint Kevin* by Mrs. J. Reid, Drumlanrig, Pollokshields, Glasgow.

Lakeside.—On January 17th there was launched by the Grangemouth Dockyard Co. a handsomely-modelled steel four-masted barquentine of the American type, built to the order of Mr. W. L. Lovitt, of Yarmouth, Nova Scotia. The dimensions of the vessel are 175 ft. by 35 ft. by 15 ft. 6 in. moulded, and she has a poop, long raised quarter-deck, topgallant forecastle, a house for the accommodation of the crew, and is fitted up in the most modern manner for working sails with the minimum number of hands. She is built on the bulb-frame principle, having one long clear hold for stowing lumber, of which it is expected she will carry 1,000,000 superficial feet, and she is fitted up with bow ports for loading and discharging timber. As she left the ways the vessel was named *Lakeside* by Miss Nellie Millar, daughter of Mr. Wm. Millar, partner of the Dockyard Co.

Tunisian.—On January 17th there was launched at Linthouse by Messrs. Alexander Stephen & Sons a twin-screw steamer of 10,200 tons, which they have built for Messrs. James & Alexander Allan, of Glasgow. The vessel is 520 ft. long over all, 59 ft. in beam, and 43 ft. deep, and she has been specially designed to meet the latest requirements of the Allan Line's Canadian trade. The hull is of steel to the requirements of the Board of Trade for foreign-going passenger steamers, and the construction and design have been under the special survey and with the scantlings required by the British Corporation for its highest class. There being between 5,000 and 6,000 tons of steel plates in her and a million and a half rivets. There is a cellular double bottom the full length of the ship, and the holds have been carefully sub-divided into watertight compartments, which have been constructed and stiffened on the most approved method. When completed, the vessel will have accommodation for about 200 first-class passengers on the upper bridge deck and in the fore end of the bridge deck, 260 second-class in the after part of bridge and on upper deck amidships, and a large number of third-class in upper deck aft, there being no fewer than 300 rooms. The first-class dining saloon is in the fore end of the bridge deck, and is a spacious apartment lighted from the front and the sides by means of specially constructed lights, and overhead by a well with a cupola skylight on the top. Several of the first-class cabins are situated abaft of the saloon, but the bulk of the state-rooms, together with the music-room and smoking-rooms, are in a commodious deck-house on the upper bridge deck. At the fore end of this deck-house is the music-room, and at the after end the smoking-room, with the cabins between. The space outside this deck-house is reserved as a first-class sheltered promenade, the stanchions at the sides being carried up to support the shade deck, which, with the exception of a small part at the fore end, is entirely given up to first-class promenade. Above this deck a light boat-deck has been built for carrying the lifeboats. The second-class dining saloon, music-room and smoking-room are at the after end of the bridge deck on the shelter deck. The whole of the accommodation is self-contained, and every part can be reached without passengers having to go into the open. The third-class accommodation is a special feature of the vessel. The bulk of the rooms are arranged for four passengers. The dining saloon is at the after end of the upper deck, and extends the full breadth of the vessel. In a house on the shelter deck aft there is a smoking-room and a women's reading-room for the use of the steerage passengers. Being intended for the Canadian trade, special care has been paid to the heating arrangements. Throughout, the accommodation is heated by means of steam pipes, with regulating valves, so that a desirable temperature may always be maintained. Ventilation has also received careful attention, electric fans being used for the main corridors. The lavatories, pantries, galleys, &c., are fitted with patent ventilating side scuttles, which are so constructed that they can be left open irrespective of the weather. Provision has been made for a continuous service of hot and cold fresh and salt water. The vessel will be lighted throughout by electricity, for which there is a most complete installation. In addition, there will be electric bells to all the rooms, there being between fifteen and sixteen miles of electrical wires. The steering gear is by Brown Brothers, of Edinburgh, and has all their latest improvements. The cargo gear is very complete, and there is a windlass and capstan forward and a warping winch aft. There is a large insulated space aft for carrying frozen meat, with an engine on the carbonic anhydride system. The engines and boilers are being supplied by the builders, and consist of two sets of triple-expansion engines and a set of seven single-ended boilers. She is a sister ship, but of greater power and accommodation, of the *Bavarian*, recently built by Messrs. William Denny & Brothers, Dumbarton, and at present engaged in the Government transport service. Miss Dunlop performed the christening ceremony, naming the vessel *Tunisian*.

Shunkai Maru No. 1.—On January 18th, Messrs. William Simons & Co., Limited, Renfrew, launched complete the *Shunkai Maru No.* 1, a steel twin-screw hopper dredger, constructed to the order of the Osaka Harbour Board, Osaka. The vessel, which is to be employed in the improvement of the Osaka harbour, is classed at Bureau Veritas, and was constructed under the inspection of Mr. C. Shiba, London, inspecting engineer of the Osaka Harbour Board in this country. She has a hopper capacity for 600 tons of spoil, and the buckets are of ample capacity to raise 500 tons of free soil per hour, having a maximum dredging depth of 36 ft. below water level. The propulsive power is supplied by two sets of compound surface condensing engines and two mild steel boilers of 120 lbs. working pressure, either set of engines being capable of driving the dredging gear. The hopper doors are raised by steam appliances: powerful steam winches are provided at bow and stern for manœuvring the vessel when at work. The vessel is lighted throughout by electricity, and comfortable quarters are provided for officers and men.

G. A. Savage.—On January 18th there was launched at Troon, by the Ailsa Shipbuilding Co., a steel-screw cargo steamer which they have built for the Zillah Shipping and Carrying Co., Limited, of Warrington. The steamer is intended to carry about 370 tons gross, and is to be engined by Messrs. Ross & Duncan, Govan. She was named *G. A. Savage*.

Mountoswald.—On January 18th there was launched from Glen Yard, Port-Glasgow, by Messrs. William Hamilton & Co. a steel screw steamer for Messrs. Lunn & Maccoy, Newcastle-on-Tyne, for the general carrying trade. The following are the dimensions:—Length, between perpendiculars, 330 ft.; breadth, 45 ft. 6 in.; depth, moulded, 26 ft. 6 in. She is designed to carry 5,450 tons deadweight on a light draught, with a nett register tonnage of about 2,085 tons. The propelling machinery, which is being supplied by Messrs. David Rowan & Co., of Glasgow, consists of one set of triple-expansion engines, having cylinders 24 in., 40 in., and 65 in. diameter respectively, by 42 in. stroke, steam being supplied by two large boilers constructed for a pressure of 180 lbs. As the vessel left the ways she was named the *Mountoswald* by Miss Lunn, daughter of one of the owners. Immediately after the launch, which was most successful, the vessel proceeded to Glasgow to receive her machinery. The *Mountoswald* is a duplicate vessel to the *Cragoswald*, built by Messrs. Hamilton for the same owners last year.

Florence.—On January 20th there was launched at Bowling, by Messrs. Scott & Sons, a screw steamer of the following dimensions:—Length, 95 ft.; breadth 21 ft. 6 in.; and depth, moulded, 10 ft. 6 in. She has been built to the order of Messrs. Joseph Monks & Co., Limited, Warrington. Engines of the compound surface-condensing type, will be supplied by Messrs. Ross & Duncan, Govan. On leaving the ways the vessel was named *Florence*, by Miss Florence Topham, daughter of Mr. C. Topham, Ulverston.

Clyde.—On January 22nd there was launched from Pointhouse Shipbuilding Yard, a screw vessel, the third of the steamers for Mr. Reid, of St. John's, Newfoundland. She was named *Clyde* by Miss Reid, of Coupar-Angus, sister of the owner.

Custodian.—Lately there was launched at Whiteinch by Messrs. Charles Connell & Co. a large twin-screw cargo-carrying steamer. Dimensions:—Length 498 ft. by 57 ft. 3 in. broad, by 46 ft. 8 in. in depth, with a deadweight of 9,200 tons; total carrying capacity, 12,250 tons. Dunsmuir & Jackson, Govan, supply the engines. The vessel was named *Custodian*.

LAUNCH.—Irish.

Saxon.—On December 21st the Royal Mail steamer *Saxon*, built by Messrs. Harland & Wolff, of Belfast, for the Union Steamship Company, was successfully launched from the south end of Queen's Island, Belfast. The new vessel is the largest and most powerful that has yet been constructed for this well-known company, and may be described as an improved *Briton*, being both larger and having more power than that vessel, which was launched by the same builders in June, 1897, the event being taken advantage of by the Chairman of the Union Company, Sir Francis Evans, K.C.M.G., M.P., and the Right Hon. W. J. Pirrie, who was then Lord Mayor of Belfast, to celebrate the progress in naval architecture during her Majesty's reign. The *Briton* is a favourite in the South African passenger trade, and the new vessel, the *Saxon*, will of course embrace all the improvements that have been effected since the former was built. The *Saxon* is the third mail steamer built by Messrs. Harland & Wolff for the Union Line, the other two being the *Norman* and *Briton*, but she is the twelfth vessel altogether built by them for that company, including the intermediate boats known as the "G.'s." The *Saxon* is 585 ft. 6 in, long by 64 ft. beam and 42 ft. 9 in. deep, and will have a gross tonnage of 12,970. The passenger accommodation will be very large, and a noticeable feature will be the size of the state-rooms, making them exceptionally large, airy, and comfortable. The first-class accommodation will be on the bridge, upper and middle decks, and the second-class on the middle decks. Besides the open-berth steerage accommodation forward, there will be provision for a large number of third-class passengers in the poop and after middle 'tween decks. A separate galley and pantry will be provided for the third-class passengers. The first-class saloon will be situated on the upper deck; it will be very handsome, spacious, and will have seating accommodation for a large number. The first-class library and drawing-room, as well as the smoking-room, will be on the promenade deck, and they will be very large and elegantly furnished. The entrance to the second-class saloon will be provided with sofas, and will make a comfortable apartment for ladies who wish to have a sitting-room on deck. Large promenade decks will be a feature in the new steamer, as they are in the *Norman* and *Briton*. The officers will have well-ventilated rooms, conveniently situated on the boat deck. The *Saxon* is fitted with two sets of quadruple-expansion engines, arranged on the balance principle to minimise vibration, and she is designed for carrying a large cargo or a considerable number of troops. All the twelve vessels built by Messrs. Harland & Wolff for the famous Union Line are twin screws, and each has been of special design, embodying all the latest improvements in naval architecture, and peculiar interest attaches to the launch of the *Saxon*, as forming another link in the chain binding the mother country to her distant colonies. The putting of the *Saxon* into the water brings a number of incidents to a satisfactory and successful termination. She was the last boat launched in 1899 by our premier shipbuilders, who easily headed the list again with seven enormous vessels of an aggregate tonnage of 82,634 and 66,150 I.H.P. The builders commenced the year with that huge leviathan, the greatest ship of the century, the *Oceanic*, and they have concluded it with the *Saxon*, which will be by far the largest and finest vessel ever built for trading to the Colonies. And there is also another interesting fact to note, viz., that this event completes a stage in the history of the Union Line, as the *Saxon* is probably the last launch under the old *regime*, as the Union and Castle Lines have declared their intention to amalgamate, so that succeeding ships (and we trust there will be many to follow in the near future) will, of course, come under the new arrangement. Miss Evans, daughter of Sir Francis Evans, M.P., Chairman and Managing Director of the Union Company, gracefully christened the new vessel the *Saxon* as she began to glide down the ways

LAUNCH.—German.

Sambia.—On December 29th a large first-class steel screw cargo steamer, built to the order of the Hamburg-American Line, was safely launched from the yard of the Flensburg Shipbuilding Co. Her principal dimensions are: 415 ft. by 50 ft. 2 in. by 31 ft. 4 in. moulded, having a deadweight carrying capacity of about 7,500 tons. The vessel is classed to German Lloyd's highest class, and is fitted with accommodation amidships and wood decks over all. She will be supplied with a large number of winches, derricks, and every other convenience for facilitating the quickest possible loading and discharging of cargoes. Triple-expansion engines of 2,000 I.H.P. will be supplied by the engineering department of this firm. On leaving the ways the christening ceremony was gracefully performed by Miss Adelheid Menzell, of Flensburg, who named the vessel *Sambia*.

LAUNCH.—Norwegian.

Peter Hamre.—A steel cargo screw steamer launched by the Laxevaags Engineering and Shipbuilding Co., Bergen, Norway, The vessel is of the following dimensions:—Length over all 245 ft.; breadth 32 ft.; depth 16 ft. 1 in. This steamer has been built to the order of H. Hamre, Esq., Bergen, and to Norwegian Veritas highest class. *Peter Hamre* has cellular double bottom for water ballast and afterpeak ballast tank, and will be provided with three of Messrs. Clarke, Chapman & Co.'s steam winches, Emerson-Walker's patent steam anchor windlass, Fisher's patent steam-steering gear, Bower's patent rapid-closing apparatus for stop valve, worked from bridge as well as from engine-room, Bower's patent protection box for propeller shaft, and large donkey boiler; triple-expansion engines by the Laxevaags Engineering and Shipbuilding Co. Cylinders 16 in., 25½ in., 42 in., and 30 in. stroke. The boiler, 14 ft. 1 in. in diameter, 10 ft. 6 in. long, for a working pressure of 175 lbs.

TRIAL TRIPS.

Granada. — On December 15th the steel screw steamer *Granada* proceeded from the Wear for her trial. The vessel (of which we gave particulars in our October issue, page 321), has been built by Messrs. John Priestman & Co., Southwick, to the order of Messrs. A. C. de Freitas & Co., Hamburg, for the Argentine and Canadian cattle trade. The trial trip resulted in a speed of 12 knots being attained.

Rapid. — On December 15th the trial trip of the steam trawler *Rapid* took place, and proved satisfactory, a speed of 10½ knots being attained on the measured mile. The vessel (of which we gave particulars in our December issue, page 421) was built by the Irvine Shipbuilding and Engineering Co., Limited, Irvine, for the Peterhead Trawling Co., Limited.

Caucasian.—On December 19th this vessel built to the order of Messrs. Lane & MacAndrew, of London, by Messrs. Sir James Laing & Sons, Limited, of Sunderland, of which we gave particulars in our December issue, page 415, was taken for her trial off the latter port, when she made an average speed of over 10¼ knots. The machinery throughout was subjected to an exhaustive trial, which proved quite satisfactory.

Verona. On December 20th the large steel screw steamer *Verona* proceeded on her official trial trip in Hartlepool Bay. The *Verona* (of which we gave particulars in our October issue, page 329), has been built by Furness, Withy & Co., Limited, Hartlepool, to the order of Sir Christopher Furness, J.P., D.L., for Messrs. R M. Sloman & Co., Hamburg. The vessel attained a speed of 11½ knots. The owners were represented by Captain Jorgensen and Herr von Essen, and the builders by Mr. G. W. Sivewright. After the trial trip the vessel proceeded to the Tyne for bunkers.

Galeka.—On December 23rd the new steamer *Galeka* proceeded down Belfast Lough for trial trip and adjustment of compasses. The *Galeka* (of which we gave particulars in our December issue, page 421), has been built by Messrs. Harland & Wolff, Limited, for the Union Steamship Co., Limited, and is a twin-screw steamer 440 ft. long. 53 ft. broad, 33½ ft. deep, and of 6,763 tons gross register. After trial the ship left the lough for Antwerp, Captain Bremner being in command.

Dordrecht.—On December 29th the *Dordrecht* left the Tyne for her loaded trial trip. She has been built by Mr. Jan Smit Cz, of Alblasserdam, Holland, to the order of Mr. Ph. van Ommeron, of Rotterdam, and is of the following dimensions, viz.:—Length, 293 ft.; beam, 42 ft. 9 in.; draft (loaded), 18 ft. 7 in. She is fitted with a set of triple-expansion engines, constructed by the North-Eastern Marine Engineering Co., Limited, Wallsend-on-Tyne, having cylinders 21¼ in., 35½ in., and 39 in. by 39 in. stroke, and two large steel boilers built by the same firm, working at 160 lbs. pressure. During the trial the machinery worked without the slightest hitch, and gave every satisfaction to Mr. Ellmer, the owner's representative.

Daphne.—On December 30th the new steamer *Daphne*, which has been built by Messrs. Wood, Skinner & Co., Limited, Bill Quay, to the order of Mr. Johannes Bull, of Tonsberg, Norway (of which we gave particulars in our December issue, page 417), had her official trial trip off the Tyne, and despite the unfavourable state of the weather, both vessel and machinery proved in every way satisfactory, a mean speed of 11 knots being obtained.

Drachenfels.—On January 3rd the s.s. *Drachenfels* went for a short trial trip before sailing from the river. The steamer has been built and engined by Wigham-Richardson & Co., Limited, at their Neptune Works, Newcastle-on-Tyne, for the Indian Service of the Deutsche Dampfschifffahrts Gesellschaft *Hansa*, of Bremen. The steamer is 470 ft. in length by 58 ft. beam, and will carry over 10,000 tons deadweight. She is fitted with a set of four crank quadruple-expansion engines on the Yarrow, Schlick & Tweedy system, working at 210 lbs. pressure, which on the trial trip gave complete satisfaction to all. The owners were represented on the trial trip by Mr. D. Wulff, of Bremen, their superintendent engineer. Immediately after the trial the vessel sailed for Cardiff, under the command of Capt. Hanssen, to load for her outward voyage.

Aero. – On January 6th the small steel screw passenger and mail steamer *Aero*, built by the Flenburg Shipbuilding Co., to the order of the Dampskibsselskabet *Aero*, of Aeroskjobing, put out to sea for her official trial trip. Her principal dimensions are:—87 ft. 6 in. by 17 ft. 8 in. by 7 ft. 11 in. She is fitted with handsomely furnished first-class saloon aft, and comfortable second-class saloon forward. The owners of this vessel have been subsidised by the Danish Government to run her between Aero and Fijn, carrying mails and passengers to and fro. She has been fitted with compound engines, having cylinders 14 in by 26 in. by 16 in. by the engineering department of this firm. On conclusion of the trial, the owners expressed themselves perfectly satisfied with the workmanship, both of the hull and machinery.

Helsingborg.—On January 8th was witnessed the trial trip of the fine steel screw steamer *Helsingborg* (of which we gave particulars in our December issue, page 416), which Messrs. Wm. Gray & Co., Limited, have built to the order of the Rederiaktiebolaget of Helsingborg (Mr. N. C. Corfitzen, manager). The vessel was in ballast trim, and with the log overboard averaged a speed of ten and a half knots, the performance of ship and machinery being highly satisfactory. She afterwards proceeded to Methil, where she loads for St. Nazarre.

Northlands.—On January 10th the fine steel screw steamer *Northlands*, built by Messrs. William Gray & Co., Limited, to the order of Messrs. Jones & Hallett, of Cardiff (of which we gave particulars in our January issue, page 476), was taken to sea for her trial trip, which was a highly satisfactory one, everything passing off without a hitch. The vessel on its conclusion proceeded to Hull, where she takes in a cargo of coal for South Africa.

Macedonia.—On January 13th the fine steel screw steamer *Macedonia*, built by Messrs. Craig, Taylor & Co., Stockton (of which we gave particulars in our December issue, page 418), left the Tees for her trial trip, during which the engines worked with the greatest smoothness, giving entire satisfaction, and a speed of 12½ knots was easily maintained, under adverse circumstances. The owners, Messrs. A. C. de Freitas & Co., Hamburg, were represented by Captain G. Cantieny (who has taken command of the vessel), and also Mr. Max Rother, who both expressed themselves as being highly pleased with the ship and engines. This is the sixth vessel that Messrs. Craig, Taylor & Co. have built for Messrs. A. C. de Freitas & Co.

Capri.—On January 15th the steamship *Capri*, a wood-cargo steamer, built by Messrs. Brunchorst & Dekke, Bergen, Norway, went on her trial trip. She has been built to the order of P. Hamre, Esq., Bergen. The vessel is 850 tons deadweight. She is provided with three steam winches and patent steam anchor windlass. The engines and boiler are built by the Laxevaags Engineering and Shipbuilding Co.. Bergen, Norway. The engines are of the triple-expansion type, about 380 I.H.P., with cylinders 12¼ in., 20 in. and 32 in., with 26 in. stroke. The machinery worked under the trial very satisfactorily, and a speed of 10½ knots was obtained. She is provided with Bower's patent rapid-closing apparatus for stop valve, worked from bridge as well as from engine room, and Bower's patent protection box for propeller shaft. The vessel and her machinery have been built under the superintendence of C. Dahm, Esq., Bergen. The managing owner and a large company of ladies and gentlemen were present on her trial trip. The trial was in every way a complete success.

Strombus.—On January 16th this vessel was taken for her trial trip by Messrs. Sir W. G. Armstrong, Whitworth & Co., Limited, of Newcastle, by whom she had been specially constructed to the order of Messrs. M. Samuel & Co. (Shell Transport and Trading Co., Limited), of London, under the direct supervision of Messrs. Flannery, Baggallay & Johnson, of London and Liverpool (of which we gave particulars in our December issue, page 419). The liquid fuel arrangements have been subjected to exhaustive trials, and have proved in every way satisfactory, the steam being well maintained. The owners and their consulting engineers feel perfectly assured that the vessel's performance will be satisfactory in every way. On the trial trip the average speed was 10·6 knots.

Engineer.—On January 17th the s.s. *Engineer*, built to the order of Messrs. Tatham, Bromage & Co., of London, for the Engineer Steamship Co., Limited (of which we gave particulars in our January issue, page 478), went down the Firth of Forth on her trial trip. As a mean of two runs between Inch Keith and Oxcar Light a speed of 11¾ knots was obtained, the engines, supplied by Messrs. Hutson & Sons, Kelvinhaugh, Glasgow, and having cylinders 16 in., 26¼ in., and 45 in. by 33 in., supplied with steam by one large boiler of 170 lbs. working pressure, worked perfectly smoothly throughout the trial. The owners were represented by Mr. Walter Phillips, 98, Leadenhall Street, London, who superintended hull and machinery during construction, assisted by Mr. George B. Wemyss, of Oswald Street, Glasgow This vessel has been built specially with the view of carrying locomotives or boilers of large dimensions, and is provided with steel derricks and powerful steam winches capable of lifting 15 tons, and special hatches of very large size. At the conclusion of the trial the owners' representative expressed himself as highly satisfied with the working of both ship and machinery.

London Bridge.—On January 19th the new steamer *London Bridge*, built by Messrs. Ropner & Son, of Stockton-on-Tees, to the order of Messrs. Furness, Withy & Co., Limited, of West Hartlepool, for account of the Bridge Steam Shipping Co., Limited, of London (of which we gave particulars in our January issue, page 477), made her official trial trip in the Tees Bay. After the adjustment of compasses, she proceeded on her run to London, from thence to Newport (Mon.) to load for Madras. The vessel has been built under the inspection of Mr. M. Havelock, of Newcastle-on-Tyne, and Captain Eugene Chilvers, the commander of the vessel. These gentlemen, together with the owners (Messrs. Moore, Innes & Co.), were present at the trial, and expressed entire satisfaction with the vessel. The builders were represented by Mr. Leonard Ropner.

Rosalie.—On January 19th the *Rosalie*, built by the Northumberland Shipbuilding Co , Limited, of Howdon-on-Tyne, and owned by Messrs. John Cory & Sons, Limited, of Cardiff (of which we gave particulars in our January issue, page 476), left the Tyne for her trials. The propelling machinery has been constructed by the Wallsend Slipway and Engineering Company, Limited, with cylinders 23 in. 38½ in., and 65 in. diameter. by 48 in. stroke, the working pressure being 180 lbs. Throughout the trial trip the engines ran most satisfactorily, the vessel maintaining a speed of over 11 knots per hour, the I.H.P. being over 2,000. Afterwards the *Rosalie* left for Cardiff under the command of Captain Pengelly, where she will load preparatory to her first voyage.

Celderland.—This vessel has been taken on her trial off the Tyne. She was constructed by the Blyth Shipbuilding Co , and is a single-deck ship built to Lloyds 100 A1 class, of the following dimensions:—Length, 249 ft.; beam, 36 ft. 9 in.; and depth, moulded, 18 ft. 4 in.; built on the deep frame principle, carrying 2,250 tons on a light draught. She is owned by the Shipping & Coal Co., of Rotterdam, and has been surveyed by Messrs. Flannery, Baggallay & Johnson, of London and Liverpool. The engines are by Messrs. MacColl & Pollock, of Sunderland, and have cylinders 20½ in , 33 in., and 54 in. by 36 in. stroke, supplied with steam by two large double-ended boilers. The vessel is fitted with powerful auxiliary engines for quick despatch of cargo, and for working the vessel, including large vertical donkey boiler, four steam winches, steam windlass, and steam steering gear. A speed of 11 knots was made on the trial.

Messrs. Geipel & Lange report that their business during the past year has steadily increased in all branches, The sales of the Geipel steam trap have been nearly double that of any previous year. They have been fitted on the new Royal yacht and on a large number of H.M. war vessels, while orders have been received from most of the foreign admiralties. About 70 of these traps will be used at the forthcoming exhibition in Paris. The new bayonet lampholder, introduced by this firm, is meeting with approval, more especially for 200-volt work. They have been engaged in fitting up transmission of power in the following works, viz.:—Patent Shaft and Axletree Co., Limited, Wednesbury; the Bristol Wagon and Carriage Works, Co., Limited, Bristol; Anglo-Swiss Condensed Milk Co's. factory in London; at the same company's factory at Aylesbury; and Brown, Marshalls & Co., Limited, Birmingham - all of which are worked on the three-phase system.

Correspondence.

[In giving insertion to communications under this heading, we do not in any way pledge ourselves to the opinions expressed therein. —Ed. M.E.]

JAPANESE INSTITUTION OF NAVAL ARCHITECTS.

To the Editor of the Marine Engineer.

Sir,—I regret to say that the information which was sent to you relating to the Japanese Institution of Naval Architects was written in poor English, which has caused your misunderstanding, and I have to write to you to correct my mistake. The subject of Mr. Iwata's speech was "a composition to prevent the tube-ends and the furnace junction to the combustion chamber from leaking." The patent was granted for the above composition to Mr. Iwata and not to me. I should be very much obliged if you would correct the errors of your description with regard to the same.

I remain, dear sir,
Yours very truly,
S. Tsutsumy.

Tokio, Japan,
December 15th, 1899.

P.S.—I make bold again to inform you about the trials of the new steamer *Swa-Maru*, built for the Nippon Yūsen Kaisha (Japan Mail Steamship Co.) by the Mitsu-Bishi dockyard of Nagasaki. The vessel, intended for the Yūsen Kaisha's European liners, is of the following dimensions: length, 443 ft.; breadth, 49 ft.; depth, moulded, 33½ ft. Her gross registered tonnage is 6,309. The machinery consists of two sets of tri-compound engines, having cylinders of 20 in., 33½ in., and 56 in. by 48 in. stroke. Each condenser has a cooling surface of 2,353 square feet. The four-bladed propellers, made of manganese bronze, are of 15 ft. diameter by 18 ft. 3 in. pitch. The steam is supplied by two double-ended (13 ft. 3 in. diameter by 17 ft. long) and two single-ended cylindrical boilers (13 ft. 3 in. diameter by 10 ft. long), of 106 and 52 square feet of grate area respectively, and the total heating surface of 9,156 square feet, working at a pressure of 200 lbs. per square inch. The first trial took place on the 2nd ult. at Nagasaki, to ascertain her maximum H.P. (a subsidy of five yen, or about 10s., was given by the Government for every one H.P. of the engines, according to the Shipbuilding Encouraging Act). The mean speed of six runs at a distance of 3·458 miles was 14·03 at a mean draught of 16 ft. 10½ in. and a displacement of 7,860 tons. The total H.P. obtained was 4,112 (port 2,064, starboard 2,048), and number of revolutions 81 at port and 82 at starboard. The second trial was to obtain the maximum speed with a light draught (mean draught of 15 ft. 2 in. and a displacement of 6,770 tons), and took place on the 5th inst. at the Tokio Bay, when the mean speed of six runs on the mile posts (three miles apart) was 14·54. The trial was in every way satisfactory, and the total H.P. obtained was 4,448 (2,198 starboard, 2,250 port), and number of revolutions was 85·5 at starboard and 84 at port. The vessel will leave Yokohama to-morrow (December 16th) for her maiden voyage to Europe.

OBITUARY.

JOHN SHORT, SHIPBUILDER.

On going to press, we hear with sincere regret of the death of Mr. John Short, on the 24th inst. He was discussing business matters with Mr. William Allan, M.P., in his office, at Sunderland, when he suddenly sank back in his chair and expired. He was 56 years of age. Mr. Short, who was head of the shipbuilding firm of Messrs. Short Brothers, was also largely interested in the timber trade, a director of the Westoll Line of steamers, the largest in Sunderland, and a member of the firm of Messrs. Lowther, Latta & Co. He was also a member of the River Wear Commission, and of the Sunderland Town Council, and chairman of the Shipowners' Society. He was recently asked, but declined, to stand as one of the Liberal candidates for Sunderland at the next general election.

THE NEW YORK PUBLIC LIBRARY
ASTOR, LENOX AND

The Marine Engineer.

LONDON, MARCH 1, 1900.

A DISCOURSE at an evening meeting of the Royal Institution was given by the Hon. C. A. Parsons upon "Motive Power, High-speed Steam Turbines," which after a slight ancient historical introduction launched into a full historical account of the introduction and development of steam turbines. The account illustrated well the slow and gradual perfecting of so novel an invention as that of a steam turbine, showing that all such novelties grow gradually to perfected form by the co-operation of many minds and according to the particular demands for useful application in the market. Even as far back as 1884 experiments were begun for the construction of a steam turbine to drive a dynamo, the turbine to run as slow, and the dynamo as fast, as possible to admit of direct coupling. Special bearings were devised to keep down vibration. The turbine itself made 18,000 revolutions a minute, and consisted of 15 successive turbine wheels, gradually increasing in size to allow for the expansion of the steam, and was of 10 H.P. In 1888 several turbo-alternators were supplied of 120 H.P. running at nine or ten thousand revolutions a minute, and thus coming down to a more practicable speed. It was found that these turbines took about 35 lbs. of steam per electrical, H.P. which was not so very bad a comparison with direct high-speed reciprocating engines. In 1892, however, the adaptation of turbines, of the radial flow type to work with condensers, marked a new epoch in steam economy, and the steam consumption has since been decreased to 18 lbs. of steam 10 degrees superheated per kilowatt-hour. This direct driving of dynamos by a high-speed rotary engine was an obvious adaptation of great commercial value as adapted to drive also a rotary machine which itself required to revolve at a very high speed. When, however, it came to adapting such turbo-motors to the propulsion of boats, the difficulty at once arose that no ordinary propeller was adapted to run at the economical speeds of the turbo-motors, and therefore could not be driven direct. Any indirect coupling by gearing at once destroyed half the advantage commercially of the adaptation of turbo-motors to screw propulsion. From this point a new departure in invention had to be taken to discover a form of propeller or propellers which could be directly driven by such turbines at a high speed. Many trials were made with various propellers, but the speed obtained was very disappointing owing to the excessive slip and inefficiency of the ordinary forms of propellers, resulting in great "cavitation" behind the propeller blades and great consequent loss of power. At last the multiple propeller of coarse pitch and large blade area with small diameter, resulting in three propellers on each shaft and a multiplication of shafts, gave excellent results, giving almost a duplication of the speed. The *Turbinia*, as is now well known, had three separate engines—high pressure, intermediate, and low pressure, each driving one screw shaft, and each shaft carrying three propellers. There was little vibration and the engines worked economically. We see that one of the latest torpedo-catchers built for the Government, and engined with the Parsons turbo-motor, is the fastest catcher afloat, having developed a speed of over 35 knots, or 41 miles per hour. The engines are similar to those of the *Turbinia*, but are two distinct sets, working on four shafts and developing an I.H.P. of 11,000. It is interesting to note the development of horse-power for the various maximum speeds of torpedo-catchers. The power for 26 knots was only 12⅓ I.H.P. per ton of displacement; 27 knots required 15¼ I.H.P.; 30 knots required 20 I.H.P.; 32 knots required 24½ I.H.P., whilst for 35 knots 31½ I.H.P. is required.

WE were glad to see that Mr. Joy, in a discussion at the Institute of Marine Engineers upon a paper read by Mr. J. F. Walliker on "Twenty years of Progress in Cargo-boat Machinery," gave voice to a similar desire that we have often expressed that the sea-going members of the profession would give the shore members the great advantage of hearing more often their daily experience at sea, on so many points that are frequently only the basis of academic discussion in papers or text-books. Sometimes an ounce of hard fact and experience is worth a pound of theory, but in sea-going vessels incidents occur of the most deeply interesting character, as affecting the behaviour of the machinery afloat, that no one ashore, nor even other sea-going engineers, are likely to hear of or be the wiser for, from the very isolation of a ship at sea, unless those sailing in her, who saw and dealt with the matter and difficulties experienced, will bestir themselves to make public, for the benefit of their professional brethren, the occurrences in question. We have always taken much trouble to state that our pages are always open to communications from such sea-going engineers, and to the illustration of any rough sketches they might desire to send to illustrate the particulars or incidents they are describing. Very often the discussions upon papers read before engineers are more interesting than the papers themselves, as the discussion is often more replete with practical experiences than a formally written paper can be. It is these experiences, even as short incidents, that we would wish to collect and publish for the benefit of our readers and of the profession generally, and we should be glad if those at sea, or about to go to sea, to whom these remarks may come would act practically upon them, and try to commit some of their experiences to black and white.

GREAT interest has been taken in the emergency mounting of naval guns for land service by Captain Percy Scott and his engineer staff. We have now particulars to hand of the way in which this work was carried out. It would appear that Captain Scott suggested to the naval and military authorities on or about the 14th of October that the Boers would bring forward heavy siege guns, which would quite overmatch the military field pieces. However, no encouragement was given to the suggestion until receipt of an urgent wire from General White that he wanted guns of greater calibre and range than his 15-pounder R.A. guns. Then the suggestions of Captain Scott were eagerly seized upon if the guns could be got ready in time, which was short. Captain Scott undertook to prepare mountings for two 4·7-inch guns in 12 hours, and he did it within the time. He started upon them at 6 a.m., and by 5 p.m. of the same day he had delivered two 4·7-inch guns and mountings complete to the *Powerful*, and also four 12-pounder long guns, which he had before prepared on his own mountings on the *Terrible*. This was a record contract and splendidly carried out, having been stated by other experts to be an impossibility. The work was only effected by the rough and ready but practical character of the mountings. That of the 4·7-inch guns consisted essentially of four baulks of timber 12 in. square by 14 ft. long, arranged as a square, with projecting ends, as a base, and through bolted together. Upon the centre of the cross or square was bolted a socket platform, with a strong upstanding spindle, and upon this spindle was mounted the ordinary naval carriage of the gun, and the mounting was completed. It was found that this mounting could be placed on any level, hard base, and the firing of the gun produced only a slight recoil of the whole structure. The instructions for mounting on shore were to dig a hole 14 ft. square and 2 ft. deep for the platform cross, drop the platform in it, ship the carriage, and place the gun in the latter. Captain Scott eventually produced a more mobile form of mounting for the 4·7-inch guns when given time to work it out, and an excellent piece of rough engineering it was. Two heavy baulks were used as a double trail mounted at one end upon a strong axle. This was simplicity itself. The wheels, however, were a bothering job, but were made of circular discs of plate iron, with two heavy washers to form a boss for the axle, the rim being formed from an angle iron, riveted on either side of the plate disc, the whole being completed by a broad plate tyre shrunk over the angle irons, and the plate wheels were strengthened by angle iron ribs. This made a capital rough and strong job, with plenty of mobility, and so well were these extempore mountings and guns appreciated that it is understood that six 4·7-inch guns so mounted, and no less than twenty-two 12-pounder naval guns, all on Captain Scott's mountings, are with the various forces at the front. It is grand to see the sister services thus supporting one another, and that the engineering skill and ability of the naval service should have added so materially to the defensive and offensive operations of our land forces.

VARIETIES of opinions upon the relative merits and demerits of water-tube and the older cylindrical boilers are still as patent as ever. Those inclined to either opinion are still as emphatic as ever, that there can be no doubt whatever on the subject. The settlement of the question will only come with direct use and lengthy experience of the newer types of water-tube boilers as compared with their older rivals. There is no doubt that such practical experiences will do much to modify forms and dimensions, to give better durability and accessibility for repairs or cleaning. We heard the other day that the Admiralty had determined for the future not to admit specifications of water-tube boilers, with tubes of less diameter than 3 in., and that 3½ in. is the preferred diameter. In consequence, one of the most successful and enterprising firms in the making of water-tube boilers immediately tested a boiler constructed with this size of tube throughout, and found the result so satisfactory that they have determined to alter some of their orders in hand to this size of tube. There is no doubt that for convenience of handling, repairs, and cleaning, the larger tubes are preferable, and if this diameter can be obtained without loss of efficiency, which appears to be the case, tubes of at least 3 in. or 3½ in. diameter should be more generally adopted by all makers.

A NEW BALANCED PISTON-VALVE AND ITS APPLICATION TO FOUR-CRANK ENGINES.*

By WILLIAM O'BRIEN (Member).

NOT many years ago the ordinary marine-engine was of the two-crank compound type, and it occupied comparatively little room on shipboard. With the introduction of the triple-expansion engine, the space required was greater; and, when the four-crank engine was adopted, a further encroachment on space was made for its accommodation. To minimise as far as possible the space occupied by the latter type of engine, as well as to reduce weight, the Clyde balanced piston-valve has been designed; and by its application to the four-crank engine the space taken up fore and aft will only be about the same as formerly required by the three-crank engine. The space thus saved may be utilised in war ships for the better equipment of magazines, etc., and in merchant vessels for cargo-carrying purposes or passenger accommodation as required.

---

* Read at a meeting of the Institution of Engineers and Shipbuilders in Scotland, January 23rd, 1900.

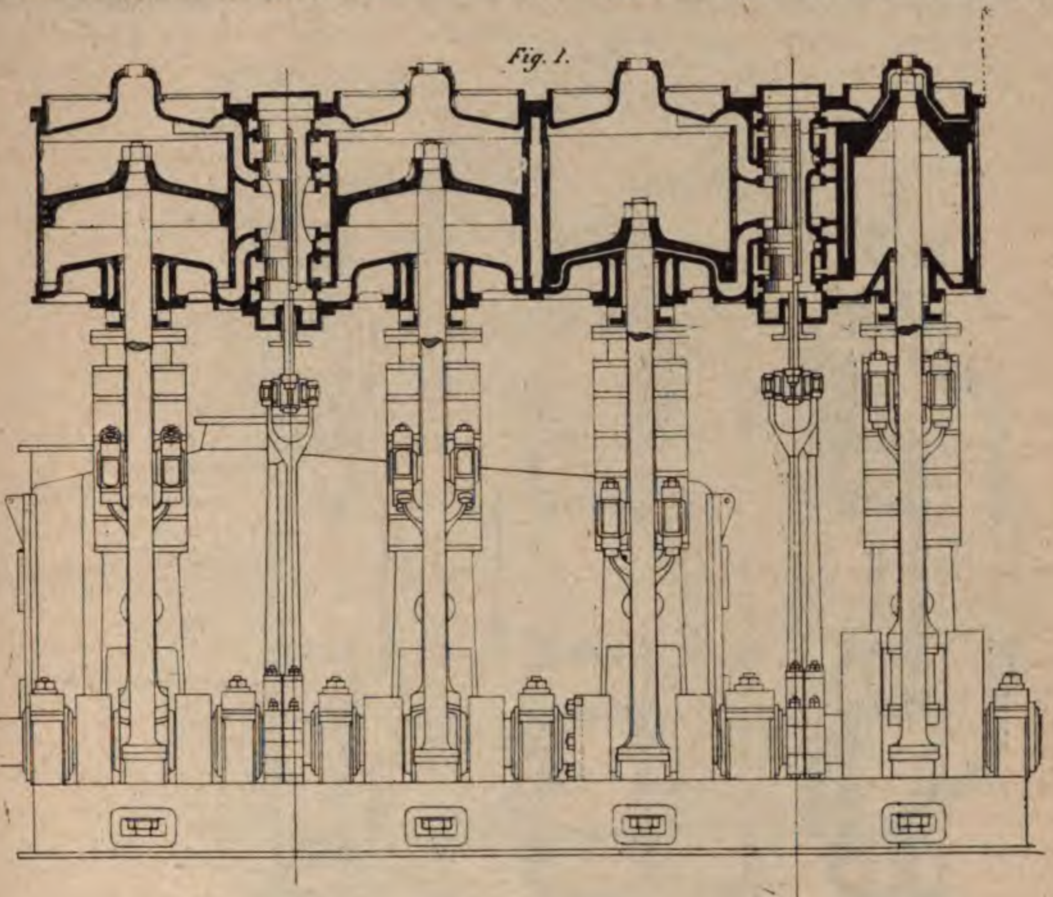

Fig. 1.

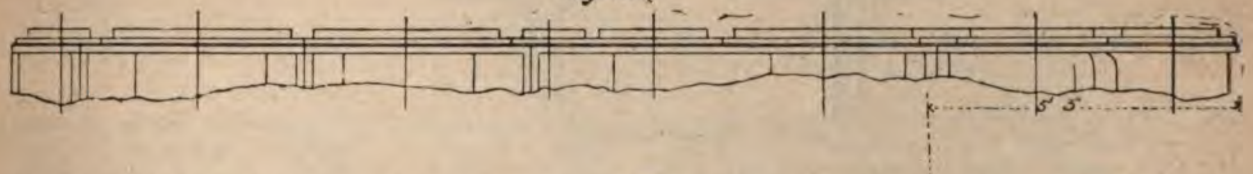

Fig. 2.

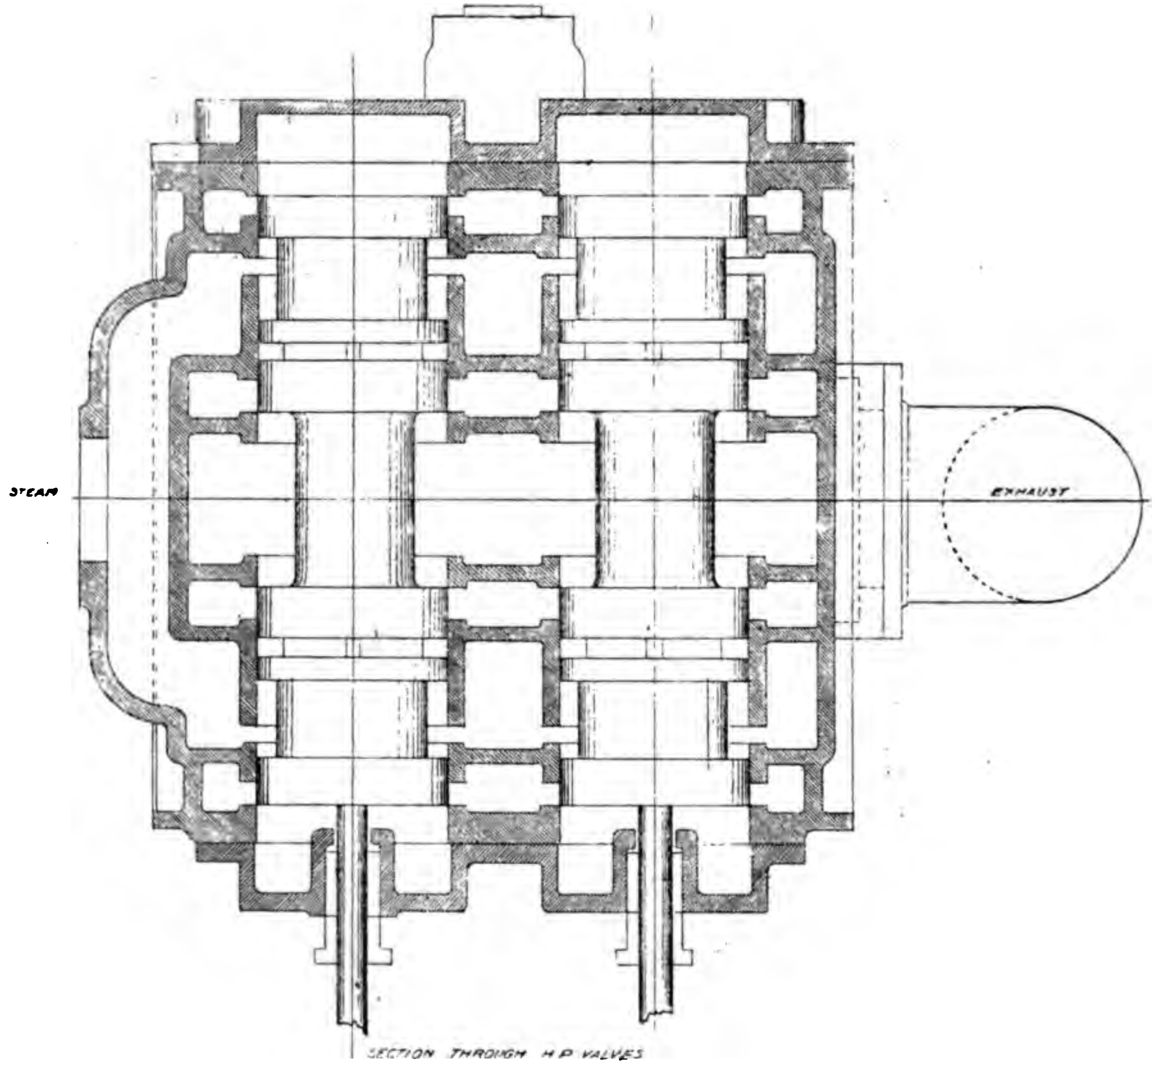
In Figs. 1 and 2, a comparison is made between an engine of the four-crank type, recently completed by an eminent engineering firm to indicate 2,500 H.P., with two piston-valves and two flat slide valves for the four cylinders, or one valve for each cylinder, and four sets of valve-gear, and an engine fitted with cylinders of the same dimensions to indicate the same H.P., having only two Clyde balanced piston-valves and two sets of valve-gear for the four cylinders. The latter engine is 5 ft. 3 in. shorter over all, and with fewer working parts than the former. There are only two sets of valve-gear against four sets, while the reversing shaft is only half the length required for the four sets of valve-gear. Some of the pipe connections between the receivers are dispensed with; the intermediate-pressure receiver pipe is done away with, saving about 11 ft. of 12-in. copper pipe: the low-pressure receiver pipe is 8 ft. long, thus saving about 2 ft. of 12-in. copper pipe; and the eduction pipe is only 4 ft. long, saving over 6 ft. of 15-in. pipe. With these reductions, and the amount of metal saved in designing the engine for the Clyde balanced piston-valve, the weight is considerably less. What might also be claimed as a very important feature, with engines designed for this type of valve, is the lessened number of joints; thus minimising the danger of leakage, saving workmanship, and reducing the cost of production. It will be seen from Fig. 2 that there is only one joint between the cylinders, which is not a steam joint: whereas in Fig. 1 there are four joints, two of the latter being steam joints and two not.

In the illustration showing the combined high-pressure and intermediate-pressure valves with five ports, the top and bottom ports take the boiler steam pressure into the high-pressure cylinder through the straight ports at the top and bottom of the cylinder. The exhaust steam from this cylinder passes over the top and bottom ends of the valve into the interior of the valve, and from there it passes through the ports on each side of the middle or exhaust port into the intermediate-pressure cylinder, through the curved ports leading to the top and bottom of the cylinder. The exhaust from the intermediate-pressure cylinder passes into the middle port of the valve, then into the receiver or connecting-pipe to the valve for the two low-pressure cylinders. This valve, which differs somewhat from the afore-mentioned valve on account of the steam pressure in the two cylinders being the same, has only three ports. The two end ports convey the steam from the intermediate-pressure receiver to the forward low-pressure cylinder, by the straight ports at the top and bottom of the cylinder; and the exhaust steam passes over the ends of the valve into its interior, thence to the exhaust or middle port of the valve, which is open to the condenser. The steam to the after low-pressure cylinder is admitted through the same two end ports of this valve, by the curved ports leading to the top and bottom of the cylinder; the exhaust from the cylinder passes into the middle port of the valve, and from there to the condenser.

Fig. 3.



SECTION THROUGH H P VALVES

From what has been said, and what is shown in the illustration, it will be apparent that the advantages gained for the same power by adopting the Clyde balanced piston-valve are saving in space, reduction in weight, and fewer working parts. Fig. 3 shows two high-pressure valves inside one casing, and Fig. 4 shows two low-pressure valves inside one casing. The subject appears to the writer to be of sufficient interest and importance to warrant his bringing it under the notice of the Institution; in fact, it seems to him to bid fair to cause some revolution in ship design, at least in the internal arrangements, by devoting the space saved to other purposes.

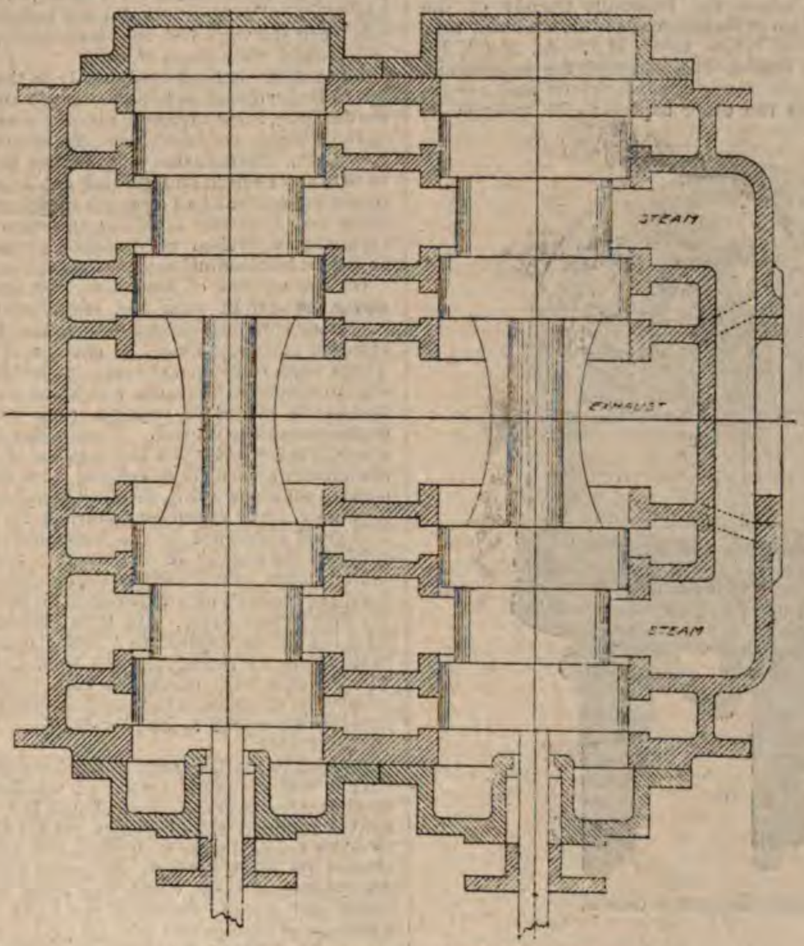
THE EDSON RECORDING GAUGE.

THE utility of a continuous graphic record of any phenomenon or function has been recognised now for many years, as is exemplified by recording barometers, gauges on water mains, and just lately continuous indicator for engines. The same principle has been employed for recording the course of a ship upon a continuous chart. The deductions and conclusions to be drawn from a record of absolute continuity are much more reliable and correct as a basis than any number of independent observations taken at specific intervals of time.

We have pleasure now in describing and illustrating the Edson Recording Gauge, which is being introduced into this country by Messrs. Findlay & Battle of 91, Queen Victoria Street, London, E.C. These gauges are made for steam, ammonia, air, gas, water, and other fluids, and can be used in any situation where a continuous record of pressure is desired to be made.

The instruments consist essentially of three distinct elements—viz., a device with a pencil or marker actuated by the pressure, a clockwork mechanism carrying and moving a chart, and an alarm device which will operate when the pressure gets outside a particular margin or range which can be pre-determined. The special feature of the Edson Gauge resides in the extreme simplicity of the recording device, which consists of a heavy steel diaphragm chamber, which, by its formation, admits of a certain flexure of the diaphragm under internal pressure. The diaphragm is of large diameter, having an area of 16 square inches, which enables it to record the slightest variation of pressure. By reason of its large diameter, the diaphragm is capable of considerable range of movement, sufficient to positively move the pencil or marker without the intervention of any gearing for multiplying motion.

Fig. 4.



SECTION THROUGH L.P. VALVE

A New Balanced Piston-Valve and its Application to Four-Crank Engines.

The instruments are fitted with high and low-pressure alarm-bells, either directly on the instrument or at a distance therefrom, by which an alarm is given when the pressure gets out of the range for which the instrument has been previously set.

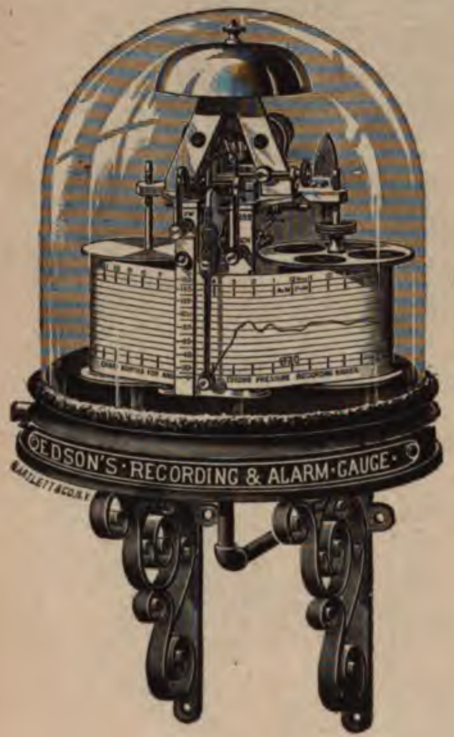
These gauges are now being used very extensively for marine work, and the Ashcroft Manufacturing Co., of New York, U.S.A., who are the makers, report that they have installed them on the steamships *New York* and *St. Paul*, of the American Line; and also on the steamship *Kaiser Wilhelm der Grosse*, of the North German Lloyd Steamship Co. They have recently been supplied to Messrs. Ludwig Loewe & Co. for their works in Berlin.

It will readily be seen that the presence of such a gauge is likely to conduce to careful firing and steady steaming of the boiler, as the chief engineer, who can have the instrument placed in his cabin, has under the immediate notice a continuous record of the pressure, covering the whole 24 hours, and quite independent of any officer or other person. From this he can note which watch gives bad results, and by noting the particular men on any particular duty he can readily find out which person or persons any particular phase of circumstances is due to.

A neat album is provided for filing the records away day by day, and, being numbered consecutively, they form a continuous record for future reference.

REPAIRS TO HULLS AND MACHINERY OF MODERN STEAMSHIPS.

THIS was the title of a paper, of considerable practical interest to shipowners, shipbuilders, repairers, and seagoing engineers, read before the Scientific Society of the Glasgow Technical College at its last meeting on the 13th ult., the author being Mr. John White Boyd, M.I.N.A., M.I.M.E., Glasgow. He began by stating that, although the commercial aspect of the subject was much too important and too inseparably connected with the other aspects to be ignored, he purposed confining himself to practical points, such as wear-and-tear and the means to obviate it, and the repairs rendered necessary by faulty construction or material. A detailed account of the various parts most subject to renewals and repairs would form altogether too lengthy a paper, and he would confine himself to items which were of the greatest importance and requiring most care and attention. He would treat of those items as were concerned, in turn, with ship's hulls, with ship machinery, and with boilers.



THE EDSON RECORDING GAUGE.

Proceeding to deal with hulls, the author first referred to water ballast tanks under the boilers, and said that of all the ballast compartments in a ship these were far the most liable to deterioration, and if not most carefully attended to by cleaning, scaling, and cement-washing, frequently, caused in time a great amount of trouble and expense. The great deterioration here was due principally to the heat from the boilers on the tank top plating, which affected floors, longitudinals, reverse frames, and intercostal angles, and was set up by sweating and contact with the heat of top plating. If tanks were always full of water, the same amount of waste would not take place; but as water-ballast was only carried at intervals, there would always be a certain amount of corrosion going on, especially as sufficient time was rarely allowed in port for examination. The ballast tanks under the holds did not suffer to the same extent, but in cargo steamers making voyages across the Atlantic in bad weather, and not sufficiently ballasted, the author said, the tank plating panted, or breathed, so much that the margin plate angles got started, and in many instances fractured from this cause, damaging cargo and giving a deal of trouble and expense. The coal bunker plating and stiffeners were another heavy item in a vessel's upkeep, especially about the lower portion of the plating and other parts where coal was almost always lodged. The giving way of these parts very rapidly was due in many cases to the condition of the coals when bunkering, and the action of the gases which arose from the various kinds of coals shipped in unsatisfactory condition. Coating the surfaces, of late years, with bitumastic enamel had proved very satisfactory, and when the work had been well done, there had been no signs of corrosion after years of use.

The author then referred shortly to the structural weaknesses apt to be developed in ordinary cargo steamers not foreseen by the designer, these involving expensive and careful remedy, such as the stiffening of deckhouses, doubling butts, bracketing bulkheads, &c. Repairs due to stranding and collision required to be skilfully devised and carried out in order to maintain the requisite continuity of strength in the general structure. The items most generally requiring attention were the cutting and repairing of broken or damaged main and reverse frames, stringers, longitudinal beams, tank floors, and intercostals.

On the subject of machinery repairs the author said that under the head of wear and tear would come all the repairs necessary through friction of moving parts, and those due to attrition of passing fluids, in steam and water pipes, cocks, &c. There were, of course, the repairs to injuries which were traceable to strains in working, and those due to stress of weather, and to the racing of engines, over which, the author said, engineers had no control. To any one who had been brought much into contact with the repairs of ship machinery it was abundantly evident that engines from different makers, doing exactly the same work, involved the shipowners in very much higher or lower expenses according to the particular maker. The great difference in the comparative cost of maintenance between the engines of the various makers might be due to faulty design, inferior materials, or unskilled workmanship, but from the author's own experience he inclined to attribute it to the first-named cause. He then defined what he considered were the points implied in "faulty design," and detailed the best means of remedying the wear and tear thereby caused. These means were concerned both with original design as to proportion of parts, selection of material, &c., and to the facilities which ought to be provided for attending the machinery whilst at work.

Repairs to shafting next engaged attention, the author saying that it was no great matter of wonder to practical marine engineers that a crank shaft should fail through being unduly bent or strained when bearings got out of line with each other, or when unequal wear took place, and when the hull of a vessel altered its shape through the action of the sea or of unequal distribution of cargo, which was often intensified by the flexibility and springy nature of the hulls themselves, which the tendency of the age was to build too light. Some shafts did, of course, break through bad forgings and others from fatigue, the material of the shaft being subjected to such extreme hard work as to crystallise it to such an extent that its vitality became exhausted and its failure imminent. Since the introduction of built crank shafts matters had greatly improved, as also since the extended use of white metal in main bearings and crank-pin journals. With such bearings there was less friction and tendency to heating, and engines, in fact, could be driven at top speed for any length of time without having any water on the bearings, a thing scarcely possible with shafts working in gun-metal.

Propeller or tail-end shafts were also, it was notorious, expensive items to shipowners and insurers, through fractures, badly fitted propellers, and corrosion when the shaft was exposed between the liners in the stern tube. All propeller shafts, in the author's opinion, should be lined with brass throughout, to protect them from the corrosive action of the sea-water augmented by the rotary motion of the shaft. This corrosion is such that propeller shafts have given way inside the stern tube, breaking the latter and damaging the hull in such a manner as has sometimes caused the foundering of the steamer. The author drew attention to the good effects of having a free circulation for lubricating purposes, and of bevelling the sharp corners of the end of brass liners where such did not cover the whole shaft. Cederval's method of protecting the tail shaft by means of a stuffing-box ring, fitted outside the stern-post bush, thus excluding sea-water altogether, and effecting lubrication by oil injected into the stern-tube was next referred to, the author declaring that this method, although as yet not much used, had such merits that, were it thoroughly known, he felt certain it would be universally adopted. The propeller boss should always be recessed the diameter of the outer brass sleeve and a careful fit made, so that it might be jointed thoroughly watertight. A good-fitting india-rubber ring made a very good joint, and the neglect of this most important part of the fitting allowed water to pass along the keyway, and thereby corrode the taper on shaft as well as the key. Many propeller shafts had to be removed from this cause. A very good and easily effected preventative was to bore a hole in the boss of the propeller, and thoroughly fill up the recess with tallow.

After some reference to thrust bearings as also being fruitful sources of trouble and expense, and asserting that in his opinion no part of the propelling machinery had been so much neglected, the author passed on to consider repairs to boilers and what chiefly necessitated them. Boiler repairs most frequently comprised renewals of furnaces, combustion chambers, and tubes, and the re-riveting and caulking of seams and butts in the bottom. Original designs might, as in the case of engines, be held partly responsible for excessive wear and tear, *e g.*, insufficient spaces for cleaning, unequal distribution of stays, and the placing of butts and seams in inaccessible places where they could not be attended to, and often where the workmen were unable, even when building, to make a substantial job. To bad workmanship might be attributed the renewal of rivets, paring, caulking, and patching, which continually went on in the case of some boilers. This, however, was gradually being reduced owing to the greater care now exercised in the selection of material and in the work put upon it during construction and to the more general use of drilled holes and a discontinuance of drifted holes. These influences, together with the mechanical appliances now in use by nearly all builders, tended to the production of first-class boilers.

Corrosion, the author thought, might be considered the most serious difficulty both shipowners and those in charge of marine boilers had to experience. It caused expense, delay, trouble, and danger, and decreased the efficiency of the boiler. Reduction of pressure and partial, if not entire, renewal of parts affected, generally followed severe pitting or corrosion. To prevent corrosion many methods had been tried, but the author thought that zinc, either in slabs or electrogens, had merits of its own which could not be disputed by the majority of engineers. The use of zinc in boilers was based on the fact that when two metals of dissimilar character were immersed in a liquid capable of chemically acting on one or both of them, and were at the same time connected together by means of a metallic connection, that metal which was most acted on became the corroded element. Zinc would, if thus used in sufficient quantity, give good results, but sometimes too much was expected from, say, four to six plates in a boiler of about 25 to 30 tons. If four times this quantity were used at first, and supplemented from time to time as it was rendered ineffective, it would be found that corrosion could be prevented.

Pitting in boilers was much more difficult to deal with, and from the author's own experience of electrogens, as patented and supplied by the Glasgow Patents Co., he found that they were most effective, both for pitting and general corrosion. Electrogens were balls of zinc, having a bar of copper through their middle as a conductor. A copper wire was fastened at each end of the copper bar, the other end of the wire being secured to the boiler structure where most convenient, preferably by a small pin, fitted into a tapped hole. The reasons why electrogens were not more in general use were: first the expense, and secondly the extra attention required to the fixing of wires; but, if shipowners were aware of the benefits of their use, they would adopt this method, which lengthened the life of a boiler, and saved a large expense under the head of wear and tear.

In concluding, the author said it was a fact that could not be disputed that when repairs became necessary they should be done in the most thorough and complete manner, because merely covering up defects in the easiest way possible cost in the end very much more to shipowners than was at all warranted or necessary. Where ships have efficient supervision, carried out on this principle, they prove most economical, not only in the matter of repairs, but in coals and stores. This was due a great deal to alterations and improvements made in the working parts, which designers could not foresee, and were only discoverable in actual practice.

THE FLEETS OF THE MAIL LINES.

(From our own Correspondent.)

The Elder-Dempster Lines.

THE extraordinary development of the African Steamship Company and of its kindred associations is quite a characteristic of the times. At first the indefatigable head of the firm which manages the African Line seemed to be content with his achievement of practically absorbing the opposition British line to the West Coast of Africa. But he was only watching his opportunity for fresh departures. Soon the cargo boats of his lines were trading both to the United States and Canadian ports. Then all manner of kindred businesses were brought into play to develop the resources of the countries with which his lines trade. To assist the tourist traffic to the Canaries a comfortable and well-appointed hotel was established. To finance the business of the West Coast, banking facilities were afforded them. To develop the palm oil trade mills have been established at Liverpool. When the twin-screw service, in respect of which Messrs. Petersen, Tate & Company negotiated for so long with the Canadian Government, fell through, Messrs. Elder, Dempster & Company it was who bought the goodwill of the old Beaver Line and secured the Canadian mail contract, for which they are now building a special fleet, commencing with the double-screw steamship *Lake Erie*, recently completed by Messrs. Palmer's, of Jarrow, and now secured by the Government for the South African transport service. The old Shaw, Savill & Albion steamship *Arawa*, which formerly held the record both out and home in the New Zealand trade—records which still hold, for they have never been beaten—is now engaged in this Canadian mail service under the new name of *Lake Megantic*, which was given her on return from her recent trip to South Africa with troops. Now the Canadian mail service seems fairly in working trim, the West Indies have taken up Mr. A. L. Jones's attention, and he has entered into a contract with the Government to run new services in that direction for the purpose of making a market for the fruit products of those colonies, so as to save them from the distress into which they have fallen through the ruinous competition of bounty-fed beet with their cane sugar. His firm will get a substantial sum from the Government to aid it in the establishment of its new lines, and the effects cannot fail to be exceedingly serious for the old-established West India Royal Mail Steam Packet Company. Some of the colonials suggest that the financial assistance given to the Elder-Dempster Company should be taken from the amount now given to the older line. But even if that suggestion be not accepted, the entry of a new, energetic and powerful rival into the field is certain to make a very serious cut into the profits of the older concern.

Since the above lines were written I hear of yet another new departure on the part of Mr. Jones. It is an experiment in quite a new direction, but it is one which may be followed by other shipowners, if successful, and perhaps even by the Admiralty itself. Mr. Jones has purchased three coalpits in South Wales, and is thus in command of a private supply of about 300,000 tons of coal per annum for the use of his fleet. The results of this experiment, which eliminates all intermediate occupations and profits, will be watched with the greatest interest. If it prove a success, no doubt Mr. Jones's example will be largely copied, and a great revolution in the coal trade must necessarily follow any extensive development of the idea.

Messrs. C. W. Kellock & Company

sold the old Union liner *Arab* by auction at Liverpool on the 15th February. She fetched a good price—over 40s. a ton, her gross tonnage being, as I stated last month, 3,192 tons, and the price realised being £6,670. She is purchased by a London shipbreaker. Thus a very famous and favourite old passenger ship disappears from the lists of the fleets.

Another Disappearance

is that of the old Cunarder *Gallia*, which on the 12th February, left Liverpool for a French shipbreaker's yard. The fact that she has gone in this way bears out the wisdom of the judge who tried the insurance case arising out of her stranding. He held that she was a constructive total loss, and the event has shown that he was right in fact as well as in law, for no one could be found who would treat her as anything else, so to a foreign scrap heap she must go. She dates from about the same period as the *Arab*, but unlike the old Union liner, she still retains her original boilers and has never had her engines tripled.

Towing Barges at Sea.

The practice of carrying coal down the East Coast in strings of barges has, as many of my readers know, already become a very important traffic, and from what one hears of American practice it is very likely to be still further extended in our own waters. It is curious to see that in France an outcry is being raised against the practice, and that by shipowners. They allege that this mode of transit should not be permitted. They do not, however, base their case upon the only ground which in this country would be likely to give them a hearing, viz., on the assertion that the practice is one fraught with danger either to the men who are sent out in charge of the barges or to the public who use the highways of the sea. Such suggestions, if there were sufficient facts to be adduced in support of them—which I do not for a moment suggest—would afford ground for some inquiry, at least, by our authorities. But in France things are done very differently. The shipowners take the ground that the competition of such craft is unfair to shipowners, because the barges can shift cargo at lower rates than they themselves could, or at least do move it. They conveniently add that there is an injustice to seamen also in the practice in that those who man the barges are not, as seamen are, liable to conscription for service in the national navy. But the real point of the grievance is the too great cheapness of transit which it threatens to bring about, a point which in this country would be considered the highest testimony to its value.

A Correction.

Last month in speaking of the loss of the *Merrimac* I gave the master as Captain Purcell. In that I was wrong. Captain Purcell was in charge of the ship when she last sailed from the United Kingdom. But, as will be remembered, the ship was stranded in Canadian waters, and as a result the court of inquiry suspended the master's certificate, whereby he had to surrender the command of his vessel. This was, at the time, considered a hard matter, but little outcry was made about it, for severe views as to the responsibilities of shipmasters have been the rule of late with Canadian courts of inquiry. In the event the matter has been in every way advantageous to Captain Purcell. In the first place he escaped drowning, and in the next he was afforded sufficient leisure to enable him to study for and pass the examination for his extra master's certificate, and thus to give himself further qualifications for command. In point of fact, the officer who had charge of the *Merrimac* at the time of her disappearance was Captain Davies.

A Converted Steamer.

The *May Flint*, now a four-masted barque on the American register, was formerly the well-known Transatlantic liner, *Persian Monarch*, which, when she took the famous elephant Jumbo from the Thames to New York, was perhaps the most discussed vessel of her day. After stranding on the American coast some years ago, she was converted into a sailing vessel and Americanised. In her new career she has proved herself a fairly good sea boat, though she has made long passages and now makes her appearance—and not for the first time—on the overdue list. On the 13th November she sailed from Hong Kong to Tacoma, and, not being reported, caused some anxiety towards the end of January, when reinsurances were effected at five guineas. Since then the rate has risen to twenty guineas. The vessel in question was built in 1880 by Messrs. A. McMillan & Company, of Dumbarton, and was in her day fairly big even for a steamer. She was especially noted for the height of her 'tween decks. In this connection it may be mentioned that Messrs. Flint, who owned her amongst their fleet of nearly a dozen big sailing vessels, were reported in November to have sold her—with the rest of their fleet—for about £100,000 to San Francisco owners for trade in the Pacific Ocean. Messrs. Flint themselves, following the lead of many other shipowners, are turning their attention to steam, and are having a fleet of four large steamers constructed for the trade between New York and Honolulu.

The "Times" and the Transports.

The task of the *Times* representative at Southampton who has been down to describe the departure of the transports for South Africa has not been an altogether enviable one. The sight of a single transport departing is no doubt a soul-stirring spectacle, and the occasion, of course, will bear reasonable repetition. But when it comes not only to seeing it, but to writing about it, day after day, and week after week, the necessary repetition of detail must become very trying when a certain amount of copy has to be provided as to each successive event. This to a certain extent must be the correspondent's excuse, but that he needs something of the kind is evident from the style of his recent remarks. As instances of what he has been reduced to we may take his comments on the departure of the *Pinemore*. These appeared in the issue of the 16th February and the greater part of his space is devoted to an account of how he was "assaulted by a door," which, impelled by a gust of wind, "knocked him flat on his back, to say nothing of other things." This, if perhaps a somewhat uninteresting private detail concerning a member of the fourth estate whom nobody knows and few perhaps care about, has the merit of doing no one any harm and of possibly being accurate. The same defence cannot be urged in respect of this correspondent's observations printed in the *Times* of the 9th February in regard to the comparative merits of the *Majestic* and the *Briton*. He there says, "the *Majestic* was beaten out of sight by the *Briton*, and promptly the theory was floated that she had been ordered to proceed under her speed. It was a false rumour, a fictitious explanation." The *Briton* did indeed make a faster passage out than did the *Majestic*. But I can see no other word of truth in the allegations here quoted. Ere ever the *Majestic* left Liverpool it was known that her orders were that she was—as is the fact, in spite of all that is said and so peristently repeated by the *Times* writer—to proceed out at reduced speed. The vessel in fact left Liverpool on the 13th (wrongly printed as the 18th in my notes) of December. Through the exigences of Christmastide my notes for the January issue of this column had to be sent in before the holidays. I wrote therefore long before (by arriving at Capetown on the 30th December) she completed her outward voyage. Yet I distinctly assured my readers that a fast passage was not to be looked for from her, and gave several weighty reasons why it would be so. These reasons were not and could not have been, as the *Times* writer suggests, an after thought faked up for the purpose of excusing an unexpected collapse. They laid bare conditions which I asserted to prevail and which, as the event showed, did in fact not only exist, but actually had the result I said they would have. Let the *Times* correspondent remember one fact, which is noted from time to time in his own journal. Some ships go out as "freight ships," and some as numbered transports. The *Briton* belongs to the former class, the *Majestic* to the latter. It will be found that the freight ships, of which the control and management are retained by their owners, make passages with troops on board as passengers such as they normally make, because they are under normal conditions. The numbered transports are no longer under their owners' control, but are loaded and sailed under the orders of the Admiralty, and their passages are very often abnormally long because the conditions which the Admiralty impose upon them are abnormal. It would be well if those who know little, and have to pick up what is told them, would refrain from imputations of the kind I have now pilloried and especially from unworthy and unfounded suggestions of motive.

The Castle-Union Amalgamation.

The last day of February, 1900, sees the extinction of the old Union Company. Founded in 1855 as a steam collier company, it is now absorbed by the more virile Castle Company, which for so many years was its keen, and, perhaps at first, its despised rival. As we have seen, the capital of the two companies was practically equal, though it was divided into ordinary stock and debentures in different proportions in each concern. New debentures and new stock of the Castle Company will be issued to wipe out the Union shares and other liabilities. The new company starts with a great fleet, worth some four millions sterling, according to the books, and probably of a great deal more value at the price of shipping to-day. The interests of the employés of the Union Company have been carefully safe guarded. The shareholders in the older concern have any protection they may claim by the addition of Sir Francis Evans to the Board of the Castle Company, and also by the admission of this gentleman (who has proved himself so able a chairman) to the firm of Messrs. Donald Currie & Company, who will manage the new company. But their real safeguard is the fact that they entrust their interests to the man who created the Castle Line, and who has proved himself so well able to manage the affairs of a big and constantly growing adventure. Economies will, and must be effected by so great a consolidation of interests, and the united mail company will be in a position so strong that it must be well able to cope even with the access of business which the close of the present South African War must bring. It will therefore be well able to ward off any attempts of any possible opposition to cut into their trade. Great changes in detail will follow, possibly, in due course, but it is to-day too early to attempt to forecast their nature. Even Sir Donald himself will probably not yet be in a position to see the full results of his own successful negotiations. It should be chronicled, however, that the shareholders of both companies welcomed the amalgamation with satisfaction and that the only question that could be raised was one of the purest detail, namely, as to how the rights of the holders of fully and half paid shares in the Union Company ought to be mutually arranged. This was settled by counsel, and eventually accepted by those affected, though the principles which guided their advisers in their opinion was not quite grasped generally.

The London, Brighton, and South Coast Railway

has issued a well-illustrated and interesting little pamphlet under the title of the "Riviera and Italy for a Ten Pound Note." It shows how tickets for a sixty-day visit to the South of France, and to that part of Italy which lies between Ventimiglia and Genoa, can be obtained for the modest sum named. The Brighton Company's route to France is one of which the popularity is rapidly increasing as the public learn to appreciate its advantages. The points in its favour are numerous indeed. In the first place the boats it provides are comfortable, fast, and seaworthy, which is something to say, considering the class of boats found on some of the shorter routes, where speed alone is the attraction to be offered. Again the country which one reaches when the steamer is left teems with historical and architectural interest, whilst it is not quite so much in the beaten track as some other parts of Western France.

The Transport Service,

thanks to the immense resources of the British Mercantile Marine, goes on with great speed and with wonderfully few hitches. The only casualty of any kind to be reported this month is the loss of a propeller-blade by the s.s. *Pinemore*, of the Johnston fleet, between Southampton and Queenstown in the heavy February gale. This matter, though not of much consequence in itself, necessitated a putting into the Mersey for repairs, and thus entailed considerable delay to the troops on board. But the long procession of transports, which started in October, still makes its way to the South, though some of those which form units in it, like a stage crowd, are making their appearance more than once in its ranks. Hardly a day passes but there is at least one departure. It is a very unusual thing to find a day when there is not at least one arrival reported from Cape Town. Several important ships have been taken recently. The Cunard Line have lent their *Sylvania* for the transport of mules from the United States, a work in which her sister, the *Carinthia*, has already made a couple of successful voyages. The White Star *Afric* of the Australian line, on her regular voyage, took out a large contingent of Imperial Yeomanry, including the contingent of the Duke of Lancaster's Own Hussars. The Orient Company has had its steamship *Austral* chartered. This, it may be noted, is not the *Austral's* first visit to the Cape. She has been there in her regular service for her owners at the time when they did not use the Suez Canal, but took the long sea route. Thus it came about that for many years the *Austral* held, if not the Cape record, at least the best steaming time between British ports and the island of Madeira. The new Dominion liner *Norseman* and the just completed Beaver liner *Lake Erie* have each started during the month, whilst the number of vessels belonging to the Castle and Union Lines that have been dispatched has been very remarkable. Much credit is due to the staffs of each line for the great expedition with which their ships have been turned round, as well in South Africa as at home ports.

The "Patria."

At the end of January I had an opportunity of inspecting the wreck of this steamship off Deal. She lies with her head pointing down channel on an even keel, and without the smallest suggestion of a list. The fury of the fire is very well evidenced by the condition of her upper works, of which one has a good view, as at low tide her decks are just awash. Right aft the deck beams have been evidently melted, and the decks have fallen in. The two after-masts are down, and everything is burnt out of the houses. There seems to be no hope or intention of raising her. However, her cargo comprised a good deal of copper, and the Whitstable divers, who have undertaken operations upon her, are chiefly concerned to get out this valuable metallic freight. The work, they seem to think, will last beyond the present summer, and then the wreck is to be dispersed.

Alleged Tampering with the Mails.

What looked at first like a repetition of the notorious Jago case came before the Southampton magistrates a few days ago, when an officer of one of the American liners was charged with improperly dealing with certain negotiable securities. But on a further hearing explanations were forthcoming and the case was dismissed. Rather a curious point to notice in this matter was the fact that the magistrates seemed to have no jurisdiction in the case, for the *St. Louis* is an American ship, and the alleged offence, if it took place at all, happened on the high seas. Thus no court, save one of the United States itself, would be competent to deal with the charge. This matter is one which may well be regarded by marine engineers. There have been cases of late where foreign courts have attempted to take cognizance of charges in regard to offences said to have been committed by British officers aboard British ships on the high seas. It is quite certain that no foreign court, of criminal jurisdiction at least, has any right to touch charges in regard to what happened on the high seas under the red ensign, and any persons charged in this way should appeal to the court on the point, and, if necessary, call in the aid of the British consul.

The Norddeutscher Lloyd

announce that their twin-screw mail steamship *Kaiserin Maria Theresa*, which sustained such unfortunate damage on her trial trip in May, 1899, is to start on her first trip for New York from Bremen on the 13th of March. She is making her renewed trials at the time I write. The company will thus have a fine companion for the *Kaiser Wilhelm der Grosse* ready for service in ample time to get the cream of the traffic for the Paris Exhibition.

The Evoy Patent Adjustment Compass

has recently been on view in Victoria Street. The invention which is now being brought forward is not by any means a new one. It has seen much practical work. It has thus stood the test of experience for long periods of time, whilst it has won encomiums from the commanders of at least two vessels in the American Line, to say nothing of other navigators. The local attraction of the steel in a steamship has ever been a source of difficulty and danger to navigators, who are upset in their calculations by the varying deviation of their standard compasses. Various devices have been tried to get over the difficulty. The Allan Line, for example, make one mast of wood, and place their compass on it. Other lines have elevated tripods to bear their compasses. These are, however, not only unsatisfactory, but very expensive expedients. The present invention has the merit of cheapness combined with efficiency. The compass, which is designed to stand rough usage, is run up to the jumper stay between two of the vessel's masts, and is thus kept clear of all her attraction. When it is desired to take a reading, the card is locked by an ingenious and simple device, and the compass lowered to the deck for comparison with the steering-compass. The recent developments in the patent have been chiefly in matters of detail. But it is attention to detail which spells success in such matters, and from what I have heard and seen Mr. Evoy's patent is likely to be found in the future in most well found vessels.

Anti-Attrition Metal.—In consequence of the steady increase in the sale of anti-attrition metal on the North-East Coast, the company, who have their head offices and works at Emerson Street, Southwark, London, S.E., inform us that they have appointed Mr. John S. Barr, of 16 and 18, Broad Chare, Newcastle-on-Tyne, as their sole agent for the Tyne and Tees.

THE FUTURE DEVELOPMENT OF THE STEAM ENGINE.

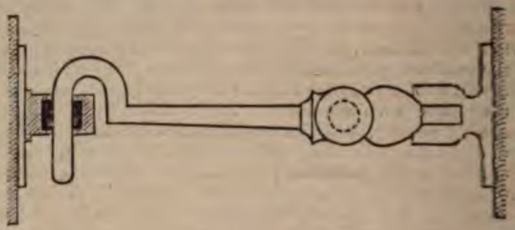
MR. ALFRED SAXON, M.I.Mech.E., read an interesting paper before the Manchester Association of Engineers, last month, on "The future development of the steam engine." After reviewing the principal features of development in the past, Mr. Saxon proceeded to consider the probabilities of the new century in reference to the direction of progress. With regard to pressures, he remarked, these would be as high as the materials and construction of the boilers would admit. He had no doubt that with a revolution in boiler construction, which they might confidently expect, standard pressures would rise to 500 lbs., and probably even higher. With higher pressures the system of expansive working would be more utilised, but must be subject to certain limits as to the number of cylinders employed. Probably it would not be found necessary to go beyond quadruple expansion. As to engine speeds, the double-acting vertical type of engine, with forced lubrication, had opened up great possibilities; and, although there was a limit to the velocity of the reciprocating parts, this did not seem to have been reached as yet, and he had not the slightest doubt that in stationary land practice they would be able to approach the high speed of 15,000 ft. per minute. As to economy, the probabilities of the new century in this respect seemed to be to reduce the steam consumption to about 8 lbs., and the coal per I.H.P. per hour down to 1 lb., or even to $\frac{3}{4}$ lb. of the best fuel burned under the most efficient conditions, in the newest and best types of boiler plant. He predicted that engine-makers in the new century would make a great point of standardising and classifying their engine designs, and that suitable units of power would be adopted to meet the varied demands, and that only compound, triple and quadruple expansion engines of the best type would be used. Simplicity in the valves and valve gear seemed to be a lesson which the steam turbine taught the reciprocating-engine builder, and in this respect a diminution of cost and wear and tear would probably be arrived at without interfering with the economy of the steam engine, although the governing cylinder would still of necessity retain valves and valve gear for the measurement and control of the steam to be admitted for work to be done during each stroke; still, he ventured to forecast the abolition of the valves and valve gear of the succeeding cylinder or cylinders.

In the discussion on the paper, Dr. Nicholson said with regard to the lines on which economy was obtainable, he and a colleague had made a series of experiments that brought out some points which, although not yet fully confirmed, ought, if true, to be more widely known. One particular point they discovered was that the leak of steam past valves from the steam chest into the exhaust without going into the cylinder was much more extensive and important than was perhaps usually imagined. In a high-speed 60-H.P. engine of American type, with automatic cut-off, they actually measured an amount of leak of 300 lbs. per hour, and inferred a much larger leak, of five to six hundred pounds, when the engine was running under normal conditions. They found that this leak occurred in the form of water across the valve face. Now the leakage would be diminished if that formation of water could be prevented, and any leakage thus be made to occur in the form of steam. The inference was that if they could heat the valve face, or superheat the steam, they would destroy that method of leaking, *i.e.*, that in the form of water, and it was to this fact that many of the economies in connection with steam engines were due rather than to causes commonly assigned. At the Manchester Technical School, where they were equipping large laboratories for research, they were going to have a large compound steam engine specially fitted for testing this very point of leakage in connection with three types of valves, viz., the slide, the Corliss, and the Sulzer.

The "Niji," a 31-knot torpedo boat destroyer, built for the Japanese Government, by Messrs. Yarrow & Co., left the West India Docks on February 7th for Greenhithe, where she remained for the adjustment of compasses, and on Sunday she left for Japan. That day had been specially selected by the Japanese authorities, as it is the anniversary of the accession to the throne of the present Japanese dynasty 2,560 years ago, which has thus been unbroken since B.C. 660. The present Emperor is the 121st of his race.

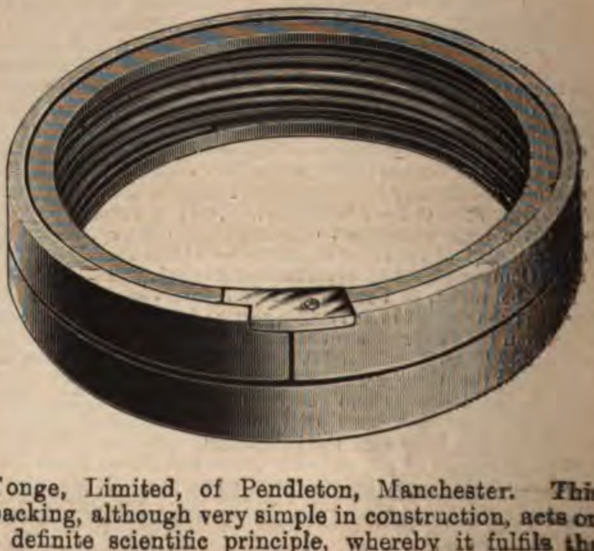
AN IMPROVED DOOR HOOK AND EYE.

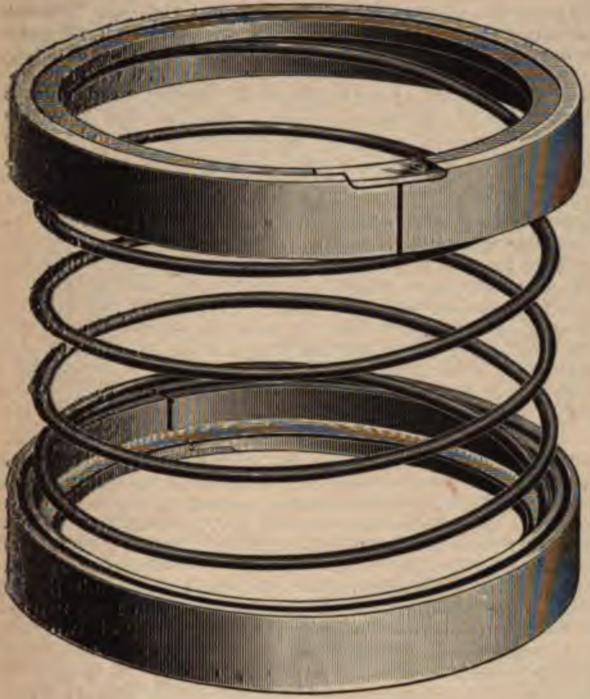
AN improved hook and eye for use on ships' cabin-doors and alley-doors, known as Taylor's patent noiseless hook and eye, is shown in the accompanying diagram. It was the invention of the late Mr. Taylor, the Liverpool agent for Messrs. George Maclellan & Co., of the Glasgow Rubber Works, Maryhill, Glasgow. The principal feature of the appliance consists in the use of a rubber-band, which may be inserted in a groove in the eye, or slipped over the beak of the hook. In either case the hook will be held so firmly through the introduction of the rubber that vibration is prevented, and the old inconvenience in connection with the securing of doors on board ship disappears. At the knuckle end the hook is double-jointed to admit of a rotary movement. This hook is being used on steamers built by Messrs. Harland & Wolff, Denny Brothers, Raylton Dixon & Co., and other companies, and is said to have proved an effective remedy for the jarring of ships' doors, which has been such an annoyance in the past. The hook and eye may practically be had of any size, and of brass or white metal.

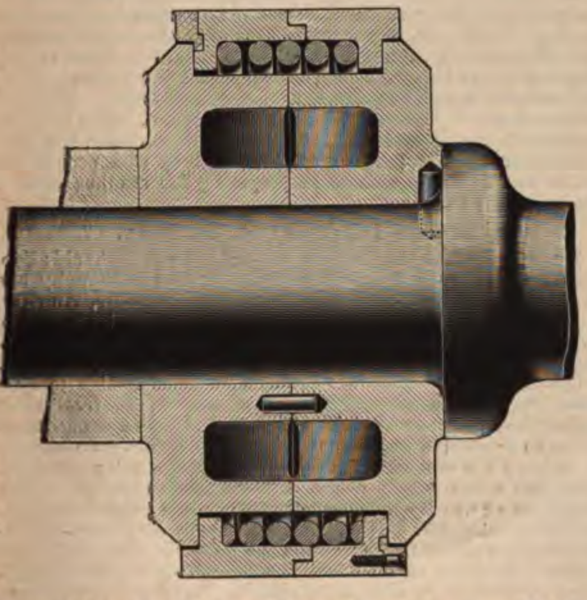


AN IMPROVED PISTON-VALVE PACKING.

THE accompanying illustrations show the latest form of the "Lancaster" patent piston-valve packing, which is made by Messrs. Lancaster & Tonge, Limited, of Pendleton, Manchester. This packing, although very simple in construction, acts on a definite scientific principle, whereby it fulfils the







two necessary conditions of being practically frictionless, and, at the same time, steamtight. As will be seen from Figs. 1 and 2, it consists of two plain cast-iron rings and one spring only. By giving the latter six or more coils inside the rings a great amount of coil-friction is set up between the spring and the rings similar to that caused when a rope is lapped several times round a capstan. This coil-friction renders it impossible to collapse the rings by any sudden pressure on the outside, such as takes place when the rings are working over parts, even if the spring is made only just strong enough to hold the rings to the sides of the valve-chest or barrel. In practice it is found that a resistance to collapse of over 200 lbs. per square inch can be combined with an active pressure of less than 2 lbs. per square inch. This ratio is sufficient for all practical purposes, and if care is taken in fitting the rings to the valve no trouble is found in working after the rings get thoroughly bedded to the barrel, and there is less wear and tear than with any other form of valve. Fig. 3 shows half of a piston-valve fitted with the "Lancaster" patent packing as working in the high-pressure valve-chest of a compound locomotive, large numbers having been supplied for this purpose to some of the principal railway companies and locomotive engineers. Hundreds of the packings are also at work in stationary engines from $1\frac{1}{2}$ in. to 26 in. diameter of valve, and their sale is rapidly increasing.

NAVAL MATTERS—PAST AND PROSPECTIVE.

(From our own Correspondents at home and abroad.)

To Raise the "Maine."

IT seems that the plan suggested to the United States Government recently for the purpose of raising the ill-fated battleship *Maine* is not to be adopted after all. The idea in question was worked out by Captain Alexander McDougall, the inventor of the whaleback type of vessel, who proposed to send to Havanna a fleet of ten or more of the whaleback steamers in service on the great lakes. These vessels are of peculiar construction and light draught; some of the tow barges drawing only $3\frac{1}{2}$ ft. without cargo, and 3,000-ton steamers only 10 ft. aft with nothing in the extreme bow, so that their mean draught would be about 5 ft. The vessels have, of course, a very large water ballast capacity to be used when required, and are loaded down to full 18 ft. in carrying ore, although they are themselves of only 22 ft. depth in some cases. The manner in which a tow barge is made to lift the stern of a steamer is as follows: the forward compartment of the consort or tow barge is filled with water, and chains, fastened to the stern of the steamer, are hove taut with windlass. Then the water is pumped to after compartments of the consort, resulting in a leverage being secured the full length of the vessel (300 ft.), so that 400 tons is thus raised on a draught of $7\frac{1}{2}$ ft. On arrival at the scene of the wreck, divers with electric drills would make holes in the bilges or sides of the *Maine*, say four in each place and about five inches apart; into these holes a steel casting shaped like a hand, with the fingers open and bent, would be placed. In the palm of this steel hand there would be a large hole to engage the shackle of the chain attachments that would be made on both sides of the wreck to the bows of as many whalebacks as would be required to make the lift. Only a short lift would be made with each effort, but it was Captain McDougall's idea that the wreck could in this way be gradually worked into very shallow water.

The Rearmament of Old Warships.

Although it is beginning to be felt that the great contest between guns and armour which commenced in 1864 is at present somewhat in favour of the former, yet it is only with the very latest types of guns and projectiles that the armour of to-day can be overcome. Yet there are at the present time many warships in the British Navy which have a muzzle-loading armament, and the uselessness of these guns at fairly long range is demonstrated by Captain Eardley Wilmot, R.N., in an article in a contemporary journal. Against one of these battleships armed with muzzle-loaders, says Captain Wilmot, a moderate-sized cruiser with 6-in. quick-firing guns could attack the other with impunity, keeping out of range by superior speed, and riddling all her unarmoured parts. He also thinks that it is a mistake to suppose that the old ordnance in broadside ironclads cannot be replaced by guns of modern type as well as with turret ships. The Austrian ironclad *Tegetthoff* is pointed to as an example of how an old warship can be improved and brought up to date. This vessel of 7.500 tons was launched in 1878, and completely refitted a few years ago with new machinery, twin-screws—involving considerable structural changes—and a new armament at a cost of £150,000. If this is all the money spent upon such alterations as are here mentioned, it would be as well for the Admiralty to send some of our obsolete battleships to the firm which made the alteration, at the same rate of pay, and we should thus obtain very cheaply a fleet of vessels capable of taking their place in the fighting line instead of being mere encumbrances to the dockyards. Some of our old ironclads are, of course, not worth rearming, and to include them in the effective list only deceives the country.

Portsmouth Dockyard.

The shipbreakers are now at work on the new Royal yacht, and Vice-Admiral Fullerton attends the yard almost daily and keeps a sharp eye on all that is being done in the way of alteration. The vessel will probably be ready for her trials some time next autumn, but more probably will not. However, 100 shipwrights of this yard have been set to work upon the vessel, although they could not easily be spared, and it is to be hoped that they will very shortly put the vessel to rights. A great number of the men who are at present working on the Royal yacht ought to have been turned on to the new armoured cruiser *Kent*, which has just made a start upon No. 5 slip. Men have been busy in the workshops preparing material for the *Kent* for some months past, and she would have been formally commenced much earlier if the slip had been ready for her. It was hoped some time ago that the *Kent* would be launched this side of Christmas, but that is now impossible, as it cannot be said when the new Royal yacht will cease troubling the yard, and the completion of the *London* and *Formidable* must not be delayed. The *Kent* is to be 440 ft. in length, and will displace 9,800 tons. She will have an I.H.P. of 22,000, and her armament will consist of 14 guns, including a twin 6-in., mounting one gun forward, and one aft, to work in a barbette, similar to the 12-in. gun on a battleship. The new Japanese battleship *Asahi* is to be docked here before she goes on her trials. In this connection it may be mentioned that the officers of the Japanese vessels which go into dock at this yard are generally permitted to wander at will over the various naval establishments.

The Navy League and our Naval Requirements.

The Navy League is apparently seriously alarmed by the formidable projected naval programmes of Germany, Russia, France, &c., and has accordingly dispatched a circular to the Press throughout the country dealing with our naval requirements. The circular commences with the stereotyped statement that, whatever the cost, the British Fleet should be able to meet and beat the combined sea-forces of any two Powers, to afford protection to our commerce, and prevent serious interruption of the food supplies and raw material upon which our existence depends. We must be strong enough, says the Navy League, to paralyse the efforts of hostile fleets by confining them to their ports, and to maintain a force of cruisers sufficient to guard the ocean highways against commerce destroyers. Our margin of superiority in battleships is insufficient, in the opinion of the Navy League, to do this, and it is pointed out that, if the lists of our battleships be examined, amongst the 53 completed battleships named in the latest Parliamentary Return will be found 16, varying from 20 to 35 years of age, deficient in speed, armed with obsolete muzzle-loading guns, and full of inflammable wooden fittings. On the other hand, no mention is made of the number of foreign battleships which are in a similar, and perhaps, worse condition; and there is not much doubt that the Continental Powers have more obsolete warships in their Navy Lists than this country has. The number and value of our cruisers completed and under construction are dealt with in the circular, and the conclusion of the Executive Committee of the Navy League is that we are still deficient in this important element of naval strength. There is no doubt that if the demands of the Navy League were acceded to by the Government, we should have a very efficient fleet, but unfortunately the expense has to be considered.

The Navy and the Army.

The proposed increase of the Army, which necessitates the spending of so much money, has made the critics apprehensive lest our efforts to maintain our supremacy afloat should in any way be relaxed on account of this expenditure. Several passages in Mr. Goschen's speech on the amendment to the Address have been quoted in support of the theory that the Navy is to be neglected, or partly so, and that the policy adopted will be that of robbing Peter to pay Paul, the former representing the Navy and the latter the Army. For instance, Mr. Goschen said in one part of his speech that Mr. Wyndham and Lord Lansdowne were elaborating plans which it was believed would place the country in the necessary state of defence, and that "we are working at those plans, and with the Navy *as it is* and those preparations, the country need entertain no feelings of insecurity." The words "as it is" have been taken by some critics as meaning that the Navy is to be allowed to weaken in order to provide for deficiencies of the Army, a policy, it is pointed out, which may easily be carried to a point which would endanger the efficiency of the former arm. Mr. Goschen also used the unfortunate words "coast defence," and these have been immediately taken up as the text on which to hang numerous homilies on the evils of spending money on fortifications which can always be laid out to better advantage on the Navy. It is well known that the Navy has already suffered more than the Army in order that huge sums should be laid out in coast defence—which is, after all, only subsidiary to the defence provided by a fleet in being. However, it is to be hoped that the fears entertained by the critics will prove to be unfounded.

Devonport Dockyard.

Some most important orders for work have been given to the Keyham factory, and the Admiralty seem to be highly pleased with the efficient and economical manner in which the orders for machinery have been carried out. The boiler shop in particular has been fortunate in obtaining orders for important Government work, for it has secured the first order for each new type of water-tube boiler for which the Admiralty has secured the patentee's rights. There are now in hand two sets of Normand boilers intended for the reboilering of two first-class torpedo boats, and a complete set of the ordinary marine type is being built for the turret ship *Hecate.* It is probable, however, that these boilers will never reach their at present intended destination; for it is likely that after all this vessel will not be reboilered and refitted as was originally intended, and the £10,500 allowed for her refit will go towards wiping off the excesses on other items of work in the refitting programme. The smithery department at this yard also deserves to be commended for the good work it has performed. It appears that the order for catheads, davits, and other large forgings for the *Implacable* was so well executed that similar orders for the *Bulwark* and *Montagu* have since been entrusted to the local staff. The old, obsolete cruisers *Carysfort*, *Constance*, *Conquest*, and *Shannon*, and the turret ship *Prince Albert* have at last departed from this yard, but there are still many other vessels whose room would be preferable to their company. The refit of the *Amphion* is already well advanced, and, what with her being dismantled aloft, and stripped between decks, she little resembles the smart vessel which put into this port a few weeks back. She is said to be preparing for another term of service in the Pacific.

Wireless Telegraphy for the Navy.

Experiments are shortly to be carried out which should afford valuable results in connection with wireless telegraphy and communication between vessels at sea and the shore. An effort is to be made to send messages to or from a ship by means of a captive balloon ashore. It is possible, however, that messages may be taken in from a ship at sea without having resource to a balloon at all, but it would seem to be desirable to have something of the kind if messages are to be freely and expeditiously sent to the fleet whilst at sea. The experiments are to be conducted by Lieutenant Arnold-Forster. The Marconi is perhaps the best known system of wireless telegraphy, but there are others which are said to be as good, if not better, nearly all of which are being tested by order of the authorities at Whitehall. Mr. H. W. Sullivan, the well-known marine electrician, has invented a new marine relay, which is being used by the Admiralty, and is declared to have been found to possess superior advantages over other relays. The Admiralty, in fact, are prosecuting their enquiries and experiments in connection with wireless telegraphy with a good deal of vigour. It may be mentioned here that Signor G. Marconi in his recent lecture on "Wireless Telegraphy" at the Royal Institution said that the experiments had shown that wireless telegraphy was reliable and certain in operation. He hoped before long that the necessary funds would be found to enable Trinity House to establish communication all round the coast with lightships and lighthouses, by means of which a vast amount of property and many lives might be saved.

The German Shipbuilding Programme.

The new Navy Bill which has been presented to the German Reichstag, and approved of by the members of the Federal Council, warns us that if the proposals are carried into effect we shall before long have another naval rival who will have to be seriously considered. Germany proposes to almost double her fleet, and, whether for offence or defence, intends building up a navy which will eventually be equal to that of France or Russia, and have to be taken into account when the Navy Estimates of this country are under consideration. There are, it seems, to be two double squadrons, composed of 34 battleships, including two flagships, with 8 large and 24 small cruisers and 80 torpedo boats. There is also to be a reserve of one battleship for every squadron, and one torpedo boat for every division, in case vessels should be lost or disabled. But these squadrons will not be ready for sea until 1917, and it is estimated that before that time 17 battleships, 39 cruisers, and 12 divisions of torpedo boats will have become obsolete, amongst which will be some of the newest vessels in the German Navy at the present moment, and a few cruisers which have not yet had their keels laid. As the various warships become obsolete others are to be laid down to take their place, a work which is to be quite independent of the proposed increase. Between now and the year 1917, 11 battleships, 8 large and 16 small cruisers, and four divisions of torpedo boats are to be constructed, and the present strength of the German fleet is to be maintained in addition. The *personnel* is also to be augmented until, by the year 1920, when the last of the contemplated ships should have been launched, the total addition will have been 35,551. The Bill, however, has not yet been passed by the German Parliament.

Chatham Dockyard.

Rumours are already current regarding the programme of ship-construction for the ensuing financial year. It is believed that the Estimates will include the laying down at this yard of a new battleship of the *Albemarle* type, and a new cruiser of the *Diadem* type, the battleships *Hood* and *Ramillies* also undergoing extensive repairs. The new battleship will probably be laid down on the slip vacated by the *Albemarle* early in July. Overtime is being resorted to freely in an effort to complete the programme of work at this yard by the time specified, but it is extremely unlikely that this will be the case. The cruisers *Grafton* and *Hawke* will certainly be completed before the end of March, but the completion of the *Imperieuse* and *Immortalite* has perforce been postponed. This is not because there is any lack of hands, for there are more men on the books at present than ever before, and nearly £13,000 per week are being paid in wages. The new battleship *Albemarle* has at present 500 shipwrights at work upon her, all of whom are working overtime in order to forward her construction as much as possible before the end of the present financial year. Although she was only commenced six weeks ago, she has made wonderful progress. The *Venerable* has now received her machinery, and her completion is to be advanced as far as possible by the end of the present month. A great number of men are working overtime on her with this end in view. The *Sappho* will soon be ready for active service, but no date has yet been fixed for hoisting the pennant or for her departure for the East Indies.

The Value of Smokeless Coal to the Navy.

It was reported a week or so back that a Cardiff firm had contracted to supply a foreign Power with nearly half-a-million tons of smokeless coal, but inquiry has only elicited the fact that no confirmation of this deal can be obtained. No sooner had the report appeared, however, than the chairman of the Executive Committee of the Navy League appealed both to Members of Parliament and the public generally to press upon the Government the necessity of taking steps to prevent large quantities of stores so essential to the efficiency of the fleet from passing out of the country into the hands of possible enemies. Smokeless coal, says Mr. Trower, is the breath of Empire. There is no substitute. Its use confers on the admiral of a fleet possessing it advantages over a fleet compelled to use smoky coal only comparable to the relative advantages of smokeless powder over the ordinary black variety. Except the Pocohontas coal measures in Virginia, there is virtually no other source of supply outside Great Britain. The practical monopoly of smokeless coal which would be obtained by our fleets if its sale were forbidden under the supreme law that governs wise nations and commonsense men is a prospective reinforcement of our national strength in time of war too obvious to need comment. There is also a want of proper colliers and supply vessels in the British fleet, a want that ought to be remedied at the earliest possible moment. It is to be hoped that the Government will have no hesitation in prohibiting the exportation of smokeless coal in time of war with a rival naval Power, and that they will at once restrict the export of this coal to foreign countries.

The New Royal Yacht.

Some radical alterations will after all be necessary before the new Royal yacht is ready for Her Majesty's use. It is declared by correspondents who have seen her that she will never be all that she was intended to be, and that on her voyage round to Portsmouth, with 550 tons of ballast in her, she was drawing two feet more of water than was intended, and altogether some important defects have yet to be put right. In the House of Commons Mr. Goschen said that until fresh calculations, which are in progress, have been made of all the weights that have still to go into the ship, it is impossible to say exactly what the extent of the error in estimate was, or what alterations will be necessary to ensure satisfactory conditions of stability, but they will probably include the shortening of the masts and funnels, the removal of a large quantity of silicate cotton which was introduced between the cabin bulkheads and in other places for the sake of deadening sound, and the removal of the greater part of the forecastle. The cost of repairing the damage to the yacht is to be kept quite separate from the amount laid down in the Estimates. The trouble with the *Victoria and Albert* has led to a demand in certain quarters for a committee on ship designs in the same way as there is at present a committee on machinery designs. The latter consists of the Engineer-in-Chief, his immediate assistant at the Admiralty, and the chief inspectors of machinery in the dockyard reserves. Sir John Durston is responsible to the Admiralty, and takes the credit for success or blame for failure. A committee on ship designs, composed of officers with a practical scientific knowledge, would be of great help to Sir William White.

Sheerness Dockyard.

The most important happening at this yard during the past month was the float-out of the sloops *Shearwater* and *Vestal*. The vessels were christened respectively by Lady Bowden-Smith and Miss G. Bowden-Smith, the wife and daughter of the commander-in-chief. The vessels were laid in February of last year, and are sister sloops to the *Condor* and *Rosario*. The engines for the *Vestal* were constructed at Keyham factory, where her Belleville boilers are being completed in readiness for delivery. The *Shearwater* was engined by the Thames Shipbuilding Co. The trials of both the *Condor* and *Rosario* are being run with much success, both the 30 hours' test at 300 H.P. and the 30 hours' run at 1,000 H.P. being accomplished without difficulty. The *Rosario* is to be ready for commissioning by the 19th of this month, and the *Condor* very shortly afterwards. On the 22nd of this month the *Basilisk* leaves for the South-East Coast of America Station to take the place of the *Beagle*, which has just paid off at this yard. Amongst the vessels which have just completed their refit is the *Circe*, which is to leave for Harwich to take the place of the *Onyx*. The *Gleaner* is in hand here, and the repairs to her will not be completed for a week or so. The *Trent* is to be paid off after a long term of service as gunnery tender here, and the *Spey* is to take her place. The latter vessel is receiving a new armament, including two 4·7-in. guns.

The Trials of the "Highflyer" and "Minerva."

Some particularly interesting and instructive steam trials have been carried out between the cruisers *Highflyer* and *Minerva*, to test the coal consumption of their respective sets of water-tube boilers. The *Minerva* is fitted with a Scotch type of boiler, and is supposed to have a H.P. of 9,600 and a speed of 19·5 knots, whilst the *Highflyer* is fitted with water-tube boilers of the Belleville type, which are supposed to give her an I.H.P. of 10,000 and a speed of 20·5 knots. Both ships are of 5,600 tons displacement. In the trials in question, it is reported that the *Highflyer* burned about 25 per cent. more fuel than did the *Minerva*, and in this connection a few extracts from a letter written to the *Globe* may be interesting. The writer, it is stated, is not on either of the two ships, but is biassed in favour of the Scotch boiler. According to this correspondent, in the first three runs the vessels steamed at ten knots for 60 hours each trial. For these three trials the *Minerva* burned for all purposes 258 tons, whilst the *Highflyer* consumed 328 tons, or 70 tons, equal to 27 per cent., more than the *Minerva*. In illustration of this we will suppose that both ships are filled with coal to 1,100 tons: then when the *Minerva* has burned 866 tons, the *Highflyer's* bunkers would be empty; but the *Minerva* would have 234 tons left, which would take her 1,638 miles, for at this speed she steams seven knots per ton of coals. After these trials the *Minerva* was ready to go at any speed as soon as the tubes and the furnaces were cleaned—no defects of any sort. But the *Highflyer*, with something like 100 steam joints to make, required five days and as many artificers as could be spared from the fleet, in addition to her own. The next trials were two of 60 hours each at 14 knots. Here the *Minerva* burned 380 tons, and the *Highflyer* 463 tons, or 83 tons in excess, nearly 22 per cent more than her competitor. Here again the *Minerva*, after cleaning tubes and furnaces, was ready to "toe the line," but there was the same sad story to relate of the *Highflyer*, the same signal from the senior officer, "How many artificers can you spare for the *Highflyer?*" and six days afterwards she was again ready for the contest of two trials of 60 hours each at 17 knots. Result: *Minerva* burned 613 tons for 98 hours, and the *Highflyer* 663 tons, or 50 tons more than *Minerva*. The remaining trials are two of 30 hours each at the highest speed that can be maintained, and two of 12 hours each at the highest speed that can be maintained. In one of these trials each ship will have one-third of her boilers alight only when the order for full speed is given. And lastly, two trials at the highest speed that can be maintained for 12 hours, the ships having previously been going at a slow speed for anything between 18 and 36 hours, the *Minerva* with one-third of her boilers alight and the remainder banked, whilst the *Highflyer* would have her remaining fires laid, and rely on the special feature of the Belleville boiler to raise steam rapidly.

The Treatment of Students at Keyham.

There have lately appeared in the Press several letters dealing with the treatment meted out by the Admiralty to the engineer students at the training college at Keyham, which is said to be in marked contrast to that accorded to the *Britannia* training school for naval cadets. It is admitted by all that the engineer officers of the Navy are in no way behindhand in patriotic sentiment, but this opinion will be considerably lessened if the engineers continue to accept the responsibility for many of the ill-timed and ill-considered letters which appear in the daily Press under various *noms-de-plume;* the writer in some cases asserting that he is speaking with the authority and sanction of the naval engineering profession. A correspondent writing to the *Globe* complains that it is nothing short of a scandal that an officer of commander's rank is considered good enough to be placed in charge of such an important establishment as the Royal Naval Engineering College. "The important duty of training engineers for the Navy," says the writer, "is surely worthy to claim the energies of an officer of post-captain's rank, and he should be assisted by an inspector of machinery." It is good policy to ask for more than you expect to get or need, and the *Globe's* correspondent cannot be accused of being too modest in his demands. The letter concludes by stating that "the scant attention which the Royal Naval Engineering College at present receives from the authorities is having a very bad effect on the character and attainments of the students, tending to make them lose all pride and zeal in their profession, even before their course there is completed; in addition to which the quality of the candidates for admission, both socially and intellectually, is being injuriously affected. Seeing that the training of an engineer officer costs the country only £86, as against £400 for the naval executive, if the reforms called for caused a slightly additional burden on the country it is one that could be well borne."

Pembroke Dockyard.

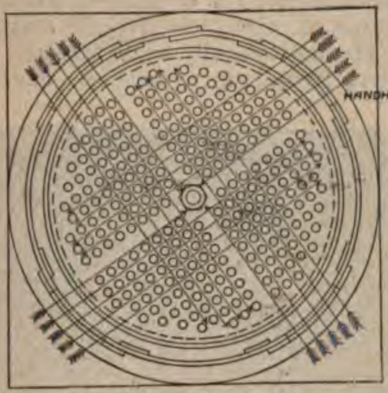
A strenuous effort is to be made to launch the new cruiser *Drake* in October next, and the *Essex* by the end of the coming financial year. The *Spartiate* is still completing, and the authorities have declined to allow any additional overtime being worked upon her. She will probably leave this yard for Portsmouth in May or June. She has been afloat in the harbour since October 27th, 1898. The water test of her boilers is to take place in about a week's time. The new armoured cruiser *Essex*, laid down on the 1st of January last, is making rapid progress. The slip on which she is being built is being extended, but the extension consists of nothing more than piles driven into the mud outside the slip, a line of balks being securely bolted down longitudinally over the top of each tier of piles.

Naval Guns for Field Service.

From news to hand from South Africa it is now certain that several 6-in. naval quick-firing guns have been mounted on carriages designed by Captain Percy Scott and sent to the front. The question was asked in Parliament whether the naval guns which have been sent up with the various naval brigades were taken from the ships on the Cape Station. Mr. Goschen in reply said that this was not the case and that the guns were taken from the stores at Simon's Town, although the carriages were designed, and many of them made, on board some of the vessels on the station. The 6-in. quick-firer which Captain Percy Scott has adapted to the purposes of field warfare is a little difficult to recognise on its improvised and most ingeniously constructed carriage. It is 21 ft. in length, throws a 100-lb. shell, and weighs seven tons. A mounting for the 6-in. guns is also said to have been designed by the experimental staff at Whale Island, which can be employed in armoured trains, or even on temporary rails. When these guns are sent to the front on their field mountings, our gunners will be able to throw 100-lb. shells into the Boer camp from at least 1,000 yards out of range of the Boer guns. Our deficiency both in the quality and quantity of field guns would have been very seriously felt if it had not been for the naval guns. Those both with Roberts and Buller are doing excellent service, and the same may be said of those seamen with their guns who were unfortunately locked up in Ladysmith. In a letter written by a bandsman at the front describing the engagement at Colenso, he says "had it not been for the navy guns we should certainly all have been massacred." Similar tributes to the efficiency and usefulness of the naval brigades have come from all parts of the theatre of war.

SIMPSON STRICKLAND & CO., DARTMOUTH AND TEDDINGTON.

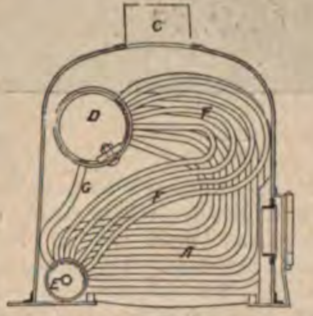
THIS firm has specialised the machinery of the high-speed launch until they have attained the remarkable performance of 18½ miles an hour with a boat only 40 ft. in length. They have specialised their Kingdon quadruple-expansion surface-condensing machinery, their triple-expansion four-cylinder engines, and the Strickland water-tube boiler until, with the high pressure of 300 lbs. per square inch, they can beat anything which is sent to race against them. In the way of launches and pleasure boats they have reached a very high standard. Amongst the types of boats they build are yacht's steam dinghy, launches; man-of-war's steam cutters. This latter is fitted with a teak awning for hot climates. Its dimensions are: length, 45 ft.; beam, 10 ft.; depth, 5 ft. 9 in. Its machinery is the H size Kingdon quadruple-expansion engine and horizontal return tube boiler with a working pressure of 175 lbs. When steaming it has a speed of 11 miles per hour. Of larger proportions is their steam yacht—length, 102 ft. in all, beam, 13 ft., and depth, 8 ft. 3 in. Her carvel is built with teak bottom, close copper and metal fastened throughout. She has forecastle, galley, and pantry; main cabin under the after deck, and four berths. Her machinery is the L size Kingdon patent quadruple-expansion engines and horizontal return tube boilers, with a pressure of 175 lbs. Her speed is 13 miles, but she can be made to go 14 miles an hour. They have also fitted their compound engines into a steam barge. One of these was 50 ft. long, 12 ft. beam, carrying 20 tons of cargo, the speed being 8½ miles an hour light. Another class of work is auxiliary machinery in sailing yachts. This machinery is intended to get the yacht along when the wind is down. One boat so fitted was 25 ft. in length by 8 ft. 6 in., and had compound engines, the total weight being 6 cwt, which gave her a speed of five miles. For colonial rivers stern-wheelers are much in requisition.



Plan of Vertical Boiler.

One of these, 24 ft. by 5 ft. 8 in. by 6 ft. draught, had a compound engine 2½ in. and 5 in. cylinders, with 7½ in. stroke with surface condenser, which gave her a speed of about six miles an hour.

As has been pointed out above their machinery has acquired a certain fame. Their Kingdon quadruple-expansion is well known. It consists of two pairs of tandem cylinders arranged on two cranks, the high-pressure and first intermediate pressure on the forward crank, and the second intermediate pressure and low-pressure on the aft crank. A single valve distributes the steam to each pair of cylinders, and there are no more working parts about the engine than are found in the ordinary compound type. By this arrangement no piston gland is subjected to the full pressure of the steam. This is almost the only quadruple engine the manufacture of which has been persisted in.

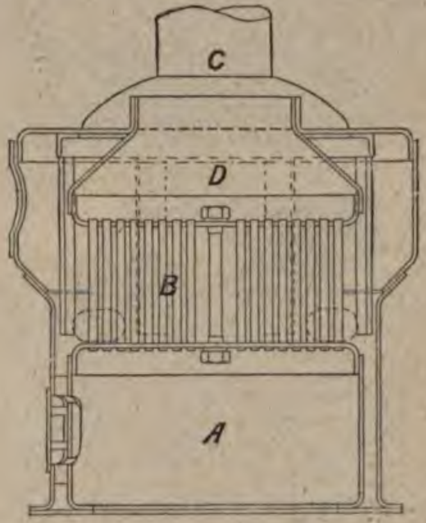


Strickland Water-Tube Boiler.

Their two-crank ordinary compo[illegible] done very satisfactory work. It has the [illegible] side the cylinder [illegible] pumps are d[illegible]

The compound, the triple, and the quadruple are condensing engines. The condenser is a solid-drawn copper tube of D section, placed outside the boat, the ends of which are fastened into suitable gun-metal castings passing through the skin of the boat. It is connected at one end with the exhaust pipe, and at the other end with the air-pump suction. A vacuum of 25 in. is easily maintained.

The boilers made by the firm for launch work are of three types—1st, the horizontal, with large combustion chamber and large furnace crown; 2nd, the vertical type, with water legs and vertical tubes leading from the furnace crown to the uptake; 3rd, the Strickland modification of the Thornycroft water-tube boiler for launches. The horizontal type consists of a cylindrical shell with a furnace at one end and a funnel at the other, horizontal tubes join the tube-plates. The great bulk of this type of boiler has caused it to be almost wholly discarded. Where, however, water is bad and the attendance very unskilled, it is the best boiler, as it can stand most ill usage. The second type is more used, as it is much less bulky. The smoke-box is inside the boiler, and the water-line is higher than the smoke box tube-plate. There is a large grate area, and high speed can be maintained even with natural draught. There is a large steam space, and this prevents priming. The third water-tube type is suitable for vessels which are intended for high speeds. It will be seen from the figure there are a steam-drum and a water-drum, and tubes joining them. The tubes, as in the ordinary Thornycroft boiler, lead into the steam-drum above the water-level. There are larger tubes, which are to the left and lead more straightly down to the water-drum, the tubes at the upper end joining into the bottom of the steam-drum. These tubes are the down carriers. The grate is under the small winding tubes, heats the water in them, and causes it to flow quickly into the steam space of the steam-drum. In some the tubes form the fire-bars.



Sectional Elevation of Vertical Boiler.

There was exhibited in the Yachting Exhibition at the Aquarium what appeared to be almost a toy engine, but which was powerful enough to force a vessel weighing 38 cwt., and of 30 ft. length, 6 ft. beam, and 3 ft. depth, through the water at a speed of 17 miles an hour. The vessel and machinery were constructed for a challenge contest at Oban. The vessel is of cedar. The engines are triple-expansion with four cylinders and four cranks; one pair of eccentrics actuate the valves of two cylinders next each other. There are thus two pair of cranks, a forward pair and an after pair, and the cranks of each pair are at 180 deg. to each other, whilst the forward pair are at 90 deg. to the aft pair. The piston speed is 750 ft. per minute at 1,100 revolutions, and the working pressure is 300 lbs. The cranks are carefully balanced, and the boat at full speed is wonderfully free from vibration. The bearings are made of phosphor bronze. The air pump is driven by a rocking beam. The boiler is the firm's own Thornycroft modified type, as shown in our illustration. Its outside dimensions are 5 ft. high and 4 ft. diam., and it makes easy steam for the engine at 300 lbs. per square inch. There is a fan driven by steel wire spring belts arranged inside the casing of the boiler, which provides the forced draught for the boiler. The circulating water for the condenser is supplied by scoops.

Boat 40 ft. x 6 ft. 5 x 5 Non-Condensing Engines.

The launch belongs to a yacht, and the race at Oban was against two other launches, one of which was fitted with engines of an older type built by the Dartmouth firm. The course was six miles in length, and the contract speed was 16½ miles. This speed she easily made, and, as mentioned above, on the race course she made 17 miles, or 14·75 knots per hour.

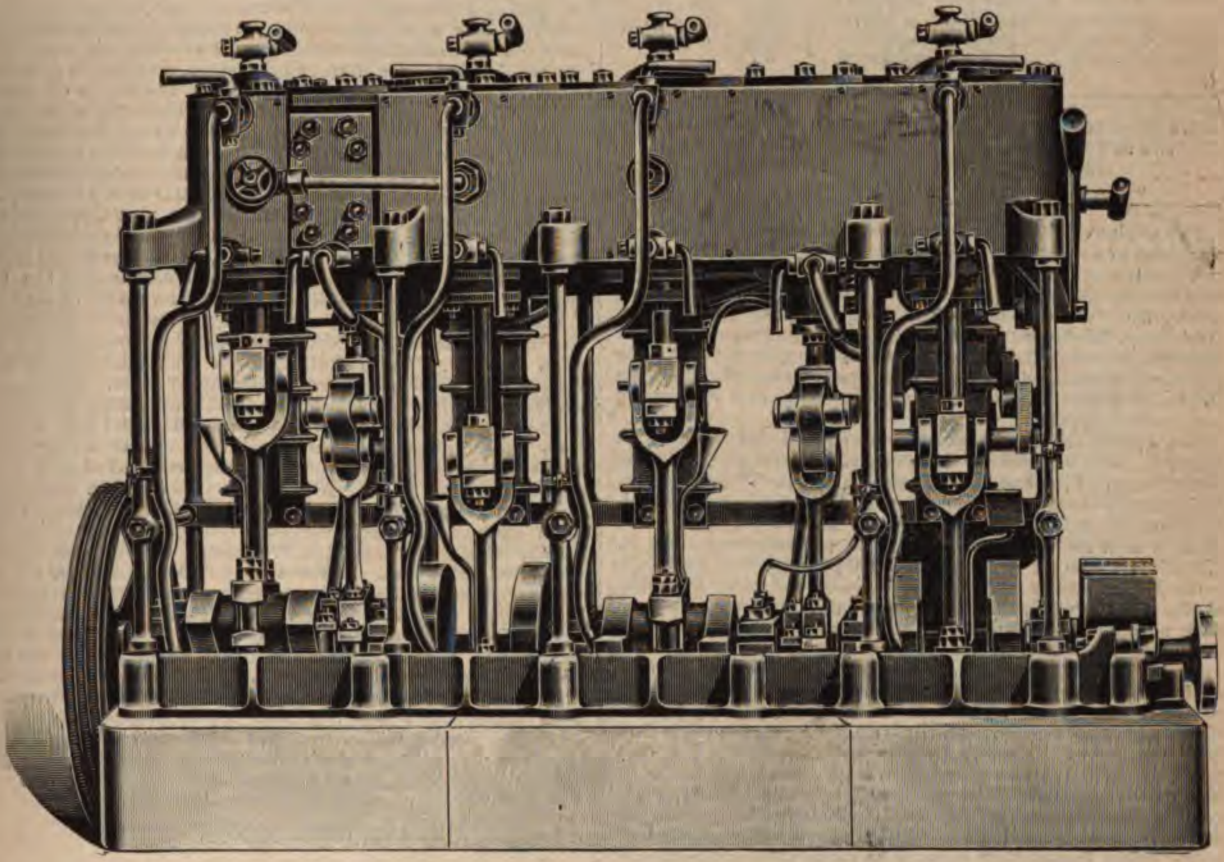
Messrs. Simpson Strickland & Co.'s, Limited, works at Dartmouth are situated on the east side of the river Dart, just above H.M.S. *Britannia*. The offices on Noss Point face the river, the steel and wood boat-building sheds being at the heads of two creeks. The boiler shops, foundry, smith and fitting shops are placed between the two boat-sheds with coppersmiths', galvanising, and general store contiguous. Most of the firm's work is of a special character, exceptionally high speeds or shallow draughts being what are most called for; consequently, a boat built by them is almost absolutely of their own manufacture, with, of course, the exception of some small fittings, and these are most usually made specially for them. The foundry, from long experience, can turn out intricate castings impossible to get elsewhere; whilst the boiler and fitting shops turn out machinery which weighs as little as 25 lbs. per I.H.P., in some cases even less. These weights, of course, can be lowered, but so far expense is prohibitive of such further reduction if uniform good working qualities are to be retained. It will easily be understood that it has taken years of careful and expensive experiment to reach the result obtained in so small a boat as Mr. N. B. Stewart's 30 ft. launch. Amongst its more ordinary work the company builds steam yachts, large cruising launches, &c., and has so far been particularly successful in this class; whilst its machinery has, by its economy, made its way, and found a market all over the world. We illustrate one of their launches moving at a speed of 18¼ miles per hour.

MARINE ENGINEERS' NOTES.

(From our own Correspondent.)

MR. ROBERTS and Mr. Taylor organised a most successful conversazione on January 31st, which was held at the Town Hall, Stratford. Many old and familiar faces were present, Alderman Kidd genial as usual, Mr. Laurie, Mr Leslie, Mr. Blelloch; indeed it was a strong turn out. Mr. Caird showed excellent slides in one of the dark rooms.

There have been fairly good results obtained in the experimental rooms by the Experimental Committee with a small feed heater. Mr. Laurie, Mr. McLaren, and Mr. Halliday have been busy with this now for some weeks. The trouble has been a want of sufficient steam with which to make the experiments, but Mr. Laurie, as usual, has come to the rescue in the matter, and is already looking about for a boiler of sufficient size and heating surface with which to provide steam for that experiment and others. As yet no progress has been made with the experiments on forced draught, but as soon as a fan has been obtained these will be proceeded with.



ENGINES OF MR. N. B. STEWART'S STEAM LAUNCH WHICH MADE 17 MILES AN HOUR AT OBAN.

There was a large meeting of members of the institute present at the discussion on Mr. J. F. Walliker's paper on Monday, February 12th. The council was well represented, and cards of invitation had been sent out to the members in town to draw a meeting. Mr. Shorey, the treasurer of the institute, was in the chair. The paper was read by Mr. Adamson. Its title was "Twenty Years of Progress in Cargo-Boat Machinery." Lloyd's Register informs us that the *Enterprise*, engined by Wilson, of London, in 1872, had a pressure at that early date of 150 lbs. to the square inch. The *Sexton*, engined by the Ousetown Engine Works of Newcastle-on-Tyne, in 1874, with a pressure of 120 lbs. per square inch, was triple-expansion, and had three cranks. The *Propontis*, engined in the same year by Messrs. Randolph & Elder, of Glasgow, was triple-expansion, and was fitted with Rowan's water-tube boilers. Mr. Perkins brought out his triples in the seventies, notable amongst them being the yacht *Isa*, with a boiler pressure of 120 lbs. The *Propontis'* boilers were not a success, because their joints gave trouble, and they had to be taken out. The boiler pressure of these water tube boilers was 90 lbs. Her present boilers are registered at 145 lbs. Dr. Kirk was very anxious during these years to obtain a boiler which would give him higher pressure, and they had to fall back on the Scotch boiler to provide them with these higher pressures after all. The author thinks the water-tube boilers for the tramp steamer is still in the future; they require delicate handling and a continuity of experience. Even the use of the evaporator so essential to the water-tube boiler can hardly be shewn to be of value to them. The introduction of the Siemens-Martin process for the manufacture of steel for ships and boilers, and Lloyd's rules regulating its testing and manipulation, gave confidence to the engineering world and hastened its adoption. Plates can now be had of five tons weight for boiler shells. Some it was said would last 30 years and it appears as if the prophecy would become true. In the attempt to get triple-engines to take up the same bed-plate space as the compound, some engineers placed the high-pressure cylinder on the top of the forward or aft engine. In other cases the third engine was attached in front of the bed-plate. The advantage of the three cranks being placed at equal angles to one another was easily seen. Mostly engines are fitted with double eccentric gear. Hawthorn, Leslie & Co.'s are fitted with Marshall's gear. These engines have 3,000 I.H.P. and pressure of steam of 160 lbs. They have been fitted with 21 cargo steamers. The five-crank engine designed by Mr. Mudd, is said to propel a vessel of 5,800 tons at 9 knots on 13½ tons of coal being at the rate of 1 lb. per I.H.P. per hour. In 1887 the average coal consumption was said to be 2·11 lbs. per I.H.P. per hour. In 1872 it was

1·828 and at present 1·5 lbs. The following table shows the pressure in 1879 and 1899:—

BOILER PRESSURE IN THE MERCANTILE MARINE IN TWENTY YEARS AS SHOWN IN "LLOYD'S REGISTER."

1879		1899
3·5 per cent.	Below 20 lb.	—
6·9 ,,	20 lb. to 30 lb.	—
4·2 ,,	30 ,, ,, 40 ,,	—
3·3 ,,	40 ,, ,, 50 ,,	—
3·3 ,,	50 ,, ,, 60 ,,	—
32·5 ,,	60 ,, ,, 70 ,,	·5 per cent.
36·1 ,,	70 ,, ,, 80 ,,	6·6 ,,
9·4 ,,	80 ,, ,, 90 ,,	12·3 ,,
·9 ,,	90 ,, ,, 100 ,,	4·2 ,,
—	100 ,, ,, 150 ,,	10·2 ,,
—	150 ,, ,, 165 ,,	45·2 ,,
—	165 ,, ,, 200 ,,	16·6 ,,
—	200 ,, and above	3·7 ,,
Five are recorded at 100 lb., two at 120 lb., one at 150 lb.		Over 5,000 steamers are registered with a pressure above 100 lb.

The work and skill of the engineer 20 years ago was nothing compared to what it is now. There were few steam-steering gears and hardly any forced draught arrangements. There are engines now for centrifugal pumps, feed pumps, auxiliary pumps, ash hoists, &c. There is now electric lighting and refrigerating machinery. There are two drawbacks—the propeller shaft and the steam pipes. There are few expansion glands fitted. He also thought better accommodation ought to be provided—the chief—he ought, at least, to have an office and a sleeping apartment separate.

The discussion on the paper was opened by Mr. W. C. Roberts. He referred to the statement about the splendid performance of the five-crank engine, which propelled a vessel of 5,800 tons at an average speed of 9 knots on 13½ tons of coal, being at the rate of 1 lb. of coal per I.H.P. per hour. Mr. Roberts said he had never come across a performance like it. It reminded him of a story of two old captains who met in a public-house, and in reply to a question by one as to the speed of the other's vessel, the other captain said, "About 9 knots an hour at sea, but about 12 knots in a public-house." The owners of the steamers who had to pay the coal he feared would not find quite so low a record. Mr. Basil Joy said that at Hull he had recently come across a tug which was 65 years old. She had had several new boilers and several new engines. Her present engines had been taken out of a trawler which had been wrecked off Margate, whilst her boiler was out of a trawler which had been wrecked off the Yorkshire Coast. A dent had been made in the bottom of the boiler by the rock, and she had been working with this indentation for years. In the early days of the triple-expansion engines the question of saving space fore-and-aft came to be of great importance, and the radial gear came in just at the right time, but with the new measurement regulations the same consideration did not apply. He was sure that engineers objected to radial gear because they did not understand it. Mr. Walliker thought there were two principal drawbacks of the engines of the present day — the screw shaft and the steam pipes. Mr. Joy would like to add a third-valve gear. In France the captain of a steamer had to pass through a very stiff course in engineering before he could obtain his proficiency certificate. If the captains of English steamers knew a little about the difficulties of engineers he would be more considerate. Mr. Lawrie said the author thought the spare time of the engineer had been greatly encroached upon, but in his engineering days, 20 years ago, he certainly had very little spare time and if the engineer of to-day had any less time for sleep and rest he must be very hard pushed indeed. The reason the author gave for the engineers of the present day being so hard worked was that there were so many auxiliary engines on board ship, but surely he did not mean that the auxiliary machines were continually breaking down. He believed that the engineer at sea had a very much better time than was the case 20 years ago when it was no uncommon thing for the engineer to remain below some two hours after his watch was done to get the water out of the stoke-hold and engine-room. He thought the passing of a master or mate in steam was little more than a farce. Nothing would cause more trouble on board ship than the state of things suggested. By the time that the ordinary engineer had complied with the new regulations of the Board of Trade for a chief engineer's certificate and properly learned his business he would want a little rest and feel inclined to leave navigation alone. Mr. W. H. Moss said the history of the *Propontis* should compel many of them to recognize what a remarkable man the late Dr. Kirk was. He had influenced marine engine practice and progress more than any other engineer from the early seventies right up to to-day. In addition to Dr. Kirk, Mr. Alexander Taylor, of Newcastle, and Mr. Seaton, of Hull, were both paving the way for the new type of engine, but the difficulty was a boiler. The engine had to wait for the boiler and the boiler for the steel makers. He had seen the Belleville at work on a long voyage in a Messageries Maritimes steamer, and he could not conceive how a competent marine engineer could be in doubt for a moment as to its inferiority to the cylindrical type. The water-tube boiler for marine purposes was wrong in principle. They wanted a boiler in which the fire, the source of power, could be efficiently controlled, and in which the water could adapt itself to its circumstances. In the cylindrical boiler the fire was taken care of; in the water-tube boiler the water was taken care of. Since the Ellis Eave's system of forced draught, the supply of air to the furnaces was better under control, the combustion more perfect. He understood that the consumption of coal with the five-crank engine in a whole year's average was 1·16 lbs. per I.H.P. per hour. Mr. Ruthven said it was notable that piston speeds had just doubled during the last twenty years. He would like to know if the 1·5 lb. of coal per I.H.P. per hour included the whole of the power developed on board. Mr. Hulme had done a good many journeys with Belleville, Yarrow, Thornycroft, Reed's and other water-tube boilers, and he was distinctly in favour of them. He thought engines should be so made that each of the pistons would have to travel at a speed corresponding somewhat to the flow of steam that was admitted into each particular cylinder. Mr. Moss spoke of the Inchmona being carefully arranged to give a low consumption per I.H.P. About three years ago Mr. Dalrymple discussed the question of coal consumption, and contended that on a basis of deadweight carried in proportion to coal burnt, a ship burning 1·24 lbs. per I.H.P. per hour was more economical than the Inchmona. It was a most serious question, for the owners of fast mail and ocean steamers, constantly exerting a high power, they had not reaped anything like the advantage from triple engines and high-pressures that the cargo-boat owner had. In fact, the anticipations of high speeds at sea at a moderate cost formed fifteen years ago had not been realised.

Members of the Institute will be interested to learn that Mrs. Shorey, the wife of the treasurer, wrote a beautiful hymn on the war, which was sung at the West Ham Church on the departure of an Essex contingent to the front. It was also received and acknowledged by the Queen.

GORDON'S SLIDING SCALES FOR SHIPBUILDERS, SHIPOWNERS, ENGINEERS, AND NAVAL ARCHITECTS.

THE sliding scales which bear the name of A. M. Gordon, devised for the ready and sufficiently accurate computation of the power necessary to drive vessels at a given speed, and also of the dimensions of vessels required to carry a given deadweight, are now very widely known and largely used throughout shipbuilding and shipping circles at home and abroad. Their author, Mr. A. M. Gordon, M.I.N.A., who until recently took a leading part in the management of Messrs. R. Napier & Sons' Shipyard, Govan, is now established in business as a consulting naval architect at Baltic Chambers, Wellington Street, Glasgow, and has just laid the shipping and shipbuilding world under further indebtedness through the devising and sale of a new sliding-scale concerned with the prompt determination of what amount of freeboard will be assigned by the Board of Trade (or other society empowered to act under their rules) to any vessel, having given dimensions of length, depth, and co-efficient of fineness.

In the two first-mentioned scales Mr. Gordon has put into the hands of those most deeply interested—and yet probably those not technically very deeply informed, viz., shipowners and their marine superintendents—a simple means of readily solving such problems as are concerned with dimensions, speed, I.H.P., displacement, and deadweight carrying capacity. Though probably few experts in naval architecture will at first be disposed to admit that any individual could invent a scale that would take into account all that is involved in determining the power required to propel a vessel at a given speed, it is abundantly evident from the wide acceptance accorded to the scales, that they take account of all that is essential for giving a very close approximation indeed to the results obtained in the actual speed-trials of ships. Besides affording a strikingly simple and rapid, they also give a nearer and truer estimate of power required in proposed vessels, than that arrived at by more painstaking, tedious, and costly methods. Many experts have only been convinced of the accuracy of the scales by actual test (which, it may be said, the author at all times invites). Yet nearly every shipbuilding and engineering firm at home and abroad, as well as a very large number of shipowning firms, marine superintendents, and consulting naval architects, now use the speed and deadweight scales. Some of the leading firms, indeed, have ordered as many as half-a-dozen scales, a fact which in itself forms the best testimonial possible to their worth and usefulness.

The new scale concerned with freeboard should commend itself, not only to shipbuilders, but also to all who have the formulating of new vessels. What more irksome task could be set an ordinary mortal than to take out from the Board of Trade tables — rules, explanations, and memoranda — the simple dimension of depth for a given length that a vessel would require to have in order to float at a given draught; or, in other words, to find what would be the assigned freeboard for a vessel of a certain length and depth? This is what the new instrument claims to rapidly make clear, and with the patronage that has been accorded the two former scales as a warrant of the accuracy and usefulness of this new one, we venture to prophecy for it wide adoption.

As to the use of these calculating scales in determining the dimensions of proposed vessels, an example may be given in order to show the great saving of time and the elimination of the chance of error, compared with the ordinary figuring methods. Say a plain cargo vessel is required, conforming to Lloyd's highest class, to carry a deadweight of 4,000 tons on a draught of 19 ft., and to steam, when so laden, 10 knots on the measured mile. Assuming that the vessel is to be built to a co-efficient of fineness of ·76: required the length, breadth and depth, also the I.H.P. to fulfil these conditions. The operator, taking *deadweight scale*, sets the co-efficient of ·76 against the required deadweight of 4,000 tons, and in sliding the moveable along the fixed part of scale, in the order clearly explained on the scale, finds the length and breadth most suitable for the particular trade that the vessel is to be engaged in—say 310 ft. length by 45 ft. breadth—the third dimension, viz., depth, say of 23 ft., being found against a speed of 10 knots. Now by reference to, and equally simple manipulation of, *freeboard scale*, it will be found that the freeboard required by the Board of Trade rules for these dimensions allows of the vessel loading to 19 ft., if she has a poop bridge and forecastle of a combined length of 125 ft., and from scale of displacement this vessel, having a co-efficient of fineness of ·76, will be found to represent a displacement of 5,760 tons. Then, from *speed scale*, the I.H.P. requisite to drive this vessel 10 knots on the mile will be found to be 1,120 I.H.P.

Circulars giving full particulars and prices of the several sliding scales can be obtained from the inventor, Mr. A. M. Gordon, Baltic Chambers, Wellington Street, Glasgow.

Institution of Naval Architects.—The annual meetings of this institution will take place on Wednesday, April 4th, and the two following days, in the hall of the Society of Arts, John Street, Adelphi, W.C. (by kind permission of the council). The Right Hon. the Earl of Hopetoun, G.C.M.G., president, will occupy the chair. The annual dinner will be given on Wednesday, April 4th, at the Grand Hall, Hotel Cecil, Strand, W.C., at 7.15 p.m.

OBITUARY.

THE LATE JAMES DEAS AND THE DEVELOPMENT OF THE CLYDE.

IN briefly alluding to the death of Mr. James Deas, the engineer-in-chief to the Clyde Trust, in the course of "Industrial and Trade Notes" last month, a promise was made to return to the subject and to give some account of the shart the deceased gentleman had taken in the development of the Clyde and its docks. He held the post of engineer to the Truse since 1869, and Glasgow Harbour, as it is to-day, is virtually the record of his service. Mr. Deas was the son of an engineer who belonged to Leslie, in Fifeshire, and his earliest professional training was obtained under his father on the Edinburgh and Dalkeith line. He was born in Broughty Ferry, however, and at the time of his death was approaching 73 years of age. His technical education was continued in the locomotive works of the Edinburgh and Glasgow Railway, and up till 1868 he served in the North British and the Glasgow and South-Western Companies, eventually succeeding his father as engineer-in chief of the North British Company. A year later he succeeded Mr. Andrew Duncan as engineer to the Clyde Trust.

Remarkable as has been the development of the navigation of the Clyde during the present century, the 30 years during which Mr. Deas was the resident engineer of the Trust, formed the period during which the greatest and most rapid advance was made. The record of the latter half of his working life is, as has been said, practically a narrative of the development of Glasgow Harbour. On Mr. Deas fell, in large measure, the responsibility of coping with the ever-increasing demand for dock accommodation. Not only had he to supervise the multitudinous details incidental to the upkeep of so vast an undertaking, but he had to initiate and supervise the various extension schemes which in almost unbroken succession have had to be undertaken. When he entered upon his duties the Trust was engaged in deepening the river, in constructing Queen's Dock, and in extending the quay space. These enterprises, successfully completed, were speedily followed by others.

Speaking at the annual dinner of the Clyde Trust officials in 1894, Mr. Deas related that in 1869 the quayage of the harbour was 5,604 yards, or 3·18 miles; the water area, 76 acres; and the gross revenue £150,000. To-day the quayage is 8½ miles, the annual revenue £410,000, and the water area 209 acres. And as to the depth of water, it has been increased since 1869 fully five feet throughout the 18 miles under the jurisdiction of the Clyde Trustees. More recently the deceased took part in the construction of Prince's tidal and graving docks—on the south side of the river—which were opened by H.R.H. the Duchess of York two or three years ago. These docks, which include one of the largest graving docks in the world—described by Sir William White as "a magnificent piece of work,"—are 81½ acres in extent. In connection with the various new works undertaken by him on the Clyde, Mr. Deas had recourse to a system, devised by himself, of using concrete instead of iron cylinders for the substructure of quay walls. Not only did the change result in a reduction of initial cost, but it was the proud boast of Mr. Deas that the three miles of quay wall so constructed had not cost the Clyde Trustees £100 for maintenance.

During the thirty years which Mr. Deas served the Trust the dredging plant was increased more than twofold in quantity, but above fourfold in efficiency, so that while in 1869 the total quantity dredged was 870,224 cubic yards, for the year ending 30th June, 1894, it amounted to 2,310,980 cubic yards, and the fleet of 22 steam barges conveyed the dredged material from the harbour and river to three miles seaward of Garroch Head, in the island of Bute, 46 miles from Glasgow. The river was deepened, widened, and straightened, including the removal of Elderslie Rock, at a cost of upwards of £70,000, so that groundings, which five-and-twenty years ago were of almost daily occurrence, are now about as rare as snow in summer; and the river was most effectively lighted by lighthouses and light towers, and by gas-lit buoys, defining the Channel from Dumbarton Rock to Port-Glasgow, so that the navigation of the river by night is as safe and easy as moving along the main thoroughfares of any great city. Dozens of steam and hydraulic cranes ranging from 30 cwt. to 130 tons were supplied for effectively and promptly dealing with cargo in all its infinite variety. Railways and sidings to the extent of

13 miles were laid along the quays on both sides of the harbour, and connected with the railway system of the kingdom.

Outside the affairs of the Clyde Trust and the development of Glasgow Harbour and dock accommodation, Mr. Deas' interests were but little exercised. Whilst not very actively identifying himself with the proceedings of the various professional institutions with which he was connected, he nevertheless in virtue of the remarkable development of the river and docks under his charge, was frequently called upon to deliver papers bearing on the subject before such bodies as the Institution of Civil Engineers, of Mechanical Engineers, and the Scottish Institution of Engineers and Shipbulilders, and his papers on the subject of the Clyde and its deveopment, forming part of the transactions of these bodies, are admirably full and informative.

ELECTRICAL NOTES.

(From our own Correspondent.)

Johnson & Phillips new integrating ampere metre is giving very good results, the accuracy claimed being 1 per cent. at all values of the current. The metre is driven by an electrically worked pendulum. The latter being so arranged that the impulse is received after the oscillations are less than a certain fixed amplitude. It works on the hit-and-miss principle like the regulator of a gas engine. The power absorbed by the mechanism not being above a watt. The metre itself is a fine iron wire, actuated by a solenoid, and this iron wire is attached to an aluminium pointer. Every 30 seconds the pointer is clamped, and the position of the pointer determines the angle through which the integrating mechanism moves. As soon as the integration for the 30 seconds has been completed the pointer is freed, and the current strength of the solenoid brings it into a new position depending on that. At the end of 30 seconds the same operation is performed. The instrument only requires $\frac{1}{200}$ of the maximum current flowing to start it.

The Frodingham Iron and Steel Co., Doncaster, like very many other engineering firms throughout the country have had an electrical plant installed for driving the machinery in their works. Electro-motors are arranged to drive the line rolls and skid, by means of worm-gearing running in oil. The speed reduction through this gearing is in the proportion of 9·5 to 1. A motor also drives the furnace-charging machine. The motors are of the enclosed type, having four poles and slotted armatures. They are of 30 H.P., but when called upon they can give out 80 H.P. each. A single lever actuates the starting, stopping, and reversing arrangements, and each motor has a controller to govern it.

In the American Institute of Electrical Engineers a valuable discussion took place on the question of the advantages of subdividing the power for driving workshops by electrical means. One member showed by experimental results and by diagrams that three small motors of total equivalent power to a large one effected a saving of from 15 to 20 per cent. by the indirect saving in consequence of the idle period of some of the machines driven. The initial cost of the motors, when their aggregate capacity was 50 H.P., was 28 per cent. higher for three machines than it was for one machine; and when the aggregate capacity was 100 H.P. the initial cost of the three machines was 2 per cent. higher than for one machine. Belts were a great source of waste of power, and the change effected in the Government printing office in Washington an increase of 15 per cent. on the output, the daily running expenses of the establishment being £2,200. In that place 5 H.P. motors were used for light machines and 10 H.P. for heavy ones. Another member gave a case in which 14,000 books were produced at a fuel cost for power of £9 per day, and after the change to motors 22,000 books were produced at a fuel cost of £1 14s. per day; and this covered the cost of power, lighting, and elevators in a twelve-storey building. Another case was given where 100 sewing machines were driven with separate motors to prevent the whole of them being thrown idle with the one break down. Another member pointed out that one-third of the machines only were at one time in operation, and that shaft losses lay between 18 to 68 per cent. of the whole energy supplied. From trials made, another member said he never found the shaft losses below 50 per cent. of the total load.

The saving in power by using Electrical Motors on board Ship.—Some further arguments have been brought forward in favour of installation of electric motors on board the United States warships. It is pointed out that the saving in steam alone would be 67 per cent. It has been overlooked what this would mean in weight of boilers, feed-water and evaporators, feed-water heaters, etc. Where the steam equipment required is for 2,400 lbs., the total weight of the necessary machinery is 876,000 lbs.; while for the same power the electrical equipment would be 612,900 lbs., which shows 263,100 lbs. less weight to carry with the ordinary machinery; with specially designed machinery for this the weight would be 498,000 lbs. less than for steam, which shows a saving of more than 50 per cent.

A Magnetic Clutch.—This is the invention of Mr. Bion J. Arnold and a number of them are in use. It consists of two simple discs of heavy mass fitted with magnetic coils. When the current is turned on through the coils the discs become magnetised and the discs are drawn together. When release is wanted the current is switched off. But magnetic action is not the sole one which is depended on for producing sufficient friction. The surfaces are rough, and the magnetic force produces simply sufficient force to prevent them from slipping over each other. Up to the present the largest clutches which have been made are 100 in. in diameter, and this one is transmitting 300 H.P. at 150 revolutions per minute. It is used for connecting the engine and generators in a large central station. The current is carried to the clutch coils through central rings on the side of the clutch. Carbon brushes are the means of contact with those rings. The current required is about 2·5 amperes at 100 volts, and the loss of current while in use is about ·001 of the power transmitted.

Trinity House and Wireless Telegraphy.—The *Times* has been accusing the Elder Brethren of not being up with the times in this matter. A letter has been sent by direction of the Elder Brethren on the matter. It says: "That evidence has recently been given that property to the value of £52,000 has been saved from loss by the establishment of wireless telegraphy between the East Goodwin lightship and the South Foreland; and that in spite of these facts the Brethren of the Trinity House move slowly in the matter. I am desired by the Elder Brethren of the Trinity House to inform you that they think it will be found that they were amongst the first in this country to move in the matter in the public interest. The experiment at the South Foreland commenced at Christmas, 1898. The board afforded the necessary accommodation to the Wireless Telegraphic Co. free of charge, and aided and encouraged them in every way, being from the outset favourably impressed by the advantages of the system. The Elder Brethren have, however, good grounds for stating that the alleged facts as to the saving of property of the value of £52,000, by means of this particular connection, are incorrect; and whilst they are of opinion that electrical communication with light ships might, in certain circumstances, be the means of saving life and property, they do not consider that any property which would otherwise have been lost has been so far saved through the agency of electrical communication of any description with light-vessels on the coast of England." The letter is answered by Major S. Flood Page, the managing director of the Wireless Telegraph & Signalling Co.

The Electrical Installation of the "Oceanic."—There are fitted on board the *Oceanic* 1,975 lamps. Of this 350 are in the engine and boiler rooms, and motor heaters, etc., take quite as much current as that supplied to the lamps. There are four dynamos of the four-pole type compound wound each with an output of 100 volts 600 amperes, and a speed of 240 revolutions per minute. They are driven with direct coupled engines of the compound twin type with cylinders 11 in. high pressure, 18 in. low pressure, and 11 in. stroke. Heavy fly wheels are fitted in the shaft to give steadiness of light. Each dynamo has an output of 1,000 16-candle-power lamps. Two of the engine dynamos are starboard, while the other two are port, and they are separated by a water-tight door. There are 28 circuits. The leads for the saloons, libraries, smoke rooms, etc., receive current from three independent circuits, in case the fuse of any one main should be blown. The wiring is in the single wire system, and the skin of the ship forms the return wire. The radiators for the electrical heating require from $7\frac{1}{4}$ to 10 amperes at 100 volts. There are electrical motors for fans for stores' hoist. Fog whistles are worked by a magnet, and they blow for a short time then stop for another short time,

NAVAL ENGINEER APPOINTMENTS.

The following appointments have been made at the Admiralty, from December 22nd, 1899, to January 23rd, 1900 :—

Underhill, A. M., engineer to the *Jupiter*, to date December 21st.

Upton, S., has been appointed engineer R.N R.

Vining, H. P., chief engineer to the *Duke of Wellington*, additional for the *Gibraltar*, to date January 1st.

Wallis, H., engineer to the *President*, for service at Elswick, to assist the overseer in the inspection of mountings of naval guns, undated.

Watch, J. S , fleet engineer to the *Duke of Wellington*, for the *Cressy*, to date January 10th.

Watson, Lewis J., engineer to the *Pembroke*, additional, for the *Argonaut*, to date January 2nd.

Watson, L. J., engineer, to be lent to the *Vernon* and *Excellent* for course of torpedo and hydraulic instruction, commencing January 3rd.

Williams, G. A., has been appointed assistant engineer R.N.R,

Wilson, W. A., engineer to the *Victory*, for the *Crane*, in lieu of a chief engineer, to date February 20th.

Wood, A. C. (probationary), assistant engineer to the *Vivid*, additional, for the *Ocean*, to date January 1st.

From January 24th, to February 20th, 1900 :—

Allden, F. A., chief engineer to the *Royal Arthur*, for the *Katoomba*, to date February 15th.

Aston, S., staff engineer to the *Diana*, to date February 15th.

Ayers, R. B , engineer to the *Vernon*, for the *Starfish*, to date February 6th.

Bain, D. H. W., assistant engineer (temporary) to the *Wallaroo*, undated.

Baker, J. G. L., staff engineer, to the *Mildura*, undated.

Batley, A. W., assistant engineer, has been promoted to be engineer, R.N.R.

Bingham, P., engineer to the *Royal Arthur*, for the *Boomerang*, to date February 15th.

Block, R. J., engineer to the *Ocean*, to date February 20th.

Cox, A. E., chief engineer to the *Pembroke*, for the *Scylla*, to date February 10th.

Crisp, A. S., engineer to the *Duke of Wellington*, for the *Chamois*, undated.

Cunningham, J. E. G. (probationary), assistant engineer to the *Ocean*, to date February 20th.

Davies, W. R., engineer to the *Tamar*, for Hongkong Yard, to date February 20th.

Davis, R., assistant engineer to the *Diana*, to date February 13th.

Dawson, F. G., engineer to the *Cambridge*, for the *Shark*, to date February 2nd.

Dixon, A. G., engineer, R.N.R., to the *Duke of Wellington*, for instructional course, commencing February 6th, at Portsmouth.

Drake, S. J., engineer to the *Vivid*, for the *Locust*, to date February 2nd.

Dupen, A. P. L., engineer to the *Phœnix*, undated.

Edwards, E., engineer to the *Wildfire*, for the *Desperate*, undated.

Edwards, G. K., engineer, has been promoted to the rank of chief engineer in Her Majesty's fleet.

Edwards, G. K., chief engineer to the *Royal Arthur*, for the *Katoomba*, to date February 15th.

Elgar, G. H., assistant engineer (temporary) to the *Ocean*, to date February 20th.

Fletcher, W. M., engineer, R.N.R., to the *Duke of Wellington*, for instructional course, commencing February 6th, at Portsmouth.

Grant, W. C. G. R. J. (probationary), assistant engineer to the *Pique*, to date February 15th.

Hammond, C. E. J., assistant engineer, has been promoted to the rank of engineer in Her Majesty's fleet.

Hare, J. S., assistant engineer, has been promoted to the rank of engineer in Her Majesty's fleet.

Harrison, J. H., assistant engineer to the *Howe*, to date January 31st.

Hatchie, D., engineer to the *Vivid*, for the *Fairy*, to date February 2nd.

Highet, W., senior engineer, R.N.R., to the *Duke of Wellington*, additional, for instructional course, commencing February 6th, at Portsmouth.

Howle, C., assistant engineer (temporary) to the *Edgar*, to date February 20th.

Hughes, H. R. S., assistant engineer to the *Vivid*, to date January 31st; for the *Pique*, to date February 15th.

Jacobs, F. G., chief engineer to the *Royal Arthur*, for the *Katoomba*, on recommissioning, to date February 15th.

Jeffery, G. H , assistant engineer, has been promoted to the rank of engineer in Her Majesty's fleet.

Johnson, H. H., assistant engineer to the *Ocean*, to date February 20th.

Kerr, J , fleet engineer to the *Duke of Wellington*, for the *Latona*, on paying off, to date February 8th.

Knight, G. G., engineer to the *Tamar*, for the *Hart*, in lieu of a chief engineer, lent to the *Edgar*, for voyages, to date February 20th.

Lawrance, W. W., chief engineer to the *Salamander*, to date January 29th.

Longland, W. E., assistant engineer to the *Majestic*, to date January 31st.

Ludlow, G. T. J., chief engineer to the *Duke of Wellington*, to date January 30th, for the *Gladiator*, to date February 15th.

Macdonald, P , engineer, R.N.R., to the *Duke of Wellington*, for instructional course, commencing February 6th, at Portsmouth.

Manning, H. L., chief engineer to the *Vivid*, additional, as engineer overseer at works of Messrs. Doxford, Sunderland, and Palmer's Shipbuilding Co., Jarrow, to date February 10th.

Monk, J., fleet engineer, has been placed on the retired list.

Moorshead, H. B., engineer to the *Vivid*, for the *Osprey*, to date February 2nd.

Moss, F. S , engineer to the *Cambridge*, for the *Ferret*, to date February 2nd.

Muir, P., engineer, R.N.R., to the *Duke of Wellington*, for instructional course, commencing February 6th, at Portsmouth.

Parry, R. W., engineer to the *Vivid*, for the *Opossum*, undated.

Pearce, W. W., engineer to the *Defiance*, for the *Lynx*, to date February 2nd.

Percey, J. J. G. G., engineer to the *Excellent*, for the *Wizard*, to date February 6th.

Pibworth, W. H., fleet engineer to the *Duke of Wellington*, for the *Naiad*, to date January 30th.

Reed, W. W., assistant engineer to the *Defiance*, to date February 20th.

Reynolds, J. A., engineer to the *Pembroke*, for the *Skipjack*, in lieu of a chief engineer, to date February 10th.

Ripley, T., engineer, R.N.R., to the *Duke of Wellington*, for instructional course, commencing February 6th, at Portsmouth.

Roberts, J. E. S., assistant engineer, has been promoted to the rank of engineer in Her Majesty's fleet.

Sharp, W., fleet engineer to the *Ocean*, to date February 20th.

Snook, V. E., engineer to the *Wildfire*, for the *Zebra*, undated.

Soper, E. P., assistant engineer has been promoted to the rank of engineer in Her Majesty's fleet.

Spalding, A., fleet engineer, has been placed on the retired list of his rank, at his own request.

Sparke, H. P., engineer to the *Excellent*, for the *Teazer*, undated.

Sparks, H. P., engineer to the *Duke of Wellington*, for the *Teazer*, undated.

Sparrow, F. W. (probationary), assistant engineer to the *Polyphemus*, to date January 31st.

Spry, F. M. D., chief engineer to the *Dido*, to date January 29th.

Steward, C. H., fleet engineer to the *Wallaroo*, undated.

Stone, C. E., assistant engineer to the *Royal Arthur*, for the *Ringarooma*, to date February 15th.

Thorne, C. W., fleet engineer to the *Vivid*, for the *Charybdis*, to date February 15th.

Toop, W., engineer to the *Melampus*, for the *Gossamer*, to date February 15th.

Tucker, J. N., assistant engineer to the *Royal Arthur*, for the *Katoomba*, undated.

Walker, J. J., fleet engineer to the *Royal Arthur*, for the *Ringarooma*, to date February 15th.

Wallace, C. J. M., assistant engineer, has been promoted to the rank of engineer in Her Majesty's fleet.

Watson, J. H., chief engineer to the *Diana*, to date February 15th.

Wand, E. V., assistant engineer, has been promoted to the rank of engineer in Her Majesty's fleet.

Webb, A. T., chief engineer to the *Pique*, to date February 15th.

Webster, G. P., engineer, has been promoted to the rank of chief engineer in Her Majesty's fleet.

Weeks, C. M. (probationary), assistant engineer to the *Royal Arthur*, for duty in the *Europa* on voyage out, to date February 15th.

Weeks, E. J., engineer to the *Torch*, to date February 1st.

White, A. F., engineer to the *Algerine*, lent to the *Edgar* for voyages, to date February 20th.

Wood, A. O. (probationary), assistant engineer to the *Ocean*, to date February 20th.

INDUSTRIAL AND TRADE NOTES.

THE CLYDE AND SCOTLAND.

(*From our own Correspondent.*)

WHILST there is still enough work on hand in Clyde shipyards and engine shops to keep all hands well employed for months to come, the situation as regards the demand—or rather non-demand—for new tonnage is causing some uneasiness on the part of firms having establishments with great productive capacities. Speaking with a gentleman at the head of one of the largest Clyde concerns the other day, our Clyde correspondent was told that never before had the company with which he was connected been so long, not only without booking an order, but without so much as an enquiry! This, of course, is not entirely representative of the state of things generally prevailing, as several very good orders have been placed on the Clyde since the year began by companies of necessity compelled to place orders, and well enough able to do so in the face of the abnormal prices ruling. Enquiries have also been made in some cases by owners who have let out their vessels as transports, and who are convinced that these will be engaged beyond the six months fixed. The fact, however, remains that few contracts for new steamers have been booked, and that there is absolutely nothing offering in the way of orders for general trading or tramp merchant ships. The extraordinary height to which prices of material have risen and stuck, conjoined to the paralysing effect of the war in South Africa, and its unseen but nevertheless real influence on our international trade relations, may be taken as the major cause of this condition of affairs.

The satisfactory fixing recently of the ironworkers' wages for another term has been a redeeming feature in the iron and steel industry. The official figures of the Scottish Manufactured Iron Trade Conciliation Board show that the selling price for November-December was £7 8s. 7·73d. and from statistics it is found that for the same two months last year the average price was £5 12s. 7·65d. per ton, which at once shows the real advances netted by manufacturers. A rise of £1 16s. per ton appears most satisfactory, but makers affirm that profits in proportion to the turnover, cost of material, and wages are small. During the month ship-plates have been held for £8 10s. to £8 12s. 6d. per ton, against £7 to £7 5s. at this time last year. Boiler-plates have been quoted at £9 10s. against £8 last year, and angles at £9 5s. to £9 7s. 6d. as compared with £6 2s. 6d. a year ago.

Whilst new orders on the Clyde have been practically *nil* during the month, the work of turning out vessels has proceeded apace, and the month's output is at least an average figure. The largest vessel turned out was the twin-screw steamer, *Sabroan*, which Messrs. Caird & Co., Greenock, launched for their friends, the P. & O. Co. She is 7,300 tons gross, and 450 ft. in length, and will be provided with engines capable of driving her at a speed of 16 knots an hour.

In our October notes reference was made to the closing of the shipyard at Greenock, for some years past carried on by Messrs. Carmichael, Maclean & Co. Operations, however, have since been carried on by Messrs. Russell & Co., of Port-Glasgow, as far as the completion of work in hand at the time of the stoppage is concerned. Mr. Carmichael, as noted in last month's notes, has now gone to be manager in the yard of Messrs. Craig, Taylor & Co., Stockton-on-Tees. Operations have now also been stopped—temporarily it should be hoped—in another Greenock yard, viz., that of Messrs. Taylor & Mitchell, at Garvel Dock. The firm have been rather slack of late, and it was reported on the 17th ult. that the men had been paid off and the yard closed. There are no vessels on the stocks at present. The yard had been open for about two years only.

There has been no stoppage of operations, but the proprietary of the old established shipbuilding and engineering business of Blackwood & Gordon has undergone a complete change as regards its active working partners. These for a number of years have been Mr. D. B. McGeoch, Mr. F. P. Purvis, and more recently Mr. J. H. McAlpine. A large financial interest in the concern has been held for a considerable time by Sir William Arrol, M.P., and Lord Overtoun. Both these gentlemen still retain their holding, but since the 1st ult., they have associated with them as working partners Mr. Robert Carswell, until recently partner in the Ailsa Shipbuilding Co, and Mr. John Reid, formerly with Messrs. Alexander Stephens & Sons, Linthouse. This new syndicate, at a meeting of the creditors of the concern as hitherto conducted, early in the month, offered them a composition of 16s. in the £, and this has been accepted. Under the new régime it is reported important additions are to be made to the shops and machinery. A patent hauling-up slip for the repair and overhaul of vessels is a recent and profitable branch of the business.

Messrs. Matthew, Paul & Co., Levenford Works, Dumbarton, who are makers of the apparatus and fittings involved in the thermo-tank system of heating and ventilating passenger and other vessels invented by Mr. Stewart, of Clydebank, are installing the system on board the two huge Cunard liners *Ivernia*, built on the Tyne, and the *Saxonia*, launched from the Clydebank Shipyard about the end of last year. This well-known Dumbarton firm also continue busy with their ordinary fan engine specialities. In their launch department they have just completed for owners abroad, for whom Mr. David Pollock, M.I.N.A., Glasgow, is naval architect, a high-speed steam launch, suited for harbour service. The little craft underwent her speed trials satisfactorily on the Clyde recently and has now been shipped to her destination in the East.

The recent bursting of one of the tube elements in the water-tube boiler on board the Clyde passenger paddle steamer *Meg Merrilees*, which resulted in the scalding and subsequent death in the infirmary of the fireman in attendance, has led Captain James Williamson, the marine superintendent for the Caledonian Steam Packet Co.—whose care and solicitousness for the safety and comfort of all connected with his company's service, as well as the general travelling public, are so well-known—to give out orders for the substitution of a cylindrical boiler of the ordinary type for the water-tube boiler which recently broke down. This hardly means that he has lost faith in the water-tube generator as having many points of advantage over the cylindrical boiler, but in the present state of uncertain knowledge with respect to the working principles and proper upkeep of the water-tube type it is inadvisable to have them on board his company's vessels. The new boiler of the ordinary type for the *Meg Merrilees* is being made by Messrs. A. & J. Inglis, of Pointhouse.

Messrs. John Macdonald & Son, engineers and machinery agents, of York Street, Glasgow—who are agents for the pneumatic drilling, caulking, and riveting tools of American make, which have been exhibited at work in several of the largest shipyards and boiler works in each of the principal districts in Britain—inform me that the riveting tools are now meeting with ready adoption, as well as the caulking and drilling tools, which have from the very first met with the greatest acceptance. Several of the largest Clyde firms—amongst them Messrs. Denny, Dumbarton, and Messrs. Russel & Co., Port Glasgow—have ordered installations of pneumatic plant, comprising the several kinds of tools and the necessary air compressors, and these will be at work in a short time. A new riveting hammer, only weighing about 12½ lbs., and of a stroke of 9 in. instead of the 6-in. stroke hammers hitherto in use, has recently been tried for the first time on this side of the Atlantic—although it has been in daily use in America for a considerable time—in the yard of Sir James Laing, at Sunderland. It is capable of knocking up rivets of 1¼-in. diameter, and on bulkhead work, with ¾-in. rivets, as many as 120 rivets have been closed in one hour.

The output of coal in Scotland 24 years ago, according to Mr. Henry Aitken, of the Cadzow Coal Co. (who referred at length to the subject when presiding at the recent semi-jubilee dinner at the Glasgow Colliery Representatives), amounted to 16,000,000 tons a year, whilst in 1898 it was 30,000,000 tons, and for 1899, although the actual figures were not yet available, it could be taken at 31,000,000 tons. As regards prices, they had moved in proportion, viz., had doubled themselves. Prices had gone up so much of late, simply because there was not sufficient coal coming out, or at any rate not so much being got forward as to meet the requirements. The increased demand had been brought about exclusively by the enormous trade activity which had prevailed all over the world, and, as coal entered very largely into the state of activity of general trade, its output and cost increased proportionately. No doubt the present scarcity, to some extent, was due to the inability of the railway companies to provide sufficient facilities for its transit. The railway companies, however, were like colliery concerns, formed with the object of making a profit, and they had increased their trade even more rapidly than had the coal trade. As an instance of this he stated that in 1875 the North British Railway Co. carried 5,600,000 tons of mineral traffic, whereas in 1899 the quantity was 16,000,000.

Cumbrae Lighthouse, which with Cloch Lighthouse further up the Firth of Clyde, forms the two objective points of the phrase "Between the lights," so well known to nautical men and to shipowners and shipbuilders in connection with speed trials of ships, has just had electric light installed in place of oil and made flashing instead of fixed. It now gives two flashes in quick succession every half minute. The light can be run either direct from the dynamos or from a set of cells. The dynamos, one of which is spare, are driven by oil engines, of which there are three, any one of which can be used to drive the pumps for supplying air to the siren fog signal. The lenses, with a dioptric converging mirror of an entirely novel design, which utilises about double the amount of light from an ordinary dioptric mirror, revolve on steel rollers on conical steel paths, the motive power being an electric motor with worm gear. The oil for the engines, landed at the bottom of the cliff, is pumped up to the top by an electric motor pump. The whole forms an establishment which, in many particulars, is so far removed from any lighthouse establishment in this or other countries as to be absolutely unique. The whole has been effected from designs by Messrs. D. & C. Stevenson, Edinburgh, engineers to the Clyde Lighthouses Trust, the contractors having been: for the optical apparatus Messrs. Lepante, Paris; for the electric plant, Messrs. Walter Dixon & Co., Glasgow; for the oil engines, Messrs. the Campbell Gas and Oil Engine Co., Halifax.

Messrs. Gourlay Brothers & Co., engineers and shipbuilders, Dundee, have obtained a contract to build a steamer for T. & J. Brocklebank, Liverpool. The dimensions are as follow:—Length, 445 ft.; breadth, 50 ft.; depth, 33 ft.; and the tonnage is 5,820. The same firm have contracted to supply the engines for a vessel to be built of wood for Antarctic exploration purposes by the Dundee Shipbuilders' Co., Limited.

The company just named are presently laying the keel of the wood vessel in question. This vessel, which is to the order of the Antarctic Exploration Committee, will be 172 ft. long by 33 ft. beam, by about 16 ft. mean draught, and 1,570 tons displacement. The hull is to be constructed generally of oak, with an outer sheathing of greenheart, and will be specially strengthened for ice pressure. A magnetic observatory is to be fitted on upper deck amidships, and to obviate any magnetic interference, all metal fittings for a radius of about 30 ft. are to be of brass. The deck is to be lined with asbestos, and the machinery will be placed aft. The vessel, which will be barque-rigged, is to be finished by March, 1901. The price, exclusive of the engines, is £33,700.

The Caledon Shipbuilding Co., who are now laying the keel of the 230 ft. long steamer for the African Steamship Co., noticed in last month's notes, have launched during the month the *Salmo*, a vessel of 1,700 tons for Thomas Wilson, Sons & Co., Hull, being the fifth vessel recently built by the company for the same owners.

After all the local fuss and Parliamentary fighting, it is not by any means improbable that the Clyde Trust will come to terms with the holders of the Renfrew Dock Bill, and take the scheme up and carry it to a practical conclusion relinquishing their own scheme of docks at Shieldhall higher up the river. The committee of management of the Clyde Trust at a meeting held on the 16th ult. had under consideration the proposal to acquire the Renfrew Dock. The discussion lasted several hours, and ultimately it was resolved by an overwhelming majority that the negotiations should be continued, and there is every reason to believe that they will be carried to a successful issue. One of the conditions laid down by the Renfrew authorities is that they shall have two representatives upon the Clyde Trust, as reconstituted, and to this proposal it is not likely that any serious opposition will be offered. Though the Bill to be presented by the Clyde trustees in the present session of Parliament concerned with the Shieldhall Dock scheme contains no reference to the Renfrew Dock, it is understood that there is no difficulty in the way of the necessary clauses being added.

Messrs. John Shearer & Son, Kelvinhaugh Slip Docks, Kelvinhaugh, Glasgow, are advertising for offers for the excavation by dredging and the removal of about 250,000 cubic yards (to be removed to sea) from a site on the banks of the river Clyde about 15 miles up the river from Greenock. This is in connection with the formation of new shipbuilding premises which the firm are about to establish in the vicinity of the new docks for which the Clyde Trust have powers on the north side of the Clyde, a little above Clydebank.

The total number of members in the Institution of Engineers and Shipbuilders, including associates and graduates, is now over 1,250. The increase has gone on during the past three or four years in an extraordinary manner. When the increase began with the election of the new secretary, there was somewhere between 800 and 900 members, etc., but in that time the increase has been something like 430. A membership of 1,250 in a technical society has never previously been known out of London. Of course this means assiduous beating-up on the part of individual members, and the rejection of any individual proposed—the proposal having to be backed by the names of three existing members—is a thing unknown. In the associates section a greater latitude as regards qualifications is allowed, and there is, consequently, a greater variety of professions represented. At the two last meetings all the associates elected, 13 in number, were Glasgow shipowners.

A petition having some time ago been addressed to the Institution of Electrical Engineers by 70 gentlemen engaged in electrical industries in Glasgow, for the formation of a local section of the institution, with its headquarters in Glasgow, this was subsequently granted, and a meeting was held in the rooms of the Institution of Engineers and Shipbuilders, at which the formation of the section was virtually arranged. Lord Kelvin has since been elected chairman of the Glasgow section, Professor Magnus Maclean vice-chairman, and Professor W. H. Watkinson secretary.

The Glasgow and West of Scotland Technical College Scientific Society held its seventh annual dinner on the 17th ult. in the Bath Hotel, Glasgow. Mr. David Home Morton, M.I.C.E., M.I.M.E., president of the society, in the chair. A company of about eighty members and guests were present. After dinner, Mr. Frank B. Lea, B.A., M.I.E.E., in proposing the "Navy, Army, and Auxiliary Forces," eulogised the gallant efforts of all these forces in the South African War now in progress. Lieutenant A. M. Downie, B.Sc., in replying, referred to the valuable services rendered by the scientific branches, and drew attention again to the fact that the mountings of the 4·7 in. naval guns from the *Powerful*, which have enabled Ladysmith to hold out so gallantly and so well, were designed and fitted by the engineers of the naval service. "The Lecturers" was given by the secretary, Mr. Andrew Stewart, A.I.E.E., and was responded to by ex-Provost William Shanks, of Barrhead. Mr. Shanks, who had delivered the most recent lecture to the society, spoke of the great value to the civilised world rendered by science, and thought that the Glasgow and West of Scotland Technical Scientific Society was doing good work in its own sphere. In proposing the toast of "The Technical College Scientific Society," Mr. David Pollock, M.I.N.A., complimented the members on the position which the society now occupied amongst the institutions of the West of Scotland established for similar objects. It had been in existence for about eight years, and during that time it had been most fortunate in the matter of having for presidents and vice-presidents men of scientific education and great practical experience, holding foremost positions in the industrial world, and of having had in the way of lecturers men of high repute in engineering and scientific circles, such names as those of Professor Archibald Barr, Professor J. G. McKendrick, Professor W. A. Watkinson, Professor Magnus Maclean, Professor H. Sexton, Mr. James Riley, &c., being examples of this. In the matter of secretaries the society had been equally fortunate, as was evidenced by the presentation on that occasion of an illuminated address of thanks to Mr. Robert A. Raphael, a former secretary; and by the fact that the present secretary, Mr. Andrew Stewart, A.I.E.E., had been instrumental, aided by the committee, in raising the membership during the past three sessions from 95 to 155.

THE TYNE.

(*From our own Correspondent.*)

Shipbuilding.—During the first half of February work has been practically at a standstill in the shipyards, and the progress made in the construction of vessels has been so small as to be scarcely noticeable. The state of the weather was of course responsible for the prolonged stoppage which—coming so soon after the New Year holidays—has proved particularly inconvenient to both employers and employed. The loss of wage, caused by the interruption to work in the shipyards of the North, would be exceedingly difficult to estimate; but, as there are some forty firms paying from £1,000 to £2,000 weekly in wages, the total loss cannot have been much below £100,000. Possibly some of this may be made up by more regular attendance on the part of the workmen when climatic conditions are again favourable for operations, and it is to be hoped that the different sections of operatives will view the matter in this light, and take advantage of such opportunities as may be afforded for making good the loss that has been sustained.

The greatly enhanced cost of tonnage still seems to act as an effectual check upon speculative enterprise in shipbuilding, and, though enquiries are still heard of, it does not appear that they very often result in the placing of orders. It is pretty generally understood, however, that the work placed before the close of 1899 is sufficient to keep all the principal yards going briskly for a good many months, and the evident lack of new orders at this juncture will not immediately affect the state of business in the yards. The impression exists in well-informed quarters that new orders will be forthcoming in abundance, as soon as the Baltic and other icebound seas become open for traffic, and when shipowners realise that a reduction in the price of tonnage is not a contingency to be depended upon.

The Low Walker yard of Messrs. Armstrong, Whitworth & Co. continues to have all the berths occupied, the vessels in hand consisting of two mail boats, of exceptional capacity; one cargo steamer, and three dredgers, which are being built for service in India and Australia. The Elswick yard of the firm is also quite full of work, one or two of the larger vessels being well advanced towards completion. At the yard of Messrs. Wood, Skinner & Co. there are four vessels in hand, two of them being in early stages of construction, and two well advanced. Messrs. W. Dobson & Co. have a very large vessel in the plating stage, and two medium-sized boats in the course of framing. The large vessel, it is understood, is ordered by a London company, and is intended for service in the colonial trade.

Messrs. Wigham-Richardson & Co. have, at the moment, two berths vacant; but it is probable they will be occupied with vessels of an important class ere long. One of the five vessels now on the stocks is well advanced towards completion, the others being in the framing or keel-laying stages. The s.s. *Attila* is moored beside the yard, and is undergoing rather an extensive overhaul. The equipment of the large steamer which Messrs. Swan & Hunter are building for the Cunard Co. is now nearly completed, and the vessel will very shortly be placed on the station intended for her. There are two other vessels being fitted out beside the yard, and all the berths are occupied with boats in various stages of building.

At the yard of Messrs. Hawthorn, Leslie & Co. there is a large vessel intended for the colonial trade, nearly ready for launching, and two others of good size in earlier stages. The firm have five torpedo-destroyers in hand, three of which are on the stocks and two in the water. They have also a couple of merchant vessels fitting out beside the quay.

The Palmer Co.'s yard has an exceptionally busy appearance, though in this case, as in others, operations have been greatly impeded by the weather. Every possible exertion is being made to forward the construction of the battleship which the company are building for the Admiralty, and, notwithstanding the unfavourable elemental conditions, fair progress has been made. There are half-a-dozen merchant vessels in hand, most of them being of large size, and there are also some vessels under repair, amongst which may be mentioned a Chinese steamer, the *Ching Wo.* The Tyne Shipbuilding Co. have their berths fully occupied, and are fitting out the Stag liner *Zinnia* beside the yard.

The large graving dock belonging to the Wallsend Slipway Co. is now occupied by the Italian steamer *Savoia*, which is to be cut asunder amidships and lengthened 66 ft. This, it will be seen, is a very important contract, and it will pretty fully engage the resources of the Slipway Co. for the next three or four months.

There is another very important lengthening contract in the hands of the Wallsend Pontoon Co., the vessel in this case being the s.s. *Wittekind*, belonging to the Norddeutscher Lloyd. She is to be lengthened 60 ft., and is, besides, to have a complete bottom repair, which will involve the renewal of the flooring, keelsons, and other structural parts. It is estimated that the contract will occupy the services of over 200 hands for the greater part of the current year.

Messrs. Readhead & Sons launched on the 17th ult. a large cargo boat named the *Cayo Soto*, built to the order of the Cuban Steamship Co., Limited. The vessel is now lying beside the yard awaiting her equipment of machinery, &c., and there is another vessel at the quay getting her fittings completed. On the stocks there are four vessels, all in early stages, and in the graving dock department business is very brisk.

Engineering.—The North-Eastern Engineering Co. have a large amount of work in hand, and two vessels are just now receiving or awaiting machinery at the shearlegs. It is understood that the Wallsend Slipway Co. have received from the owners of the Shell Line of steamers, Messrs. Samuel, instructions to fit the s.s. *Rocklight*, and seven others of the company's steamers with a patented apparatus for the burning of liquid fuel in the boiler furnaces. The fitting of the apparatus involves a considerable amount of work in each vessel, and, when it is considered that eight are to be done, the contract assumes very important proportions. The probability is indeed, that, in course of time, the whole of Messrs. Samuel's steamers will be fitted with the patent oil burners, which arrangement will make the company wholly independent of coal supply. With this end in view, the company are now arranging for the establishment of depots at suitable ports on the lines of traffic traversed by their steamers, where stocks of oil can be kept, and where steamers can call for supplies when necessary. The vessels that are to be fitted with the oil-burning apparatus are also to be supplied with (in each case) a set of "settling" tanks. These tanks will be filled with oil from the vessel's cargo, which after undergoing a necessary process of purification will be utilised to supply the burners. Up to the present, the substitution of liquid fuel for coal has only been successfully carried out on oil-carrying steamers, and the system is not likely to be adopted in general cargo or passenger steamers, until oil storage depots are established at all the principal shipping centres throughout the world. The Admiralty has been experimenting with the system, especially with reference to the propulsion of torpedo destroyers, on which class of vessel the available space for fuel carriage is necessarily small. No definite result, we believe, has yet been arrived at; but it is understood that the experiments will shortly be resumed, and it is confidently expected that the outcome will be the adoption for torpedo boats, and torpedo boat destroyers, of one or other of the patented arrangements for the burning of liquid fuel.

At a meeting of the shareholders of the Wallsend Slipway and Engineering Co., Limited, held on the 17th ult., it was resolved that a dividend of 5 per cent. per annum be paid on the ordinary and preference shares for the year ending December 1st, 1899. The retiring director, Mr. G. B. Hunter, was re-elected.

The engineering department of the Palmer Co.'s works is kept very busy, and at the works of the Tyne Brass and Copper Tube Manufacturing Co. a good deal of activity is to be noted.

Messrs. Newton & Nicholson, of Tyne Dock, the proprietors and manufacturers of Taylor's corrugated packing, continue to experience a good demand for their speciality, and the works are kept actively going.

The works of Messrs. H. Watson & Sons, Walker Gate, are showing undiminished briskness—the demand for their patent ballast pumps, filters, &c., continuing to be very active.

Messrs. Donkin & Co. (late Donkin & Nichol), of the St. Andrew's Engine Works, Newcastle, have in hand a large number of orders for steering gears, engine-room telegraphs, and other specialities, and the firm still find it necessary to keep a large part of their machinery running extra hours.

Mr. W. F. Snowdon, of No. 32, Side, has been appointed the representative in the Tyne and Wear districts of Messrs. W. Christie & Co., 70, Wellington Street, Glasgow, the sole licensees for the United Kingdom for the sale of the Andrew White patent packing. This packing is described as "the patent galvanic metal paper packing," and many remarkable advantages are claimed for it, such as automatic action, security against damage, capability of standing extremely high pressures, durability, &c. It has only recently been introduced in this country, but has already achieved a very marked success.

Forges and foundries continue to be briskly employed, and in the local iron and steel works business is active. Coppersmiths and brass finishers are also doing well.

Blyth.—The important announcement that has recently been made of the incorporation of the Blyth Dry Dock Co. with the Blyth Shipbuilding Co. has excited much favourable comment in this district, the consensus of opinion being that such a "closing of the ranks" cannot but make for good to all concerned in the enterprise, as well as to the port of Blyth and the district generally. There is some probability that a marine engine works will be started in connection with the shipbuilding works ere long, and, should this expectation be realised, there is little doubt that the necessary adjuncts of forge and foundry will speedily follow. That the port of Blyth is capable of great development may be judged from the circumstance that the harbour has 8,000 ft. of quayside space, including 22 high-level coaling staiths. Work at the present time is most active at both the shipbuilding yard and the Blyth Dry Docks. At the former place extensive improvements are being carried out, whilst at the dry docks several important repair contracts are being proceeded with.

THE WEAR.

(From our own Correspondent.)

Shipbuilding.—Very few, if any, new contracts have been booked by Wear shipbuilders this year, and it would be difficult to say whether owners or builders are the least anxious to incur new responsibilities in the way of giving or accepting orders. That the former are "holding off," in the hope of securing easier terms later on, is hardly to be doubted, and that the latter—what with stress of weather and unwillingness to work when they *can* work, on the part of the workmen—are also content to rest awhile on their oars, is equally certain. At the time of writing things look gloomy enough, for the weather—after showing for a day or so one of its better moods—has again assumed its wintry character, effectually stopping outdoor work, which category, of course, includes the greater part of the operations carried out in the shipyards. To give an idea of the state of work in the different yards, it may be stated that at the North Sands establishment there are five vessels on the stocks, and one fitting out at the Manors Quay. Messrs. Blumer & Co. have four vessels in progress, and the Strand Shipbuilding Co., two. Messrs. Bartram & Son have two vessels on the stocks, and at the Sunderland Shipbuilding Co.'s yard there are four vessels in various stages of progress.

Messrs. W. Doxford & Sons are busily preparing for delivery the fine vessel launched a few weeks ago for the Peninsular & Oriental Co., and are also engaged in fitting out other vessels recently put off the stocks. There are now in course of building in the yard three large "turret" ships and a torpedo destroyer, and there is also a vessel of the latter class being fitted out in the river.

Messrs. Short Brothers have four vessels on the stocks, two of which are for local owners, and two for owners at a distance. The equipment of a vessel recently launched is also being proceeded with at the jetty, and in the designing department there is quite as much activity as usual.

Messrs. Priestman & Co. launched a vessel of large size early in the month, and have two others well advanced on the stocks. Messrs. Pickersgill have three vessels building, and at Messrs. R. Thompson & Sons' an equal number are on the stocks. At each of the last-named establishments a vessel is being fitted out on the water.

Sir James Laing & Sons are well occupied with both new and old work, and are utilising their graving docks at Deptford and Cornhill for repairing purposes. Amongst the new vessels in progress are two to be employed in the South African trade, and one or two others for special service on other important routes. The contemplated alterations in connection with the building berths in the West yard have not yet been commenced, and it is probable will now be put off till the advent of the slack period, which—however long it may be deferred—must certainly come in the long run. There has been a good demand lately for ships' boats manufactured from the old material—wood; and local builders have had as much work as they could do. Enquiries for wooden boats have come from all quarters, and there has been some difficulty experienced in meeting requirements. This revival of activity in what was looked upon as a decaying industry is significant, and seems to show that in the eyes of many owners, wood is the best of all materials for small boats. Before the introduction of steel boats the wooden boat building industry had become demoralised through the efforts of boat builders to outdo each other in supplying a cheap article. Unseasoned wood of the commonest kind was accordingly employed, and, being put together in a hasty and slovenly manner, boats were produced which were little better than death traps. This method of business, of course, brought the wooden boats into bad repute; but in spite of the general condemnation, there were still some who believed that a boat properly built of adequately seasoned wood was the best thing to trust to for saving life at sea. This belief is now becoming more widespread, and there appears to be every probability that in the future, wooden boats of the right description will be preferred for the equipment of steamers, and especially of passenger steamers, to boats constructed of steel or any other material.

Engineering.—The marine engine works continue busy, and in most cases partial night-work is maintained. Owing to the interruption to work in the shipyards, engineering contracts are now generally ahead, and such vessels as may be launched within the next few weeks will not have to wait long for their machinery. At the Palmer's Hill Works a vessel built by the Blyth Shipbuilding Co. is receiving her machinery, and at each of the other establishments the equipment of vessels is being carried out. At the Sunderland Forge and Electrical Works business continues active, there being important contracts in hand in both departments. Other forges in the vicinity are also busy, and at the foundries orders are plentiful. The Monkwearmouth Iron Works are fully supplied with work in all departments, and the demand for Bell & Rockliff's patent sections appears to have increased. Manufacturers of steering gears, ash hoists, winches, and other steamship accessories are still kept busy.

The Hartlepools.—The yards of Sir William Gray & Co. are exceedingly busy, all the building berths being occupied, and there being some good repair contracts in hand. At Messrs. Furness & Withy's yard business is also brisk, and Messrs. Irvine's establishment is in an equally satisfactory condition. Marine engine works show no diminution of activity, and at the steelworks the pressure of business is very great. Other local industries are generally prosperous, and at the docks there are some indications of increasing stir, as one or two timber-laden vessels have arrived.

Stockton.—Messrs. Ropner launched on the 16th ult. a vessel of large size, ordered by Messrs. Runciman, of Newcastle. She was named the *Ventmoor*, and will be engined by Messrs. Blair & Co. Boiler and bridge builders at this centre are greatly pressed with work, and night shift is being resorted to wherever possible. In smaller engineering works business is fairly good, and steelworks are kept going to their very utmost capacity.

Middlesbrough.—It is understood that Sir Raylton Dixon & Co. have booked one or two orders for vessels of a superior class, and have also secured an exceptionally important repair contract. Messrs. Craggs & Sons have plenty of work, and the same may be said of Messrs. Harkess & Sons. Messrs. Bolkow & Vaughan have proposed to spend a very large amount in extensions, and the putting down of new plant. Engineering works are busy, and it is understood that Messrs. Furness, Westgarth & English are about to fit eight Deighton furnaces on the s.s. *Dahome*, to replace others.

Darlington.—The Darlington Forge Co., Limited, continue to be busy in all departments, and, it is understood, have recently booked some further important contracts.

THE MERSEY.

(From our own Correspondent.)

THE marine and general engineering industries of this district continue very actively employed. In some sections, however, there is rather a falling off as regards new work. Machine tool makers are busily engaged, but are not just now securing any large weight of fresh orders. In constructive work there is also perhaps not quite the same pressure—although makers of material report no falling off—and in the general engineering trades the outlook scarcely indicates a continuance of the present activity, unless a good deal of work, now being apparently held back, is eventually brought forward. In one or two branches, however, there is no slacking off in any respect. The principal firm of locomotive builders have already nearly two years' work in hand, and other Lancashire firms have quite twelve months' orders on their books, and there is still a large weight of work coming forward, enquiries on the market representing about 80 locomotives for different railway companies. Electrical engineers are also exceedingly pressed with work.

The usual monthly returns of the principal engineering trade unions show a considerable reduction in the number of unemployed members on the books. To some extent this is due to the fact that the holiday suspensions, which last month caused a temporary rise in the out-of-work list, are now at an end, but it also indicates a maintenance of full employment throughout the leading branches of engineering. The Amalgamated Society of Engineers have now under 2 per cent. of the total membership on donation, whilst locally there is about the same proportion receiving support. In Manchester it is reported that overtime is still being largely indulged in, and that the Employers' Federation has given a point-blank refusal to the request made by the district committee of the men for an abolition of overtime on Monday nights. The Steam Engine Makers' Society have about ½ per cent. on benefit, with practically a clear book in the Lancashire towns. There are now only about 1¼ per cent. of the members of the Machine Workers' Association on benefit, either generally or in the Manchester district. Returns as to the state of trade continue very satisfactory, and the Steam Engine Makers' Society report a demand for men from the Government dockyards that they are unable to meet.

In the monthly report of the Amalgamated Society of Engineers, it is stated that recent cases have placed it beyond doubt that workmen are not entitled to compensation under the Act when working out for their employers, the *Bullfinch* disaster being cited as a case in point. "It should therefore," the report proceeds—"be definitely understood by members being sent out to the erection or repair of machinery, or on other work, that the risks incidental to such employment are not covered by the Compensation Act, and if they deem it necessary they must make their own arrangements." It may be added that some of the district committees have made arrangements covering risks on trial trips, &c.

Messrs. Laird Brothers, of Birkenhead, inform me that they have nothing new to report just now, but that they will shortly be launching H.M.S. *Mutine*.

Messrs. Brown & Co., of 49, Deansgate, Manchester, have brought out a new patent form of expansion joint for steam and other pipes. This joint has been designed to overcome the difficulties of leakage, broken flanges, cracked fittings, &c., which are so frequently met with where the ordinary expansion joints are used, particularly under high steam pressures. The shell in which the sliding pipe works is surrounded by an annular chamber provided with a special packing box and piston, the area of this annular piston being equal to that of the sliding pipe, to which it is attached by means of long bolts. Connections are made between the pipe and the annular chamber, so that the pressure is the same in both; and, as the pressure tends to force the sliding pipe in one direction and the annular piston in the opposite direction, these forces balance one another, and the pipe is free to slide in or out of the expansion joint without regard to the pressure in the same. The joints are made of steel forgings, with the exception of the glands, which are cast. The cost is somewhat greater than that of the ordinary joint, but it is claimed that the saving in pipes and repairs, &c., will more than repay the total cost. Balancing arrangements on this principle can be applied to existing expansion joints if desired, without removing the latter from their places.

During the past month there has been some fluctuation in prices in the open markets for pig-iron, but generally maker's quotations have remained firm at recent rates. Business is not coming forward in any very great quantity, buyers mostly simply covering their requirements, but still there has been a fair trade passing through. Lancashire makers are now steady at about 79s. 6d. less 2½ for foundry, with Lincolnshire 75s. 6d. net, and Derbyshire about 80s. net, delivered Manchester. Forge qualities average 74s. 2d. net for Lincolnshire; and 76s. less 2½ for Lancashire, delivered Warrington. Middlesbrough and Scotch iron showed some irregularity, and an easing tendency during the earlier part of the month, but they are now assuming a steadier tone, and Middlesbrough is again quoted 78s. 4d. to 78s. 10d. net, by rail Manchester, with Scotch iron 80s. 6d. to 81s. net, for Eglinton and Glengarnock, delivered Manchester Docks, whilst American pig-iron is quoted 75s. to 78s. net cash.

In the finished iron trade business continues active, and makers report the enquiry greater than they can entertain, as they are already heavily sold for several months ahead. There has been no further official change in list rates, but above the basis prices are being asked on new business. Lancashire bars are quoted £10 5s. to £10 10s., with North Staffordshire about the same. Sheets are now £11 5s. to £11 10s. List rates for hoops are still £10 7s. 6d. for random, to £10 12s. 6d. for special cut lengths, delivered Manchester district, and 2s. 6d. less for shipment, but export business has been done at £10 10s. f.o.b. Liverpool.

The demand for steel is brisk, with prices tending to harden. Hematites would seem to have recovered from the recent irregularity, and are now firm at 90s. 6d. to 93s. 6d. less 2½; local billets are now quoted £7 10s. to £7 12s. net; steel bars £9 15s. and £9 17s. 6d. to £10 and £10 5s. The steel plate makers have agreed on a basis of £10 5s. less 2½ for boiler plates, delivered in the Manchester district.

In the metal market there is no material change to be noticed. There is an active demand for all descriptions of manufactured goods, especially for locomotive builders, boiler makers, and electrical engineers' requirements. List rates remain unaltered, but the tendency is to harden. Delivered Manchester district, prices are as under: —Solid-drawn brass boiler tubes, 9d.; condenser tubes, 10½d.; copper tubes, 11½d; brazed copper, gas and steam tube, 11¼d.; brazed brass tubes, 10d.; common rolled brass, 8¾d.; common brass wire, 8½d; copper wire, 8½d. per lb.

Business in the timber trade has been steady, with little fluctuation in values. Arrivals have been fairly moderate, and deliveries generally satisfactory, and stocks all round are comparatively light. Owing to the strong advance in values asked for Canadian woods, little progress has so far been made in contracting for next season. Several parcels of teak squares have arrived by steamer, but there has been rather more enquiry, and stocks are of fairly moderate compass, with prices steady. Planks have arrived freely, and continue in fair request at firm prices; stocks are not excessive. There have been no arrivals of greenheart, but the stock is sufficient for present requirements. There is a good demand for piling logs and wood of extreme size.

In the coal trade there has been a pressure of demand all round, the severe weather having greatly increased the requirements for housefire coals, whilst the recent active enquiry for the lower descriptions suitable for iron-making, steam, and general manufacturing purposes is fully maintained. The heavy snow and the frost have also caused a blockage of transit by road, rail, and canal, and in some cases works have had to be temporarily closed owing to the inadequacy of the deliveries of coal that collieries have been able to make. Prices are firm, with a hardening tendency, and the Manchester collieries have levelled their rates up to a full 1s. 8d. advance, making the upward move on their part equal to that made last month by the West Lancashire collieries. In the open market special rates are ruling where buyers not under contract wish to obtain supplies. At the pit mouth list prices are about 14s. 6d. to 15s. 6d. for best house coal; 13s. to 14s. for medium; 12s. to 12s. 6d. steam and forge coal; 9s. 6d. to 10s. for medium; and 10s. 6d. to 11s. for best slack.

For shipment the demand continues to increase, with prices shorter if anything, and where cargoes are absolutely needed for prompt shipment, high rates have to be paid, *i.e.*, about 15s. 6d. to 16s. for ordinary steam coal, and 16s. 6d. to 17s. for better qualities delivered ports on Mersey.

In the coke trade enquiry continues in excess of the supplies, and higher prices are asked here and there, but list rates for foundry and furnace sorts remain without official alteration.

Trade continues good in the engine and boiler shops of Liverpool and Birkenhead. A fair amount of new work is in hand, and repairs and oddment work have come in pretty freely, so that shops and hands have been well employed. The fitting out of transports has gone on steadily, and has found a good deal of work for nearly all branches of the local ship building and fitting shops. Fresh steamers have been chartered by the

Government during the month and there is every prospect of transport work being an important item to Liverpool and Birkenhead builders and fitters for some time to come.

Ships' tank and cable makers have also been well employed. The former have had some good orders on transport account, special provision for a water supply having to be made on some of the steamers.

The local makers of refrigerating machines for ships' use are busy. The Liverpool Refrigeration Co., Limited, have a large amount of work on order, and Messrs. Arrowsmith, Sinclair and Co. are also busy with work of this kind at the time of writing. The making of machines for refrigerating store-rooms on ship-board has become an important branch of the engineering trade, and all of the principal makers of such machines have been very busy for months past. Most of the ocean steamship companies, passenger and cargo, have gone in for refrigerated store-rooms on their steamers, so that there has been a large demand for machines for the work. The Liverpool makers of these machines have had orders to supply several steamers of leading lines, and at the present time have much work of the kind in hand.

Graving-dock work has been fairly brisk on both sides of the Mersey since the year came in. This work finds much for fitters and coppersmiths to do, so that it has helped to make for the general prosperity. The "middle" graving-docks of the Mersey Docks and Harbour Board at Liverpool and Clover, Clayton and Co.'s docks at Birkenhead have been in almost constant use.

In illustration of the readiness of the Mersey Docks and Harbour Board to provide new machinery and appliances, to which reference was made last month it may be mentioned that at the meeting of the Board on January 15th the proceedings of the Works Committee were confirmed. These included the acceptance of a tender for providing an electric lighting installation for the cattle wharf at the north end of the Prince's Landing Stage. A recommendation of the Warehouse Committee to provide two new hydraulic tobacco presses at the Stanley Dock Warehouses, at an estimated cost of £1,400, was also approved of.

The result of the trials of H.M.S. gunboat *Britomart*, which was built by Messrs. W. H. Potter & Sons, Liverpool, and engined by Messrs. Fawcett, Preston & Co., Limited, also of Liverpool, were received in the district with great interest and were regarded as very satisfactory. The *Britomart* is a sister ship to the *Bramble*, which was built and engined by the same firms for the Admiralty a short time ago. It is hoped in marine engineering circles in Liverpool, in view of the recent evidences which have been given of the capacity of local yards to produce good Admiralty work, that more work of the kind will find its way to the Mersey. The objection which is sometimes raised, that the Mersey is too crowded a river for launching, is ridiculed by those who live on the banks of the Mersey and know the river best. That many ships, large and small, use the Mersey daily is true, but the part of the river used by ships of any size is a broad and deep estuary, in which a fleet of Atlantic liners or warships can ride and manœuvre safely. Hitherto Liverpool and Birkenhead builders have easily launched all the ships they have built, and there have been no mishaps. If orders reach the Mersey, the ships will be built and launched in spite of the traffic on the river.

Since the references to the Liverpool Salvage Association, which appeared in the MARINE ENGINEER of February, were penned, the annual meeting of this association has taken place at Liverpool. At the meeting Mr. J. Kidman, who presided, made certain observations which fully supported the references to the association made last month. He spoke of the association as the only completely equipped salvage association in the United Kingdom, having powerful and up-to-date wrecking steamers and appliances. He admitted that there were other salvage bodies in the country, but they, for the most part, employed other people. The Liverpool association was unique, as its servants did the work themselves, not for profit, but for the benefit of underwriters and others who employed them. Mr. Kidman referred to the appointment of divers who were mechanics, to the permanent crews of their wrecking steamers, and to the new diving gear, which was supplied with telephonic apparatus; as evidences of the advance and improvements which were made in their service from time to time.

Another association which holds a foremost place amongst the steamship-owning communities of the United Kingdom, the Liverpool Steamship Owners' Association, has also held its annual meeting at Liverpool during the month. Some remarkable figures in reference to the steam shipping of Liverpool appeared in the report which was submitted at the meeting. The tonnage of the vessels owned by members of the association was stated as 2,221,824, representing 20 per cent. of the total British steam tonnage afloat. For the first time since the formation of the association in 1858, the tonnage owned by members exceeded 2,000,000 tons. The members of the association were the owners of 25 per cent. of the total number of British steam vessels of the speed of 12 knots and upwards, and of 28 per cent. of the total number of British steam vessels of above 3,000 tons. Upwards of two-fifths of the vessels chartered by the Government for the war belonged to members of the association. The announcement of the foregoing figures produced a pardonable feeling of elation, not only amongst the steamship owners but in all branches of the shipping trade in Liverpool. They are totals which it would be hard to match and of which any port might be proud.

Among the many matters touched in the annual report of the Liverpool Steamship Owners' Association was that of the need of an adequate reserve of skilled engineers and firemen for the Royal Navy. It was pointed out that as many engineers and firemen were now required for the Navy as seamen, but that the great resources of the country in trained engineers and firemen were entirely overlooked. The belief was expressed that reserves could be formed at small trouble and expense in the engineers' shops, in the factories, in ironworks, in gas-works, and similar works throughout the country; which would assure to the Royal Navy the services of a large body of highly skilled engineers and firemen, who after a few weeks' service at sea would form efficient members of the crew. The subject has received much attention in the steam-shipping circles of Liverpool, as it is well-known that difficulty is experienced in obtaining efficient firemen for the Navy.

An important twelve days' sale of shipbuilding plant began in Liverpool on Monday, 19th of February, and will close on Tuesday, March 6th. The plant is that contained in the Toxteth Dock and Park Street building yards, which have been carried on for many years by Mr. Caleb Smith. Mr. Smith is having to relinquish possession of the yards owing to the Mersey Docks and Harbour Board requiring the sites for dock extension. The plant is catalogued into 2,630 lots, and comprises some large bending and drilling machines, and fitting-shop appliances. The whole are being sold by auction by Messrs. Thomas Whitehead and Sons, of Liverpool.

THAMES.

(From our own Correspondent.)

A NEW joint has been invented by Mr. Preschlin, the manager of Elmore's German and Austro-Hungarian Metal Co., which gets rid of the brazed joints, the source of so many failures in copper steam pipes. The part of the pipe most subject to strain is that of the joint between the flange and the pipe where the brazing has been made. The joint consists of two flanges, with the hole for the pipe conically turned, and of two conical plugs to fit on the inside of the pipe. The pipe is between the flange and the plug, and it is made bell-mouthed to receive the plug, which, after insertion into the end of the pipe, is lapped round the plug. The expanded end of the pipe is compressed between the plug and the flange, and then the flanges are driven home with bolts. The pipes were tested under a longitudinal strain by Messrs. D. Kirkaldy & Son. The pipes tested were one set about 4·346 in. and 4·145 in. outside diameter, and 3·95 in. and 3·938 in. inside diameter respectively. Fracture took place with the thicker pipes at a pressure of 30,000 lbs. per square inch, and with the thinner at 39,000 lbs. per square inch.

The Parsons steam turbine is by no means the only one in the field, although it is the most successful in its applications. But there is another one manufactured by Messrs. Greenwood & Batley, Limited, of Leeds, called the De Laval steam turbine. In its present form it is of the impulse type, and takes up the kinetic energy of the steam—kinetic energy of any mo body depending on the square of the speed, the higher the better. In some machines the speed is 30,0 these are small machines. In larger machines of about 200 H.P. the speed is 10,000 revolutions. These high speeds must necessarily be reduced for communicating motion to working machines, and this is done by double helical gearing. On machines up to 30 H.P. one gear is found sufficient, but in machines above 30 H.P., the pinion in the turbine shaft gears into two wheels on opposite sides, producing balanced strains. The reduction of speed is about 10 to 1. They have applied the motor to drive machinery by means of belts, and ropes to drive dynamos, the dynamos being placed on the second speed shaft; to turbine pumps, the pump being placed in the second speed shaft; to turbine exhaust and pressure fans. On a 300 H.P. steam turbine motor the consumption of steam was 13·9 lbs. per brake H.P.

Mr. A. F. Hills, of the Thames Iron Works must be a very busy man. Not long ago the old firm of John Penn & Sons, of Greenwich, was taken over by the company, and he naturally became managing director of that. But the valley of the Thames is not enough for Mr. Hills, and to be managing director of the largest shipbuilding yard, as well as one of the largest engineering shops, does not absorb his whole energies. He is also chairman of Messrs. Reavell & Co., of Ipswich. This firm is on the Admiralty list, and it has the orders in process of execution for 36 sets of fans and engines for three battleships. The engines of these battleships are being constructed by the Thames firm. Messrs. Reavell & Co. make an air compressor which has four compressing cylinders with trunk pistons, the connecting rods of which are actuated by a common crank. The suction parts of the cylinder are uncovered by the piston at the end of the stroke. The air is drawn from the crank chamber through the grid valve. A weighted lever is constantly tending to open the grid to its fullest extent, but it is controlled by a plunger in a cylinder connected with the receiver. When the receiver pressure rises the section is throttled. The cylinders are water jackets, and corrugated to assist the water in taking away the heat as rapidly as possible. The driving shaft may be actuated by means of engine electric motion or by belting.

We are having milling machines now to do almost everything in engineering work. The latest is one to cut screws. That Messrs. John Holroyd & Co. of the Perseverance Works, Milnrow, Rochdale, have brought out a new one will be of great interest to the managers of engineering works on the Thames and elsewhere, most of whom are fitting up their shops with the latest machine tools in order to allow them to successfully cope with their work and get it done in time. The machine cuts screws of any length, and up to 1¾ in. diameter. The great advantage which these milling machines offer is that they can be worked by men who are not necessarily classed skilled, and this, with the cutting of a screw which formerly required very skilled labour indeed, can be done in this machine by an unskilled worker. There was always a difficulty with threads produced in a lathe not being quite accurate. For one thing this was due to the cut not being taken all at one time, and that there was always a certain amount of backlash. Now with the milling machine, which takes the entire cut at once, there is no backlash, the nut on the screw being adjustable so as to take all backlash out of it. There is an advantage also from the cutter lasting much longer than the cutting tool. A cutter has been known to last without sharpening whilst it cut 30 1-in, screws 6 in. long.

NORTH-WEST OF ENGLAND.

(*From our own Correspondent.*)

Barrow-in-Furness.—There is very little change to note in the shipbuilding industry in this district. The greatest possible activity is maintained, and every effort is being put forth to push forward the many important contracts on hand. These, as is known, are almost exclusively of the Admiralty class, and indeed the only commercial work on hand is that of repair orders, and they are not very numerous. The very bad weather experienced during the month has greatly retarded outdoor work, except in cases where men are employed under cover in the holds of ships and elsewhere. The severest snowstorm experienced in the district for thirteen years had to be contended with, and this led to the suspension of outside work for some days, but it happened at a time when the local volunteers were going out for active service, and under any circumstances the men would have taken a holiday at this time, not only from patriotic motives, but because they seem to find any excuse for a few days' leisure at any time, and this especially so when builders are very busy and when men are well off with plenty of money in their pockets, and with every prospect of good piping times for a long while to come. It seems to be one of the exigences of the shipbuilding trade that frequent holidays are indulged in. St. Lubbock is to some extent responsible for this. Time was when the Christmas and Whitsuntide holidays were the only playtimes recognised, now there are the Easter and the August bank holidays to be observed, and as many more as fate may decree. What with one holiday and another from five to six weeks out of every year are spent away from work, and, although the necessity is great for a change, there seems to be no remedy at hand.

The work in progress at the Naval Construction Works of Vickers, Sons & Maxim embraces the first-class British battleship *Vengeance*, which is being fitted up in the Devonshire Dock; the first-class armoured cruisers *Hogue*, *Euryalus*, and *King Alfred* the torpedo-boat destroyer *Vixen*, and the Japanese battleship *Mikasa*. The *Vengeance* has her engines and boilers in, both masts are stepped, and her general fittings are being proceeded with. She will be ready for her dock trials in the early summer of this year and by the autumn will, it is expected, be in the hands of the Admiralty. The *Hogue* is in a forward state. Her armour is being fixed, and she will be launched in the autumn. Her sister ship, the *Euryalus*, is next in order of progress, and will be ready for taking the water soon after the *Hogue*, but it will be next year before the *King Alfred* is launched. She will be the finest and largest cruiser ever built here, and will in addition to being strongly armoured, as well as protected, have a high rate of speed. Considerable energy is being employed in the construction of the Japanese battleship *Mikasa*, as the Japanese Admiralty require delivery as soon as possible, and in view of the possible entanglement with Russia this is quite easy to understand, but eighteen months under the most favourable conditions must elapse before she can be completed and ready for service. The first ship to be launched at Barrow will be the torpedo-boat destroyer *Vixen*, and it is expected she will give a very good account of herself, as the experience the firm have now had will enable them to fulfil the very exacting conditions of these frail craft with much less trouble and with more certainty and expedition than was previously possible. It takes some time and experience to enable builders and engineers to tackle this work successfully, but when once they have been through the mill they are able to bring valuable experience to the aid of economic production, and to the celerity with which they can complete the contracts undertaken. Take the case of the *Leopard*, the seventh torpedo boat built at Barrow, and the last delivered to the Admiralty, is a striking proof of this. She went through most exacting trials without a single hitch, and she is admitted to be the crack torpedo-boat destroyer in the Devonport flotilla. Only recently in a spin from Belfast to the English Channel she beat all her sister ships, and even when the flotilla were under easy steam with three of their boilers going, the *Leopard* outdistanced them all, although she had only two boilers in steam. The admiral in command of her signalled her back, and, leaving his flagship, went on board the *Leopard*, and proceeded with her home in order to see for himself how she managed to do better than her sister craft, with 33 per cent. less boilers at work. He was eminently satisfied with her performance. This is a feather in the cap of the Thornycrofts, whose boilers, built at Barrow, are used in this torpedo-boat destroyer. The *Otter*, another Barrow-built torpedo-boat destroyer, which gave some trouble to her builders, is now in commission, and is giving almost equal satisfaction to the *Leopard*. The *Sturgeon*, *Skate*, *Starfish*, *Bittern*, and *Avon*, torpedo boat destroyers, built at Barrow, are highly spoken of by the Admiralty officers in charge of them. It is evident that Messrs. Vickers, Sons & Maxim have made for themselves a good name as builders of these light but fast and highly destructive little ships. But to the experience gained in the construction of these craft must be added the fact that they are fitted in their engine rooms with shafts and other working parts made of Vickers steel, which has been proved the most reliable and trustworthy.

The marine engineering department of Messrs. Vickers's works at Barrow is very fully employed; indeed, there is a perfect congestion of work in progress, but it is passing through at a very satisfactory rate, and will be ready for the several ships in progress of construction when they are ready to be fitted with their engines, main and auxiliary, their Belleville and other boilers, and other mechanical fittings. This department is undergoing a process of very considerable extension in every branch. New iron and steel foundries are springing into existence, all of them of considerable size and constructed on the most modern lines. A new brass foundry, new electric power works, and a dozen minor establishments are springing into life, with the ultimate result that the works will soon double their size and have double the capacity of production in the point of tonnage of ships launched and I.H.P. constructed, that they were when Messrs. Vickers, Sons & Maxim took over the concern a couple or three years ago. There is no stint in capital expenditure, but the money in all cases is being very wisely spent, and the best practical and expert opinions are guiding the directors in this work of extension. Already a vast increase in the number of men employed is noticeable, and this increase is showing itself more and more every day.

The gun-mounting business at the Naval Construction Works is becoming a very important department. The great bay, originally erected for this purpose, has been twice enlarged already, and a third and considerable enlargement is now in progress of construction, and even then the department will not be nearly large enough for the work it has to do, and arrangements are therefore almost completed whereby the present capacity of the department will be more than doubled. At present over 200 machines are at work in the various details of gun mounting, and it is probable ere long more than double that number will be in operation. Over 1,500 men are now employed in gun mounting operations at Barrow. In a couple of years it is anticipated that over 3,000 men will be employed, because not only is there a big rush of naval work, not only have the firm *carte blanche* from the Admiralty and other sources to build guns for naval purposes, but they have now to face the necessity, thanks to the Transvaal War, of building big siege guns and heavier garrison and field guns than are at present in use by the British artillery. This is destined to be a very big department at the Naval Construction Works, and there are those who share the opinion that in the sweet-by-and-by not only will gun mountings be produced at Barrow, but guns as well, for the steel of which they are made is produced in the town, and the port of Barrow gives cheap facilities for shipment, not only to British ports, but to the countries of the world.

With this view it is interesting to know that the dock sill at Barrow is being deepened, so that vessels of 30 ft. draught can ride safely in the docks, and vessels of 100 ft. beam can safely be berthed. This work of dock improvement will be completed during the summer months, and it is quite on the cards that subsequently a big graving dock of great length and depth, capable of docking the largest ship ever built, or ever likely to be built, will be provided at Barrow.

Messrs. Vickers, Sons & Maxim some time ago contracted to build the engines for the Spanish cruiser *Estremadura*, but let off the work to an engineering firm at Barcelona, who have worked from the Barrow designs. The Belleville boilers for the ship have been constructed at Barrow, and will be shipped to Spain. The Barrow firm are responsible for the speed results of the ship on her trial trip.

West Cumberland.—The shipbuilding industry in West Cumberland is very brisk, and orders are plentiful. Both the yard at Maryport and the one at Workington are full of work, and likely to be for some time; indeed, orders are more plentiful than builders can undertake, and as they confine themselves to the building of small craft, this may be taken as a proof that, whilst the general movement is in the direction of building very large steamers, there is still a very full and healthy demand for comparatively small ships. Very few sailing ships have been built in recent years in West Cumberland, and it is probable no more will be built, as the big cargo steamers now entering all long sea trades are crushing the old type of sailing vessel out of existence.

Shipbuilding Material.—A marked improvement has arisen in the demand for shipbuilding material, and the makers in this district are not only very busily employed, but they are in receipt of inquiries which could only be justified by a very brisk demand for new shipping tonnage. Ship plates have advanced to £8 2s. 6d. and £8 3s. 9d. per ton net at works or f.o.b.; boiler plates are at £9 15s. All classes of shipbuilding material are in full request, and the mills in every department are kept busily employed, and are likely to remain so for an indfinite length of time.

Hematites.—The hematite pig-iron trade is very active, and the market has undergone a change for the better during the month, especially as regards warrant iron. This was depressed owing to a variety of causes, which have been proved unfounded, and now, when stocks are being depleted in order to meet a heavy demand for prompt deliveries, prices are advancing, and are now at 77s. 6d. net cash sellers, buyers one penny less. Makers are very firm at 80s. to 82s. per ton for mixed Bessemer Nos. net free on board. During the month stocks have been reduced considerably, and now stand at 170,085 tons, or 11,976 tons less than at the beginning of the year. There are 47 furnaces in blast as compared with 40 in the corresponding week of last year.

Shipping.—The shipping trade is very well employed, and freights are very satisfactory. The exports of pig iron since the beginning of the year have reached 114,581 tons, and of steel 54,078 tons, being an increase of 53,721 tons of pig iron, and a decrease of 17,348 tons of steel, as compared with the corresponding period of last year.

Workmen's Houses.—There is still a great scarcity of houses for workmen in Barrow, owing to the growth of Barrow industries, and the increased and ever-increasing number of men employed. Messrs. Vickers are building several hundred houses on Walney Island, near their works, and private builders are putting up several hundreds of new houses in the town proper, but there is immediate need of fully 1,000 additional houses at the present time, to say nothing of what will evidently be required in the early future.

Miscellaneous.

Electric Canal Haulage has received another step forward by Siemens & Halske. They have been making experiments with barges on the Finon Canal with two different systems. One is a kind of telphorage motor, the other is an electrical locomotive which runs along the tow-path on plain rails. In the first system the motor is suspended on rods supported on posts, and the current is supplied to it by means of a separate wire. There are great difficulties in this case, due to accidents due to the great strain produced by the motor. In the other case the traction wheels on the rail support 85 per cent. of the weight of the locomotive, the other wheels run on a light rail, or in the ground tow-path. The highest speed is three miles per hour, and the traction force 12 cwt. A series motor is used, which allows of a higher speed when running light.

Japanese Launches.—Messrs. Mitsubishi Zosenjo, of Nagasaki, Japan, launched the following vessels during 1899:—Three steel twin-screw steamers, each fitted with a twin set of triple-expansion engines: the *Awa Maru*, 6,309 tons gross register, 4,112 I.H.P.; the *Bakan Maru*, 320 tons gross register, 320 I.H.P.; the *Toyora Maru*, 322 tons gross register, 346 I.H.P. A single-screw steel steamer, the *Akunoura Maru*, 1,630 tons gross register, fitted with triple-expansion engines of 900 I.H.P. Also two bucket-dredgers of 130 ft. and 120 ft. long, one first-class torpedo boat of 120 tons and two second-class torpedo boats of 82 tons (these were sent out in pieces from Europe and reinstated in Messrs. Mitsubishi Zosenjo's yard). Besides these six wooden steam launches, each of 45 ft., were launched and completed.

John Hopkinsom Memorial.—The inauguration of a new wing to the engineering laboratory at Cambridge University, which is the gift of the widow of Professor Hopkinson took place on the 2nd February. The sum handed over by the widow, son, and daughter for this purpose was £5,000. The wing is a block 92 ft. long and 40 ft. wide, mostly of three storeys and built alongside the old engineering laboratory. In the building is a lecture theatre, a class-room, a large laboratory for testing the materials, and for hydraulic experiments, a dynamo room, and several small rooms. Prominent engineers assisted in the memorial, to the extent of £1,200, to properly fit the place with apparatus, and gifts of further apparatus have been given. A testing machine has been presented by past and present students of Dr. Hopkinson. A portrait of Dr. Hopkinson was unveiled in the lecture theatre by the Vice-Chancellor, and Lord Kelvin delivered the inaugural address. The Vice-Chancellor explained that of the total cost—£12,500—no less than £11,000 had been contributed by donors. Lord Kelvin said he was the Senior Wrangler of 1871, and since then he had largely added lustre to the long roll of distinguished men who had won the highest honour with which this mathematical university annually crowned the career of one of its undergraduates. He had the rare power of grasping a high scientific truth
applying it practically to mechanical art for the u
kind. This was splendidly illustrated in the
did in improving the dynamo. Hopk
light was now in use in lighthouses all

LAUNCHES AND TRIAL TRIPS.

LAUNCHES—English.

Kielder Castle.—On January 16th there was launched at Willington-Quay-on-Tyne for the Castle Trawl and Line Fishing Co., Limited, of North Shields, a steel steam ketch of about 128 tons gross, named the *Kielder Castle.*

Cymodocee.—On January 16th there was launched at Sunderland for A. C. Le Quellec, of Algiers, a steel schooner-rigged steamer, of about 3,810 tons gross, named the *Cymodocee.*

King William.—On January 18th there was launched at Grimsby, for the Monarch Steam Fishing Co., Limited, of Grimsby, a steel steam trawler of about 160 tons gross, named the *King William.*

Livingstone.—On January 19th there was launched at Hull, for the National Steam Trawling Co., Limited, of Hull, an iron steam ketch, named the *Livingstone.*

Ranee.—On January 20th there was launched at Hull from the yard of Earle's Shipbuilding Co. a steam trawler, built to the order of Mr. Ernest Sleight, of Grimsby. The vessel is 110 ft. long by 21 ft. beam by 11 ft. 3 in. moulded depth, and will be fitted with engines of the triple compound type, having cylinders 11 in., 20 in., and 32 in., by 23 in stroke, supplied with steam by a large steel boiler working at 180 lbs. pressure. The christening ceremony was performed by Miss Dorothy Downing, the vessel being named the *Ranee.*

Banca.—On January 20th there was launched from Messrs. Doxford & Sons, Limited, Pallion Shipyard, the large turret vessel *Banca.* Her dimensions are:—Length, 440 ft.; breadth, 51 ft. 6 in.; and depth, moulded, 32 ft.; whilst her deadweight capacity on 24ft. 9 in. is 8,080 tons. The vessel is fitted throughout with 'tween and lower decks, numerous derricks, and powerful winches, provided for rapidly handling cargo. The steamer is classed with British Corporation. Although the 55th turret afloat, it is the first vessel of this type built for the Peninsular and Oriental Steam Navigation Co., and she is in all respects up to the highest standard required by the company in their fleet. The engines, with cylinders, 27½, 45½, and 75 in. by 54 in., and three boilers, 15 ft. 2 in. by 11 ft. 9 in. long, are also by the builders.

Connie and **Kathleen.**—On January 22nd there was launched by Earle's Shipbuilding Co., at Hull, for the Fleetwood Steam Fishing Co., Limited, two steam trawlers named the *Connie* and *Kathleen.*

Steam Dredger.—On January 29th Messrs. Sir W. G. Armstrong, Whitworth & Co., Limited, launched from their Walker shipyard the first of four suction dredgers they are at present building from the designs of Mr. Lindon W. Bates. The vessel in question is for the Port Improvements Commission of Calcutta. She is a steel screw hydraulic suction dredger of the following dimensions, viz.:—Length, 128 ft.; beam, 30 ft.; depth, 8 ft. 9 in. The dredger will be fitted with dredge, pumping, and propelling machinery manufactured by the Wallsend Slipway and Engineering Co.

Cambrian and **Bostonian.**—On January 29th there was launched at North Shields for the Boston Steam Fishing Co., Limited, of Boston, two steel steam ketches of about 190 tons gross each, named the *Cambrian* and *Bostonian.*

Minerva.—On January 30th there was launched at South Shields for the Vedra Steam Fishing Co., Limited, of Sunderland, a steel steam ketch named the *Minerva.*

Marburg.—On Wednesday, January 31st, Messrs. Furness, Withy & Co., Limited, launched from their Middleton shipyard, Hartlepool, a large steel screw steamer, built to the order of Messrs. the Norddeutscher-Lloyd, of Bremen, Germany. She is over 400 ft. in length, and built throughout of Siemens-Martin steel, with a measurement capacity of about 12,900 tons. The vessel is of the three-deck type, with long poop and forecastle, and takes Lloyd's highest class. The holds are fitted for wood shifting boards, and all decks, deck erections, skylights, bulwarks, bulkheads, &c., are constructed of steel and iron. The greater portion of the shell plates are in 24-ft. lengths. Eleven steam winches, donkey boiler, patent steam-steering gear, with hand-screw gear fitted aft, direct steam patent windlass, 14 derricks, six large cargo hatches, and other modern appliances are fitted for the handy working of the ship. Cellular double bottom is fitted all fore and aft, and the fore and after peaks are also available for water ballast. An extra number of bulkheads are fitted, making the vessel practically unsinkable in the event of collision at sea. A large hold is fitted just aft of the engine-room for the carriage of camphor, and the vessel is fitted up in the 'tween decks forward for Chinese passengers. The vessel will be lighted throughout by electricity, and the saloon and cabin, for the accommodation of the captain and officers of the ship, are handsomely finished. She will be rigged as a two-masted fore-and-aft schooner. Triple-expansion engines will be fitted by Messrs. Sir Christopher Furness, Westgarth & Co., Limited, Middlesbrough, having cylinders, 28 in., 44 in., 75 in. by 48 in. stroke, steam being supplied by two boilers, 14 ft. long by 12 ft., and one 15 ft. 5 in. by 12 ft., working at a pressure of 180 lbs., Howden's forced draught being also fitted. This vessel is a duplicate of the *Freiburg*, now being completed at Messrs. Furness, Withy & Co.'s yard for the same owners. On leaving the ways the ceremony of christening the vessel *Marburg* was gracefully performed by Mrs. R. Dahl, wife of the superintendent for the owners.

Skipsea.—On January 31st Messrs. William Gray & Co., Limited, launched the large steel screw steamer *Skipsea*, which they have built to the order of Messrs. William Brown, Atkinson & Co., Limited, of Hull, for the Sea Steamship Co., Limited. Her principal dimensions are:—Length over all, 336 ft.; breadth, 47 ft.; and depth 24 ft. 10 in., and she is built to Lloyd's highest class, with poop, bridge, and forecastle, and fore-and-aft schooner rig. Very tasteful cabin accommodation is provided in a large deck-house on the bridge. The engineer's rooms are also on the bridge, and the crew's accommodation forward. The hull is built with deep frame and a cellular double bottom and after peak tank for water ballast, steam windlass, steam-steering gear amidships, hand-screw gear aft, six steam winches; and the whole of the outfit is of the most approved description. The engines are by the Central Marine Works of Messrs. William Gray & Co., Limited, on the triple-expansion system, with cylinders 24 in., 38 in., and 64 in. diameter, and 42 in. piston stroke, and three single-ended main boilers to work at 160 lbs. pressure per square inch. The ship and machinery have been built under the superintendence of Messrs. J. Jamieson & Co., on behalf of the owners. The ceremony of naming the *Skipsea* was gracefully performed by Miss F. Fenton, daughter of Mr. E. Fenton, one of the directors. The following were also present at the launch, viz.: Mr. Joseph Atkinson (chairman of the Sea Steamship Co., Limited), Mr. and Mrs. Arthur Atkinson, Mr. E. Fenton, Miss B. Fenton, Mr. Jenkins (principal of Messrs. J. Jamieson & Co.), and Captain Blenkarn, who will take command of the steamer.

King Haakon.—On February 1st there was launched at Selby for the Viking Steam Fishing Co., Limited, an iron steam ketch named the *King Haakon.*

Atlas.—On February 1st there was launched at Bill Quay, Newcastle-on-Tyne, by Messrs. Wood, Skinner & Co., Limited, a handsome steel screw steamer of the following dimensions, viz.:—Length, 248 ft.; breadth, 35 ft.; and depth, moulded, 20 ft. 6 in., which has been built to the order of Messrs. Eyde & Hein, of Arendal, Norway. The vessel is of the improved single-deck type, with bridge and topgallant forecastle, and has been constructed under special survey for Lloyd's 100 A1 and also Norwegian Veritas 100 A1* classifications. The saloon, captain's accommodation, and spare berths are in a large house on the bridge deck amidships, having chart-room and wheel-house on flying bridge above, the officers' and engineers' accommodation being in side houses amidships, whilst the crew are berthed in the topgallant forecastle. Water ballast is provided in the cellular double bottom all fore and aft, and in the after peak. She will be rigged as a fore-and-aft schooner with telescopic topmasts, and will be fitted with all the most modern description of deck machinery and other appliances for facilitating the rapid loading and discharging of cargo and general working and navigation. The propelling machinery has been constructed and will be fitted by the North-Eastern Marine Engineering Co., Limited, at the Northumberland Engine Works, Wallsend-on-Tyne, and will consist of a set of triple-expansion engines of the improved type, having cylinders 18½ in., 30 in., and 49 in. in diameter, with a stroke of 33 in., steam being supplied by a large steel multitubular boiler, working at 160 lbs. pressure per square inch. The machinery has also been constructed to the requirements, and under the special survey of both Lloyd's and the Norwegian

Veritas for their respective highest classification. The ceremony of christening the vessel was performed by Miss Josephine Jacobsen, of Grimstad, Norway, niece of Captain Jacobsen, who named her *Atlas*.

Sevilla.—On February 1st there was launched at Sunderland by Messrs. J. Priestman & Co. a screw steamer, built to the order of Messrs. A. C. de Freitas & Co., Hamburg, for their Argentine and Canadian cattle trade. The principal dimensions are:—Length, 410 ft.; breadth, extreme, 52 ft. 2 in.; depth, moulded, to shelter deck, 38 ft. 7 in.; having a total displacement of about 11,000 tons. This vessel is to take the highest class, 100 A1, at Lloyd's, being built to the three-deck rule, with shelter deck. The engines and boilers will be supplied by Messrs. T. Richardson & Sons, of West Hartlepool. Miss R. Willson, Enfield, Gateshead, named the vessel *Sevilla*.

Zillah.—On February 1st there was launched at Sunderland by Messrs. Bartram & Sons a large steel screw steamer for Messrs. Brightman & Co., of London. She is of the spar-deck type, with poop, long bridge, and topgallant forecastle, and is of the following dimensions:—Length, 340 ft.; breadth, 48 ft. 6 in.; depth, moulded, 28 ft. 6 in. She has been built to take the highest class at Lloyd's registry, under the supervision of Captain Sutton on behalf of the owners. The engines will be supplied by Messrs. Blair & Co., of Stockton, the cylinders being 24 in., 43 in., and 66 in., with a stroke of 45 in. The christening ceremony was performed by Mrs. Turner (wife of the managing owner), who named the vessel *Zillah*.

Kensington.—On February 1st Messrs. Cochrane & Cooper, Limited, launched from their Grovehill Shipyard, Beverley, a new steam trawler of the following dimensions: 100 ft. by 21 ft. by 11 ft. depth of hold, built to the order of the Queen Steam Fishing Co., Limited, Grimsby. Triple-expansion engines are being fitted by Messrs. J. Cran & Co., Leith, and the vessel will be fitted out ready for sea with all modern appliances for trawling. Miss Southern, of Grimsby, named the vessel s.s. *Kensington*, and after the ceremony the company adjourned to the Beverley Arms for breakfast. Amongst the company were Mr. Osborne, of the Queen Steam Fishing Co., Limited, and also Messrs. Strickland and Southern, of Grimsby.

Osmo.—On February 2nd Messrs. Craig, Taylor & Co launched from their Thornaby Shipbuilding Yard, Thornaby-on-Tees, a fine steel screw steamer of the following dimensions, viz.: 254 ft. by 37 ft. by 18 ft. depth, moulded; raised quarter-deck type, with bridge and topgallant forecastle, the bows being specially strengthened for ice. The vessel has been built to the highest class in Lloyd's under special survey, and is constructed to carry about 2,150 tons deadweight on a light draught of water. She has water ballast in double bottom fore and aft, and in peak. She has large cubic capacity, and is equipped with four double-powered steam winches, patent direct steam windlass, patent steam-steering gear amidships, screw gear aft, large donkey boiler, and all the latest improvements for expeditious loading and discharging. The engines have been constructed by Messrs. MacColl & Pollock, of the Wreath Quay Engine Works, Sunderland, the cylinders being 18½ in., 30 in., 49 in., by 33 in. stroke, with two large steel boilers working at 160 lbs. pressure. This vessel has been built to the order of the Bjorneborgs Angfartygs Aktiebolag Porin Hoyrylaiva Osakeyhtio (Mr. Oscar Heine, manager), under the superintendence of Mr. George Jaques, Newcastle, and Captain Wikstrom. As the vessel left the ways, she was gracefully christened the *Osmo* by Mrs. Elliott, of Newcastle.

Puritan.—On February 3rd there was launched at Hull for G. Walton, of Hull, an iron steam ketch named the *Puritan*.

Lizzie.—On February 6th there was launched by the Selby Shipbuilding Co., at Selby, for Sir Christopher Furness, the steam trawler *Lizzie*.

Zeila.—On February 8th there was launched by Messrs. J. P. Rennoldson & Son, at South Shields, an iron screw tug, of the following dimensions: 75 ft. by 17 ft. 6 in. by 10 ft. moulded. The engines are of the compound surface-condensing type, of 250 I.H.P., and will be fitted by the builders. She is built to the order of the Peninsular and Oriental Steam Navigation Co., London, and intended for service in connection with their line at the port of Aden. The vessel was named the *Zeila*.

Charlotte.—Lately Earle's Shipbuilding Co. launched at Hull a large steam trawler, built to the order of Messrs. A. & G. Vidor Fils, of Boulogne-sur-Mer. The vessel is 126 ft. long by 22 ft. beam by 12 ft. moulded depth, and will be fitted with triple-expansion engines having cylinders 13 in., 22 in., and 36 in. by 24 in. stroke. The trawler was named *Charlotte*.

Briardale. — On February 15th Messrs. Short Brothers launched from their shipbuilding yard at Pallion a handsomely modelled steel screw steamer, built to the order of Messrs. G. H. Elder & Co., of Newcastle-on-Tyne. The vessel has been built under special survey to the highest class in Lloyd's register, and is of the following dimensions, viz.:—Length, 327 ft.; breadth, 42 ft.; and depth, moulded, 26 ft. 9 in.; and is of the strengthened spar-deck type. The vessel is fitted with a full poop, long bridge amidships (on which houses are fitted up for the accommodation of the captain and officers), and topgallant forecastle for crew. There are four large hatchways, with a powerful steam winch at each, steam being supplied to the latter by a large multitubular donkey boiler placed in the stokehold. The double bottom, which is on the cellular principle, is subdivided into trimming tanks for water ballast. On leaving the ways the vessel was named *Briardale*, the ceremony being gracefully performed by Miss Mildred Cail, of Newcastle-on-Tyne. The vessel is to be fitted with triple-expansion engines by Messrs. the North-Eastern Marine Engineering Co., Limited, of Sunderland, having cylinders 23 in., 38 in., and 62 in. by 42 in., with two boilers 14 ft. 6 in. by 10 ft. 6 in., 160 lbs. pressure. The construction of the vessel has been under the supervision of Captain Fothergill, who will take command on completion.

Rosario.—On February 16th the Blyth Shipbuilding Co., Limited, launched from their shipbuilding and graving dock works at Blyth a steel screw steamer, built to the order of Messrs. Orders & Handford, Newport (Mon). The dimensions of this vessel are:—Length, 282 ft.; breadth, 40 ft. 9 in.; depth, 20 ft. 6 in., and is built to class 100 A1 at Lloyd's, on the single-deck principle, with deep frames. The saloon and captain's cabin are arranged for in house on bridge, whilst the accommodation for the officers and engineers is under bridge, and the crew in topgallant forecastle. The equipment includes stockless anchors, powerful steam winches, large donkey boiler, steam windlass with quick warping gear, steam-steering gear, and all the latest appliances for the quick and economical working of the vessel. Triple-expansion engines of good power will be supplied and fitted by Messrs. J. Dickinson & Sons, Limited, of Sunderland. As the vessel left the ways she was named *Rosario* by Miss James, of Swansea. The hull and machinery have been constructed under the inspection of Mr. Boddy, superintendent engineer, of Newport.

Ventmoor.—On February 16th Messrs. Ropner & Son, Stockton-on-Tees, launched a steel screw steamer of the following dimensions, viz.:—Length, between perpendiculars, 330 ft. 6 in.; breadth, extreme, 46 ft. 6 in.; depth, moulded, 27 ft. The steamer has been built to the order of Messrs. Walter Runciman & Co., of Newcastle-on-Tyne. The vessel is built on the three-deck rule, with one deck laid, having full poop, long bridge, and topgallant forecastle. The saloon and cabins for the captain and officers will be fitted up in the poop, the accommodation for engineers under the bridge deck, and the crew will be berthed in the forecastle as usual. She has double bottom for water ballast on the cellular principle, fore and aft, and in large after peak tank. The vessel will carry about 5,600 tons deadweight on Lloyd's freeboard, is fitted with direct steam windlass, stockless anchors, steam-steering gear amidships, with powerful screw gear aft, and five large steam winches supplied with steam from two donkey boilers, the outfit generally being liberal and fully up to date. She will be fitted with a set of triple-expansion engines by Messrs. Blair & Co., Limited, of about 1,200 I.H.P., steam being supplied by two steel boilers 15 ft. 3 in. by 10 ft. 6 in., steam pressure being 160 lbs. per square inch. The christening ceremony was gracefully performed by Miss Ropner, of Preston Hall, who gave the vessel the name of *Ventmoor*.

LAUNCHES—Scotch.

Montenegro.—On January 20th there was launched at Port-Glasgow for Montenegro, Ferreira & Co., of Para, a steel schooner-rigged steamer, of about 417 tons gross, named the *Montenegro*.

Agamemnon.—On January 23rd there was Greenock, by Messrs. Scott & Co., a screw steaming dimensions, viz.: 440 ft. by 52 ft. 6 in. by 35 ft., moulded; gross displacement, 13,410 tons; deadweight, 8,775 tons; gross tonnage, 6,800 tons. The vessel is fitted with triple-expansion engines, constructed by the builders, having cylinders 29 in., 50 in., and 82 in. diameter by 5 ft. stroke, and 4,500 H. P., giving a sea speed of 13 knots. The vessel has been specially designed for the Ocean Steamship Co.'s line of China steamers. The christening ceremony was performed by Mrs. George Holt, who named the vessel *Agamemnon*.

Clan Maclachlan.—On February 29th Messrs. Alexander Stephen & Sons launched a steel screw steamer of the following dimensions: 395 ft. by 48 ft. by 30 ft., for the Clan Line. The vessel is built in excess of Lloyd's requirements for 100 A1 three-deck class, and is fitted with engines having cylinders 25 in., 41 in. and 67 in. diameter by 48 in. stroke; and boilers 15 ft. 6 in. diameter by 11 ft. 6 in. long, with Howden's forced draught, and suitable for 200 lbs. pressure. The steamer will carry close on 7,000 tons deadweight. Her auxiliary machinery and cargo appliances are very complete and of the most approved type. The vessel is the seventeenth built by Messrs. Stephen for the Clan Line, and she was gracefnlly named the *Clan Maclachlan*, by Miss Maclachlan, of Dunrowan, Dumbreck, Glasgow.

Kilbroney.—On January 30th the Irvine Shipbuilding and Engineering Co., Limited, Irvine, launched a steel screw steamer of 320 tons deadweight, to the order of the Clanrye Steamship Co., Limited, Newry. The vessel has been built to Lloyd's highest class under special survey for the owners' coasting trade, her dimensions being 135 ft. by 21 ft. 6 in. by 11 ft. 9 in. moulded. Mr. W. V. V. Lidgerwood, Coatbridge, is supplying the machinery, the engines being of the compound surface condensing type, having cylinders 17½ in., and 40 in. by 27 in. stroke, steam being supplied from a large steel boiler at 140 lbs. working pressure. The vessel on leaving the ways was gracefully named *Kilbroney* by Mrs. Sneddon, Claremont, Irvine.

Shinano Maru.—On January 30th there was launched from the shipbuilding yard of Messrs. David and William Henderson and Co., Partick, a handsomely modelled twin-screw steamer, which has been built to the order of the Nippon Yusen Kaisha, of Tokio. This vessel, which is similar, but with increased first-class passenger accommodation, to the five steamers completed by the builders some little time ago for the same owners, has been built under the supervision of Mr. A. R. Brown, Japanese Consul at Glasgow, and Mr. George McFarlane. Her principal dimensions are:—Length over all, 463 ft.; beam, moulded, 49 ft. 2 in.; depth, moulded, 33 ft. 6 in.; and a gross tonnage of about 6,000. She is classed in Lloyd's 100 A1 three-deck rule. A most complete installation of electric light by Messrs. W. C. Martin & Co., Glasgow, is being fitted throughout the vessel, Napier Brothers' capstan windlass, and Caldwell's steam-steering gear. The machinery will be supplied by the builders' firm, and consists of two sets of triple-expansion engines, each having cylinders, 20 in., 33½ in., and 56 in. diameter, by 48 in. stroke. Steam is supplied by two large double-ended and two single-ended boilers, constructed for a working pressure of 200 lbs. per square inch. On leaving the ways the vessel was gracefully named *Shinano Maru* by Mrs Negishi, wife of the Japanese manager of the company in London.

Esles.—On January 31st Messrs. Robert Duncan & Co. launched at Port-Glasgow a steel screw steamer of 1,900 tons gross register, to carry 3,100 tons deadweight. Dimensions: length, 280 ft.; breadth, 40 ft.; depth, 20 ft. 6 in. The steamer is named *Esles*, and was built to the order of Messrs. Constantine, Pickering & Co., Middlesbrough, and has since been transferred to Mr. F. G. Camino, jun., Santander. Messrs. Dunsmuir & Jackson, Glasgow, will supply the machinery.

Invernia and **Ben Attow.**—On February 1st two trawlers were launched by Messrs. Hall, Russell & Co., at Aberdeen, for the Irvine Steam Fishing Co., Limited, North Shields, and the North British Steam Fishing, Co., Limited, Aberdeen. The vessels, which were named respectively the *Invernia* and the *Ben Attow*, are 150 tons gross register, and are fitted with boiler and triple-expansion engines of 320 I.H.P.

Drumblade.—On February 1st there was launched at Montrose a steel steam ketch of about 196 tons, named the *Drumblade*, for the Aberdeen and North of Scotland Steam Fishing Co., of Aberdeen.

Planet Venus.—On February 3rd Messrs. Napier & Miller, Limited, launched at Yoker, on the Clyde, the steel screw steamer *Planet Venus* for Messrs. R. W. Leyland & Co., of Liverpool. Her dimensions are:—Length between perpendiculars, 385 ft.; breadth, moulded, 48 ft. 6 in.; depth, moulded, 29 ft. 9 in.; having a deadweight carrying capacity of about 7,000 tons, and a gross tonnage of 4,400 tons. The vessel is built to the highest class of the British Corporation, with cellular double bottom, all fore and aft; also after peak for water ballast. The vessel is fitted with two pole masts, and is fore and aft schooner-rigged. Her machinery is being supplied by Messrs. Dunsmuir & Jackson. Engines triple-expansion, with cylinders 27 in., 43 in., and 72 in., with 48 in. stroke; two boilers of large size, with a working pressure of 180 lbs. During construction the hull and machinery have been under the personal supervision of Messrs. Maxton & Sinclair, consulting engineers, Liverpool, and Captain J. W. Kelly, of Messrs. Leyland, who will take command of the vessel when finished. The christening ceremony was performed by Mrs. Preston, wife of Mr. Arthur J. Preston, one of the partners of Messrs. R. W. Leyland & Co.

Ern.—On February 5th there was launched at Aberdeen, for D. Sherrit, of Aberdeen, a steel steam ketch of about 182 tons, gross, named the *Ern*.

Sirius.—On February 12th there was launched at Port-Glasgow, by Messrs. Russell & Co., the steel screw steamer *Sirius*, 5,500 tons deadweight carrying capacity, for French owners. Dimensions: length, 330 ft.; breadth, 38 ft.; depth, 26 ft. Messrs. Kincaid & Co., Greenock, will supply the engines.

Portadown.—On February 13th there was launched at Paisley, by Messrs. John Fullerton & Co., a steel screw steamer of about 350 tons, which has been built to the order of Messrs. Joseph Fisher & Sons, Newry, for their coasting trade. The steamer is largely in excess of Lloyd's requirements, and has the most modern outfit for working both ship and cargo. Compound engines of 450 I.H.P. are being supplied by Messrs. Hall-Brown, Buttery & Co., Govan. The steamer was named *Portadown* by Mr. Edward Connolly, engineer, Newry, under whose superintendence it has been built.

Gladys.—On February 15th there was launched at Bowling by Messrs. Scott & Sons a screw steamer of the following dimensions: 95 ft. by 21 ft. 6in. by 10 ft. 6in., moulded, which they have built to the order of Messrs. Joseph Monks & Co., Limited, Warrington. Compound surface condensing engines are to be fitted on board by Messrs. Ross & Duncan, Govan. On moving down the ways the steamer was named *Gladys* by Miss M. Gladys Thomas, Brou Avon, Cressington Park, Liverpool.

Tugela.—On February 19th there was launched at Port-Glasgow by Messrs. A. Rodger & Co. the steel screw steamer *Tugela*, for Messrs. Maclay & Macintyre, Glasgow. The dimensions are:—Length, 326 ft.; breadth, 48 ft.; depth, 26 ft. 4½ in. This steamer will carry 5,600 tons deadweight. Messrs. Hall-Brown, Buttery & Co., Glasgow, will supply the machinery.

Saturn, Jupiter, and **Mercury.**—On February 19th there was launched at Govan by Messrs. Mackie & Thomson, the steam trawlers, *Saturn*, *Jupiter*, and *Mercury*, which they have built for the Grimsby and North Sea Steam Trawling Co. The dimensions of each are:—Length, 108 ft. between perpendiculars; breadth, 21 ft.; depth, 12 ft.; tonnage, 180 gross. Triple-expansion engines of 400 I.H.P. will be supplied by Mr. W. V. V. Lidgerwood, Coatbridge. The vessels, which were named by Miss Alward, Miss Cook, and Miss Richards, Grimsby, are the first three of an order for six of the same type, and make 22 which the firm have built for the same owners.

Sappho.—There was launched from the yard of Ramage & Ferguson, Limited, a steel screw steamer, built to the order of the Bristol Steam Navigation Co, Limited, for their general trade between Germany and Bristol. The following are the principal particulars of the new vessel:—Length between perpendiculars, 230 ft.; breadth, 33 ft.; depth, moulded, 17 ft. 4 in. Triple-expansion engines, having cylinders, 18 in., 27½ in., 45 in. diameter, by 33 in. stroke, steam being supplied from a large boiler working up to 160 lbs. pressure. The vessel is supplied with steam windlass, steam-steering gear, steam cranes, and all the most modern improvements for the rapid handling of cargo. The vessel was named *Sappho* by Mrs. John T. Ramage, St. Aubyns. The builders afterwards entertained a large company to lunch, when the usual toasts were honoured.

TRIAL TRIPS.

Hercules.—On January 23rd the steamship *Hercules*, built by Messrs. R. Craggs & Sons, Middlesbrough, to the order of Mr. John Lockie, of Newcastle-on-Tyne (of which we gave particulars in our January issue, page 476), had her trial trip off the mouth of the Tees. Owing to the fog and haze on the water, it was not deemed prudent to drive the vessel at full speed; but on a run seaward for over an hour, under easy conditions, she travelled at the rate of ten knots per hour, which speed was considered highly satisfactory under the circumstances.

Gelderland.—On January 24th the steamer *Gelderland*, recently launched by the Blyth Shipbuilding Co., Limited, of Blyth, was taken to sea for her official trial trip. The vessel, which was built for the Lombard Steamship Co. of London, has been transferred to the Scheepvaart en Steenkolen Maatschappy of Rotterdam. Her principal measurements are as follows:—Length, 259 ft.; beam, 37 ft.; and depth, 18 ft. She is of the raised quarter-deck type, and has been built to Lloyd's highest class. The cabins for captain, officers, and engineers are fitted in iron houses on bridge, and the crew are berthed in topgallant forecastle. The deck machinery is of the latest type for the quick and safe working of the vessel and her cargo. The engines and boilers have been supplied and fitted by Messrs. MacColl & Pollock, of Sunderland, the cylinders being 20½ in., 33 in., and 54 in., with a stroke of 36 in. and 170 lbs. pressure. Amongst those on board were Mr. Horstmann, one of the directors of the steamship company, Captain Schmidt, and Mr. Bagallay, of the firm of Messrs. Flannery, Bagallay & Johnson, of London, Mr. Stenhouse, of Newcastle, and others. After adjusting compasses various trials of speed were made over the measured mile, with gratifying results. After the trial the vessel was taken to the Tyne, where she will load and proceed to Antwerp under the command of Captain F. O. Peters.

Nina.—On January 27th the new steel screw steamer *Nina*, which has been built by Messrs. William Dobson & Co., to the order of Messrs. Fenwick, Stobart & Co. (of which we gave particulars in our February issue, page 522), was taken to sea for her official trip, which resulted satisfactorily.

Val de Travers.—On January 29th the s.s. *Val de Travers*, built by Messrs. S. M'Knight & Co., Limited, of Ayr, to the order of Mr. John Harrison, of London, to meet the requirements of his rapidly increasing trade, proceeded down the Firth of Clyde to run her speed trials on the measured mile at Skelmorlie. The dimensions of the vessel are 200 ft. by 30 ft. 6 in. by 14 ft. She is constructed of steel to Lloyd's highest class under special survey, and is of the raised-quarterdeck type, with strong double bottom. Her deadweight-carrying capability is upwards of 1,050 tons, which is combined with a cubic capacity of about 50,000 cubic feet, whilst at the same time she has a net register tonnage of 275 tons. The machinery has been supplied by Messrs. Ross & Duncan, of Govan, and consists of a fine set of triple-expansion engines, having cylinders 17 in., 27½ in., and 44 in. diameter, by 33 in. stroke, supplied with steam by a large single-ended marine type return tube boiler working at 160 lbs. pressure. Steam-steering gear, windlass, and powerful steam winches for rapid handling of cargo have been fitted. The *Val de Travers* on trial had on board 1,043 tons of cargo, and was drawing 12 ft. 10 in. Six runs were made on the measured mile with and against the tide, and the mean speed obtained was 10·425 knots, which was considered highly satisfactory, especially as the speed attained against wind and tide was 10·23 knots.

Trent.—On February 1st the new steamship *Trent*, built by Messrs. R. Napier & Sons, Limited for the Royal Mail Steam Packet Co., London (of which we gave particulars in our October issue, page 331), completed her official trials on the Firth of Clyde. The machinery consists of a set of triple-expansion engines, having cylinders 37 in., 58 in., and 97 in. diameter by 5 ft. 6 in. stroke, and six single-ended boilers for a working pressure of 180 lbs. The machinery is capable of indicating about 8,000 H.P. The Royal Mail Co. were represented by Mr. Arthur, their superintending engineer, and the results of the two days' trials were very satisfactory, the speed having been easily attained, and the other conditions of the contract fully complied with.

Nubia.—On February 3rd the fine large screw steamer *Nubia*, built by Messrs. William Gray & Co., Limited, and owned by the Hamburg-America Line, Hamburg, was taken to sea for her trial trip. The vessel has been built to Lloyd's highest class, her principal dimensions being:—Length between perpendiculars, 338 ft.; breadth, 51 ft.; depth, 26 ft. 11 in. The engines have been supplied by the Central Marine Engine Works of William Gray & Co., and have cylinders 25½ in., 40½ in., and 67 in. diameter by 45 in. stroke. The boilers are three in number, single-ended, 13 ft. 3 in. diameter by 10 ft. 6 in., and work at a pressure of 170 lbs. per square inch. A speed of ten knots was averaged against a rough sea, the vessel being in ballast trim.

Steam-launch.—On February 7th Messrs. Matthew Paul & Co., Dumbarton, tried for speed at the mouth of the Leven a handsomely constructed steam-launch, fitted with engines having their patent single eccentric valve gear, which has since been shipped to her owners abroad. The trials, which were in every respect satisfactory, the speed attained being close on eight knots, were watched on behalf of the owners by their consulting naval architect, Mr. David Pollock, M.I.N.A., 128, Hope Street, Glasgow.

Telefon.—On February 8th the fine screw steamer *Telefon*, built by Messrs. Wood, Skinner & Co., Limited, Bill Quay, Newcastle-on-Tyne, for Mr. P. A. Gron, of Sandefjord, Norway (of which we gave particulars in our February issue, page 522), left the Tyne for her official trial trip. A large company on board, included Mr. Gron, jun., representing the owner; Mr. Skinner, sen., Mr. Skinner, jun., and Mr. J. Wood, jun., representing the builders; Mr. D. Myles, representing the engineers, Mr. Larsen, of Det Norske Veritas, and Mr. Klaveness, of Sandefjord. The vessel attained a mean speed of 10 knots, which was considered very satisfactory, and afterwards left for Pensacola, under the command of Captain A. D. Christensen, of Skien, Norway.

H.M.S. Assurance.—On February 9th H.M.S. *Assurance*, built by Messrs. J. M'Arthur & Co., Paisley (of which we gave particulars in our January issue, page 479), went down the river on her trial trip. The trials were in every respect satisfactory, the speed and power required being easily exceeded. The Admiralty were represented at the trial by Messrs. Rawlins, Smith, Jago, and Bolden. On completion of her trials the *Assurance* sailed for Devonport.

Lochwood.—On February 13th the steel screw steamer *Lochwood*, built by Messrs. Craig, Taylor & Co., Thornaby-on-Tees (of which we gave particulars in our February issue, page 522), proceeded to sea for her trial trip, which proved highly satisfactory. During the whole of the trip the engines worked with the greatest smoothness, and, on a run of 1½ hour, a speed of a little over 12 knots was maintained. The owners, Messrs. Constantine, Pickering & Co., Middlesbrough, were represented by Mr. William Constantine. The vessel proceeded to the Tyne to load for the Cape.

Sambia.—On February 13th, the fine steel screw cargo steamer *Sambia*, which has been built by the Flensburg Shipbuilding Company, Flensburg, to the order of the Hamburg-America Line, put out to sea for her official trial trip. Her principal dimensions are: 415 ft. by 50 ft. 2 in. by 30 ft. 3 in., moulded, having a deadweight capacity of about 7,500 tons. The vessel has been built to German-Lloyd's highest class A4 1, "three-deck rule," with long poop and forecastle. Accommodation is fitted amidships, the vessel having wood decks over all. She has been supplied with a large number of winches and derricks, and every other convenience for facilitating the quickest possible loading and discharging of cargoes. Triple-expansion engines have been fitted by the engineering department of this firm, having cylinders 26½ in., 44 in. and 72 in. by 48 in. stroke, steam being supplied by two large double-ended boilers. During the trial the vessel made a speed of 11¾ knots, the owners' representatives having expressed themselves highly satisfied both with the hull and machinery of the vessel.

Penmount.—On February 13th the fine steel screw steamer *Penmount*, built by Messrs. William Gray & Co., Limited, to the order of Mr. Richard B. Chellew, of Truro (of which we gave particulars in our February issue, page 523), was taken to sea for her trial trip. A very satisfactory trial run was made, after which the vessel proceeded to Cardiff to load for Buenos Ayres.

Shirley.—On February 13th this vessel had a very successful trial, doing 11 knots, light ship. The *Shirley* is a large steel screw steamer, built by Mess [illegible] for Messrs. Houlder, Midd [illegible] particulars in our [illegible] Hallett, Pattis [illegible] struction of this ship and her machinery on behalf of the owners, and their Mr. Ritson was present at the trial. This vessel proceeded to Cardiff to load.

Aqua.—On February 15th the new steamer *Aqua*, built by Messrs. Ropner & Son, of Stockton-on-Tees, to the order of Sir Christopher Furness, of West Hartlepool, for account of the Newman & Dale Steamship Co., Limited, of London (of which we gave particulars in our February issue, page 523), made her official trial trip in the Tees Bay. After the adjustment of compasses, she proceeded on her run to Cardiff, to load for Naples. The vessel has been built under the inspection of Mr. Maxwell Hill, of Newcastle-on-Tyne, and she will be commanded by Captain Thomas Tate. These gentlemen were present at the trial, and expressed entire satisfaction with the vessel. The builders were represented by Mr. Leonard Ropner.

Braeside.—On February 16th the s.s. *Braeside*, built by Messrs. R. Williamson & Son, Workington, for Messrs. Thomas Pinkney & Sons, of Sunderland, went down the Clyde on her trial trip. She is a vessel 128 ft. between perpendiculars, by 20 ft. breadth moulded, by 10 ft 4½ in., depth moulded, and carries 240 tons on 9 ft. 4½ in. loaded draught. She is built under special survey to Lloyd's 100 A1 class and steams 10 knots loaded. She is fitted with a set of McKie & Baxter's standard high ratio compound surface-condensing engines having cylinders 15 in. and 32 in. by 24 in., supplied by steam from a horizontal return tube boiler 10 ft. 6 in. by 10 ft. long. These engines are built upon the Standard design adopted by the firm three years ago and it is found that they are even more economical in coasting work than triple-expansion engines. The vessel's engines had not been tried until the morning she left Glasgow, and she proceeded to the Wemyss Bay mile when it was blowing a whole gale of wind. After the trials were over the vessel proceeded on her voyage, and the owner expressed himself highly pleased with the results attained.

Correspondence.

[In giving insertion to communications under this heading, we do not in any way pledge ourselves to the opinions expressed therein.—Ed. M.E.]

RECEIVER DROP IN MULTIPLE-EXPANSION ENGINES.

To the Editor of the Marine Engineer.

Dear Sir,—I have read with interest the paper on "Receiver drop in Multiple-Expansion Engines," published in your magazine for February, and read before the North-East Coast Institution of Engineers and Shipbuilders, by Professor R. L. Weighton, M.A., on the 19th ult. I do not propose to refer to the main object of the paper, which is most instructive, but to what is merely a side issue.

Can you tell me how the B.H.P., referred to in the tables, was obtained? The average B.H.P. was about 140, and to absorb this power by friction would entail serious difficulties; to measure it by driving a dynamo brings in the dynamo efficiency.

I am, yours truly,
A. C. F.

Dumbarton.

[I cannot do better than refer you to Vol. XIII. of the "Transactions of the North-East Coast Institution of Engineers and Shipbuilders," in which you will find a paper by Professor R. L. Weighton, M.A., fully describing the brake horse power appliances, and all other details of the engines at the college, Durham. You will find the power is absorbed by an hydraulic brake of special design.—Ed. M.E.]

Reviews.

Arc Lamps and How to Maintain Them. By H. Smithson and E. R. Sharpe. London: Whittaker & Co. 1899.

This little book is intended to give useful information, not so much to those who are engaged in the practical work of manufacturing or installing arc lamps as to those who have such lamps installed on their premises, and desire to understand their practical management and get the best results from them. Descriptions of the peculiarities of most arc lamps on the market are given, and amongst those discussed are the Brockie Pell, the Crompton, the Royce, and the Koerting and Mathieson amongst ordinary lamps, as well as those enclosed lamps which are founded on the Jandus patents. Reference is also made to the characteristics of alternating lamps and of inverted arcs. In the preliminary chapter the general points of an electric installation from the consumer's point of view are briefly discussed, and at the close a few hints on carbons are afforded. The book will certainly be useful to users of these lights, and it should not by any means be thought the less of in that it deals very tersely with its subject.

Electric Bells and Alarms. By F. E. Powell. London: Dawbarn & Ward.

The third number of the Model Engineer Series deals with a subject which appeals to every one who wishes to carry out those little jobs about the house which, if omitted, render the home uncomfortable, and which, if effected by the workman, often involve the householder in some expense and much uncomfortable delay. Most houses are now fitted with electric bells, and so the hints as to how to repair them will be generally useful, even if the fitting of them has already been effected by the builder. But there are other tempting forms of electric bells which may well occupy the ingenuity and labour of the amateur, and many valuable suggestions and hints in this regard will be found in Mr. Powell's little work. He tells how burglar alarms may be planned and carried out, and how common clocks, whether they be of the alarm construction or not in the first place, may be made into electrical alarms. These offer two advantages, in that they may be easily silenced when they have roused the sleeper, whereby much annoyance is often to be avoided; whilst, if the disturbance has only been temporary, they will again take up their necessary duty. The little task which the author has set himself seems to have been well achieved, and the results are likely to be useful to a large circle.

Lean's Royal Navy List, January, 1900. London: Witherby & Co.

The eighty-ninth issue of this standard work of reference is characterised by the fulness and accuracy of detail which have been so noticeable in its predecessors. The information it contains in regard to the biography of the members of the senior service is not only full, but of a kind which cannot be elsewhere found, whilst it is brought very fully down to date. The deaths of those officers who fell at Graspan and Ladysmith at the beginning of the military operations in Natal are all chronicled, together with the circumstances under which they fell and the service which they had previously seen. It is hard, indeed, to find any point in which improvement of such a work might be suggested; but, as this is pre-eminently a work of reference, the convenience of those who use it might be greatly facilitated if the printing on the edges were made to act as a guide to the contents of the various parts of the volume in the way which prevails with many directories and other such books.

Transactions of the Institution of Naval Architects for 1899. *Vol. XLI.* London. 1899.

An unusually important and valuable selection of papers is included in the present volume of these transactions. The first is from the pen of Sir John Durston, K.C.B., Engineer-in-Chief of the Navy. He gives an exhaustive account of a series of experiments conducted on board H.M.S. *Argonaut* in November and December, 1898, when the ship was tried by her contractors at 3,600, at 13,500, and at 18,000 I.H.P. The last-named speed, it should be noted, is her maximum. These trials are the first which have been made public with regard to the water consumption of engines in the Royal Navy, and they are therefore likely to be of very great instruction and value. From them it is seen not only what quantity of water is used by the main engines, but it is shown with great clearness that a very considerable proportion of the whole water evaporated, and thus of the coal burnt and of the power generated, goes to the auxiliary machinery. The problem of attacking the coal consumption of auxiliary machinery is one that must be dealt with in the near future. Economy here is not only needful, but likely to be attainable when full knowledge as to present conditions is reached. The first point is to diagnose the disease and learn its full extent; then we may learn how to apply remedies to it. Rear-Admiral Melville, Chief Engineer of the United States

Navy, read a valuable paper on "The Logical Position of the Motive Power of Warships." Whilst we in this country are adhering, after consideration, to the twin-screw principle for warships, the navy over whose engineering department Admiral Melville so ably presides has gone in for the triple-screw, and the present paper is at once a justification of the position thus taken up, together with a plea for the adoption of a triple-screw system where the middle propeller shall be driven by machinery whose power shall be equal to that of the two wing engines taken together. He gives three reasons in support of his proposition. At page 41 there is set out a summary of the arguments for and against the triple-screw, and this—as, indeed, the whole paper—can be studied with the greatest advantage. Mr. Milton's paper on "Steampipes" will be read with much interest by all those who remember the unaccountable failures which have of recent years taken place in this part of the marine engine—especially with that most recent example of failure, the steamship *Prodano*. Mr. Howden's paper on "Torpedo-boat Destroyers for Sea Service" elicited a somewhat warm discussion, but at the same time it ventilates a part of the question he discusses, which at the present time is not, perhaps, sufficiently regarded. Dr. Elgar's valuable paper on the "Distribution of Pressure on the Bottom of a Ship on the Blocks" in dry dock has, of course, especial reference to the unfortunate *Fulda's* case; but it may well have the attention of all those who are concerned in the construction and management of steamships with a long over-hang forward. Mr. Hunter's paper on "Large Atlantic Steamers," and Mr. H. F. Swan's discussion of the rise of the "Ice Breaker," both deal with important modern topics of marine architecture, whilst the papers on "Balancing" and on "Thrust Block Friction," by Herr von Kodolitsch, deal with necessary questions of marine engineering. The whole volume is got up in the usual handsome manner characteristic of these transactions, and is accompanied by a great wealth of valuable and instructive diagrams.

The Naval Word Book. By N. W. Thomas, M.A. Kiel: Lipsius & Tischer. 1899.

Mr. Thomas has afforded in a small volume a very useful collection of English and German words and expressions relating to nautical affairs. The equivalents are placed in parallel columns, and they arranged according to their relation, first to the ship and to her outfit, then to her manœuvring and docking, and so to her machinery department. Further on tactical phrases and the officer's career are dealt with. Facility of reference is sought as well by the general arrangement of the book as by a table of contents which is prefixed to it. The little work gives technical equivalents in a cheap and handy form, and will certainly be of great use to the seafarer who wishes to master professional German. It is not perhaps the first work of its class, but it is certainly the first we have seen which comes in popular form and at popular price. In an appendix will be found tables for the conversion of English to metric weights and measures. It is perhaps a pity that a cheap cloth cover has not been substituted for the paper wrapper, but that is a Continental characteristic.

Reed's Tide Tables and Nautical Almanac for 1900. Sunderland: Thomas Reed & Co.

We have received a copy of the fifty-seventh issue of this useful publication. Times of high water at the principal ports of the country, a general tide table for Great Britain, Ireland, and the west coasts of Europe, information as to the lighting, fog signalling, and buoying of our coasts, and as to the arrangements made for the electric communication with lightships are afforded as well as a good deal of purely local information. Amongst the latter is much that is useful to those who go thither with vessels. For example, there is a table showing the clear space under Sunderland Bridge at various states of the tide. ("Clear space," by the way, would be a more accurate description of what is meant than "height," for the actual height of the bridge is a constant.) Information as to local charges, local bodies of various kinds—the regulations which affect those who navigate the Wear—the collection of all these matters makes the book indispensable to others besides the residents of the port.

Electric Wiring, Fittings, Switches, and Lamps. By W. Perren Maycock, M.I.M.E London: Whittaker & Co. 1899.

Mr. Maycock's contribution to the Library of Arts, Sciences, and Industries is a very comprehensive and exhaustive one. It deals with the whole subject (which has now attained so great dimensions) of the application of electricity to lighting in domestic and public places. The practical work of the fitter is clearly explained. Full descriptions are given of the very manifold patent appliances for use and ornament which are now so commonly associated with electric light. The theoretical side of the question has also due attention. Diagrams and illustrations are afforded in great profusion, and the reviewer can only say that whilst the book has been in his hands it has proved of the greatest use to him in regard to an installation in which he is personally interested. The special case of ship-wiring has attention, and the latest devolopments—such of them as are of commercial interest at least—are all chronicled. The book is one which will prove useful to all students of the science as practically applied.

Marine Engines. By L. E. Bertin, Director of Naval Construction. Paris: Bernard & Cie.

Sir William White, in introducing to English readers the English version of M. Bertin's "Marine Boilers" (John Murray), recently translated by Mr. Leslie S. Robertson, writes as follows:—

"Although M. Bertin is so well known, not merely in France, but in all maritime countries, I may be permitted to indicate briefly what his claims are to deal with this important subject. He is one of the most eminent members of that distinguished body, the Génie Maritime. His career has embraced long service in the French dockyards, at sea, and in the Ministry of Marine . . . . As Chef du Service Technique at the Ministry of Marine . . . . he is responsible to the Minister of Marine for the practicability and technical accuracy of the designs for all new French ships. As a matter of fact, M. Bertin is the responsible designer of the latest and swiftest cruisers now building in France. Consequently no one is better placed for speaking authoritatively, and with complete information respecting the most recent French practice in marine engineering and boiler construction."

M. Bertin, from his official position as Chief Constructor to the French Navy, has the *entrée* to all the latest and most accurate data of ships built and building both in France and abroad, and he published a short while ago his extremely interesting book on "Marine Boilers," above referred to. It is therefore with no small interest that we awaited his companion volume on "Marine Engines" which has lately appeared. The ground covered by this book is more familiar to English readers than was the ground covered by his earlier volume on "Marine Boilers," which dealt more particularly with tubulous boilers, in which the French then had more experience than we had had, and therefore in one sense this present volume is hardly likely to prove so welcome an addition to technical literature on this side of the Channel as M. Bertin's first volume, which our contemporary, the *Engineer*, characterises as "the most noteworthy book on boilers that has been written."

We do not, however, wish to detract for one moment from the great value of the volume now before us: it is undoubtedly a masterpiece of careful compilation, handled with all M. Bertin's well known high scientific ability, and it should prove a work of reference of great utility to those to whom the French lauguage and the metrical system of weights and measures are not a hindrance. We can especially recommend it to the careful study of those who may be called on to lecture upon or teach marine engineering. This book, like his "Marine Boilers," is the outcome of M. Bertin's lectures to the students at the Ecole d'Application du Génie Maritime, which school prepares the future engineer officers for the French Navy, and therefore we may expect to find the subject matter treated in a highly scientific and mathematical manner. This is more especially the case in the first two chapters dealing with the properties and expansion of steam where the use of the calculus is freely employed.

Though in a short review like the present, it is impossible for us to attempt to do justice to a work of nearly 700 pages, let us now turn to the contents of the book itself, which we find divided into three distinct parts:—

I. The energy and distribution of steam in the cylinder.
II. The mechanical aspect of the steam engines.
III. The construction of steam engines.

The first three chapters are devoted to the mathematical treatment of the expansion of steam, energy contained in steam, and similar subjects, and is of a highly mathematical character, and, we fear, a good deal above the average practical engineer of this country. Some interesting details are given as to the great reduction that has been attained in the steam per I.H.P. per hour. In 1852 the *Napoleon* burnt 4·35 lbs. per I·H.P. per hour, whereas the *Forban* only burnt 0·90 lb. per I.H.P. per hour on her consumption trials. The relation of the weight and space occupied by machinery and boilers to the volume of the cylinders is discussed, and examples from actual practice are cited. Also the most economical power at which the engines can be run from the point of view of coal consumption is treated of, and M. Bertin points out that the most economical speed for the engines does not as a rule coincide with the speed of the engines that corresponds to the most economical speed of the ship, and he shows how these two speeds are related and that they must not be confounded.

The effect of compression on the power, economy, and safety of engines, or their immunity from accident, is fully treated, together with diagrams from actual practice, and the special relief valves used by M. Normand for this purpose are illustrated.

M. Bertin cites some interesting particulars from actual practice showing how the steam consumption of an engine may increase after she has been in commission for some time, and the causes giving rise to this. He draws attention to a matter which we fear is often neglected by some practical engineers, and that is the very pernicious influence that water has on the consumption and economy of steam, if the steam piping is not properly lagged, and condensation to any extent is allowed to take place in the pipes.

The subject of jackets is naturally one on which the opinion of engineers is largely divided, and M. Bertin cites cases from practice where their use has been both beneficial and also detrimental. He attributes the latter cases to want of proper draining, and this is only too often the case unless it is done automatically, as with the many calls on the attention of an engineer on watch, the draining of the jackets is naturally apt to escape his notice.

Chapter IV. occupies 73 pages and deals exclusively with valves, valve gears, valve diagrams, &c., and the subject is handled in a masterly way. Our space forbids us going into details, suffice it to say that the various well-known gears are all noticed, and their good and bad points discussed, as well as their influence on the steam distribution.

Part I. closes with Chapter V., on starting and turning engines, and the handling of the main engines. We don't know that there is much in this chapter of special interest, or that is not generally known in this country, and we shall therefore pass straight on to Part II.

Part II. opens with Chapter VI., on the turning moment and resistance to rotation, which are handled by M. Bertin very trigonometrically, and occupy about 20 pages. He passes on to the interesting questions of vibrations and forces tending to produce them. As would naturally be expected, he borrows freely from the excellent work done by Mr. Otto Schlick and Mr. Yarrow, and the discussion that has taken place in this country on this subject, adding some *data* obtained from observations on vessels of the French Navy.

Chapter VII. deals with the lubrication and internal friction of engines. The methods adopted abroad for lubricating the various moving parts of the engines are illustrated, but do not seem to differ materially from the similar arrangements usually adopted in this country. What M. Bertin calls "the coefficient of wear" is defined and illustrated by a long table containing particulars of the leading vessels in the French Navy.

M. Bertin consecrates nearly ninety pages, forming Chapter VIII., to the important subject of Propellers. The chapter contains a mass of information of a practical nature, drawn from the best practice of the day. No less than seven tables are given covering the ground from the early wooden ships to the latest fast destroyers. The work on this subject done by M. Normand in France, Messrs. Froude, Thornycroft, Barnaby and others in this country is analysed, and the results given in a handy form. Multiple screws on one shaft seem to have been used as early as 1850 by Mr. Doyère, but the screws were too close and the result unsatisfactory. M. Terré, one of M. Bertin's chief assistants, is using them again now on the *Grenadier*, similarly to Mr. Parsons on the *Turbinia*.

Chapter IX. occupies about eighty pages and is given up to the description of condensers, air pumps, circulating pumps, and kindred subjects. M. Bertin shows how the present tendency is to use separate condensers and air pumps in the best recent practice, what has led to their adoption, and the advantages and disadvantages of their use. He discusses the efficiency of the cooling surface and the amount required in relation to the H.P. and the H.S. and valuable tables giving the particulars and dimensions of a large number of boats are given. This chapter closes Part II.

Part III. contains three chapters. Chapter X. on the strength of materials, Chapter XI. on the principal moving parts and the framing of an engine, and Chapter XII. on the general arrangements of engines on board and the weight and space occupied.

Chapter X. is interesting as containing the allowances and stresses permitted abroad in the various moving parts, as compared with the usual practice on this side of the Channel, but space prohibits us dealing exhaustively with the subject matter of this chapter. We note that Mr. Seaton's valuable work on the steam engine is largely referred to throughout the present volume whenever they cover the same ground.

Chapter XI. deals with such details as cylinder linings, glands, stuffing boxes, pistons (conical and otherwise), piston rods, slippers, guides, and so forth, all of which are fully illustrated as the various parts are discussed.

Chapter XII., the closing chapter of the book, gives what, to many designers and chief draughtsmen or those occupied in getting out designs, will prove of the greatest value, and that is the actual finished weights of all classes of vessels from the smallest to the largest. As these weights are drawn from official sources not open to the general public, they should prove of exceptional value, and, taken together with the similar tables for boilers published in M. Bertin's "Marine Boilers" are in themselves quite unique.

We are sorry to see that M. Bertin has not included an Index, and this is a distinct want in a work of reference of this nature. The volume is full of the most valuable information from beginning to end, but the trouble will be to know where to find it when it is wanted, without an index.

There are nearly 400 illustrations scattered over a volume of 700 pages.

The work will be a distinct addition to our technical literature. The amount of information contained in it is enormous. The subject matter is handled in a masterly way by a man of exceptional ability and unrivalled opportunities of access to the very best and latest information all over the world, and we can confidently recommend it to those of our readers who are familiar with the French language.

(It may be of service to some of our readers to point out that M. Bertin's book on Marine Boilers, above referred to, is published in English by Mr. John Murray.)

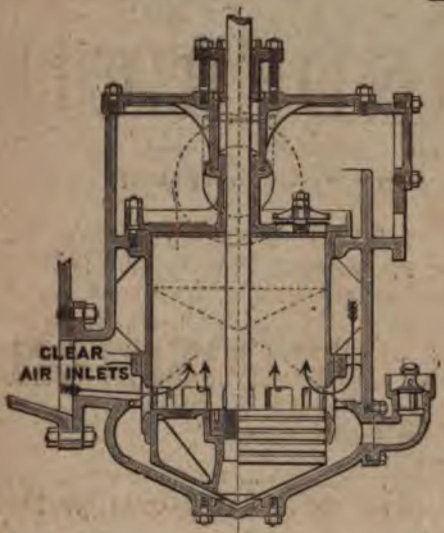
RICHARDSON'S ENGINEERS' AGENCY.—EMPLOYERS having VACANCIES for Managers, Engineers, Draughtsmen and Foremen are invited to apply to the above, who always have on their books a number of first-class men SEEKING ENGAGEMENTS. Strict confidence observed.—65, Imperial Buildings, Ludgate

EDWARDS PATENT AIR PUMP.

No Foot or Bucket Valves. No Doors required in Barrel.



The whole of the valves can be examined, cleaned, or renewed without stopping the engines, loss of vacuum, or loss of fresh water. It is almost impossible for the failure of a valve to lead to a breakdown.

There being no foot valves, pressure is not required in the condenser to open them and drive the water up into the pump.

The water being driven into the barrel mechanically, the speed of the water must correspond with the speed of the bucket, however fast the pump be driven.

These pumps will deal efficiently with a large body of water, and are specially suitable for jet purposes.

Excellent results obtained in connection with out-board condensers.

A large number are at work on land and at sea, giving the greatest satisfaction.

63, Leadenhall Street, London, E.C.,
23rd December, 1898.

Dear Sir,—Thanks for yours of the 21st inst.

"Haiching." Your Air Pump on this vessel worked splendidly at the trial trip. Vacuum 29 in. during the whole of the time.

Yours faithfully, (Sgd.) A. J. DUDGEON.

F. Edwards, Esq., 62, Bishopsgate Street, E.C.

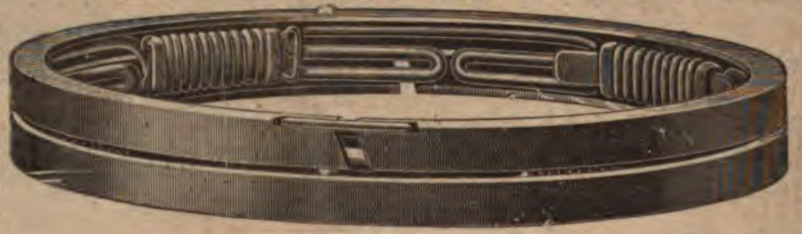
LOCKWOOD & CARLISLE'S IMPROVED PATENT DOUBLE-ACTION METALLIC
PISTON PACKING RINGS & SPRING.

The SPRING RINGS are SIMPLE and EFFICIENT, and are designed so as to have two distinct actions—one to press the Packing Rings outwards against the walls of the cylinder, and the other to press the Rings apart against the flat faces. Thus no inclined plane required in Rings.



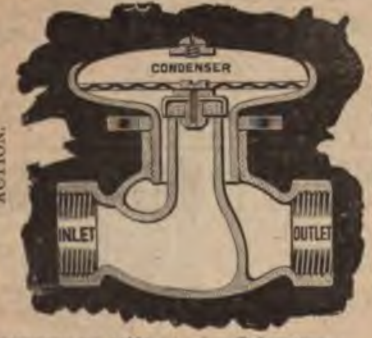
HIGHEST AWARD, Inventions Exhibition, 1885.

GOLD MEDAL, Liverpool, 1886.

Lockwood & Carlisle,
Limited,
EAGLE FOUNDRY, SHEFFIELD.
TELEGRAPHIC ADDRESS: PISTON, SHEFFIELD.

THE "MIDGET" STEAM TRAP For Pressure up to 120 lb.

PERFECTLY AUTOMATIC IN ACTION.



WIDE OPEN WHEN COLD.

THE SMALLEST, LIGHTEST, AND MOST COMPACT STEAM TRAP IN THE WORLD.

The "MIDGET" is perfectly automatic, and equally reliable at all pressures; having no sliding surfaces or frictional contact, the valve cannot possibly jam or get out of order, and once set requires no re-adjustment.

ADVANTAGES—

No. 1. Strength and durability.
" 2. Smaller number of parts than any other Steam Trap.
" 3. Reliable in action.
" 4. Uniform action of all temperatures and pressures.
No. 5. Compactness and neatness.
" 6. Non-liability to get out of order.
" 7. Being made entirely of gun-metal there is nothing to corrode.
" 8. Delivers water to any height according to pressure of steam.

GARNER'S SPINAL REST.

Specially adapted for the comfort of all passengers on board ship, and undoubtedly superseding the old deck chair. This invention was patented by Mr. Garner after being advised to secure it by an eminent surgeon. It is simple, inexpensive, and effective; affords a continuous rest to all who want a recumbent or reclining position. Ordinarily made in DEAL, covered in Baize, with Mahogany or Teak Fittings, Price 25s. Made in Walnut, Oak, Mahogany, or Teak, upholstered in Velvet, price £8. Considered by eminent medical men as affording the best means of taking the weight off the spine. The combined actions of the seat and footboards taking away all the irksomeness and tediousness of reclining.

BOARD OF TRADE.

To Sea-Going Engineers.
BOARD OF TRADE EXAMINATIONS.
W. H. THORN,
Member N.E.C. Inst. Engineers and Shipbuilders,
Author of "Reed's Engineers' Handbook," "Reed's Extra Chief's Guide," &c., &c.
5, WATERVILLE TERRACE,
NORTH SHIELDS.

Prepares Engineers for passing for 2nd, 1st, Extra 1st, Board of Trade, Lloyd's Examinations and Assistant Probationary Engineer for temporary service in the Navy, either at home or in the Colonies.

Tuition by Correspondence.

Mr. THORN has perfected a system of tuition by post, which has in all cases given great satisfaction. There is no longer any need for Engineers to lose money by leaving their ships and staying weeks on shore. W. H T.'s method of preparation by correspondence is PERFECT. Syllabus and particulars post free to any address.

This School is one where Extras are prepared for Examination, by THOROUGH SYSTEMATIC training, not "cramming."

At the January (1898) Examination for Extra First Class Engineers, out of NINE successful candidates, SEVEN were from this school, and of these, FIVE PASSED THE FIRST TIME OF GOING UP, MAKING FIFTY-SEVEN SUCCESSES ALTOGETHER.

90 per cent of Pupils pass the first time.
The OLDEST ESTABLISHED and MOST SUCCESSFUL School in the Kingdom.

HAWTHORN'S
Marine Engineering & Mathematical Academy,
(Established 1888.)
41, EAST INDIA DOCK ROAD, POPLAR, E.
Principal - J. HAWTHORN.
M. I. Mar. E. Extra Chief Engineer. Fellow R. Met. Soc. Memb. Soc. Arts. 1st Medallist in Navigation from Royal Naval Schools, Greenwich.

Engineers entering this School receive a thorough preparation from a practical sea-going Engineer of 15 years' service.

Candidates prepared for 2nd Class. 1st Class, and Extra Chief Certificates.

Personal Lectures, accompanied by Diagrams, on the Verbals and Elementaries twice a week.

Candidates Successfully Prepared by Correspondence.
Hours: 10 a.m. to 1 p.m.; 2 p.m. to 4.30 p.m.
EVENING CLASSES are held on Tuesday, Wednesday, Thursday and Friday. Hours: 7 p.m. to 9 p.m.

Summary of results from this Academy during the past eight years:—

Extra Chiefs,	B. T. Surveyors,	1st Class,	2nd Class,
13.	8.	656.	834.

95 per cent. of which passed on first trial.

LEASK'S
MARINE ACADEMY,
91, Minories, Tower Hill, London, E.

OUR UNIQUE SYSTEM OF EDUCATION,
includes everything required at the Examination, and produces results far ahead of any other.
VERBALS A SPECIAL FEATURE.
These embrace Indicator Diagrams, Setting of Slide Valves, Geared and Oscillating Engines, Boilers, Testing of Water Gauge, Salting, Pitting, Corrosion, Scaling, Priming, Breakdowns, and all other practical subjects included in the Verbal Examination.
OUR CORRESPONDENCE SYSTEM,
which obviates the necessity of leaving the ship to pass, is highly appreciated by Engineers all over the Globe.
IT WILL SAVE YOU POUNDS. Try it.

Principal Tutor: A. RITCHIE LEASK,
Consulting Marine Engineer & Surveyor,
Author of "Triple-Expansion Engines and Boilers," "Breakdowns at Sea," "Refrigerating Machinery," &c.
Write for LEASK'S ENGINEERS' HANDBOOK, and get full particulars & specimen papers, gratis & post free.

PRITCHARD'S MARINE ENGINEERING ACADEMY,
8, WALTON ROAD, LIVERPOOL.
Principal: E. L. PRITCHARD (Extra Chief Engineer).

THE SPECIAL ATTENTION of all Engineer Candidates who are desirous of presenting themselves for any grade of Board of Trade Certificates of competency is directed to the high standard of efficiency of the System of Tuition followed at this Academy. At the April Examination for Extras, out of six successful, three were from this Academy, and passed first trial.

Terms on application, will be forwarded to any part of the world.

GAUGE GLASSES.
GUILBERT-MARTIN,
Represented by ARTHUR HAMBURGER,
1 & 2, FALCON STREET, LONDON. E.C.
Manufacturer of Gauge Glasses for Steam Boilers, also Glass Tubes for Chemical and other purposes. Enamels for Iron (Cast and Wrought) and all Metals.

Inventor and Patentee of the BEACON (red-reflecting) gauge glass. With this glass the height of the water in a boiler can be seen at a glance, and will be found invaluable in dark and confined stoke-holes the level of the water being as clearly discernible in semi-obscurity as in full daylight. The glasses have been adopted by most of the Atlantic-going steamers, also by the Continental Railway Companies.

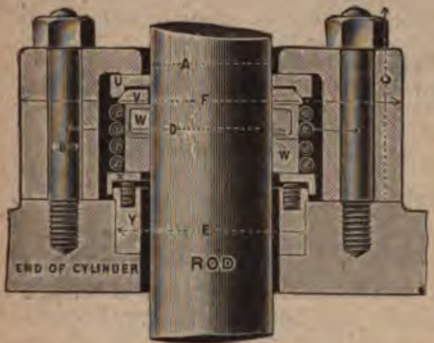
THE "LANCASTER"
R.T.M.
METALLIC PACKINGS.



The "Lancaster" Packings have been introduced to meet the requirement for a *Metallic Packing* which shall be at once *simple,* and, at the same time, *perfectly efficient.* In the best existing forms of METALLIC PACKINGS hitherto made the metallic blocks are kept in position against the rod by means of a number of small springs, which are troublesome to manipulate and easily lost, thus causing much inconvenience. In the *"Lancaster" Packings* these are replaced by *one,* or in the larger Packings by *two springs,* which, completely encircling the block, press them to the rod with a *PERFECTLY EQUAL PRESSURE* at the same time leaving them free to give with any oscillation which may occur owing to the rod being out of truth with the cylinder. The Spring is *capable of being adjusted* without taking the Packings off, and can be *TIGHTENED IN THREE MINUTES* after the outer casing has been removed.

ALWAYS SENT ON APPROVAL.

NORMANDY'S PATENT
DISTILLING MACHINERY

TWO GOLD MEDALS, London International Health Exhibition. 1884.

The Water produced is **PURE, COLD, CLEAR,** and agreeable to the **TASTE.**

NORMANDY'S PATENT EVAPORATORS and **CONDENSERS** for **STEAMERS** produce, from Sea Water, Cold Drinking Water of above quality when worked with the greasy steam from the main boilers, and at the same time will also supply Hot Fresh Water for Make-up Feed.

NORMANDY'S PATENT DISTILLING MACHINERY for **LAND STATIONS** produces at least 29 tons, or 6,500 gallons, of Water of above quality per ton of coal.

NORMANDY'S DISTILLING MACHINERY has been largely supplied to the English Admiralty, and to the German, Russian, Spanish, Dutch, Japanese, and other Governments. Also to the P. & O., Royal Mail, and many other Liner Companies and Yachts, including the Royal Yacht "Victoria and Albert." Also to Land Stations in various parts of the world.

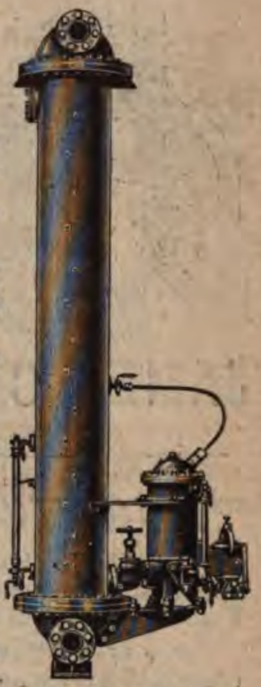
H.M.S. "Powerful," "Terrible," "Arrogant," "Furious," "Venus," "Diana," &c., &c., are also supplied with **NORMANDY'S COMPOUND DISTILLING MACHINERY.**

NORMANDY'S PATENT MARINE AERATED FRESH WATER CO., Ltd.,
Opposite Custom House Station, Victoria Dock Road, LONDON, E.

ALSO SOLE MAKERS OF
NORMAND'S PATENT

FEED WATER HEATER.

ADOPTED BY THE BRITISH AND OTHER GOVERNMENTS.



FEED HEATER.

THE "HEZZANITH" STANDARD BINNACLE, COMPASS & AZIMUTH INSTRUMENT.

Advantages:—

1st. An absolutely reliable Binnacle at *half the usual price.*

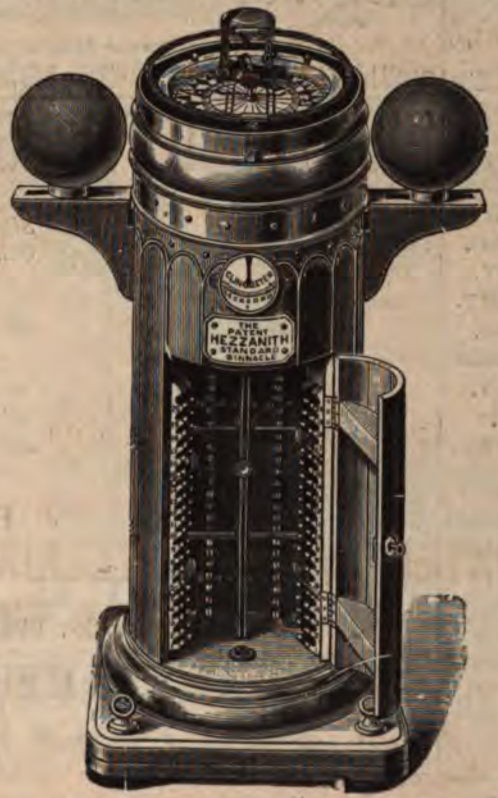
2nd. Patent *endless* silken spoke light card (Thomson's pattern).

3rd. A patent system, by which the magnets can be adjusted to precision without disturbing the card when moving the magnets.

4th. An Azimuth Instrument which can be adjusted and worked with ease.

5th. A Compass and Binnacle so complete in itself that any captain can, without aid, adjust it.

6th. All parts made of *best material*, forming an instrument which will stand "Tramp" wear and tear.



THE PATENT HEZZANITH STANDARD BINNACLE

Compasses fitted to the following steamers:—"Galena," "Navigation," "Chittagong," "Starlight," "Electra," "Daybreak," "Arana," "Pinta," "Balbao," "Dante," "Alvarado," "Gravina," "Bravo," "Pizarro," "Cortes," "Thomas Wayman," "Flambro," "Verax," "Glendower," "Bearsford" "Garth," &c.

And hundreds of others.

Also upon several Canadian Government Cruisers, including the last, the "*Lansdowne,*" Russian, Swedish, Danish, and Australian Colonies Cruisers, and Merchant Steamers, &c., &c.

S.S. "STARLIGHT":—"The two Patent Hezzanith Binnacles supplied to this ship have turned out first-class."
April, 1897. W. H. MILLER, Master.

Numberless Testimonials & Satisfactory Reports about every Binnacle supplied.

GUARANTEED FOR 12 MONTHS

Wholesale of the Manufacturers, **HEATH & CO., LTD.** *CRAYFORD LONDON. S.E.*

PRICE 30/-

KELLY'S DIRECTORY

OF THE

Merchants, Manufacturers & Shippers

For 1899,

BEING

A Guide to the Export, Import, and Manufacturing Industries of the World.

WITH WHICH IS AMALGAMATED STREET'S INDIAN AND COLONIAL DIRECTORY.

THIS Work was originally issued every Three years, but the demand for it has been so steady and continuous that it has been found necessary to issue it Annually.

As in former Editions, the Work contains lists of the

IMPORTERS, EXPORTERS, MERCHANTS and MANUFACTURERS of GREAT BRITAIN and IRELAND, AND THE PRINCIPAL TRADING CENTRES OF THE WORLD.

Divided into **2 Divisions,** Foreign and Home.

The First Division embraces the British Colonies and possessions throughout the World, and the various Foreign Countries and their Colonies to which British Manufactures are exported, arranged under following Heads:—

INDIAN AND COLONIAL POSSESSIONS.	EUROPE (CONTINENTAL).	ASIA.
	AMERICA, NORTH & SOUTH.	AFRICA.

With each Country will be found a concise statistical account of its financial position, the ports and principal towns, with a short topographical account of each, together with classified list of the *Consuls, Bankers, Merchants, Commission Merchants, Brokers, and Shipping Agents,* and others who are *Buyers of British Goods,* and also the *Manufacturers of Goods Exported.*

The Second Division of the Work embraces the names and addresses of the actual Manufacturers in the United Kingdom of the articles exported, classified in the usual way, describing as clearly as possible the specialities of each Manufacturer. Lists are also given of the Merchants and Shippers who export British Goods; also Manufacturers who have either depots abroad or Consignees to whom they ship their own goods, will be included in this list and indicated by a special mark.

This part of the Work will be of great value to Buyers abroad, and also to the Merchants in this Country, by putting them in communication with the actual Manufacturers of such goods as are required abroad: while to Manufacturers it will be valuable, as showing them the Merchants and Shippers to the various Countries with which they may desire to do business.

The Trade Mark Section, as in the last Edition, is printed on coloured paper, and the Publishers feel that they cannot too strongly point out to Traders the importance of making their Trade Marks well known, and so avoiding the misleading imitations with which some of the Foreign Markets are flooded.
